## Changes to LED Specifications for A Series Indicators

Type of Change:

- Engineering
$\square$ Part Number
『 Product 『 Appearance

The LEDs for A Series Indicators will be changing. This will result in different electrical values from the previous LEDs for Red, Yellow and Green. The revision applies to standard and custom indicators. Following are comparisons between the specifications and a table of effected standard part numbers.

## Notes

- The LED circuit is isolated and requires an external power source.
- If the source voltage is greater than the LED's rated voltage, a ballast resistor must be connected in series with the LED. The resistor value can be calculated by using the formula shown here.
- There are no changes to any other specifications or external dimensions.

$R=\frac{E-V_{F}}{I_{F}}$
Where: $R=$ Resistor Value (Ohms)
$\mathrm{E}=$ Source Voltage (V)
$V_{F}=$ Forward Voltage (V)
$I_{F}^{F}=$ Forward Current (A)
- Contact the factory if further details are needed.
