Description

AZ952S-01F is a design which includes a bi-directional ESD rated clamping cell to protect high-speed data interfaces in an electronic system. The AZ952S-01F has been specifically designed to protect sensitive components which are connected to data and transmission lines from over-voltage caused by Electrostatic

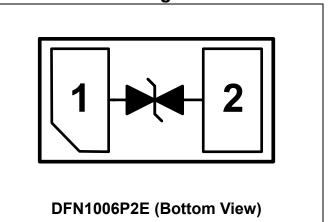

Discharging (ESD), Lightning, and Cable Discharge Event (CDE).

AZ952S-01F is a unique design which includes proprietary clamping cell with ultra-low capacitance in a small package. During transient conditions, the proprietary clamping cell prevents over-voltage on the control lines, or data lines, protecting any downstream components.

AZ952S-01F is bi-directional and may be used on lines where the signal swings above and below ground.

AZ952S-01F may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 (\pm 15kV air, \pm 8kV contact discharge).

Typical Characteristics

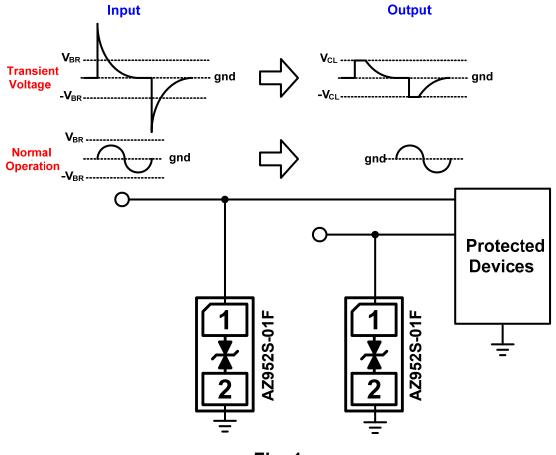

Application Information

The AZ952S-01F is designed to protect one line against system ESD pulse by clamping it to an acceptable reference. It provides bi-directional protection.

The usage of the AZ952S-01F is shown in Fig. 1. Protected line, such as data line or control line, is connected at pin 1. The pin 2 is connected to a ground plane on the board. In order to minimize parasitic inductance in the board traces, all path lengths connected to the pins of AZ952S-01F should be kept as short as possible. In order to obtain enough suppression of ESD induced transient, a good circuit board is critical. Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ952S-01F.
- Place the AZ952S-01F near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.
