## description/ordering information

The TLV1117 is a positive low-dropout voltage regulator, designed to provide up to 800 mA of output current. The device is available in $1.5 \mathrm{~V}, 1.8 \mathrm{~V}, 2.5 \mathrm{~V}, 2.85 \mathrm{~V}, 3.3 \mathrm{~V}, 5 \mathrm{~V}$, and adjustable output voltage options. All internal circuitry is designed to operate down to 1 V input-to-output differential. Dropout voltage is specified at a maximum of 1.3 V at 800 mA , decreasing at lower load currents.
The low-profile surface-mount KTP package allows the device to be used in applications where space is limited. The TLV1117 requires a minimum of $10 \mu \mathrm{~F}$ of output capacitance for stability. Output capacitors of this size or larger normally are included in most regulator designs.

Unlike pnp-type regulators, where up to $10 \%$ of the output current is wasted as quiescent current, the quiescent current of the TLV1117 flows into the load, increasing efficiency.
The TLV1117C device is characterized for operation over the virtual junction temperature range of $0^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$, and the TLV1117I device is characterized for operation over the virtual junction temperature range of $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$.

## TLV1117

ADJUSTABLE AND FIXED LOW-DROPOUT VOLTAGE REGULATORS

SLVS561 - DECEMBER 2004
functional block diagram

absolute maximum ratings over operating free-air temperature range (unless otherwise noted) $\dagger$

$\dagger$ Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
package thermal data (see Note 1)

| PACKAGE | BOARD | $\theta \mathbf{J P}^{*}$ | $\theta$ JC | $\theta_{\text {JA }}$ |
| :--- | :--- | :--- | :---: | :---: |
| PowerFLEX (KTE) | High K, JESD 51-5 | $2.7^{\circ} \mathrm{C} / \mathrm{W}$ |  | $23^{\circ} \mathrm{C} / \mathrm{W}$ |
| PowerFLEX/TO-252 (KTP) | High K, JESD 51-5 | $3^{\circ} \mathrm{C} / \mathrm{W}$ |  | $28^{\circ} \mathrm{C} / \mathrm{W}$ |
| QFN (DRJ) | High K, JESD 51-5 | TBD |  | TBD |
| SOT (DCY) | High K, JESD 51-7 |  | $4^{\circ} \mathrm{C} / \mathrm{W}$ | $53^{\circ} \mathrm{C} / \mathrm{W}$ |
| TO-263 (KTT) | High K, JESD 51-5 | TBD |  | TBD |
| TO-220 (KCS) | High K, JESD 51-5 | $3^{\circ} \mathrm{C} / \mathrm{W}$ |  | $19^{\circ} \mathrm{C} / \mathrm{W}$ |

*For packages with exposed thermal pads, such as QFN, PowerPAD, and PowerFLEX, $\theta_{J P}$ is defined as the thermal resistance between the die junction and the bottom of the exposed pad.
NOTE 1: Maximum power dissipation is a function of $T_{J}(\max ), \theta_{J A}$, and $T_{A}$. The maximum allowable power dissipation at any allowable ambient temperature is $\mathrm{P}_{\mathrm{D}}=\left(\mathrm{T}_{\mathrm{J}}(\max )-\mathrm{T}_{\mathrm{A}}\right) / \theta_{\mathrm{JA}}$. Operating at the absolute maximum $\mathrm{T}_{\mathrm{J}}$ of $150^{\circ} \mathrm{C}$ can affect reliability.
recommended operating conditions

$\dagger$ The input-to-output differential across the regulator should provide for some margin against regulator operation at the maximum dropout (for a particular current value). This margin is needed to account for tolerances in both the input voltage (lower limit) and the output voltage (upper limit). The absolute minimum $\mathrm{V}_{\mathrm{IN}}$ for a desired maximum output current can be calculated by the following:
$\mathrm{V}_{\mathrm{IN}(\text { min })}=\mathrm{V}_{\mathrm{OUT}}(\max )+\mathrm{V}_{\mathrm{DO}}($ max $@$ rated current $)$

APPLICATION INFORMATION

$\mathrm{V}_{\text {OUT }}$ is calculated as:

$$
\mathrm{V}_{\text {OUT }}=\mathrm{V}_{\mathrm{REF}}\left(1+\frac{\mathrm{R} 2}{\mathrm{R} 1}\right)+\left(\mathrm{I}_{\mathrm{ADJ}} \times \mathrm{R} 2\right)
$$

Since $I_{\text {ADJ }}$ typically is $55 \mu \mathrm{~A}$, it is negligible in most applications.
NOTES: A. Output capacitor selection is critical for regulator stability. The recommended minimum is $10-\mu \mathrm{F}$ tantalum or $50-\mu \mathrm{F}$ aluminum electrolytic, with either one having an ESR between $0.3 \Omega$ and $22 \Omega$. Larger COUT values benefit the regulator by improving transient response and loop stability.
B. C $_{\text {ADJ }}$ can be used to improve ripple rejection. Ensure that the impedance of $\mathrm{C}_{\text {ADJ }}\left(X_{\text {CADJ }}=\frac{1}{2 \pi f_{\text {ripple }} \mathrm{C}_{A D J}}\right)$ is $<\mathrm{R} 1$ to prevent the ripple from being amplified. If $\mathrm{C}_{A D J}$ is used, then a larger $\mathrm{C}_{\mathrm{OUT}}$ is required ( $22-\mu \mathrm{F}$ tantalum or $150-\mu \mathrm{F}$ aluminum electrolytic).
C. $\mathrm{C}_{\text {IN }}$ is recommended if TLV1117 is not located near the power-supply filter.
D. An external diode is recommended to protect the regulator if the input instantaneously is shorted to GND.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with Tl's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI .

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. Tl is not responsible or liable for such altered documentation.

Resale of Tl products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. Tl is not responsible or liable for any such statements.
