When the quantity of transmit data written in the FTDR register as a result of transmission is equal to or less than the specified transmission trigger number, the TDFE flag in the serial status register (FSR) is set to 1 and a TXI interrupt request is generated.

When the data units equaling or exceeding the specified transmission trigger number are stored in the receive FIFO register (FRDR) and the RDF flag in the FSR register is set to 1, a receive data full interrupt (RXI) request is generated. When the quantity of received data in the FRDR register is below the specified reception trigger number and no next data has been received yet even after the period of 15 ETUs elapsed*1 from the last stop bit, the DR flag in the FSR register is set to 1 and a receive data ready interrupt (DRI) request is generated. In clock synchronous mode, a DRI interrupt request is not generated.

When the BRK flag in the FSR register or the ORER flag in the LSR register is set to 1, a BRI interrupt request is issued. When the ER flag in the FSR register is set to 1, an ERI interrupt request is issued.

When TEND flag in the FSR register is set to 1, a TEI interrupt request is issued.

When the RIE bit is cleared to 0 and the REIE bit in the SCR register is set to 1, an ERI and a BRI interrupt requests are issued but an RXI interrupt request is not.

An TXI interrupt indicates that transmit data can be written and an RXI interrupt indicates that receive data is stored in the FRDR register.

Note 1. It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

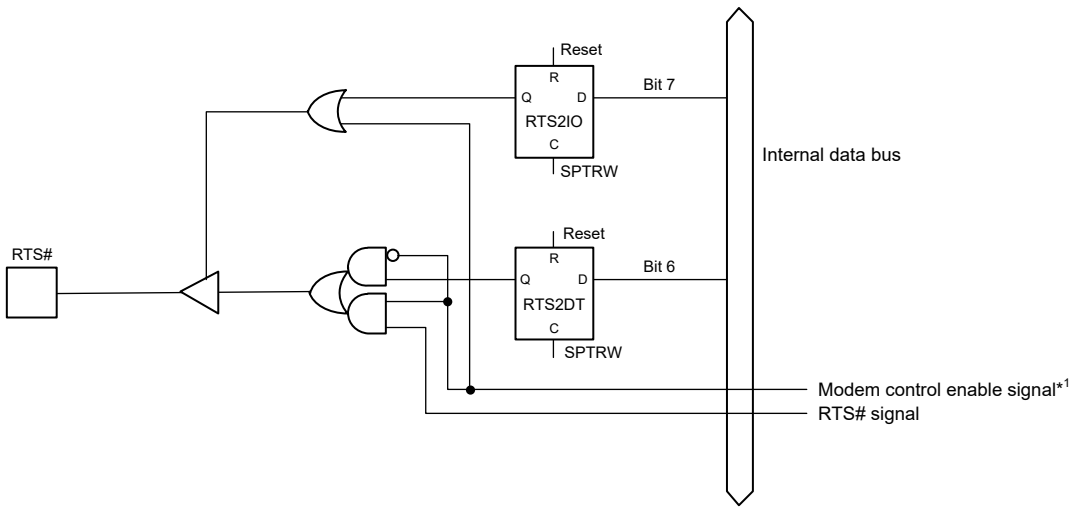
Table 23.19 SCIFA Interrupt Sources

Name	Level/Edge	Interrupt Source	Interrupt Enable Bit	DMAC Activation	Priority
BRI	Level	Interrupt caused by break (BRK) or overrun (ORER).	RIE or REIE	Impossible	High
ERI	Level	Interrupt caused by framing or parity (ER).	RIE or REIE	Impossible	↕
RXI	Level	Interrupt caused by receive FIFO data full (RDF).	RIE	Possible	
TXI	Level	Interrupt caused by transmit FIFO data empty (TDFE).	TIE	Possible	
TEI	Level	Interrupt caused by transmit end (TEND).	TEIE	Impossible	
DRI	Level	Interrupt caused by receive data ready (DR).	RIE	Impossible	Low

Note: The TEI and DRI interrupts share the same vector number.
The ERI and BRI interrupts share the same vector number.
If CPU processing is used, clear the flag after the block transfer. If the DMAC is activated, access to the flags is prohibited.

23.6 Serial Port Register (SPTR) and SCIFA-Related Pins

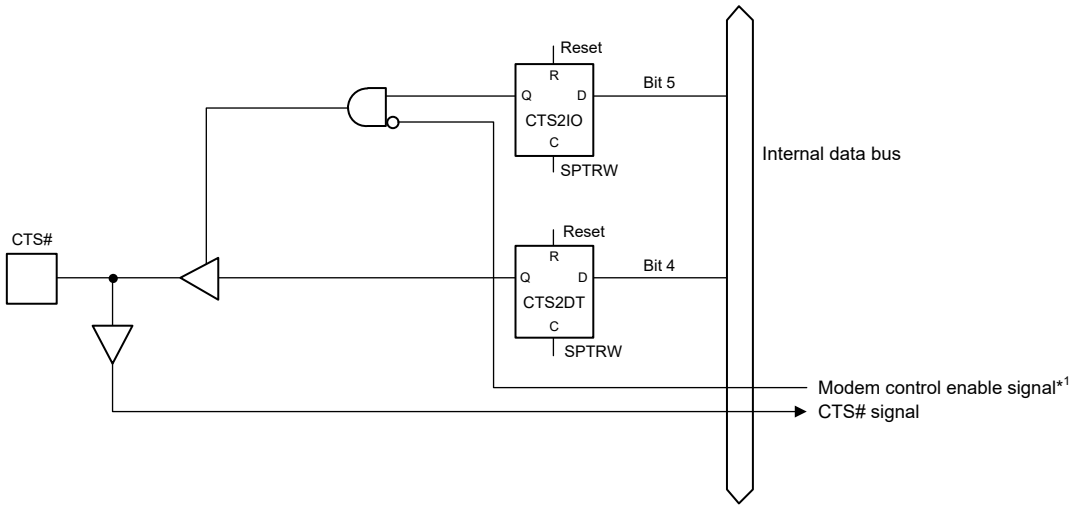
Figure 23.19 to **Figure 23.22** show the relationships between the SPTR register and the SCIFA-related pins.



Note: SPTRW: SPTR write

Note 1. These signals allow the RTS# pin to enter the modem control state with the MCE bits in FCR.

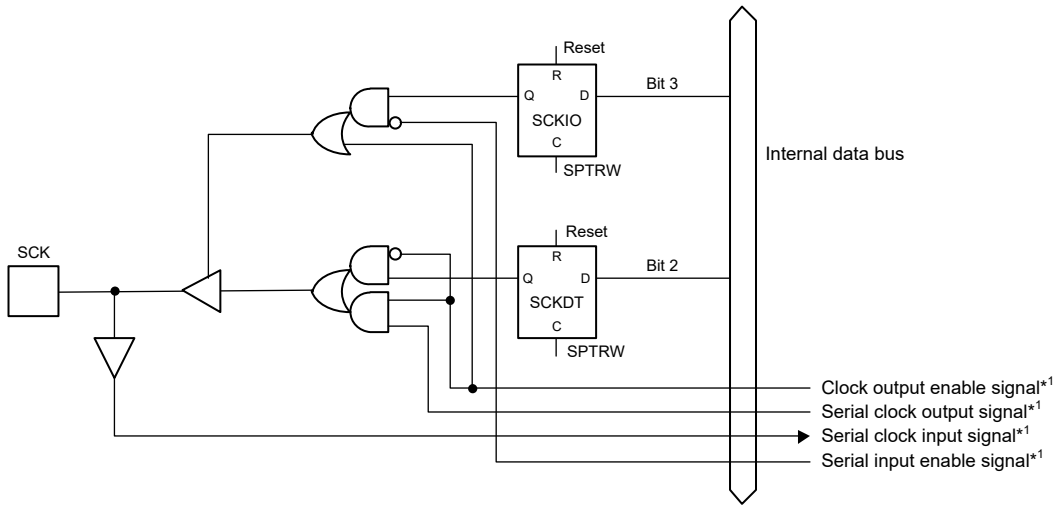
Figure 23.19 RTS2IO Bit and RTS2DT Bit in the SPTR Register, and RTS# Pin



Note: SPTRW: SPTR write

Note 1. These signals allow the CTS# pin to enter the modem control state with the MCE bits in FCR.

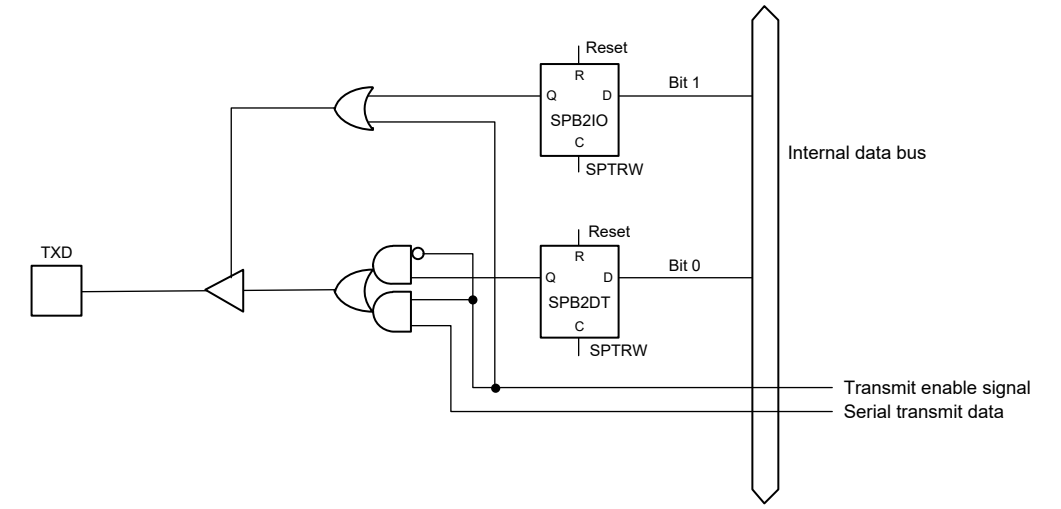
Figure 23.20 CTS2IO Bit and CTS2DT Bit in the SPTR Register, and CTS# Pin



Note: SPTRW: SPTR write

Note 1. These signals control the SCK pin according to the settings of the CM bit in SMR and CKE[1:0] bits in SCR.

Figure 23.21 SCKIO Bit and SCKDT Bit in the SPTR Register, and SCK Pin



Note: SPTRW: SPTR write

Figure 23.22 SPB2IO Bit and SPB2DT Bit in the SPTR Register, and TXD Pin

23.7 Noise Cancellation

Figure 23.23 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a two-stage flip-flop circuits and a match detection circuit. When the input signals of the noise filter and the output signals of the two-stage flip-flop circuits completely match, the matched level is conveyed as an internal signal. Unless otherwise matched, the previous value is retained. (When the levels sampled on three consecutive cycles of the sampling clock of the noise filter match, the signal is considered valid. If three consecutive sampled values do not match, the signal is considered to be noise rather than a received signal).

In asynchronous mode, the noise cancellation can be applied to the receive signal input to the RXDn pin. The receive level of the RXDn pin is taken in the flip-flop circuit of the noise filter on the base clock (the clock with a frequency 16 or 8 times the transfer rate*[1]).

If the base clock is stopped once with the noise filter enabled and then the base clock input is restarted again, the noise filter operation resumes from the state where the clock was stopped. When SCR.RE is set to 0 during input of the base clock, the noise filter outputs 0 as the internal RxDn signal. The internal match detector continues operating even while operations for reception are stopped, and the result from the last time previous consecutive samples matched is output at the same time as operations for reception are resumed.

Note 1. A frequency 16 times bit rate when the SEMR.ABCS0 bit and the SEMR.BGDM bit are both 0, and a frequency 8 times bit rate when either the SEMR.ABCS0 bit or the SEMR.BGDM bit is 1.

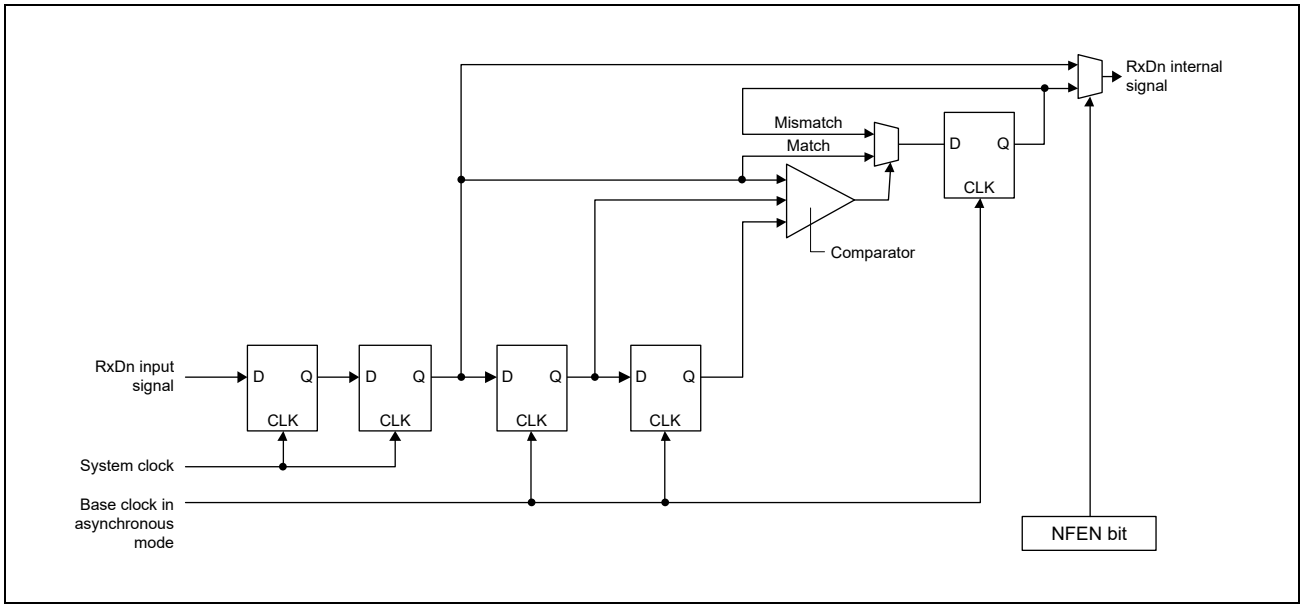


Figure 23.23 Block Diagram of Digital Noise Filter Circuit

23.8 Usage Notes

The following is the notes on using the SCIFA.

23.8.1 FTDR Register Writing and TDFE Flag

The TDFE flag in the serial status register (FSR) is set when the number of transmit data bytes written in the transmit FIFO data register (FTDR) has fallen below the transmission trigger number set by bits TTRG[1:0] in the FIFO control register (FCR) or bits TFTC[4:0] in the FIFO trigger control register (FTCR). After the TDFE flag is set, transmit data up to the number of empty bytes in the FTDR register can be written, allowing efficient continuous transmission.

However, if the number of data bytes written in the FTDR register is equal to or less than the specified transmission trigger number, the TDFE flag will be set to 1 again even after being read as 1 and cleared to 0.

The number of transmit data bytes in the FTDR register can be checked by the 8 higher-order bits of the FIFO data count register (FDR).

23.8.2 FRDR Register Reading and RDF Flag

The RDF flag in the serial status register (FSR) is set when the number of receive data bytes in the receive FIFO data register (FRDR) has become equal to or greater than the reception trigger number set by bits RTRG[1:0] in the FIFO control register (FCR) or bits RFTC[4:0] in the FIFO trigger control register (FTCR). After the RDF flag is set, receive data equivalent to the trigger number can be read from the FRDR register, allowing efficient continuous reception.

However, if the number of data bytes in the FRDR register exceeds the reception trigger number, the RDF flag will be set to 1 again even after being read as 1 and cleared to 0.

The number of receive data bytes in the FRDR register can be checked by the 8 lower-order bits of the FIFO data count register (FDR).

23.8.3 Break Detection and Processing

When a framing error (FER) is detected, a break signal can be detected by reading the RXD pin value directly. In a break, the input from the RXD pin becomes all low. Therefore, the FER flag in the serial status register (FSR) is set to 1 and the parity error flag (PER) may also be set to 1.

Upon detection of a break signal, the SCIFA stops the received data transfer to the FRDR register but continues the receive operation.

23.8.4 Writing to the SPTR Register

b6, b4, b2, and b0 of the SPTR register respectively indicate the input status of their corresponding pins. (See the description of each bit of **Section 23.2.12, Serial Port Register (SPTR)** for details.)

Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

23.8.5 Break Signal Transmission

The output signal from the TXD pin is determined by the SPB2IO bit and the SPB2DT bit in the serial port register (SPTR). The break signal can be sent by using these bits.

The TXD pin does not function as a transmit data output pin during the period from when the SCIFA is initialized to when the TE bit in the SCR register is set to 1 (transmission possible). The TXD pin status during this period is replaced by the SPB2DT bit value. Therefore, the SPB2IO and SPB2DT bits in the SPTR register must have been set to 1 (high output) at first (mark (high) status).

To transmit the break signal during serial transmission, set the SPB2IO bit in the SPTR register to 1, clear the SPB2DT bit to 0 (specify a low level), and then clear the TE bit in the SCR register to 0 (transmission stop). Clearing the TE bit to 0 initializes the transmitter regardless of the current transmission status, and outputs a low level from the TXD pin.

23.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode

The SCIFA operates on a base clock with a frequency 16 times the transfer rate*[1]. In reception, the SCIFA internally latches the received data at the rising edge of the eighth base clock pulse*[1]. The timing is shown in **Figure 23.24**.

Note 1. This is an example when the SEMR.ABCS0 bit is 0. When the ABCS0 bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock. The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

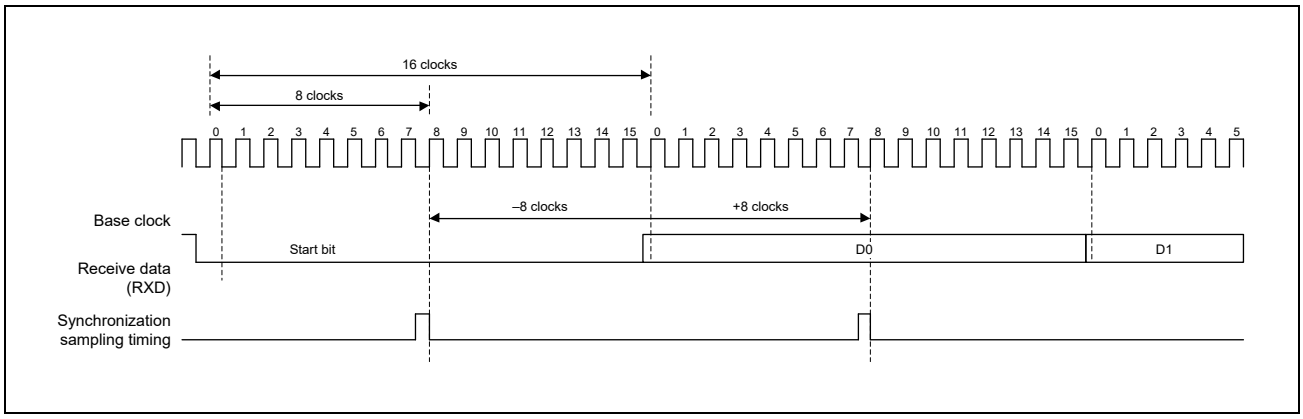

Figure 23.24 Receive Data Sampling Timing in Asynchronous Mode

The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

[Equation 1]

$$M = \left\{0.5 - \frac{1}{2N} - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\right\} \times 100[\%]$$

Where: M: Receive margin (%)

N: Ratio of clock frequency to bit rate (N = 16)

D: Clock duty (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute deviation of clock frequency

From equation 1, if F = 0 and D = 0.5, the receive margin is 46.875%, as given by equation 2.

[Equation 2]

When D = 0.5 and F = 0:

$$M = \left(0.5 - \frac{1}{(2 \times 16)}\right) \times 100\% = 46.875\%$$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

23.8.7 Note on FER Flag and PER Flag in Serial Status Register (FSR)

The FER flag and PER flag in the serial status register (FSR) are status flags that apply to next entry to be read from the receive FIFO data register (FRDR). After the CPU or DMAC reads the receive FIFO data register, the flags of framing errors and parity errors in the receive data will be cleared. To check the received data for the states of framing errors and parity errors, only read the receive FIFO data register after reading the serial status register.

23.8.8 Notes on External Clock Input in Clock Synchronous Mode

Before setting the TE and RE bits in the serial control register (SCR) to 1, wait for four or more cycles of the peripheral operating clock after the external clock (SCK) is changed from 0 (low) to 1 (high). To input the external clock (SCK) (to start communication), wait for one or more cycles of the external clock after the TE and RE bits in the SCR register are set to 1.

23.8.9 Module Standby Mode Setting

SCIFA operation can be disabled or enabled using the standby control register. As the initial setting, the SCIFA operation is halted. Register access is enabled by clearing module standby mode. For details, refer to **Section 41, Low Power Mode**.

23.8.10 Notes on Operation for Reception when an Internal Clock is Selected in Clock Synchronous Mode

When an internal clock is selected as the clock for reception in clock-synchronous mode, if the number of data stored through the receive FIFO data register (FRDR) becomes equal to or greater than the specified reception trigger number, the RDF flag is set, the RXI interrupt request is generated and, at the same time, output of the synchronizing clock and reception of serial data are stopped. Once the number of data are again less than the specified reception trigger number, output of the synchronizing clock and the reception of serial data are restarted. In addition, if an internal clock is selected for reception in clock synchronous mode, the ORER flag is not set to 1 since no overrun occurs. Accordingly, overruns (indicated by the ORER flag) cannot be used as a BRI interrupt source.

24. Serial Communications Interface (SCIg)

This MCU has two independent serial communications interface (SCI) channels. The SCIs consist of the SCI0 and SCI1 modules, referred to in common as “SCIg modules”.

The SCIg modules (SCI0 and SCI1) can handle both asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communications chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communications Interface Adapter (ACIA). As an extended function in asynchronous communications mode, the SCI also supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards).

24.1 Overview

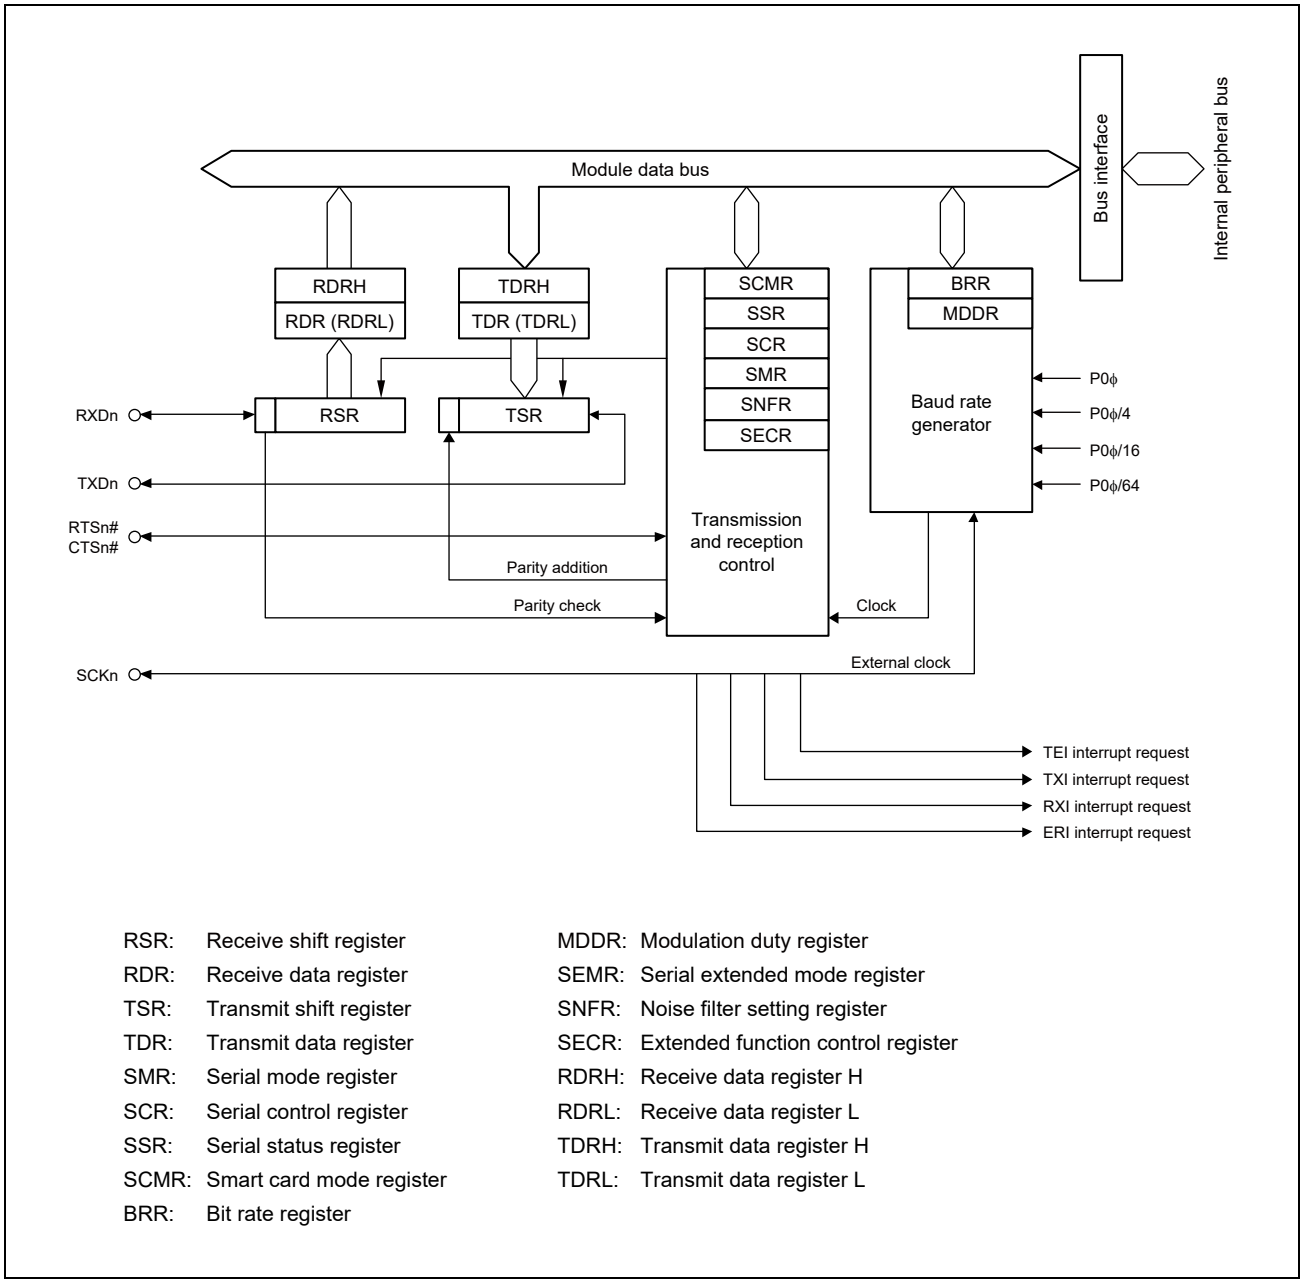
Table 24.1 lists the specifications of the SCIg modules. **Figure 24.1** shows the block diagram of the SCI0 and SCI1 modules.

Table 24.1 SCIg Specifications (1/2)

Item		Description
Serial communications modes		• Asynchronous • Clock synchronous • Smart card interface • IrDA (only for channel 0)
Transfer speed		Bit rate specifiable with the on-chip baud rate generator.
Full-duplex communications		Transmitter: Continuous transmission possible using double-buffer structure. Receiver: Continuous reception possible using double-buffer structure.
I/O pins		See **Table 24.2**.
Data transfer		Selectable as LSB first or MSB first transfer
Interrupt sources		Transmit end, transmit data empty, receive data full, and receive error
Low power consumption function		Module stop state can be set for each channel.
Asynchronous mode	Data length	7, 8, or 9 bits
	Transmission stop bit	1 or 2 bits
	Parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	CTSn# and RTSn# pins can be used in controlling transmission/reception.
	Start-bit detection	Low level or falling edge is selectable.
	Break detection	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.
	Clock source	An internal or external clock can be selected.
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Multi-processor communications function	Serial communication among multiple processors
	Noise cancellation	The signal paths from input on the RXDn pins incorporate digital noise filters.
Clock synchronous mode	Data length	8 bits
	Receive error detection	Overrun error
	Hardware flow control	CTSn# and RTSn# pins can be used in controlling transmission/reception.

Table 24.1 SCIg Specifications (2/2)

Item		Description
Smart card interface mode	Error processing	An error signal can be automatically transmitted when detecting a parity error during reception
		Data can be automatically retransmitted when receiving an error signal during transmission
	Data type	Both direct convention and inverse convention are supported.
Bit rate modulation function		Correction of outputs from the on-chip baud rate generator can reduce errors.



RSR: Receive shift register
RDR: Receive data register
TSR: Transmit shift register
TDR: Transmit data register
SMR: Serial mode register
SCR: Serial control register
SSR: Serial status register
SCMR: Smart card mode register
BRR: Bit rate register
MDDR: Modulation duty register
SEMR: Serial extended mode register
SNFR: Noise filter setting register
SECR: Extended function control register
RDRH: Receive data register H
RDRL: Receive data register L
TDRH: Transmit data register H
TDRL: Transmit data register L

Figure 24.1 Block Diagram of SCIg (SCI0 and SCI1)

Table 24.2 lists the pin configuration of the SCIs for the individual modes.

Table 24.2 SCI Pin Configuration in Asynchronous Mode and Clock Synchronous Mode

Channel	Pin Name	I/O	Function
SCI0	SCI0_SCK	I/O	SCI0 clock input/output
	SCI0_RXD	Input	SCI0 receive data input
	SCI0_TXD	Output	SCI0 transmit data output
	SCI0_CTS#/RTS#	I/O	SCI0 transfer start control input/output
SCI1	SCI1_SCK	I/O	SCI1 clock input/output
	SCI1_RXD	Input	SCI1 receive data input
	SCI1_TXD	Output	SCI1 transmit data output
	SCI1_CTS#/RTS#	I/O	SCI1 transfer start control input/output

24.2 Register Descriptions

BASE Address (Cortex A55 Address Space): (ch0) H'0_1004_D000 (ch1) H'0_1004_D400
BASE Address (Cortex M33/Cortex-M33_FPU address Space Secure): (ch0) H'4004_D000 (ch1) H'4004_D400
BASE Address (Cortex M33/Cortex-M33_FPU Address Space Non-Secure): (ch0) H'5004_D000 (ch1) H'5004_D400

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 24.3 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	Serial Mode Register	SMR	R/W	H'00	BASE (ch0) + H'0000	8
	Bit Rate Register	BRR	R/W	H'FF	BASE (ch0) + H'0001	8
	Serial Control Register	SCR	R/W	H'00	BASE (ch0) + H'0002	8
	Transmit Data Register	TDR	R/W	H'FF	BASE (ch0) + H'0003	8
	Serial Status Register	SSR	R/W*1	H'84	BASE (ch0) + H'0004	8
	Receive Data Register	RDR	R	H'00	BASE (ch0) + H'0005	8
	Smart Card Mode Register	SCMR	R/W*1	H'F2	BASE (ch0) + H'0006	8
	Serial Extended Mode Register	SEMR	R	H'00	BASE (ch0) + H'0007	8
	Noise Filter Setting Register	SNFR	R	H'00	BASE (ch0) + H'0008	8
	Extended Function Control Register	SECR	R/W	H'00	BASE (ch0) + H'000D	8
	Transmit Data Register H	TDRH	R/W	H'FF	BASE (ch0) + H'000E	8
	Transmit Data Register L	TDRL	R/W	H'FF	BASE (ch0) + H'000F	8
	Transmit Data Register HL	TDRHL	R/W	H'FFFF	BASE (ch0) + H'000E	16
	Receive Data Register H	RDRH	R	H'00	BASE (ch0) + H'0010	8
	Receive Data Register L	RDRL	R	H'00	BASE (ch0) + H'0011	8
	Receive Data Register HL	RDRHL	R	H'0000	BASE (ch0) + H'0010	16
	Modulation Duty Register	MDDR	R/W	H'FF	BASE (ch0) + H'0012	8
1	Serial Mode Register	SMR	R/W	H'00	BASE (ch1) + H'0000	8
	Bit Rate Register	BRR	R/W	H'FF	BASE (ch1) + H'0001	8
	Serial Control Register	SCR	R/W	H'00	BASE (ch1) + H'0002	8
	Transmit Data Register	TDR	R/W	H'FF	BASE (ch1) + H'0003	8
	Serial Status Register	SSR	R/W*1	H'84	BASE (ch1) + H'0004	8
	Receive Data Register	RDR	R	H'00	BASE (ch1) + H'0005	8
	Smart Card Mode Register	SCMR	R/W*1	H'F2	BASE (ch1) + H'0006	8
	Serial Extended Mode Register	SEMR	R	H'00	BASE (ch1) + H'0007	8
	Noise Filter Setting Register	SNFR	R	H'00	BASE (ch1) + H'0008	8
	Extended Function Control Register	SECR	R/W	H'00	BASE (ch1) + H'000D	8
	Transmit Data Register H	TDRH	R/W	H'FF	BASE (ch1) + H'000E	8
	Transmit Data Register L	TDRL	R/W	H'FF	BASE (ch1) + H'000F	8
	Transmit Data Register HL	TDRHL	R/W	H'FFFF	BASE (ch1) + H'000E	16
	Receive Data Register H	RDRH	R	H'00	BASE (ch1) + H'0010	8
	Receive Data Register L	RDRL	R	H'00	BASE (ch1) + H'0011	8
	Receive Data Register HL	RDRHL	R	H'0000	BASE (ch1) + H'0010	16
	Modulation Duty Register	MDDR	R/W	H'FF	BASE (ch1) + H'0012	8

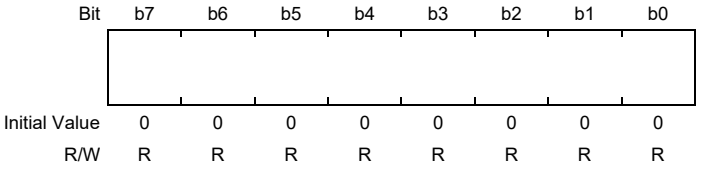
Note 1. Partly, R only

24.2.1 Receive Shift Register (RSR)

RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is automatically transferred to the RDR register.

The RSR register cannot be directly accessed by the CPU.

24.2.2 Receive Data Register (RDR)



Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

RDR is an 8-bit register that stores receive data.

When one frame of serial data has been received, the received serial data is transferred from RSR to RDR. Then the RSR register can receive the next data.

Since RSR and RDR function as a double buffer in this way, continuous receive operations can be performed.

Read RDR only once after a receive data full interrupt (RXI) has occurred. Note that if next one frame of data is received before reading receive data from RDR, an overrun error occurs.

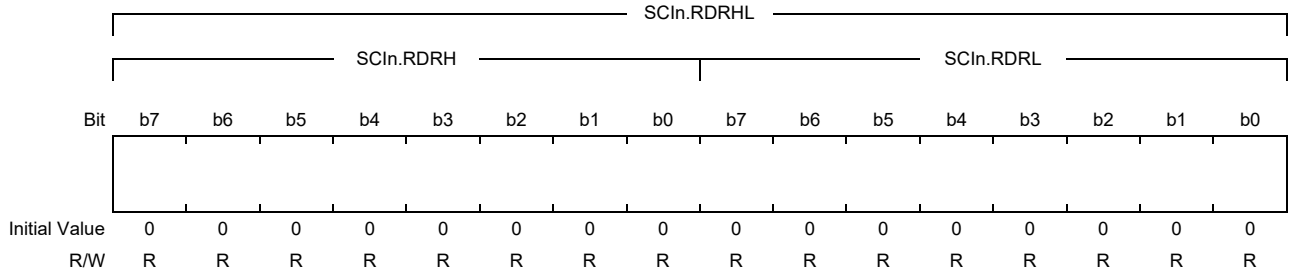
RDR cannot be written to by the CPU.

24.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL)

Receive Data Register H (RDRH)

Receive Data Register L (RDRL)

Receive Data Register HL (RDRHL)



RDRH and RDRL are 8-bit registers that store receive data. Use these registers when asynchronous mode and 9-bit data length are selected.

RDRL is the shadow register of RDR; i.e. access to RDRL is equivalent to access to RDR.

After one frame of data is received, the received data is transferred from the RSR register to these registers, thus allowing the RSR register to receive the next data.

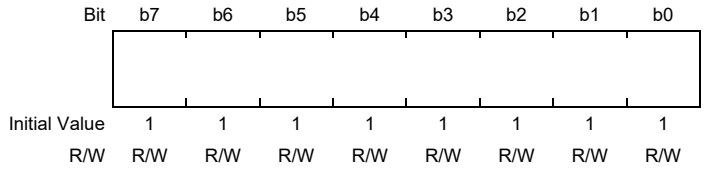
The RSR, RDRH and RDRL registers have a double-buffered construction to enable continuous reception.

Read RDRH and RDRL should be performed only once in the order from RDRH to RDRL when a receive data full interrupt (RXI) request is issued. Note that an overrun error occurs when the next frame of data is received before the received data has been read from RDRL.

The CPU cannot write to the RDRH and RDRL registers. Bits 0 to 7 in RDRH are fixed to 0. These bits are read as 0. The write value should be 0.

The RDRHL register can be accessed in 16-bit units.

24.2.4 Transmit Data Register (TDR)



TDR is an 8-bit register that stores transmit data.

When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission. The double-buffered structures of TDR and TSR enable continuous serial transmission. If the next transmit data has already been written to TDR when one frame of data is transmitted, the SCI transfers the written data to TSR to continue transmission.

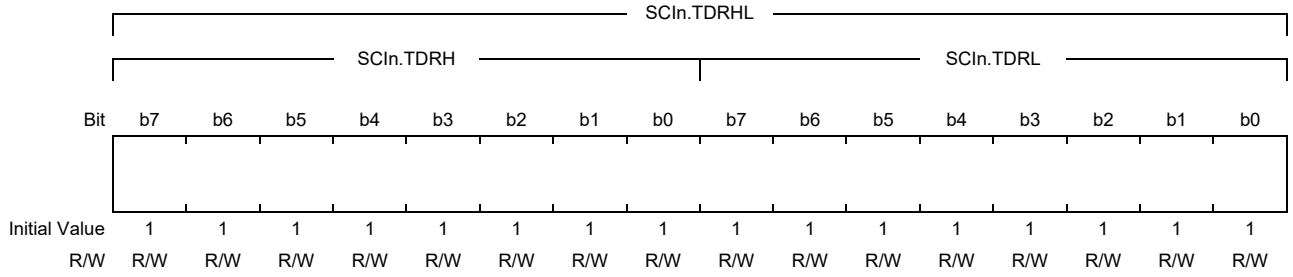
The CPU is able to read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (TXI).

24.2.5 Transmit Data Register H, L, HL (TDRH, TDRL, TDRHL)

Transmit Data Register H (TDRH)

Transmit Data Register L (TDRL)

Transmit Data Register HL (TDRHL)



TDRH and TDRL are 8-bit registers that store transmit data. Use these registers when asynchronous mode and 9-bit data length are selected.

TDRL is the shadow register of TDR; i.e. access to TDRL is equivalent to access to TDR.

When empty space is detected in the TSR register, the transmit data stored in the TDRH and TDRL registers is transferred to TSR; i.e., transmitting is started.

The TSR, TDRH and TDRL registers have a double-buffered construction to realize continuous reception. When the next data to be transmitted is stored in TDRL after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.

The CPU can read and write to the TDRH and TDRL registers. Bits 0 to 7 in RDRH are fixed to 1. These bits are read as 1. The write value should be 1.

Writing transmit data to the TDRH and TDRL registers should be performed only once in the order from TDRH to TDRL when a transmit data empty interrupt (TXI) request is issued.

The TDRHL register can be accessed in 16-bit units.

24.2.6 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data.

To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.

TSR cannot be directly accessed by the CPU.

24.2.7 Serial Mode Register (SMR)

Remark Some bits in SMR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CM	CHR	PE	PM	STOP	MP	CKS[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKS[1:0]	00b	R/W*4	Clock Select b1 b0 0 0: P0ϕ clock (n = 0)*1 0 1: P0ϕ/4 clock (n = 1)*1 1 0: P0ϕ/16 clock (n = 2)*1 1 1: P0ϕ/64 clock (n = 3)*1
b2	MP	0b	R/W*4	Multi-Processor Mode (Valid only in asynchronous mode) 0: Multi-processor communications function is disabled 1: Multi-processor communications function is enabled
b3	STOP	0b	R/W*4	Stop Bit Length (Valid only in asynchronous mode) 0: 1 stop bit 1: 2 stop bits
b4	PM	0b	R/W*4	Parity Mode (Valid only when the PE bit is 1) 0: Selects even parity 1: Selects odd parity
b5	PE	0b	R/W*4	Parity Enable (Valid only in asynchronous mode) • When transmitting 0: Parity bit addition is not performed 1: The parity bit is added • When receiving 0: Parity bit checking is not performed 1: The parity bit is checked
b6	CHR	0b	R/W*4	Character Length (Valid only in asynchronous mode*2) Selects in combination with the SCMR.CHR1 bit. CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3
b7	CM	0b	R/W*4	Communications Mode 0: Asynchronous mode 1: Clock synchronous mode

Note 1. n is the decimal notation of the value of n in BRR (refer to **Section 24.2.11, Bit Rate Register (BRR)**).

Note 2. In other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.

Note 3. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.

Note 4. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relation between the settings of these bits and the baud rate, refer to **Section 24.2.11, Bit Rate Register (BRR)**.

MP Bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi-processor mode.

STOP Bit (Stop Bit Length)

Selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

PM Bit (Parity Mode)

Selects the parity mode (even or odd) for transmission and reception. The setting of the PM bit is invalid in multi-processor mode.

PE Bit (Parity Enable)

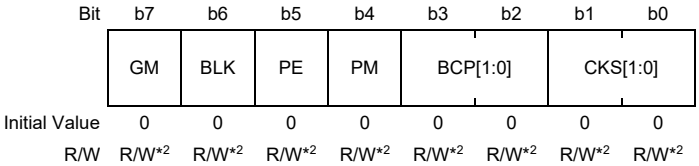
When this bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception. Irrespective of the setting of the PE bit, the parity bit is not added or checked in multi-processor format.

CHR Bit (Character Length)

Selects the data length for transmission and reception. Selects in combination with the CHR1 bit in SCMR.

In other than asynchronous mode, a fixed data length of 8 bits is used.

(2) Smart Card Interface Mode (SCMR.SMIF = 1)



Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKS[1:0]	00b	R/W*2	Clock Select b1 b0 0 0: P0ϕ clock (n = 0)*1 0 1: P0ϕ/4 clock (n = 1)*1 1 0: P0ϕ/16 clock (n = 2)*1 1 1: P0ϕ/64 clock (n = 3)*1
b3, b2	BCP[1:0]	00b	R/W*2	Base Clock Pulse Selects the number of base clock cycles in combination with the SCMR.BCP2 bit. **Table 24.4** lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits.
b4	PM	0b	R/W*2	Parity Mode (Valid only when the PE bit is 1) 0: Selects even parity 1: Selects odd parity
b5	PE	0b	R/W*2	Parity Enable When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode.
b6	BLK	0b	R/W*2	Block Transfer Mode 0: Normal mode operation 1: Block transfer mode operation
b7	GM	0b	R/W*2	GSM Mode 0: Normal mode operation 1: GSM mode operation

Note 1. n is the decimal notation of the value of n in BRR (refer to **Section 24.2.11, Bit Rate Register (BRR)**).

Note 2. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relationship between the settings of these bits and the baud rate, refer to **Section 24.2.11, Bit Rate Register (BRR)**.

BCP[1:0] Bits (Base Clock Pulse)

These bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set these bits in combination with the SCMR.BCP2 bit.

For details, refer to **Section 24.6.4, Receive Data Sampling Timing and Reception Margin**.

Table 24.4 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

SCMR.BCP2 Bit	SMR.BCP[1:0] Bits		Number of Base Clock Cycles for 1-Bit Transfer Period
0	0	0	93 clock cycles (S = 93)*1
0	0	1	128 clock cycles (S = 128)*1
0	1	0	186 clock cycles (S = 186)*1
0	1	1	512 clock cycles (S = 512)*1
1	0	0	32 clock cycles (S = 32)*1 (Initial Value)
1	0	1	64 clock cycles (S = 64)*1
1	1	0	372 clock cycles (S = 372)*1
1	1	1	256 clock cycles (S = 256)*1

Note 1. S is the value of Base Clock Cycles for 1-bit Period in BRR (refer to **Section 24.2.11, Bit Rate Register (BRR), Table 24.8, Base Clock Settings in Smart Card Interface Mode**).

PM Bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd).

For details on the usage of this bit in smart card interface mode, refer to **Section 24.6.2, Data Format (Except in Block Transfer Mode)**.

PE Bit (Parity Enable)

Set the PE bit to 1.

The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

BLK Bit (Block Transfer Mode)

Setting this bit to 1 allows block transfer mode operation.

For details, refer to **Section 24.6.3, Block Transfer Mode**.

GM Bit (GSM Mode)

Setting this bit to 1 allows GSM mode operation.

In GSM mode, the SSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, refer to **Section 24.6.6, Serial Data Transmission (Except in Block Transfer Mode)** and **Section 24.6.8, Clock Output Control**.

24.2.8 Serial Control Register (SCR)

Remark Some bits in SCR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W*2	R/W*2	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKE[1:0]	00b	R/W*1	Clock Enable • For SCI0 and SCI1 (Asynchronous mode) b1 b0 0 0: On-chip baud rate generator The SCKn pin functions as I/O port. 0 1: On-chip baud rate generator The clock with the same frequency as the bit rate is output from the SCKn pin. 1 x: External clock The clock with a frequency 16 times the bit rate should be input from the SCKn pin. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1. (Clock synchronous mode) b1 b0 0 x: Internal clock The SCKn pin functions as the clock output pin. 1 x: External clock The SCKn pin functions as the clock input pin.
b2	TEIE	0b	R/W	Transmit End Interrupt Enable 0: A TEI interrupt request is disabled 1: A TEI interrupt request is enabled
b3	MPIE	0b	R/W	Multi-Processor Interrupt Enable (Valid in asynchronous mode when SMR.MP = 1) 0: Normal reception 1: When the data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE bit is automatically cleared to 0, and normal reception is resumed.
b4	RE	0b	R/W*2	Receive Enable 0: Serial reception is disabled 1: Serial reception is enabled
b5	TE	0b	R/W*2	Transmit Enable 0: Serial transmission is disabled 1: Serial transmission is enabled
b6	RIE	0b	R/W	Receive Interrupt Enable 0: RXI and ERI interrupt requests are disabled 1: RXI and ERI interrupt requests are enabled
b7	TIE	0b	R/W	Transmit Interrupt Enable 0: A TXI interrupt request is disabled 1: A TXI interrupt request is enabled

Remarks: x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0, while the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. While the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.

CKE[1:0] Bits (Clock Enable)

These bits select the clock source and SCKn pin function.

The combination of the settings of these bits and of the SEMR.ACS0 bit sets the internal TMR clock.

TEIE Bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.

A TEI interrupt request is disabled by setting the TEIE bit to 0.

MPIE Bit (Multi-Processor Interrupt Enable)

When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE is automatically cleared to 0, and normal reception is resumed. For details, refer to **Section 24.4, Multi-Processor Communications Function**.

When the receive data includes the MPB bit is SSR set to 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.

When the receive data includes the MPB bit set to 1, the MPB bit is set to 1, the MPIE bit is automatically cleared to 0, the RXI and ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting the flags ORER and FER to 1 is enabled.

MPIE should be set to 0 if multi-processor communications function is not to be used.

RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W*2	R/W*2	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKE[1:0]	00b	R/W*1	Clock Enable • When SMR.GM = 0 b1 b0 0 0: Output disabled (The SCKn pin is available for use as an I/O port according to the I/O port settings.) 0 1: Clock output 1 x: (Setting prohibited) • When SMR.GM = 1 b1 b0 0 0: Output fixed low x 1: Clock output 1 0: Output fixed high
b2	TEIE	0b	R/W	Transmit End Interrupt Enable This bit should be 0 in smart card interface mode.
b3	MPIE	0b	R/W	Multi-Processor Interrupt Enable This bit should be 0 in smart card interface mode.
b4	RE	0b	R/W*2	Receive Enable 0: Serial reception is disabled 1: Serial reception is enabled
b5	TE	0b	R/W*2	Transmit Enable 0: Serial transmission is disabled 1: Serial transmission is enabled
b6	RIE	0b	R/W	Receive Interrupt Enable 0: RXI and ERI interrupt requests are disabled 1: RXI and ERI interrupt requests are enabled
b7	TIE	0b	R/W	Transmit Interrupt Enable 0: A TXI interrupt request is disabled 1: A TXI interrupt request is enabled

Remarks: x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written in TE and RE.

For details on interrupt requests, refer to **Section 24.8, Interrupt Sources**.

CKE[1:0] Bits (Clock Enable)

These bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, refer to **Section 24.6.8, Clock Output Control**.

TEIE Bit (Transmit End Interrupt Enable)

This bit should be 0 in smart card interface mode.

MPIE Bit (Multi-Processor Interrupt Enable)

This bit should be 0 in smart card interface mode.

RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

24.2.9 Serial Status Register (SSR)

Remark Some bits in SSR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Initial Value	1	0	0	0	0	1	0	0
R/W	R/(W)*2	R/(W)*2	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	MPBT	0b	R/W	Multi-Processor Bit Transfer Sets the multi-processor bit for adding to the transmission frame 0: Data transmission cycles 1: ID transmission cycles
b1	MPB	0b	R	Multi-Processor Value of the multi-processor bit in the reception frame 0: Data transmission cycles 1: ID transmission cycles
b2	TEND	1b	R	Transmit End Flag 0: A character is being transmitted. 1: Character transfer has been completed.
b3	PER	0b	R/(W) *1	Parity Error Flag 0: No parity error occurred 1: A parity error has occurred
b4	FER	0b	R/(W) *1	Framing Error Flag 0: No framing error occurred 1: A framing error has occurred
b5	ORER	0b	R/(W) *1	Overrun Error Flag 0: No overrun error occurred 1: An overrun error has occurred
b6	RDRF	0b	R/(W) *2	Receive Data Full Flag 0: When data is transferred from RDR 1: When data has been received normally, and transferred from RSR to RDR
b7	TDRE	1b	R/(W) *2	Transmit Data Empty Flag 0: When data is transferred to TDR 1: When data is transferred from TDR to TSR

Note 1. Only 0 can be written to this bit, to clear the flag.

Note 2. Write 1 when writing is necessary.

MPB Bit (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

TEND Flag (Transmit End Flag)

Indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

FER Flag (Framing Error Flag)

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When the stop bit is 0
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after reading FER = 1
  Even when the SCR.RE bit is set to 0, the FER flag is not affected and retains its previous value.

ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed. Note that, in clock synchronous mode, serial transmission also cannot continue.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
Initial Value	1	0	0	0	0	1	0	0
R/W	R/(W)*2	R/(W)*2	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	MPBT	0b	R/W	Multi-Processor Bit Transfer This bit should be set to 0 in smart card interface mode.
b1	MPB	0b	R	Multi-Processor This bit is not used in smart card interface mode. It should be set to 0.
b2	TEND	1b	R	Transmit End Flag 0: A character is being transmitted. 1: Character transfer has been completed.
b3	PER	0b	R/(W) *1	Parity Error Flag 0: No parity error occurred 1: A parity error has occurred
b4	ERS	0b	R/(W) *1	Error Signal Status Flag 0: Low error signal not responded 1: Low error signal responded
b5	ORER	0b	R/(W) *1	Overrun Error Flag 0: No overrun error occurred 1: An overrun error has occurred
b6	RDRF	0b	R/(W) *2	Receive Data Full Flag 0: When data is transferred from RDR 1: When data has been received normally, and transferred from RSR to RDR
b7	TDRE	1b	R/(W) *2	Transmit Data Empty Flag 0: When data is transferred to TDR 1: When data is transferred from TDR to TSR

Note 1. Only 0 can be written to this bit, to clear the flag.

Note 2. Write 1 when writing is necessary.

TEND Flag (Transmit End Flag)

With no error signal from the receiving side, this bit is set to 1 when further data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR.TE bit = 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, TEND flag is not affected and retains the value 1.
- When a specified period has elapsed after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated
  The set timing is determined by register settings as listed below.
  When SMR.GM = 0 and SMR.BLK = 0, 12.5 etu after the start of transmission
  When SMR.GM = 0 and SMR.BLK = 1, 11.5 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 0, 11.0 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 1, 11.0 etu after the start of transmission

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

ERS Flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1
  Even when the SCR.RE bit is set to 0, the ERS flag is not affected and retains its previous value.

ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, the receive data prior to an overrun error occurrence is retained, but data received following the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

24.2.10 Smart Card Mode Register (SCMR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	BCP2	—	—	CHR1	SDIR	SINV	—	SMIF
Initial Value	1	1	1	1	0	0	1	0
R/W	R/W*1	R/W	R/W	R/W*1	R/W*1	R/W*1	R/W	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	SMIF	0b	R/W*1	Smart Card Interface Mode Select 0: Non-smart card interface mode (Asynchronous mode, clock synchronous mode,) 1: Smart card interface mode
b1	—	1b	R/W	Reserved This bit is read as 1. The write value should be 1.
b2	SINV	0b	R/W*1	Transmitted/Received Data Invert 0: TDR contents are transmitted as they are. Receive data is stored as it is in RDR. 1: TDR contents are inverted before being transmitted. Receive data is stored in inverted form in RDR.
b3	SDIR	0b	R/W*1	Transmitted/Received Data Transfer Direction This bit can be used in the following modes. • Smart card interface mode • Asynchronous mode (multi-processor mode) • Clock synchronous mode 0: Transfer with LSB first 1: Transfer with MSB first
b4	CHR1	1b	R/W*1	Character Length 1 (Only valid in asynchronous mode)*2 Selects in combination with the SMR.CHR bit. CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3
b6, b5	—	11b	R/W	Reserved These bits are read as 1. The write value should be 1.
b7	BCP2	1b	R/W*1	Base Clock Pulse 2 Selects the number of base clock cycles in combination with the SMR.BCP[1:0] bits. **Table 24.5** lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits.

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.

Note 3. LSB first should be selected and the value of MSB (b7) in TDR cannot be transmitted.

SMIF Bit (Smart Card Interface Mode Select)

When this bit is set to 1, smart card interface mode is selected.

When this bit is set to 0, non-smart card interface mode, i.e., asynchronous mode (including multi-processor mode), clock synchronous mode is selected.

SINV Bit (Transmitted/Received Data Invert)

Inverts the transmit/receive data logic level. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR.

CHR1 bit (Character Length 1)

Selects the data length of transmit/receive data. Selects in combination with the CHR bit in SMR.

A fixed data length of 8 bits is used in modes other than asynchronous mode.

BCP2 Bit (Base Clock Pulse 2)

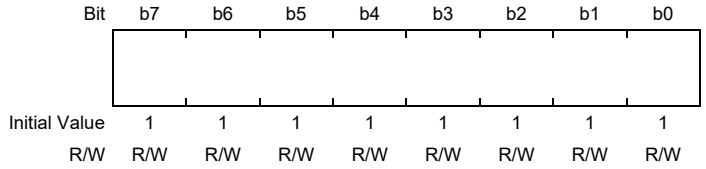
Selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR.BCP[1:0] bits.

Table 24.5 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

SCMR.BCP2 Bit	SMR.BCP[1:0] Bits		Number of Base Clock Cycles for 1-Bit Transfer Period
0	0	0	93 clock cycles (S = 93)*1
0	0	1	128 clock cycles (S = 128)*1
0	1	0	186 clock cycles (S = 186)*1
0	1	1	512 clock cycles (S = 512)*1
1	0	0	32 clock cycles (S = 32)*1 (Initial Value)
1	0	1	64 clock cycles (S = 64)*1
1	1	0	372 clock cycles (S = 372)*1
1	1	1	256 clock cycles (S = 256)*1

Note 1. S is the value of Base Clock Cycles for 1-bit Period BRR (refer to **Section 24.2.11, Bit Rate Register (BRR), Table 24.8 Base Clock Settings in Smart Card Interface Mode**).

24.2.11 Bit Rate Register (BRR)



BRR is an 8-bit register that adjusts the bit rate.

As each SCI channel has independent baud rate generator control, different bit rates can be set for each. **Table 24.6** shows the relationship between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor communication, clock synchronous mode, and smart card interface mode.

The initial value of BRR is H'FF.

BRR can be read from by the CPU, but it can be written to only when the TE and RE bits in SCR are 0.

Table 24.6 Relationship between N Setting in BRR and Bit Rate B

Mode	SEMR BGDM Bit	Setting ABCS Bit	BRR Setting	Error
Asynchro-nous or multi-processor communi-cation	0	0	$N = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
	0	1	$N = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
	1	0		
	1	1	$N = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$
Clock synchronous			$N = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	
Smart card interface			$N = \frac{P0\phi \times 10^6}{S \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times S \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$

Remarks: B: Bit rate (bps)
N: BRR setting for on-chip baud rate generator (0 ≤ N ≤ 255)
P0ϕ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in the table below.

Table 24.7 Clock Source Settings

SMR.CKS[1:0] Bit Setting	Clock Source	n
0 0	P0ϕ clock	0
0 1	P0ϕ/4 clock	1
1 0	P0ϕ/16 clock	2
1 1	P0ϕ/64 clock	3

Table 24.8 Base Clock Settings in Smart Card Interface Mode

SCMR.BCP2 Bit Setting	SMR.BCP[1:0] Bit Setting	Base Clock Cycles for 1-bit Period	S
0	00	93 clock cycles	93
0	01	128 clock cycles	128
0	10	186 clock cycles	186
0	11	512 clock cycles	512
1	00	32 clock cycles	32
1	01	64 clock cycles	64
1	10	372 clock cycles	372
1	11	256 clock cycles	256

Table 24.9 lists examples of N settings in BRR in normal asynchronous mode. **Table 24.10** lists the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode are listed in **Table 24.12**. Examples of BRR (N) settings in smart card interface mode are listed in **Table 24.14**. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, refer to **Section 24.6.4, Receive Data Sampling Timing and Reception Margin**. **Table 24.11** and **Table 24.13** list the maximum bit rates with external clock input.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) in the serial extended mode register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice that listed in **Table 24.9**. When both of those registers are set to 1, the bit rate becomes four times the listed value.

Table 24.9 Examples of BRR Settings for Various Bit Rates (Asynchronous Mode)

	Operating Frequency P0ϕ (MHz)		
	100		
Bit Rate (bps)	n	N	Error (%)
110	—	—	—
150	—	—	—
300	3	162	−0.15
600	3	80	0.47
1200	2	162	−0.15
2400	2	80	0.47
4800	1	162	−0.15
9600	1	80	0.47
19200	0	162	−0.15
31250	0	99	0.00
38400	0	80	0.47

Note: This is an example when the ABCS and BGDM bits in SEMR are 0.
When either the ABCS bit or BGDM bit is set to 1, the bit rate doubles.
When both ABCS and BGDM bits in SEMR are set to 1, the bit rate increases four times.

Table 24.10 Maximum Bit Rate for Each Operating Frequency (Asynchronous Mode)

	SEMR Settings				
P0ϕ (MHz)	BGDM Bit	ABCS Bit	n	N	Maximum Bit Rate (bps)
100	0	0	0	0	3125000
		1	0	0	6250000
	1	0	0	0	6250000
		1	0	0	12500000

Table 24.11 Maximum Bit Rate with External Clock Input (Asynchronous Mode)

	Maximum Bit Rate (bps)		
P0ϕ (MHz)	External Input Clock (MHz)	SEMR.ABCS Bit = 0	SEMR.ABCS Bit = 1
100	25.000	1562500	3125000

	Operating Frequency P0ϕ (MHz)	
	100	
Bit Rate (bps)	n	N
110	—	—
250	—	—
500	—	—
1 k	—	—
2.5 k	3	155
5 k	3	77
10 k	2	155
25 k	1	249
50 k	1	124
100 k	0	249
250 k	0	99
500 k	0	49
1 M	0	24
2.5 M	0	9
5 M	0	4
7.5 M	0	2

Note: Continuous transmission or reception is impossible. After transmitting or receiving one frame of data, there is an interval of a 1-bit period before starting transmitting/receiving the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. For this reason, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate.

Remarks: Space: Setting prohibited.
—: Can be set, but an error will occur.

Table 24.13 Maximum Bit Rate with External Clock Input (Clock Synchronous Mode)

P0φ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (Mbps)
100	16.6667	16.6667

Table 24.14 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372)

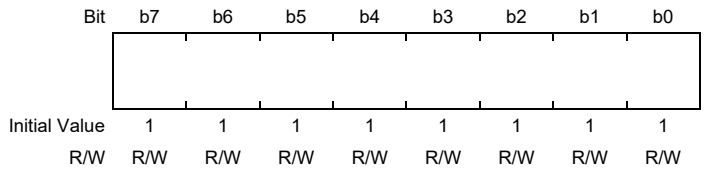
100.00	1562500	0	0

Table 24.16 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 372)

P0φ (MHz)	Maximum Bit Rate (bps)	n	N
100.00	134409	0	0

24.2.12 Modulation Duty Register (MDDR)



MDDR corrects the bit rate adjusted by the BRR register.

When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in **Table 24.17**.

The initial value of MDDR is H'FF. Bit 7 in this register is fixed to 1.

The CPU can read the MDDR register, but this register is only writable when the TE and RE bits in SCR are 0.

Table 24.17 Relationship between MDDR Setting (M) and Bit Rate (B)
When Bit Rate Modulation Function is Used

Mode	SEMR BGDM Bit	Setting ABCS Bit	BRR Setting	Error
Asynchro-nous or multi-processor communi-cation	0	0	$N = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (256M) \times (N+1)} - 1\right\} \times 100$
	0	1	$N = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256M) \times (N+1)} - 1\right\} \times 100$
	1	0		
	1	1	$N = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (256M) \times (N+1)} - 1\right\} \times 100$
Clock synchronous			$N = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$	
Smart card interface			$N = \frac{P0\phi \times 10^6}{S \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times S \times 2^{2n-1} \times (256M) \times (N+1)} - 1\right\} \times 100$

Note: Do not use this function in clock synchronous mode with the highest speed setting (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).

Remarks: B: Bit rate (bps)
M: MDDR setting (128 ≤ MDDR ≤ 256)

N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
P0ϕ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in **Table 24.7** and **Table 24.8**, **Section 24.2.11, Bit Rate Register (BRR)**.

24.2.13 Serial Extended Mode Register (SEMR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	RXDESEL	BGDM	NFEN	ABCS	—	BRME	—	ACS0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W	R/W*1	R/W*1	R/W	R/W	R/W	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	ACS0	0b	R/W*1	Asynchronous Mode Clock Source Select (Valid only in asynchronous mode) 0: External clock input 1: Reserved bit
b1	—	0b	R/W	Reserved This bit is read as 0. The write value should be 0.
b2	BRME	0b	R/W	Bit Rate Modulation Enable 0: Bit rate modulation function is disabled. 1: Bit rate modulation function is enabled.
b3	—	0b	R/W	Reserved This bit is read as 0. The write value should be 0.
b4	ABCS	0b	R/W*1	Asynchronous Mode Base Clock Select (Valid only in asynchronous mode) 0: Selects 16 base clock cycles for 1-bit period. 1: Selects 8 base clock cycles for 1-bit period.
b5	NFEN	0b	R/W*1	Digital Noise Filter Function Enable (In asynchronous mode) 0: Noise cancellation function for the RXDn input signal is disabled. 1: Noise cancellation function for the RXDn input signal is enabled.
b6	BGDM	0b	R/W	Baud Rate Generator Double-Speed Mode Select (Only valid the CKE[1] bit in SCR is 0 in asynchronous mode). 0: Baud rate generator outputs the clock with normal frequency. 1: Baud rate generator outputs the clock with doubled frequency.
b7	RXDESEL	0b	R/W*1	Asynchronous Start Bit Edge Detection Select (Valid only in asynchronous mode) 0: The low level on the RXDn pin is detected as the start bit. 1: A falling edge on the RXDn pin is detected as the start bit.

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

SEMR selects the clock source for 1-bit period in asynchronous mode.

ACS0 Bit (Asynchronous Mode Clock Source Select)

Selects the clock source in the asynchronous mode.

The ACS0 bit is valid in asynchronous mode (CM bit in SMR = 0) and when an external clock input is selected (CKE[1:0] bits in SCR = 10b or 11b).

Set the ACS0 bit to 0 in other than asynchronous mode.

BRME bit (Bit Rate Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by on-chip baud rate generator is evenly corrected when this function is enabled.

NFEN Bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function.

When the function is enabled, noise cancellation is applied to the RXDn input signal in asynchronous mode. In any mode other than above, set the NFEN bit to 0 to disable the digital noise filter function.

When the function is disabled, input signals are transferred as is, as internal signals.

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

Selects the cycle of output clock for the baud rate generator.

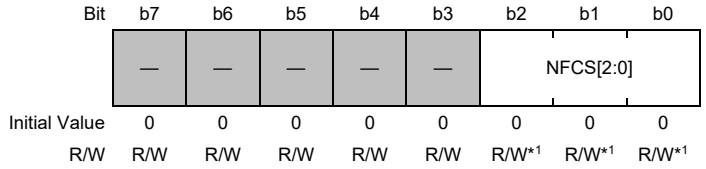
This bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0). For the clock output from the baud rate generator, either normal or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved and the bit rate is doubled. Set this bit to 0 in modes other than asynchronous mode.

RXDESEL Bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1 when reception should be stopped while a break occurs or when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.

Set this bit to 0 in modes other than asynchronous mode.

24.2.14 Noise Filter Setting Register (SNFR)



Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	NFCS[2:0]	All 0	R/W*1	Noise Filter Clock Select In asynchronous mode, the standard setting for the base clock is as follows. b2 b0 0 0 0: The clock signal divided by 1 is used with the noise filter. Settings other than above are prohibited.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR are 0 (serial reception and transmission disabled).

NFCS[2:0] Bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b.

24.2.15 Extended function control register (SECR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSE	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	—	0b	R/W	Reserved This bit is read as 0. The write value should be 0.
b1	CTSE	0b	R/W*1	CTS Enable 0: CTS function is disabled (RTS output function is enabled). 1: CTS function is enabled.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Writing to the bit is only possible when the SCR.RE and SCR.TE bits are 0.

SECR is used to select the extension settings in asynchronous and clock synchronous modes.

CTSE Bit (CTS Enable)

Set this bit to 1 if the SSn# pin is to be used for inputting of the CTS control signal to control of transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode. Do not set both the CTSE and SSE bits to enabled (even if this setting is made, operation is the same as that when these bits are set to 0).

24.3 Operation in Asynchronous Mode

Figure 24.2 shows the general format for asynchronous serial communications.

One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).

In asynchronous serial communications, the communications line is usually held in the mark state (high level).

The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

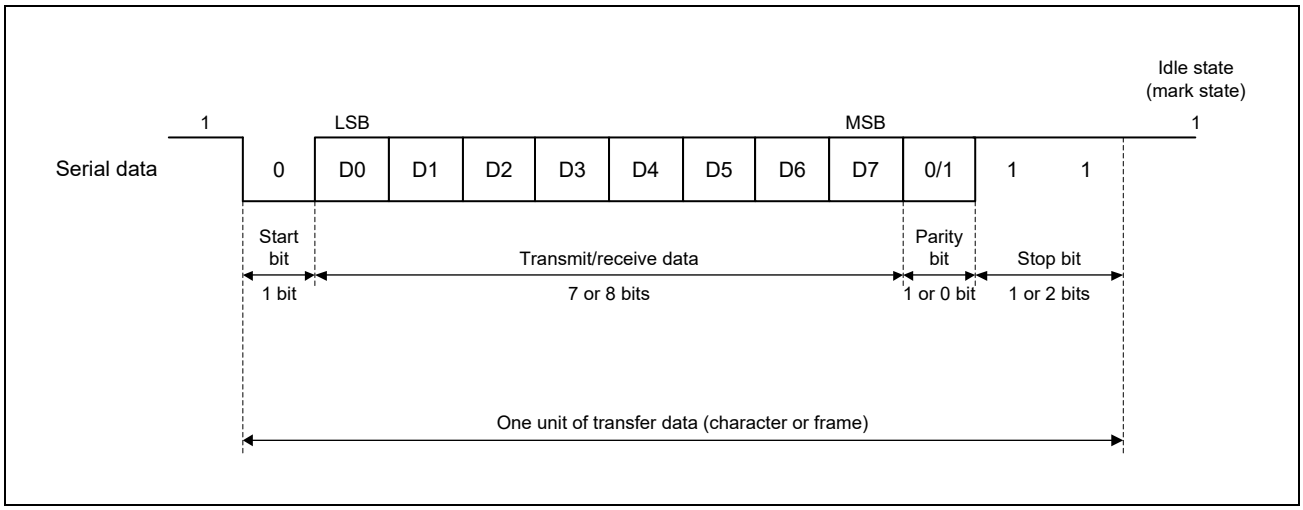


Figure 24.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, 2 Stop Bits)

24.3.1 Serial Data Transfer Format

Table 24.18 lists the serial data transfer formats that can be used in asynchronous mode.

Any of 18 transfer formats can be selected according to the SMR and SCMR setting. For details of multi-processor function, refer to **Section 24.4, Multi-Processor Communications Function**.

Table 24.18 Serial Transfer Formats (Asynchronous Mode)

SCMR Setting	SMR Setting				Serial Transfer Format and Frame Length												
CHR1	CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12	13
0	0	0	0	0	S	9-bit data									STOP		
0	0	0	0	1	S	9-bit data									STOP	STOP	
0	0	1	0	0	S	9-bit data									P	STOP	
0	0	1	0	1	S	9-bit data									P	STOP	STOP
1	0	0	0	0	S	8-bit data								STOP			
1	0	0	0	1	S	8-bit data								STOP	STOP		
1	0	1	0	0	S	8-bit data								P	STOP		
1	0	1	0	1	S	8-bit data								P	STOP	STOP	
1	1	0	0	0	S	7-bit data							STOP				
1	1	0	0	1	S	7-bit data							STOP	STOP			
1	1	1	0	0	S	7-bit data							P	STOP			
1	1	1	0	1	S	7-bit data							P	STOP	STOP		
0	0	—	1	0	S	9-bit data									MPB	STOP	
0	0	—	1	1	S	9-bit data									MPB	STOP	STOP
1	0	—	1	0	S	8-bit data								MPB	STOP		
1	0	—	1	1	S	8-bit data								MPB	STOP	STOP	
1	1	—	1	0	S	7-bit data							MPB	STOP			
1	1	—	1	1	S	7-bit data							MPB	STOP	STOP		

Note: S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

24.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate.

In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization. Since receive data is sampled at the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in **Figure 24.3**. Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left|(0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\right| \times 100\ [\%] \cdots \text{Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SEMR = 0, N = 8 when ABCS in SEMR = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$$M = \{0.5 - \frac{1}{(2 \times 16)}\} \times 100\ (\%) = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

Note 1. This is an example when the ABCS bit in SEMR is 0. When the ABCS bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock.

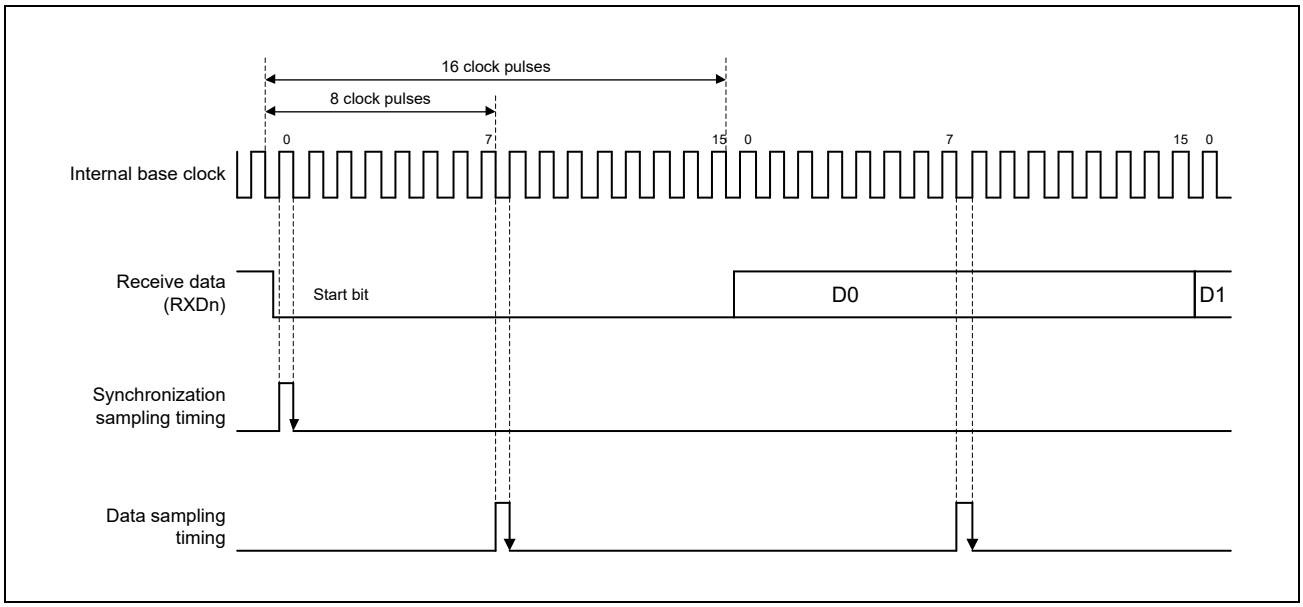

Figure 24.3 Receive Data Sampling Timing in Asynchronous Mode

24.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the SCI's transfer clock, according to the setting of the CM bit in SMR and the CKE[1:0] bits in SCR. When an external clock is input to the SCKn pin, the clock frequency should be 16 times the bit rate (when ABCS in SEMR = 0) and 8 times the bit rate (when ABCS in SEMR = 1).

When the SCI is operated on an internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in **Figure 24.4**.

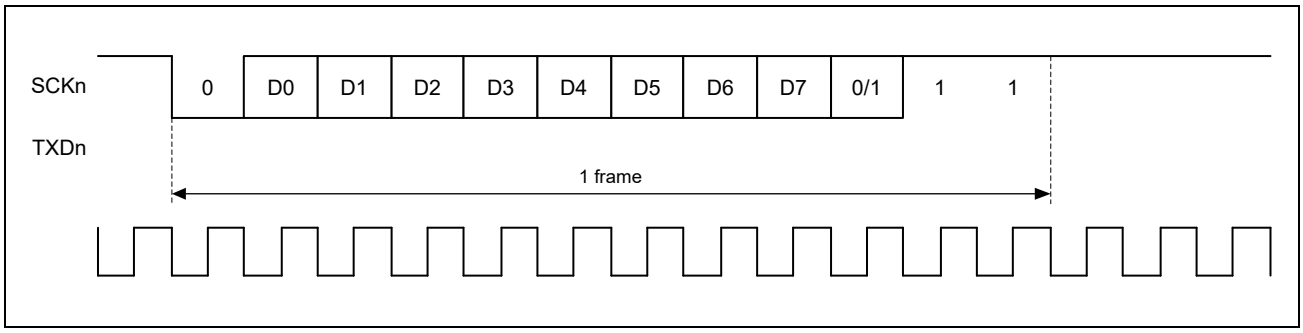

Figure 24.4 Phase Relationship between Output Clock and Transmit Data
(Asynchronous Mode: SMR.CHR = 0, PE = 1, MP = 0, STOP = 1)

24.3.4 Double-Speed Mode

The output clock frequency of the on-chip baud rate generator is doubled by setting the SEMR.BGDM bit to 1, enabling high-speed communication at a doubled bit rate. If the SEMR.ABCS bit is set to 1 under the above condition, the number of base clock cycles changes from 16 to 8, so the bit rate becomes four times faster than the initial state.

As shown by Formula (1) in **Section 24.3.2, Receive Data Sampling Timing and Reception Margin in Asynchronous Mode**, setting the SEMR.ABCS bit to 1 changes the number of cycles to 8, and the sampling interval becomes longer. This causes the reception margin to decrease. Therefore, setting the SEMR.BGDM bit to 1 and the SEMR.ABCS bit to 0 is recommended instead of setting the SEMR.BGDM bit to 0 and the SEMR.ABCS bit to 1 for high-speed operation at a doubled bit rate.

24.3.5 CTS and RTS Functions

The CTS function is the use of input on the CTSn# pin in transmission control. Setting the SECR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, placing the low level on the CTSn# pin causes transmission to start.

Applying the high level to the CTS# pin while transmission is in progress does not affect transmission of the current frame, which continues.

In the RTS function, by using the function of output on the RTSn# pin, a low level is output when reception becomes possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]

Satisfaction of all conditions listed below

- The value of the RE bit in the SCR is 1
- Reception is not in progress
- There are no received data yet to be read
- The ORER, FER, and PER flags in the SSR are all 0

[Condition for high-level output]

- The conditions for low-level output have not been satisfied.

24.3.6 SCI Initialization (Asynchronous Mode)

Before transmitting and receiving data, start by writing the initial value H'00 to SCR and then continue through the procedure for SCI given in **Figure 24.5**. Whenever the operating mode or transfer format is changed, SCR must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization. Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR, RDRH, and RDRL.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.

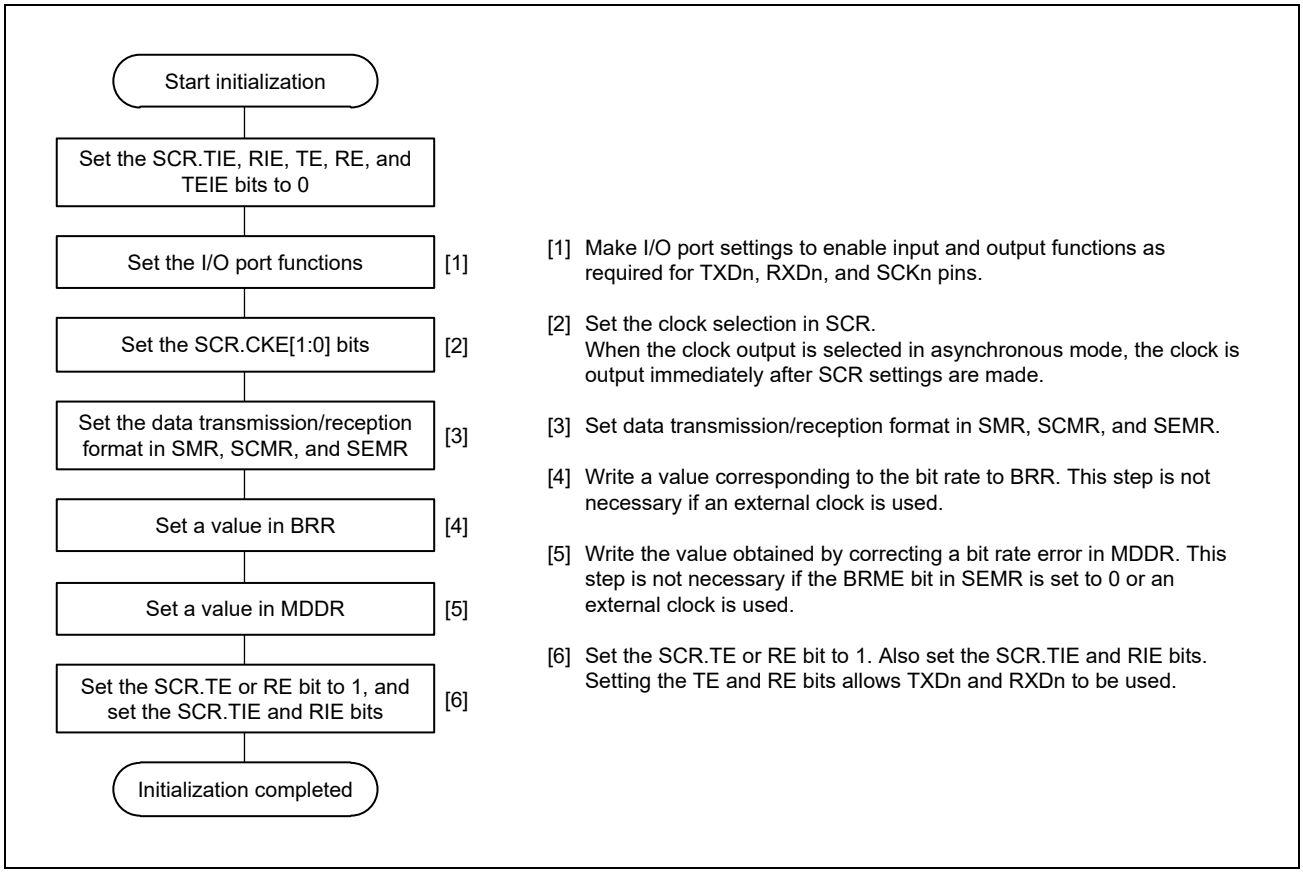

Figure 24.5 Sample SCI Initialization Flowchart (Asynchronous Mode)

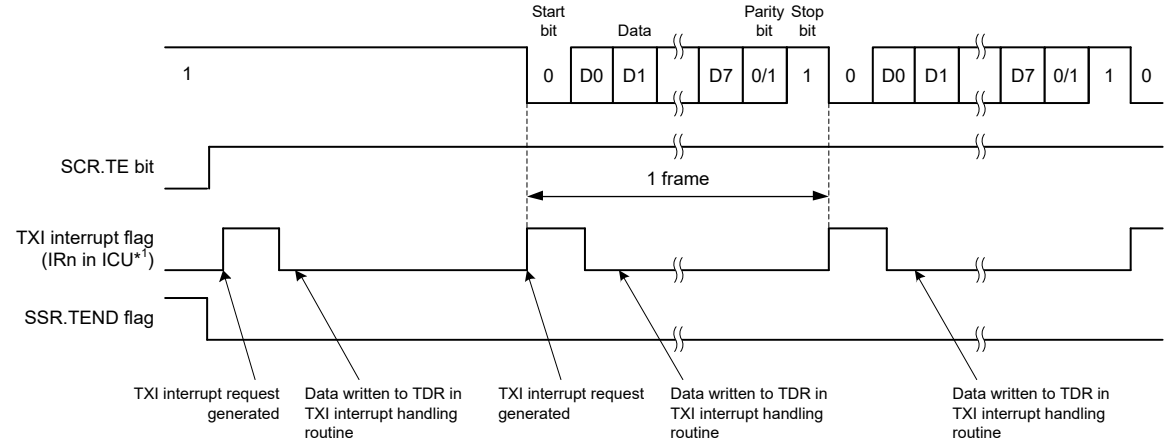
24.3.7 Serial Data Transmission (Asynchronous Mode)

Figure 24.6 to **Figure 24.8** show an example of the operation for serial transmission in asynchronous mode. In serial transmission, the SCI operates as described below.

1. The SCI transfers data from TDR*1 to TSR when data is written to TDR*1 in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the CTSE bit in SECR is set to 0 (CTS function is disabled) and a low level on the CTSn# pin causes data transfer from TDR*1 to TSR. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR*1 in the TXI interrupt handling routine before transmission of the current transmit data is completed. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR*1*2 from the handling routine for TXI requests.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR*3 at the time of stop bit output.
5. When TDR*3 is updated, setting of the CTSE bit in SECR to 0 (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from TDR*1 to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR*3 is not updated, the TEND flag in SSR is set to 1, the stop bit is sent, and then the mark state is entered in which 1 is output. If the TEIE bit in SCR is 1 at this time, the TEND flag in SSR is set to 1 and a TEI interrupt request is generated.

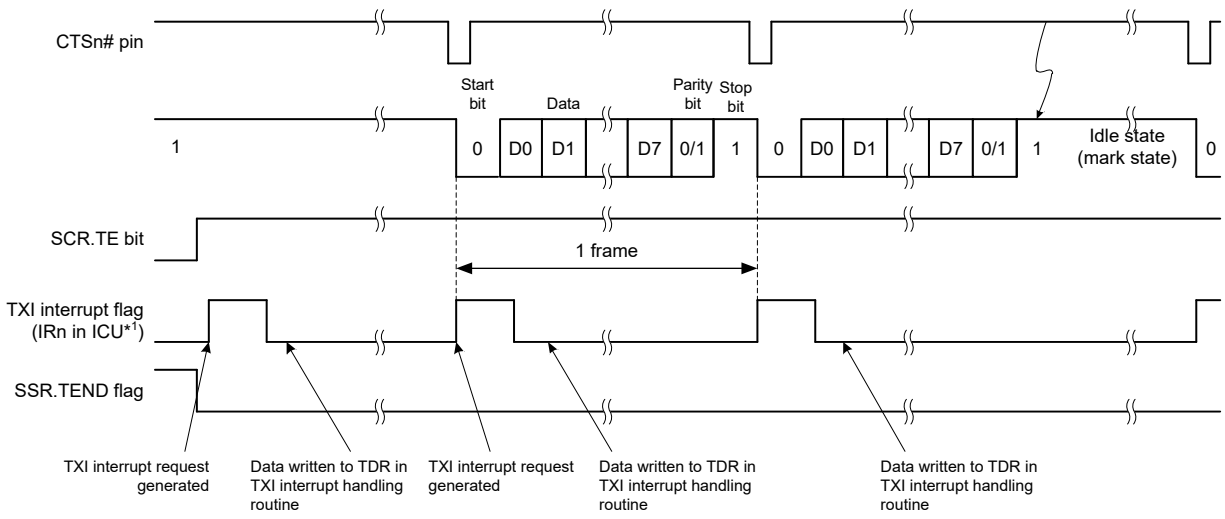
Note 1. Write data not to TDR but to the TDRH and TDRL registers when 9-bit data length is selected.
Note 2. Write data in the order from TDRH to TDRL when 9-bit data length is selected.
Note 3. The SCI checks for updating of the TDRL register only and does not check for updating of the TDRH register when 9-bit data length is selected.

Figure 24.9 shows a sample flowchart for serial transmission in asynchronous mode.



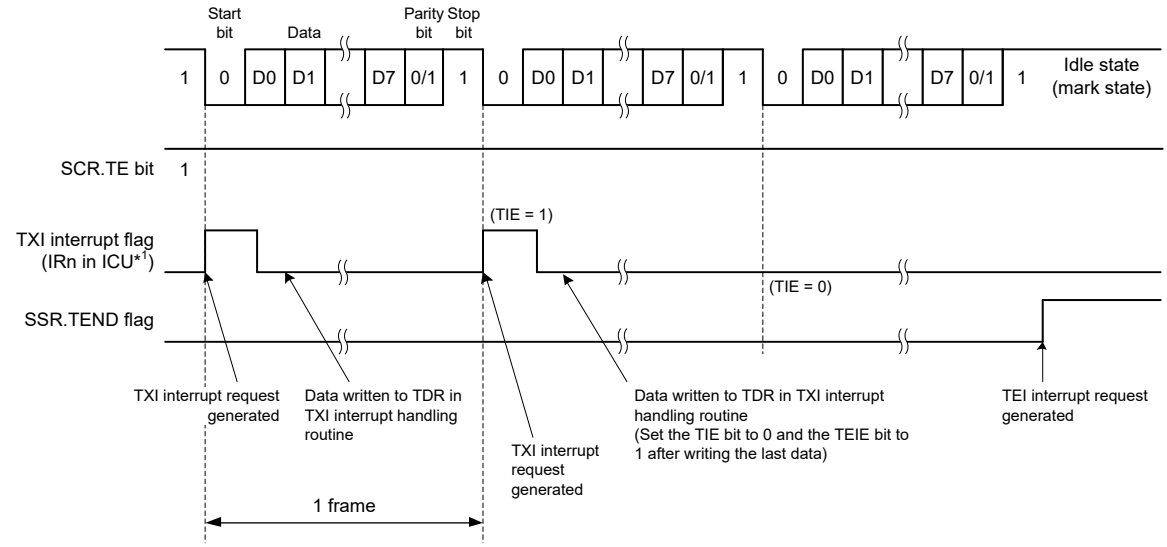
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.6 Example of Operation for Serial Transmission in Asynchronous Mode (1)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission)



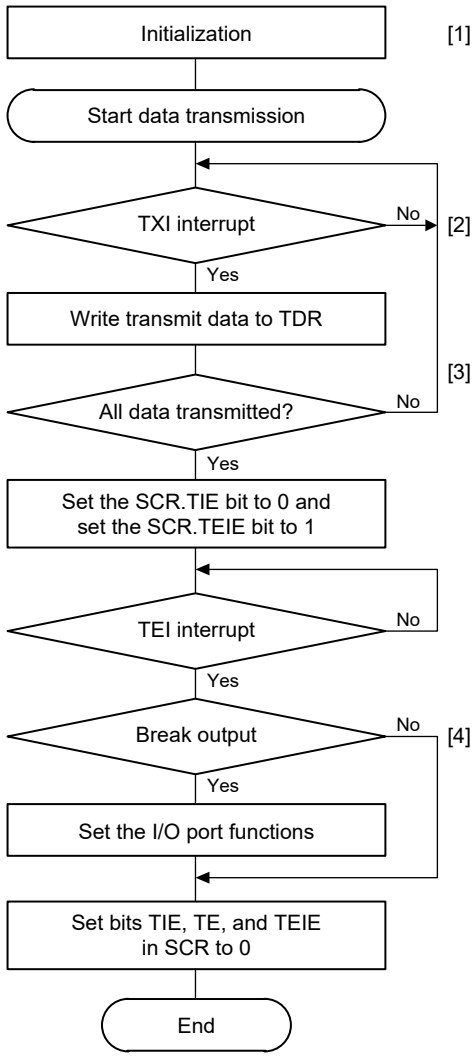
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.7 Example of Operation for Serial Transmission in Asynchronous Mode (2)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.8 Example of Operation for Serial Transmission in Asynchronous Mode (3)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] Transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

Note: The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

Figure 24.9 Example of Serial Transmission Flowchart in Asynchronous Mode

24.3.8 Serial Data Reception (Asynchronous Mode)

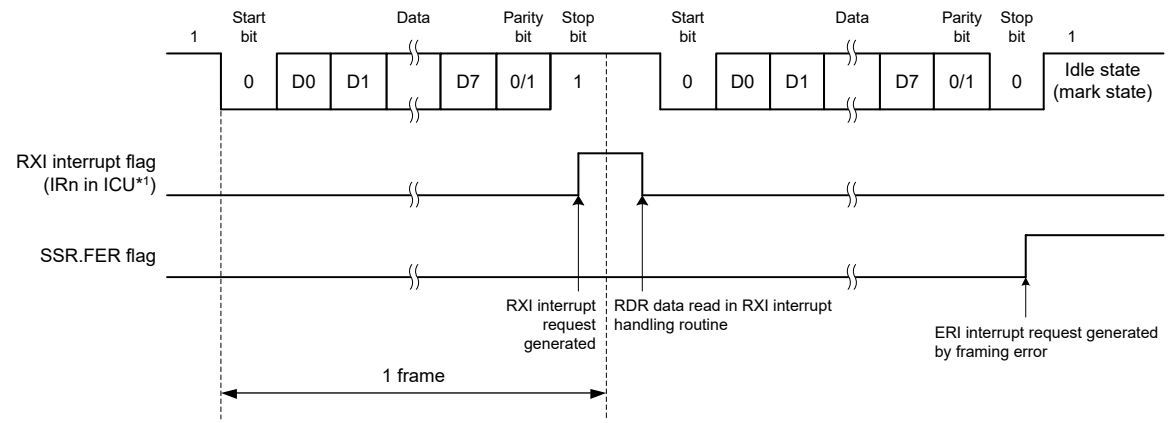
Figure 24.10 and **Figure 24.11** show an example of the operation for serial data reception in asynchronous mode. In serial data reception, the SCI operates as described below.

1. When the value of the RE bit in SCR becomes 1, the output signal on the RTSn# pin goes to the low level.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, the ORER flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR*[1].
4. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR*[1]. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0) is detected, the FER bit in SSR is set to 1 and receive data is transferred to RDR*[1]. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR*[1]. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR*[1] in this RXI interrupt handling routine before reception of the next receive data is completed. Reading the received data that have been transferred to RDR*[1] causes the RTSn# pin to output the low level.

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.

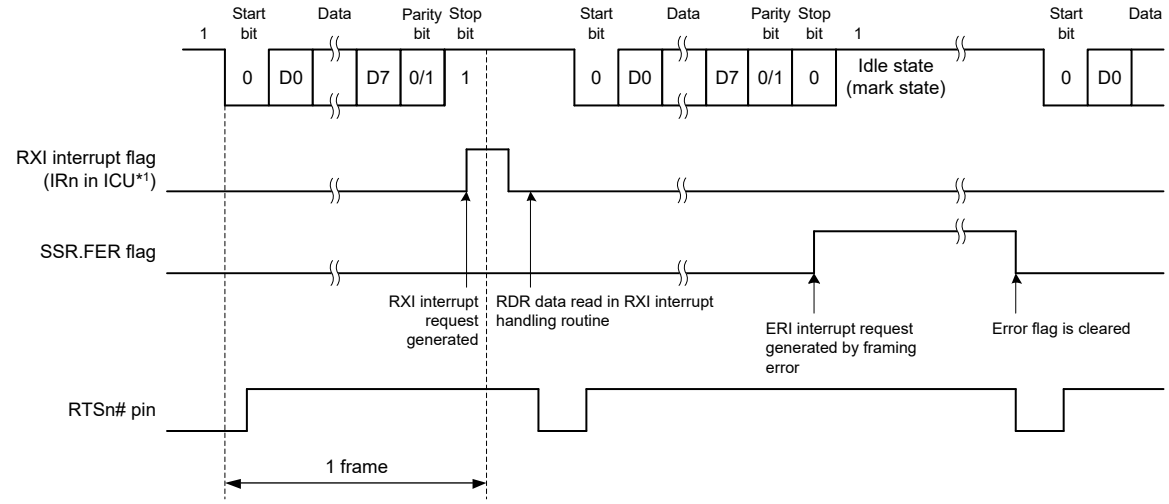
NOTE

The SCI checks for reading of the RDRL register only and does not check for reading of the RDRH register when 9-bit data length is selected.



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.10 Example of SCI Operation for Serial Reception in Asynchronous Mode (1)
(When RTS Function is Not Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.11 Example of SCI Operation for Serial Reception in Asynchronous Mode (2)
(When RTS Function is Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)

Table 24.19 lists the states of the flags in the SSR status register and receive data handling when a receive error is detected.

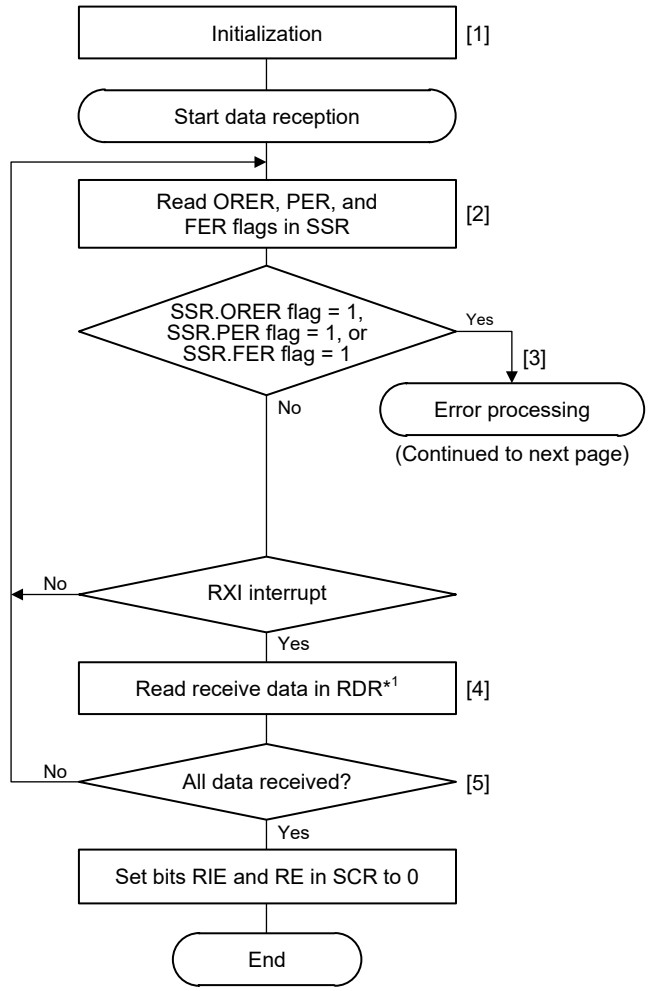
If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0 before resuming reception. Moreover, be sure to read the RDR (or the RDRL) during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR (or the RDRL) register because received data which has not yet been read may be left in RDR (or the RDRL).

Figure 24.12 and **Figure 24.13** show samples of flowcharts for serial data reception.

Table 24.19 Flags in the SSR Status Register and Receive Data Handling

Flags in the SSR Status Register				
ORER	FER	PER	Receive Data	Receive Error Type
1	0	0	Lost	Overrun error
0	1	0	Transferred to RDR*1	Framing error
0	0	1	Transferred to RDR*1	Parity error
1	1	0	Lost	Overrun error + framing error
1	0	1	Lost	Overrun error + parity error
0	1	1	Transferred to RDR*1	Framing error + parity error
1	1	1	Lost	Overrun error + framing error + parity error

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.



[1] SCI initialization:
Set data reception.

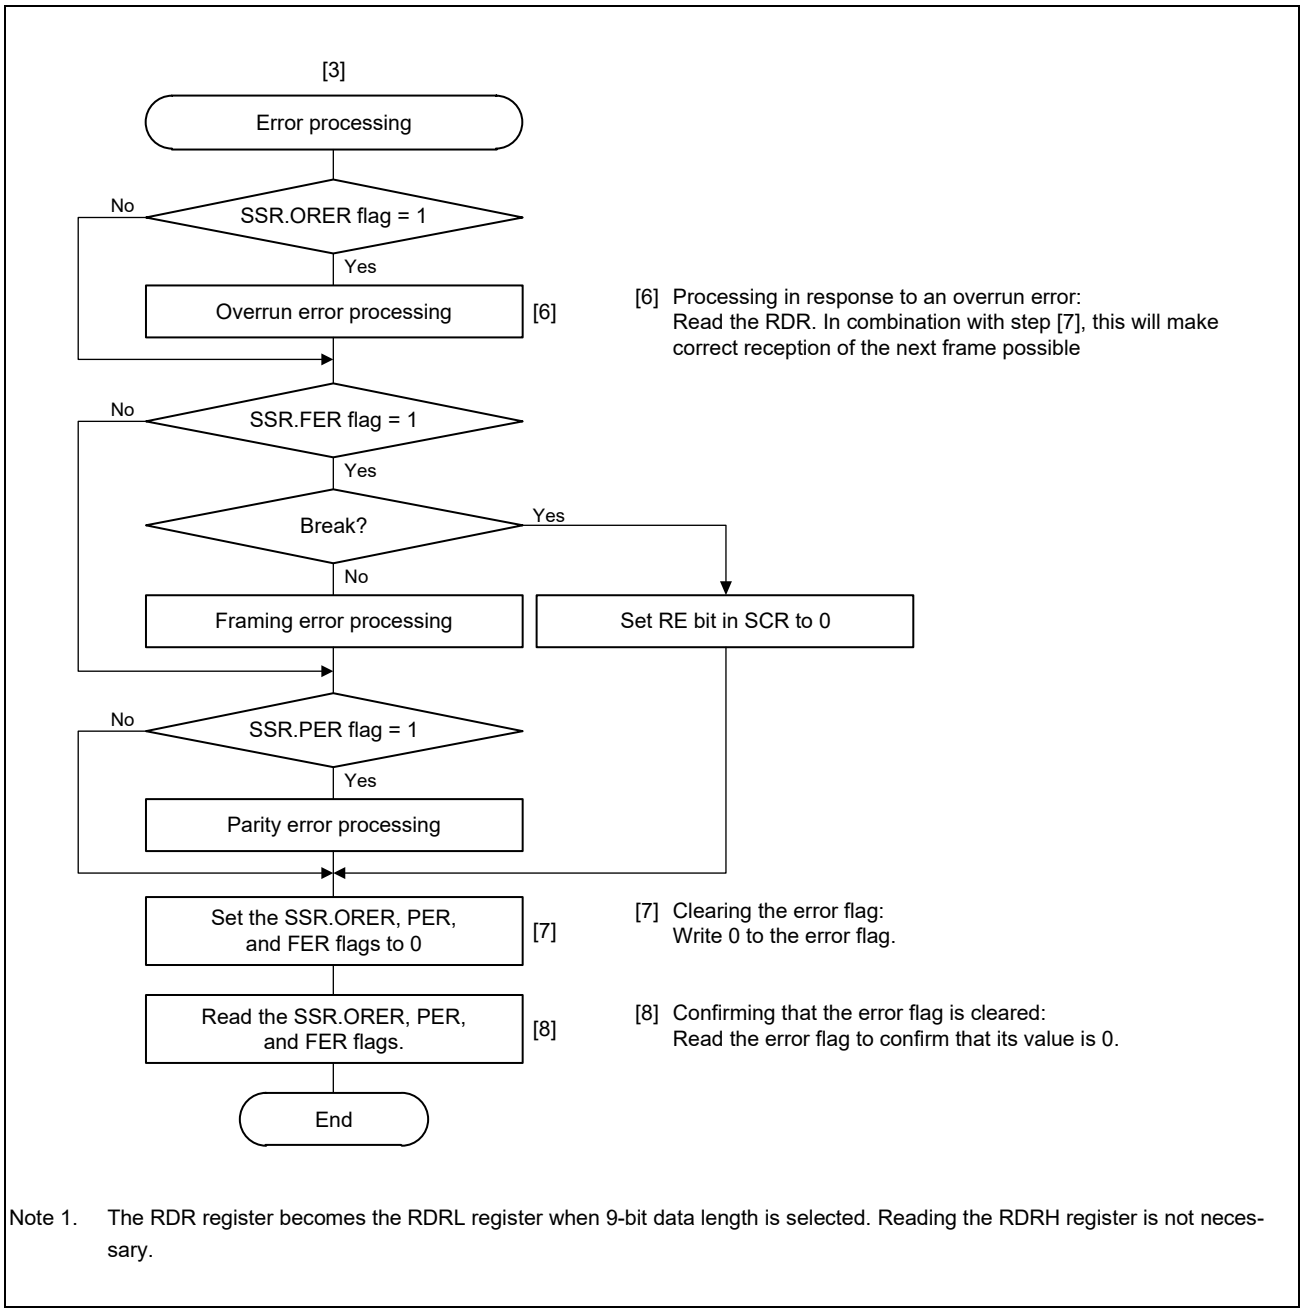
[2][3] Receive error processing and break detection:
If a receive error occurs, an ERI interrupt is generated. An error is identified by reading the ORER, PER, and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER, PER, and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. In the case of a framing error, a break can be detected by reading the value of the input port corresponding to the RXDn pin.

[4] Read the receive data in RDR once in the RXI interrupt handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the stop bit of the current frame is received, read data from RDR in the RXI interrupt processing routine.
The RDR data can also be read by activating the DMAC.

Note 1. The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 24.12 Example Flowchart of Serial Reception in Asynchronous Mode (1)



Note 1. The RDR register becomes the RDRL register when 9-bit data length is selected. Reading the RDRH register is not necessary.

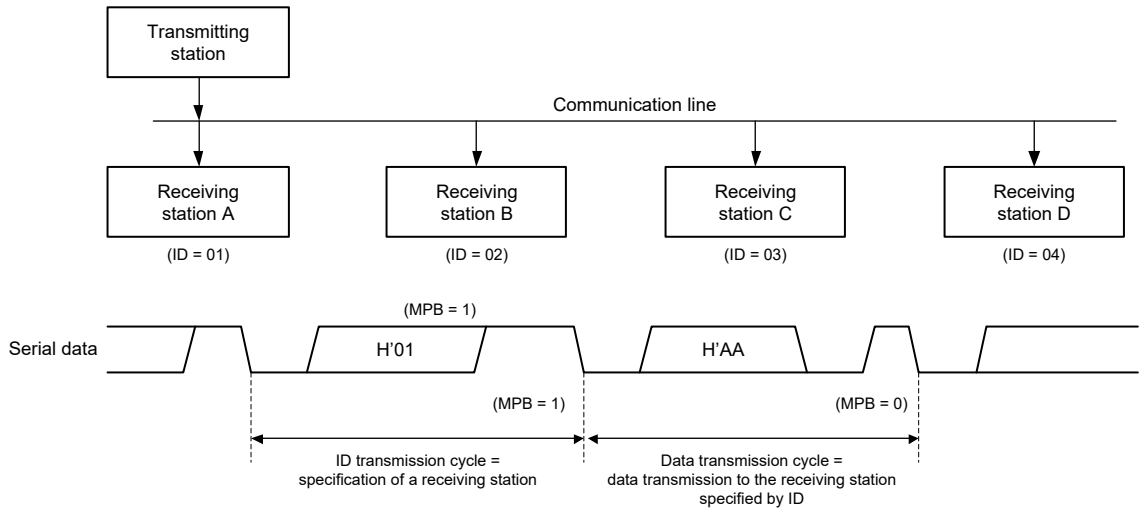
Figure 24.13 Example Flowchart of Serial Reception in Asynchronous Mode (2)

24.4 Multi-Processor Communications Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle and when the multi- processor bit is set to 0, it indicates the data transmission cycle. **Figure 24.14** shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1 is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0 is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself and if the two match, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1.

For supporting this function, the SCI provides the MPIE bit in SCR. When the MPIE bit is set to 1, transfer of receive data from the RSR to the RDR (the RDRH and RDRL registers when 9-bit data length is selected), detection of a receive error, and setting the respective status flags ORER and FER in SSR are disabled until reception of data in which the multi-processor bit is set to 1. Upon receiving a reception character in which the multi-processor bit is set to 1, the MPBT bit in SSR is set to 1 and the MPIE bit in SCR is automatically cleared, thus returning to a normal reception operation. During this time, an RXI interrupt is generated if the RIE bit in SCR is set.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the normal asynchronous mode.

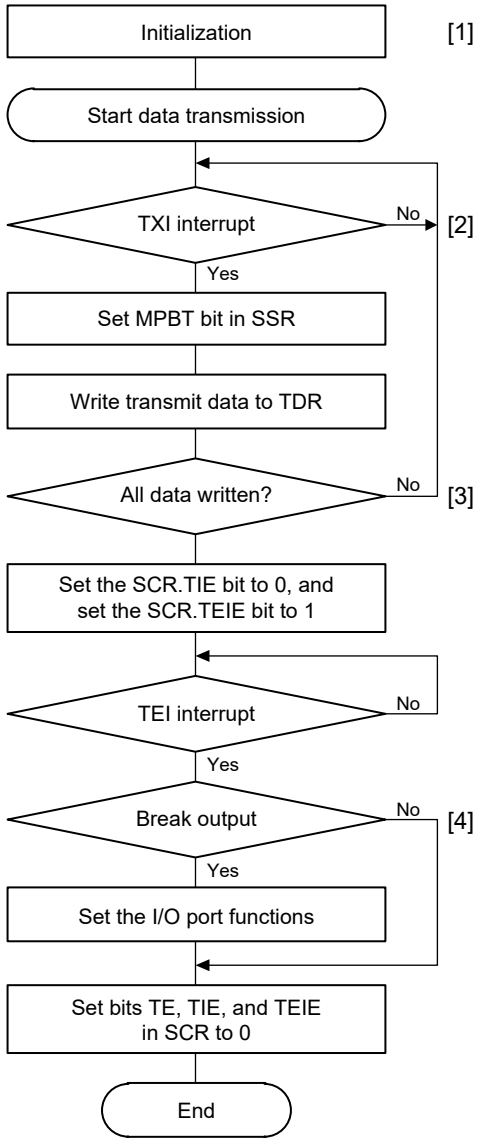


Note: MPB: Multi-processor bit

Figure 24.14 An Example of Communication using the Multi-Processor Format (Example of Transmission of Data H'AA to Receiving Station A)

24.4.1 Multi-Processor Serial Data Transmission

Figure 24.15 is a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in SSR set to 1. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0. The other operations are the same as the operations in asynchronous mode.



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Set the MPBT bit in SSR to 0 or 1, and write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

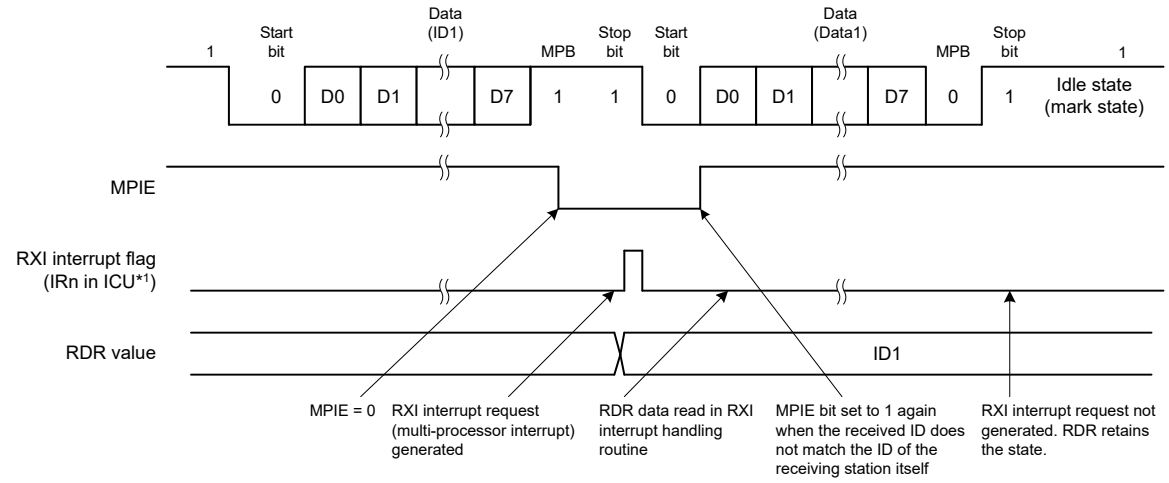
Note: The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

Figure 24.15 Example of Multi-Processor Serial Transmission Flowchart

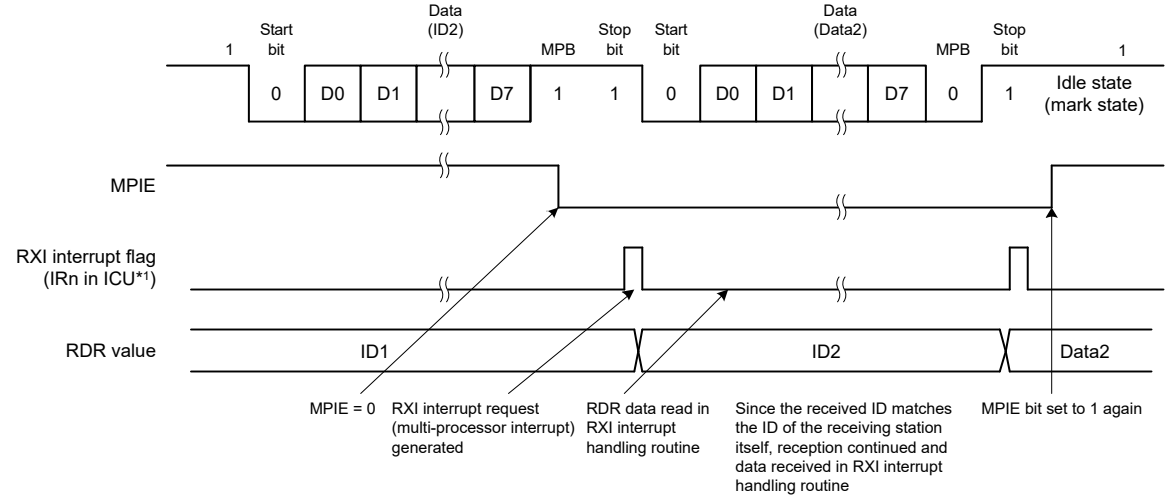
24.4.2 Multi-Processor Serial Data Reception

Figure 24.17 and **Figure 24.18** are sample flowcharts of multi-processor data reception. When the MPIE bit in SCR is set to 1, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1. When the communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to RDR (the RDRH and RDRL registers when 9-bit data length is selected). During this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode.

Figure 24.16 is the example of operation for reception.



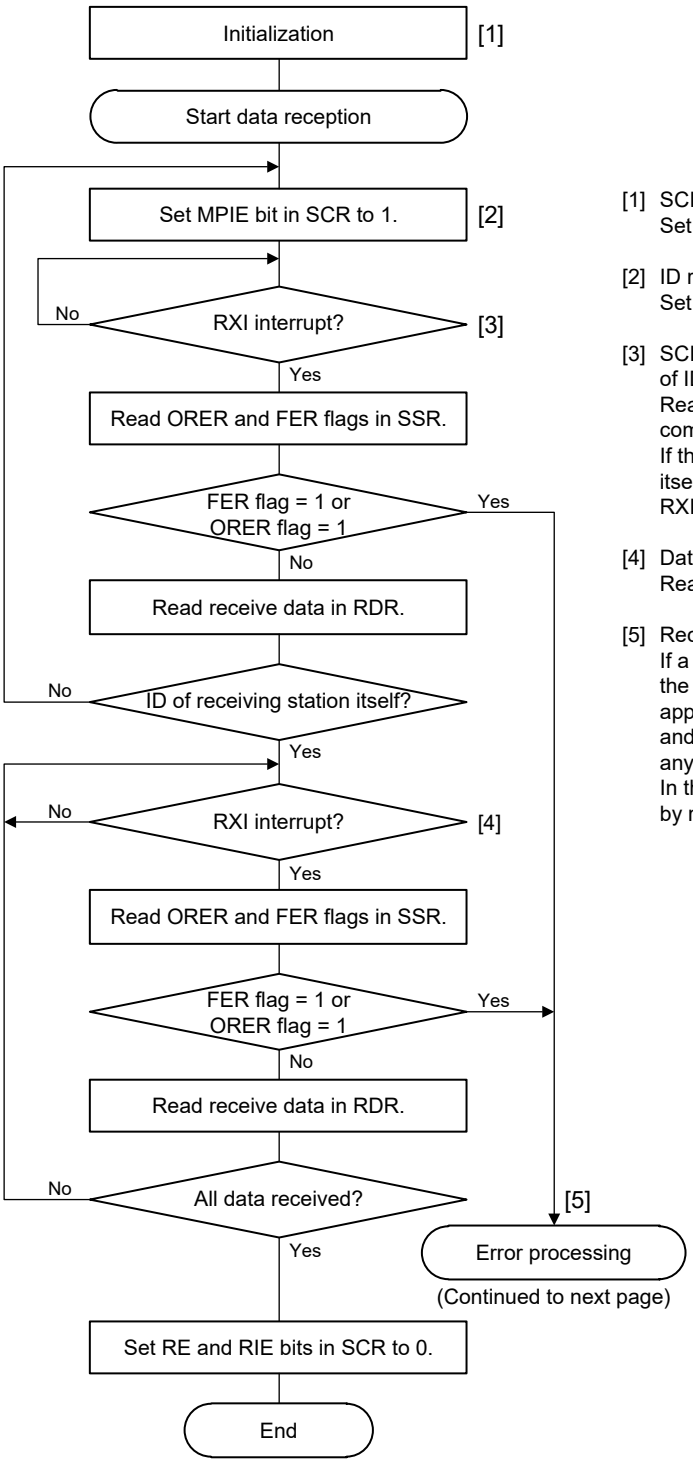
(a) When the received ID does not match the ID of the receiving station itself



(b) When the received ID matches the ID of the receiving station itself

Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.16 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit)



[1] SCI initialization:
Set data reception.

[2] ID reception cycle:
Set the MPIE bit in SCR to 1 and wait for ID reception.

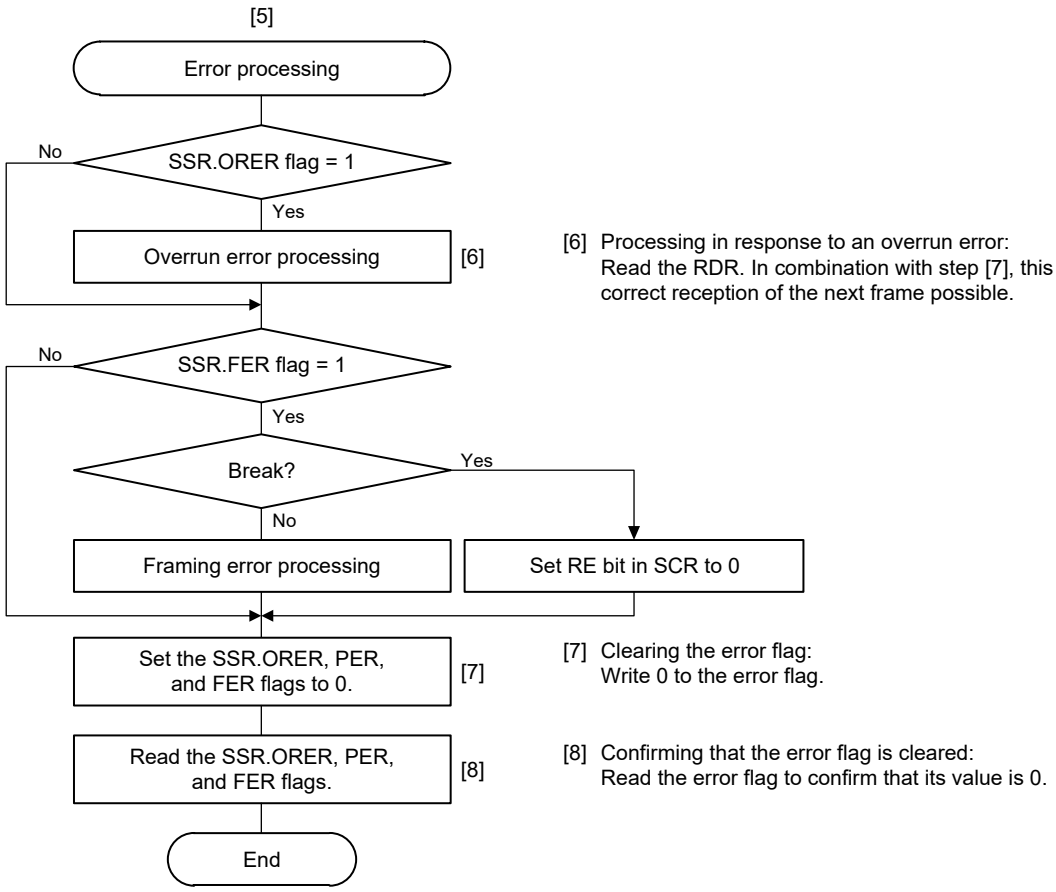
[3] SCI status confirmation and reception and comparison of ID:
Read data in RDR at the first RXI interrupt, and compare it with the ID of the receiving station itself.
If the ID does not match the ID of the receiving station itself, set the MPIE bit to 1 again, and wait for another RXI interrupt RXI interrupt request.

[4] Data reception at an RXI interrupt:
Read data in RDR once in the RXI interrupt routine.

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading the ORER and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1.
In the case of a framing error, a break can be detected by reading the value of the RXDn pin.

Note: The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 24.17 Example of Multi-Processor Serial Reception Flowchart (1)



Note: The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 24.18 Example of Multi-Processor Serial Reception Flowchart (2)

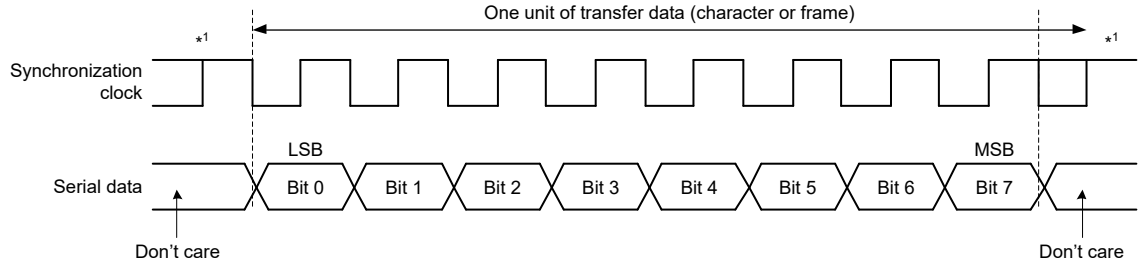
24.5 Operation in Clock Synchronous Mode

Figure 24.19 shows the data format for clock synchronous serial data communications.

In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.

In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last bit output state.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.



Note 1. Holds a high level except during continuous transfer.

Figure 24.19 Data Format in Clock Synchronous Serial Communications (LSB First)

24.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected, according to the setting of the SCR.CKE[1:0] bits.

When the SCI is operated on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character, and when no transfer is performed the clock is held high. However, when only data reception is performed while the CTS function is disabled, the synchronization clock output is started at the same time when the SCR.RE bit set to 1. The synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

When only data reception is performed and the CTS function is enabled, the clock output is not started even when the SCR.RE bit set to 1 if the CTSn# pin input is high when the SCR.RE bit is 0. The synchronization clock output is started when the SCR.RE bit is set to 1 and the CTSn# pin input is low. After that, if the CTSn# pin input is high on completion of the frame reception, the synchronization clock output is stopped at the high level. If the CTSn# pin input continues to be low, the synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

24.5.2 CTS and RTS Functions

In the CTS function, CTSn# pin input is used to control reception/transmission start when the clock source is the internal clock. Setting the SECR.CTSE bit to 1 enables the CTS function.

When the CTS function is enabled, placing the low level on the CTSn# pin causes reception/transmission to start.

In the RTS function, RTSn# pin output is used to request reception/transmission start when the clock source is an external synchronizing clock. A low level is output when serial communications become possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output] Satisfaction of all conditions listed below

- The value of the RE or TE bit in the SCR is 1
- Neither transmission nor reception is in progress
- There are no received data yet to be read (when the SCR.RE bit is 1)
- Transmit data has been written (when the SCR.TE bit is 1)
- ORER flag in SSR is 0

[Condition for high-level output]

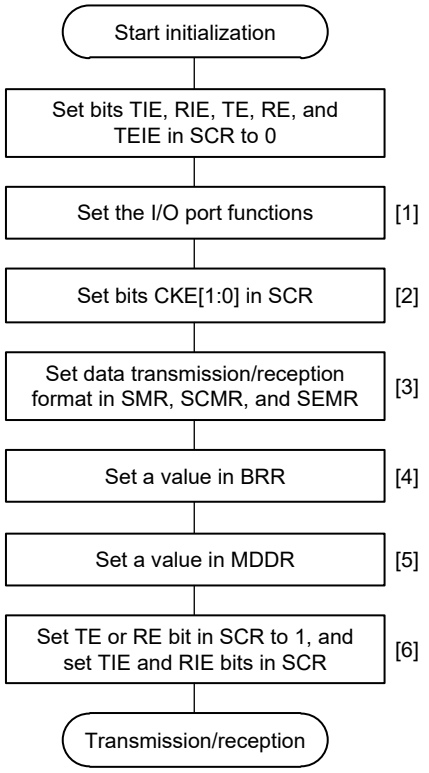
- The conditions for low-level output have not been satisfied.

24.5.3 SCI Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, start by writing the initial value H'00 to the SCR and then continue through the procedure for SCI given in **Figure 24.20**. Whenever the operating mode or transfer format is changed, the SCR must be initialized before the change is made.

Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.



[1] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[2] Set the clock selection in SCR.
When an internal clock is selected, the SCK pin functions as the clock output pin.

[3] Set the data transmission/reception format in SMR, SCMR, and SEMR.

[4] Write a value corresponding to the bit rate to BRR. This step is not necessary if an external clock is used.

[5] Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is cleared to 0 or an external clock is used.

[6] Set the TE bit or RE bit in SCR to 1. Also set the TIE and RIE bits in SCR.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note: In simultaneous transmit and receive operations, the TE and RE bits in SCR should both be set to 0 or 1 simultaneously.

Figure 24.20 Example of SCI Initialization Flowchart (Clock Synchronous Mode)

24.5.4 Serial Data Transmission (Clock Synchronous Mode)

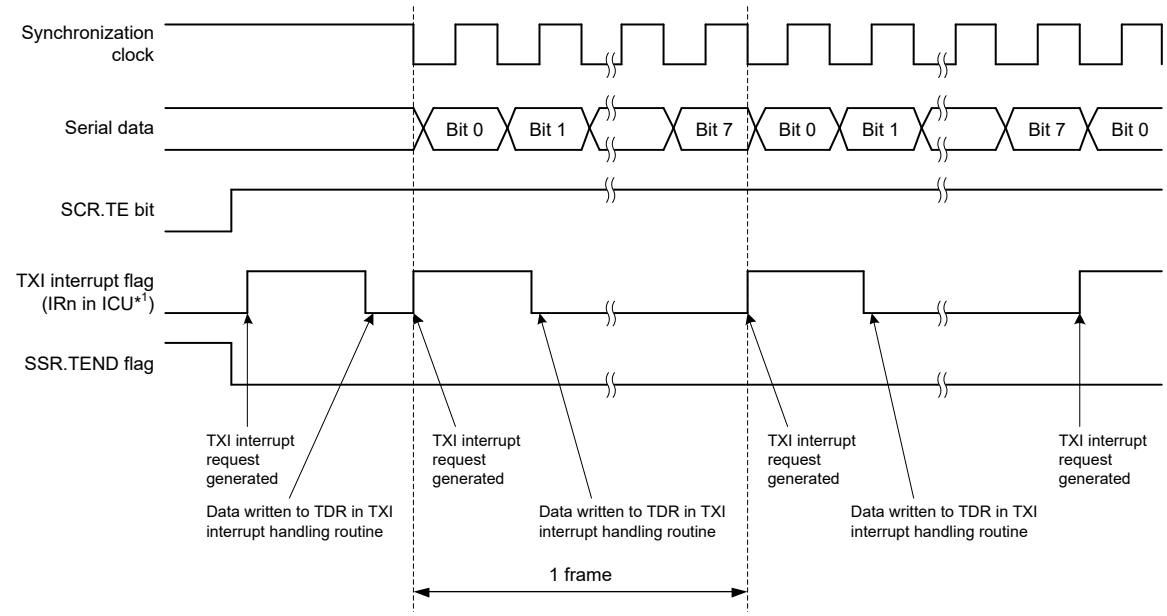
Figure 24.21, **Figure 24.22**, and **Figure 24.23** show an example of the operation for serial transmission in clock synchronous mode.

In serial data transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in this TXI interrupt handling routine before transmission of the current transmit data has finished. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR from the handling routine for TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when clock output mode has been specified and in synchronization with the input clock when use of an external clock has been specified. Output of the clock signal is suspended until the input CTS signal is at the low level while the CTSE bit in SECR is 1 (CTS function is enabled).
4. The SCI checks for updating of (writing to) the TDR at the time of the last bit output.
5. When TDR is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame is started.
6. If TDR is not updated, set the SSR.TEND flag to 1 and the TXDn pin retains the output state of the last bit. If the TEIE bit in SCR is 1 at this time, a TEI interrupt request is generated. The SCKn pin is held high.

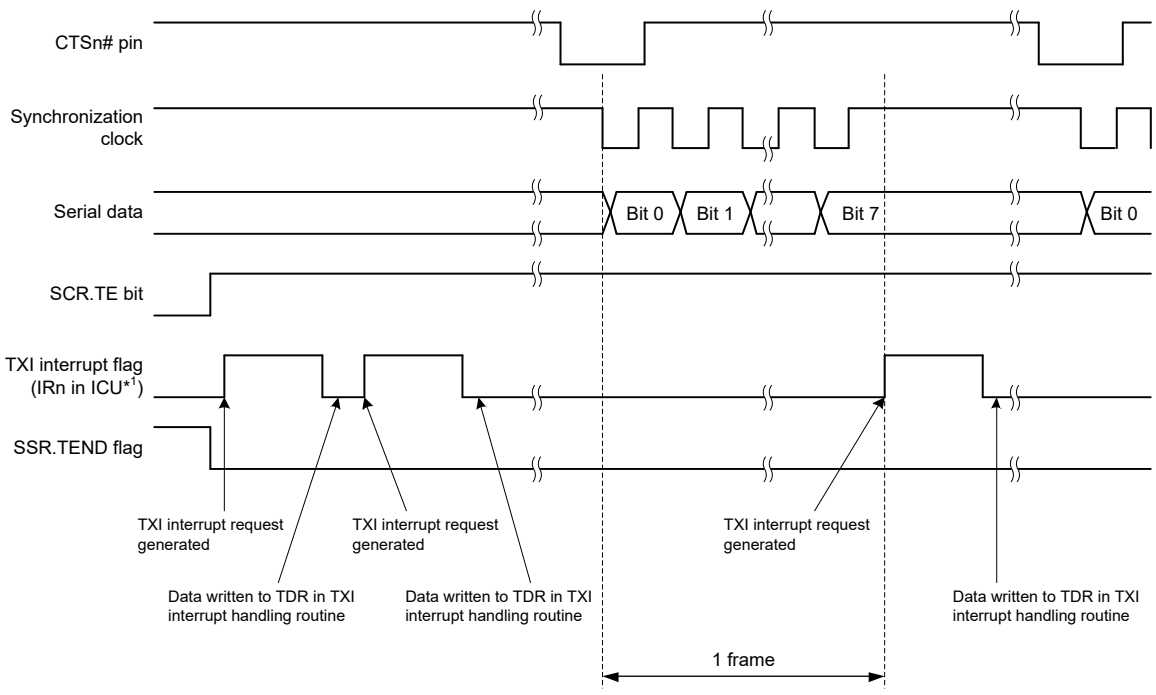
Figure 24.24 shows a sample flowchart of serial data transmission.

Transmission will not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Be sure to set the receive error flags to 0 before starting transmission. Note that setting the RE bit in SCR to 0 does not clear the receive error flags.



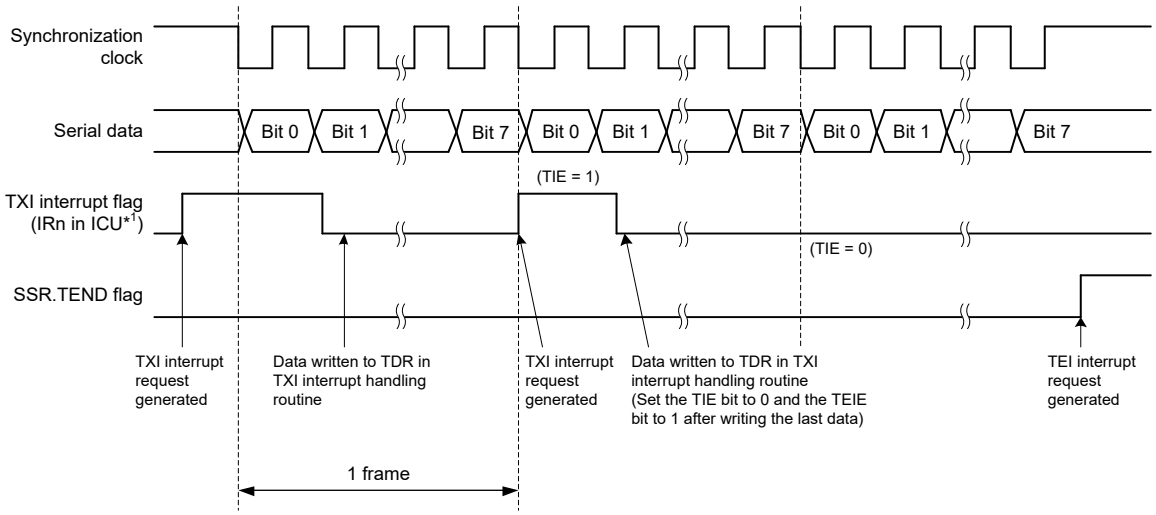
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.21 Example of Serial Data Transmission in Clock Synchronous Mode (1)
(When the CTS Function is Not Used at the Beginning of Transmission)



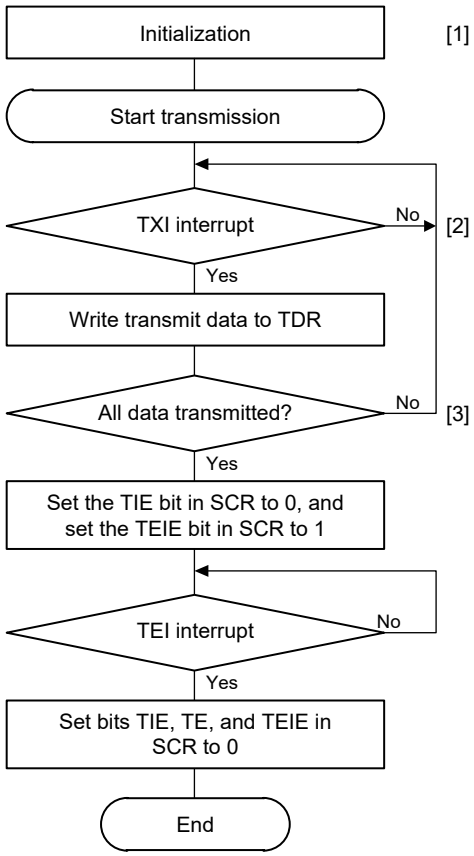
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.22 Example of Serial Data Transmission in Clock Synchronous Mode (2)
(When the CTS Function is Used at the Beginning of Transmission)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.23 Example of Serial Data Transmission in Clock Synchronous Mode (3)
(From the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.

[2] Writing transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Transmit data is written to TDR once from the handling routine for TXI requests.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR upon accepting a transmit data empty interrupt (TXI) request. Transmit data can also be written to TDR by activating the DMAC by the TXI interrupt request. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

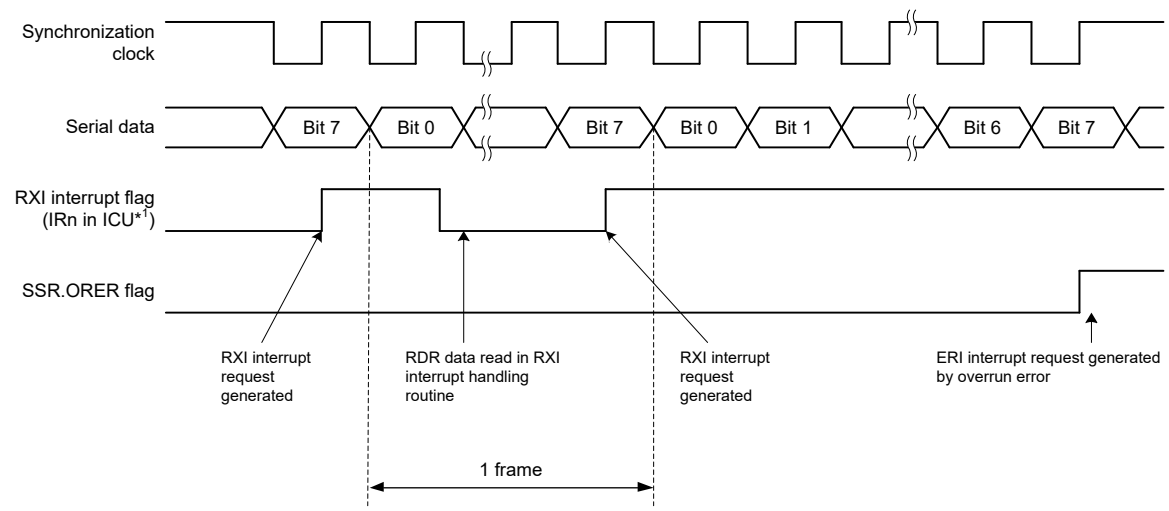
Note: When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR.TEND flag to 1. Setting the SCR.TE bit to 0 immediately after this may lead to insufficient received-data hold time on the receiver side.

Figure 24.24 Example Flowchart of Serial Transmission in Clock Synchronous Mode

24.5.5 Serial Data Reception (Clock Synchronous Mode)

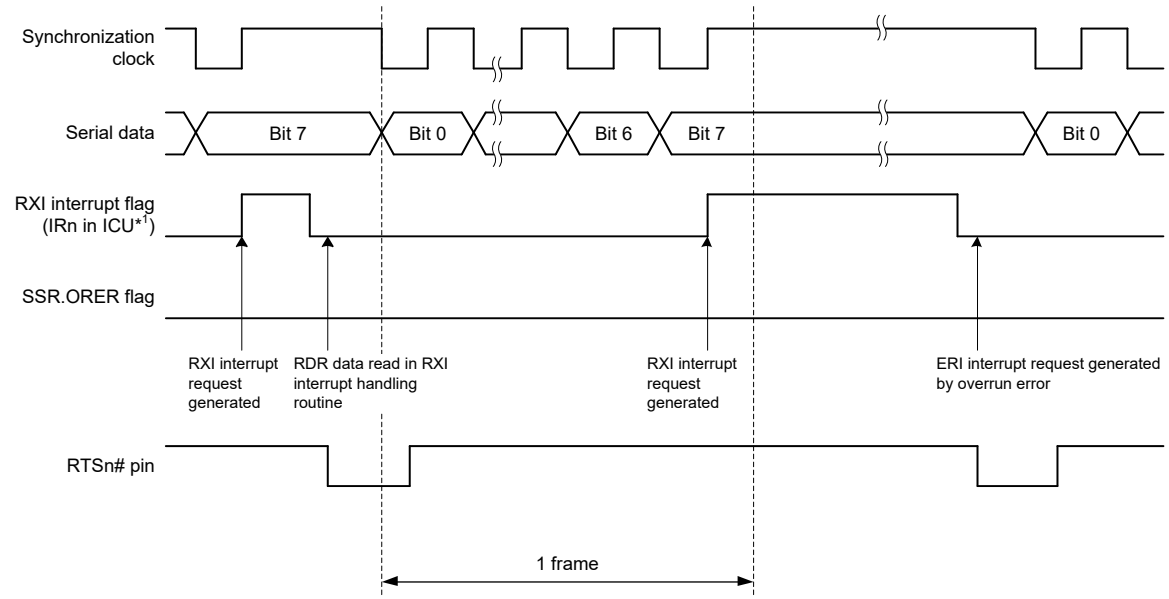
Figure 24.25 and **Figure 24.26** show an example of SCI operation for serial reception in clock synchronous mode. In serial data reception, the SCI operates as described below.

1. The value of the RE bit in SCR becoming 1 places the signal output on the RTSn# pin at the low level (when the RTS function is in use).
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in RSR.
3. If an overrun error occurs, the ORER bit in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. When reception finishes successfully, receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt handling routine before reception of the next receive data is completed. Reading out the received data that have been transferred to RDR causes the RTSn# pin to output the low level (when the RTS function is in use).



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.25 Example of Operation for Serial Reception in Clock Synchronous Mode (1)
(When RTS Function is Not Used)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.26 Example of Operation for Serial Reception in Clock Synchronous Mode (2) (When RTS Function is Used)

Data transfer cannot be resumed while a receive error flag is 1. Accordingly, clear the ORER, FER, and PER bits in SSR to 0 before resuming reception. Moreover, be sure to read the RDR during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read RDR because received data which has not yet been read may be left in RDR.

Figure 24.27 shows a sample flowchart for serial data reception.

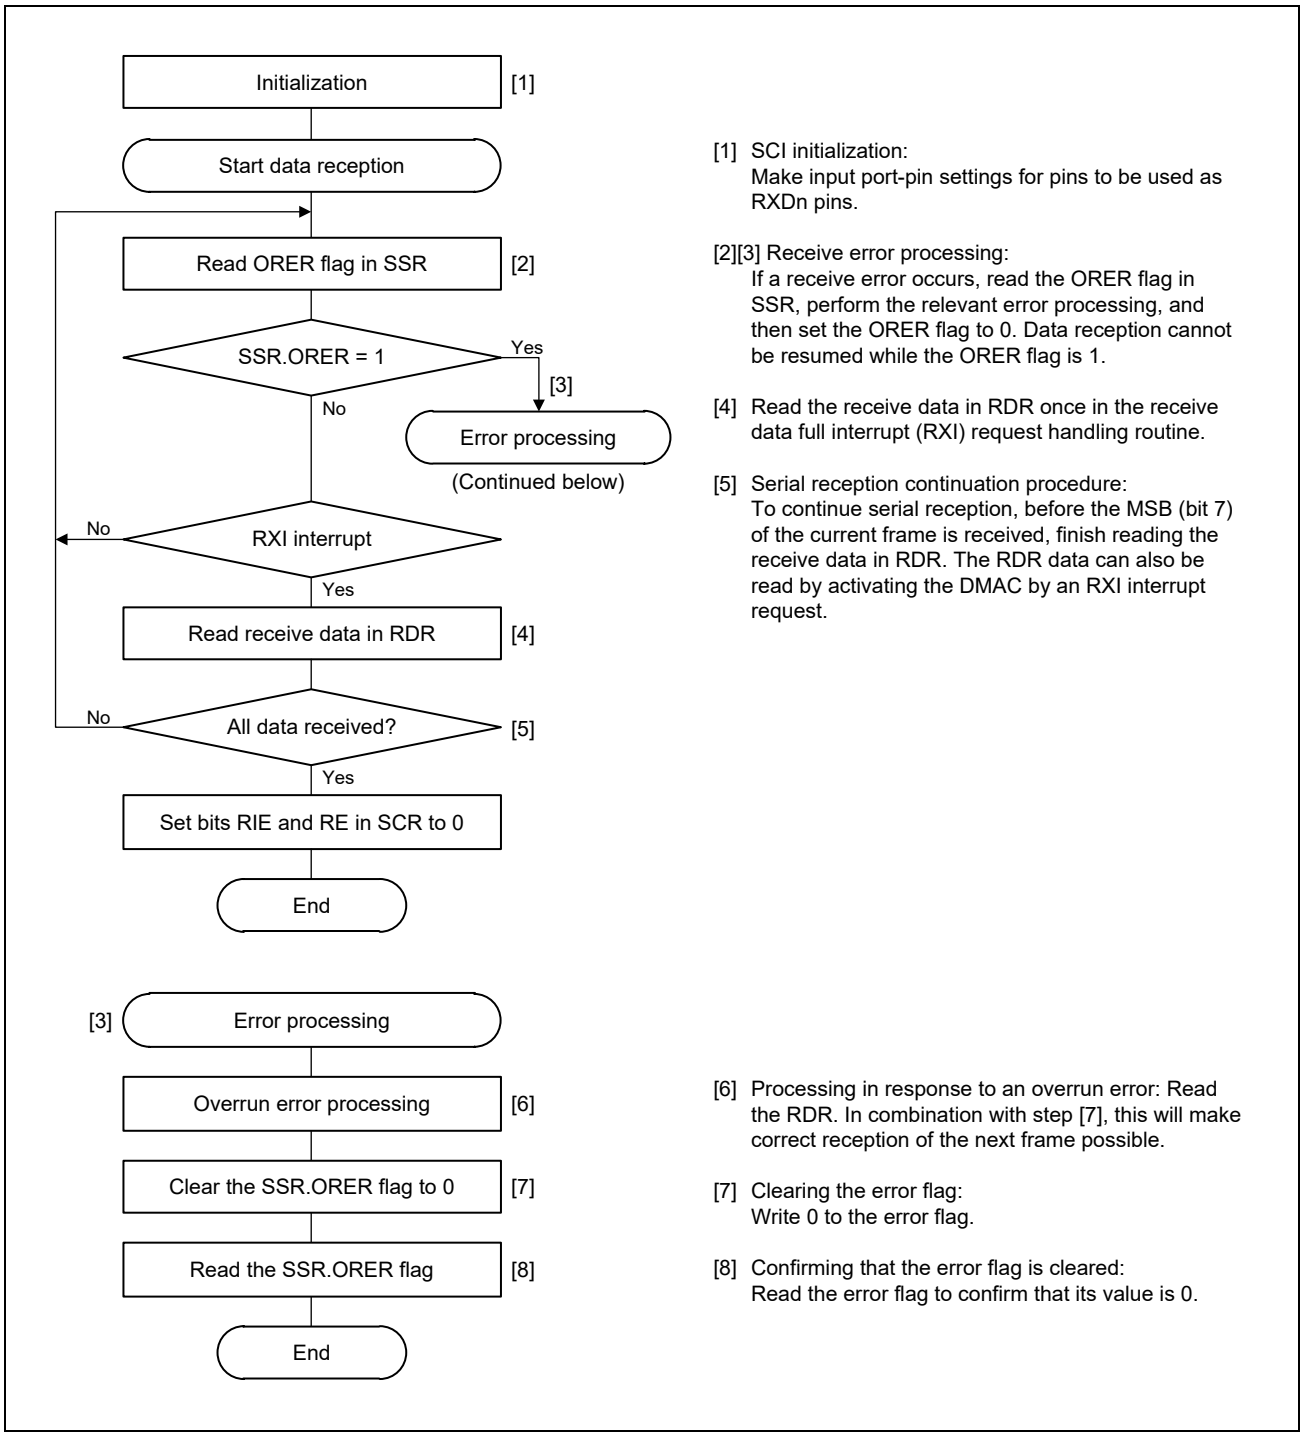


Figure 24.27 Example Flowchart of Serial Reception in Clock Synchronous Mode

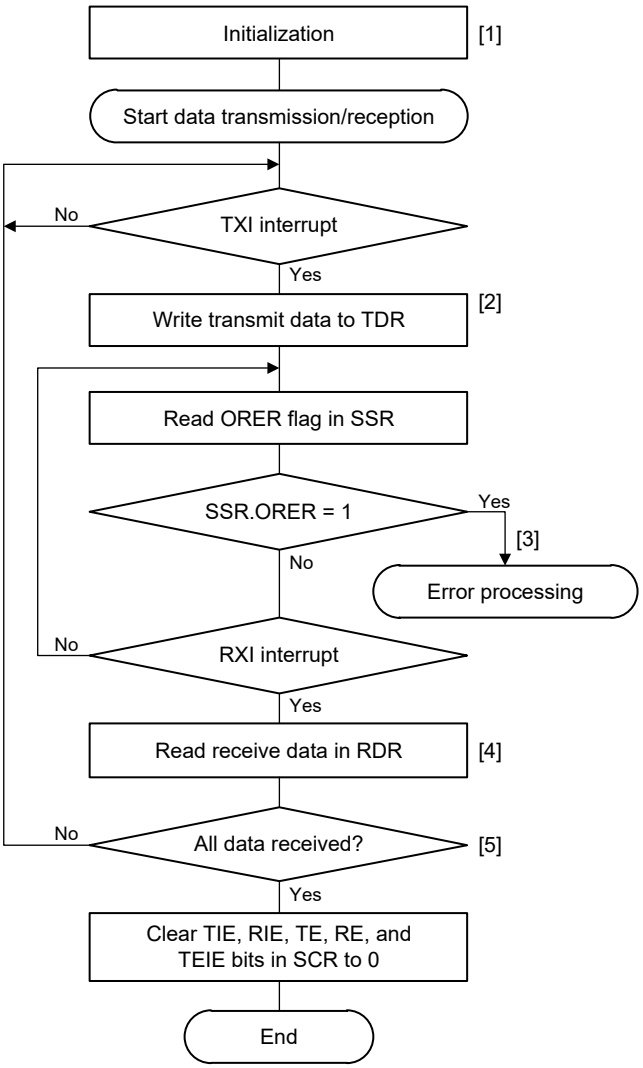
24.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 24.28 shows a sample flowchart for simultaneous serial transmit and receive operations in clock synchronous mode.

After initializing the SCI, the following procedure should be used for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI has finished transmission by reading that the TEND flag in SSR is 1, and then initialize the SCR register. Then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode, check that the SCI has finished reception, and then set the RIE and RE bits to 0. Then check that the receive error flags (ORER, FER, and PER in SSR) are 0, and then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.



[1] SCI initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[2] Transmit data write:
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[4] Reading receive data:
Read the receive data in RDR once in the RXI interrupt request handling routine.

[5] Serial transmission/reception continuation procedure:
To continue serial transmission and reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR by the RXI interrupt. Also, before the MSB (bit 7) of the current frame is transmitted, write data to TDR by the TXI interrupt.
Transmit data can also be written to TDR by activating the DMAC by a transmit data empty interrupt (TXI) request. Similarly, the RDR data can also be read by activating the DMAC by a receive data full interrupt (RXI) request.

Note: When switching from transmit or receive operation to simultaneous transmit and receive operations first set the TIE, RIE, TE, RE, and TEIE bits in SCR to 0, and then set TIE, RIE, TE, and RE bits to 1 simultaneously.

Figure 24.28 Example Flowchart of Simultaneous Serial Transmission and Reception in Clock Synchronous Mode

24.6 Operation in Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function of the SCI.

Smart card interface mode can be selected using the appropriate register.

24.6.1 Sample Connection

Figure 24.29 shows a sample connection between a smart card (IC card) and this MCU.

As in the figure, since this MCU communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor.

Setting the TE and RE bits in SCR to 1 with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.

To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card. The output port of this MCU can be used to output a reset signal.

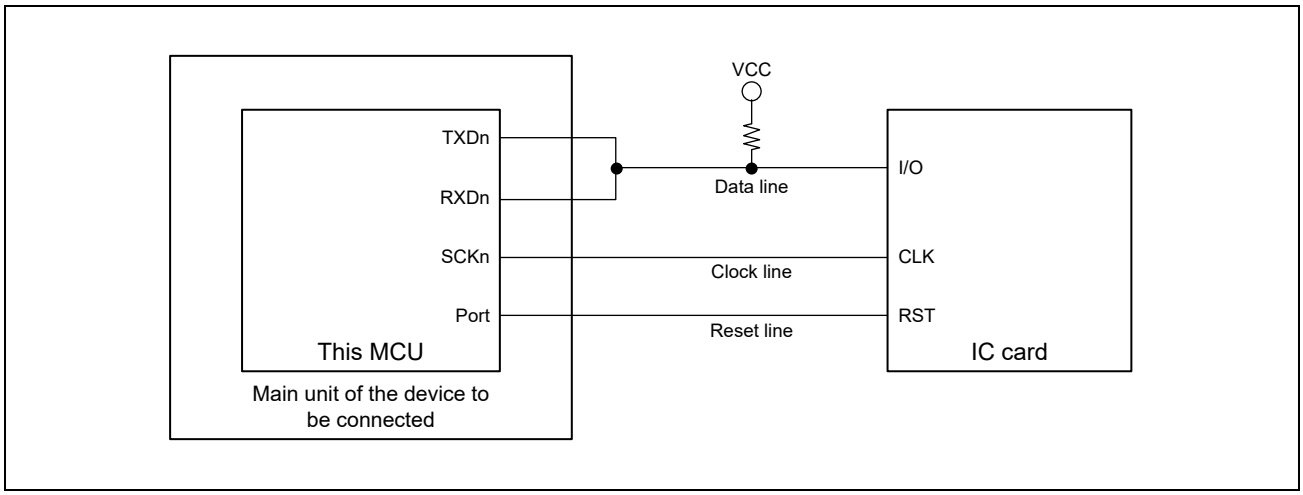


Figure 24.29 Sample Connection with a Smart Card (IC Card)

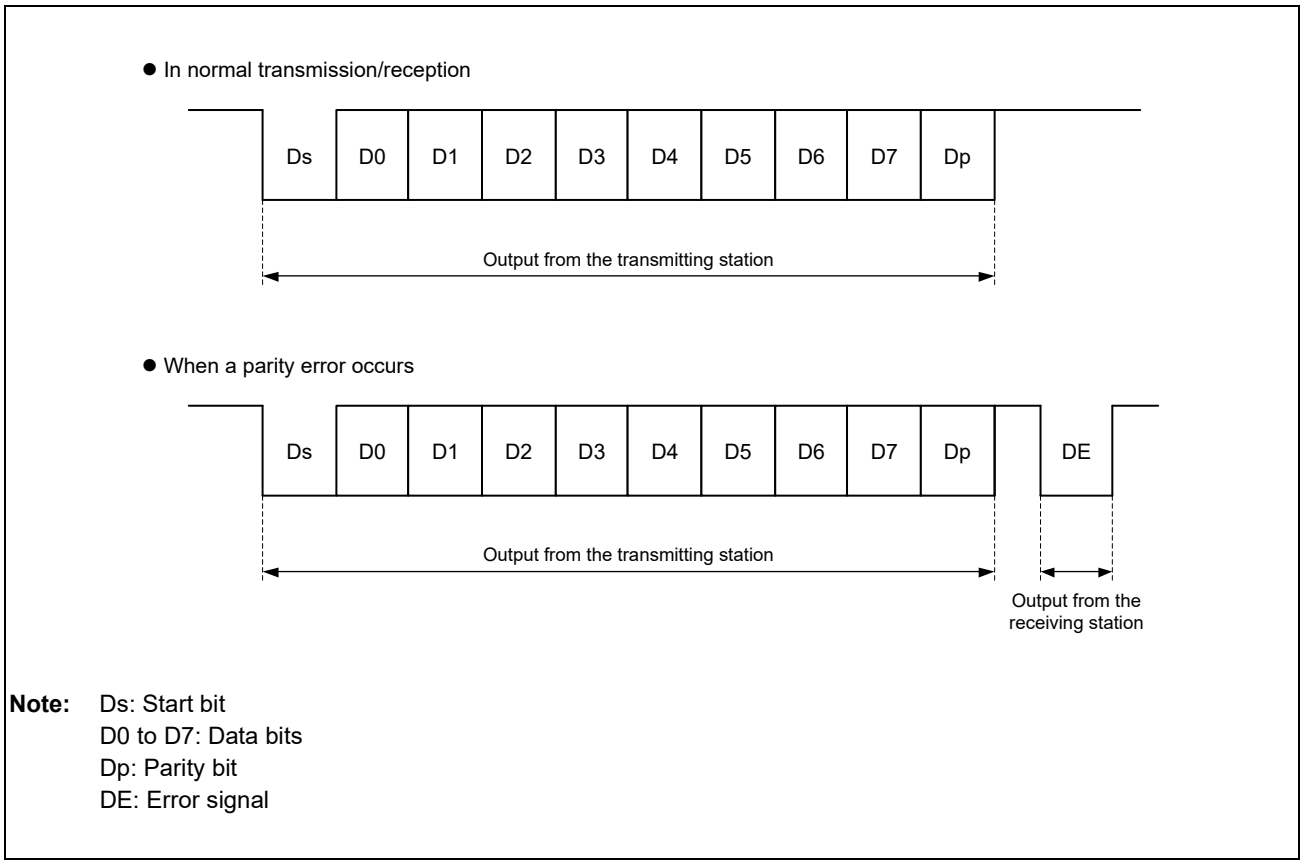
24.6.2 Data Format (Except in Block Transfer Mode)

Figure 24.30 shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring 1 bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 etu.



Note: Ds: Start bit
D0 to D7: Data bits
Dp: Parity bit
DE: Error signal

Figure 24.30 Data Formats in Smart Card Interface Mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

(1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB first as the start character, as shown in **Figure 24.31**. Therefore, data in the start character in the figure is H'3B.

When using the direct convention type, write 0 to both the SDIR and SINV bits in SCMR. Write 0 to the PM bit in SMR in order to use even parity, which is prescribed by the smart card standard.

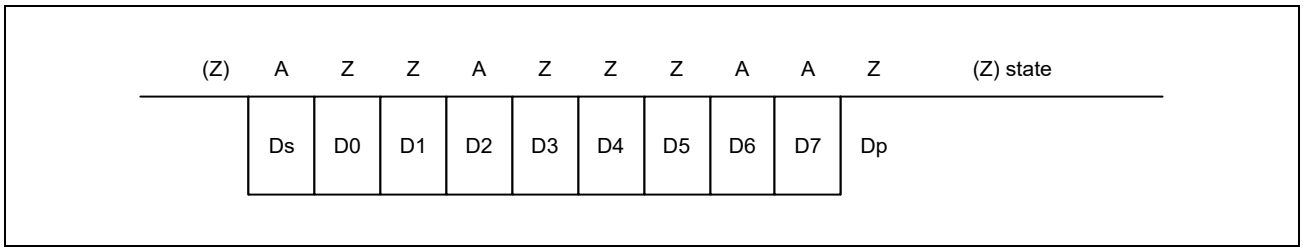


Figure 24.31 Direct Convention (SDIR in SCMR = 0, SINV in SCMR = 0, PM in SMR = 0)

(2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB first as the start character, as shown in **Figure 24.32**. Therefore, data in the start character in the figure is H'3F. When using the inverse convention type, write 1 to both the SDIR and SINV bits in SCMR. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SINV bit of this MCU only inverts data bits D7 to D0, write 1 to the PM bit in SMR to invert the parity bit for both transmission and reception.

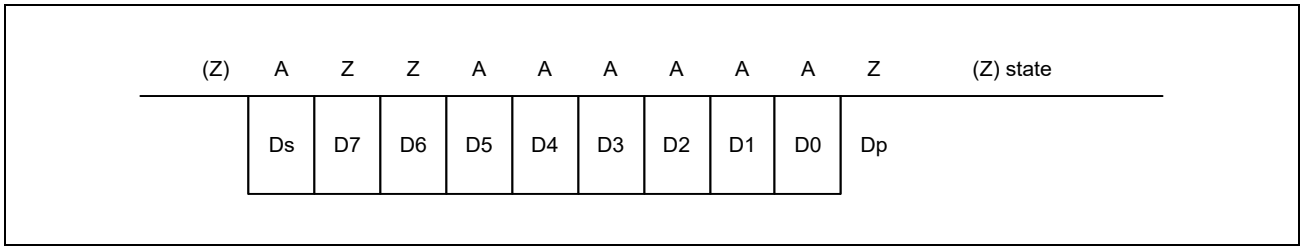

Figure 24.32 Inverse Convention (SDIR in SCMR = 1, SINV in SCMR = 1, PM in SMR = 1)

24.6.3 Block Transfer Mode

Block transfer mode is different from normal smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since the PER bit in SSR is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not retransmitted during transmission, the TEND flag in SSR is set 11.5 etu after transmission start.
- In block transfer mode, the ERS flag in SSR indicates the error signal status as in normal smart card interface mode, but the flag is read as 0 because no error signal is transferred.

24.6.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.

In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of the BCP2 bit in SCMR and the BCP[1:0] bits in SMR (the frequency is always 16 times the bit rate in normal asynchronous mode).

For data reception, the falling edge of the start bit is sampled with the base clock to perform internal synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in **Figure 24.33**. The reception margin here is determined by the following formula.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ [\%]$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256) D: Duty cycle of clock (D = 0 to 1.0)
L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \left\{ 0.5 - \frac{1}{(2 \times 372)} \right\} \times 100\ [\%] = 49.866\%$$

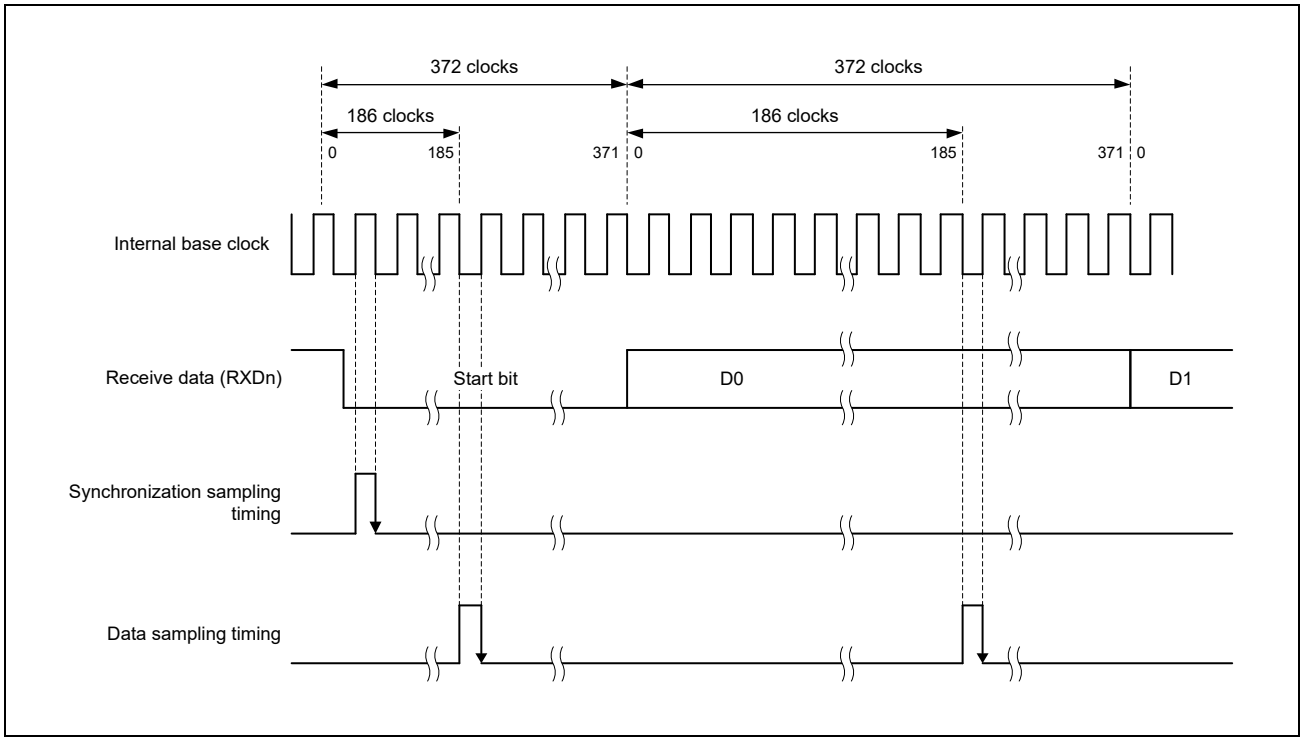

Figure 24.33 Receive Data Sampling Timing in Smart Card Interface Mode (When Clock Frequency is 372 Times the Bit Rate)

24.6.5 SCI Initialization (Smart Card Interface Mode)

Initialize the SCI following the example of flowchart shown in **Figure 24.34**.

Be sure to initialize the SCI before switching from transmission mode to reception mode and vice versa. Even if the RE bit is set to 0, the RDR register is not initialized.

To change reception mode to transmission mode, first check that reception has completed, and then initialize the SCI. At the end of initialization, set TE = 1 and RE = 0. Reception completion can be verified by reading the RXI request, ORER, or PER flag in SSR.

To change transmission mode to reception mode, first check that transmission has completed, and then initialize the SCI. At the end of initialization, set TE = 0 and RE = 1. Transmission completion can be verified by reading the TEND flag in SSR.

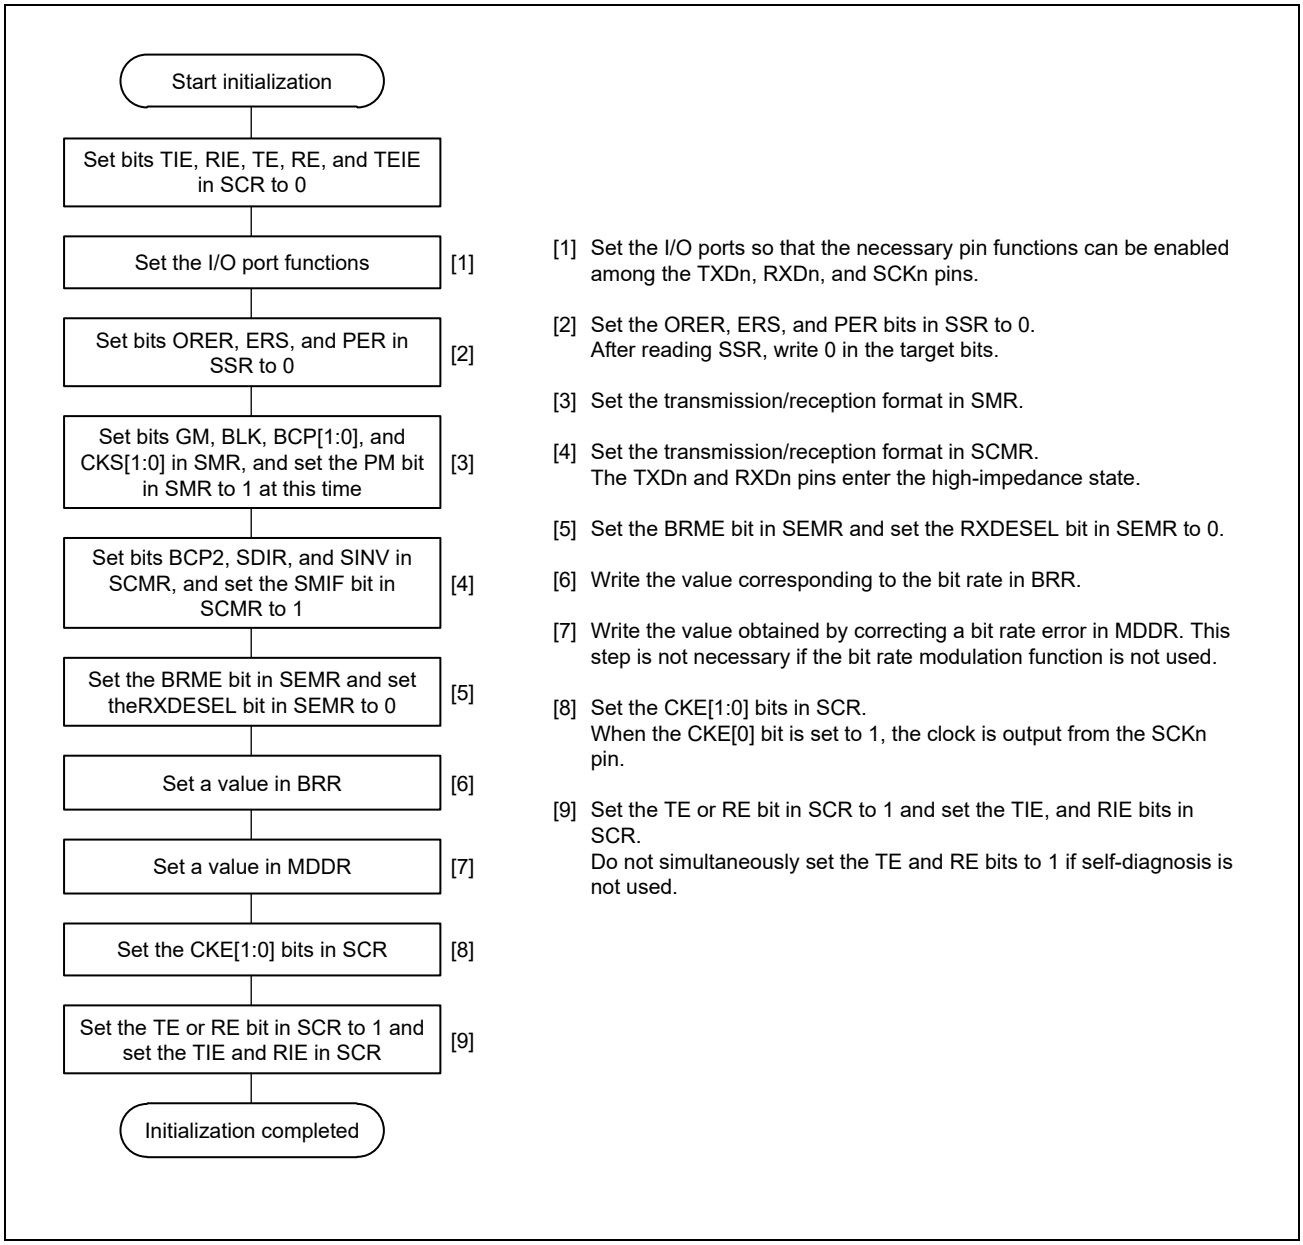

Figure 24.34 Example of SCI Initialization Flowchart (Smart Card Interface Mode)

24.6.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be retransmitted, is different from that in non-smart card interface mode. **Figure 24.35** shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, the ERS flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the ERS flag to 0 before the next parity bit is sampled.
2. For a frame in which an error signal is received, the TEND flag in SSR is not set. Data is retransferred from TDR to TSR allowing automatic data retransmission.
3. If no error signal is returned from the receiver, the ERS flag is not set to 1.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.

Figure 24.37 shows a sample flowchart of serial transmission. All the processing steps are automatically performed using a TXI interrupt request to activate the DMAC.

When the TEND flag in SSR is set to 1 in transmission, if the TIE bit in SCR is 1, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag is automatically set to 0 when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag is not automatically cleared, set the RIE bit to 1 beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag to 0. When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings.

For DMAC settings, refer to **Section 14, Direct Memory Access Controller**.

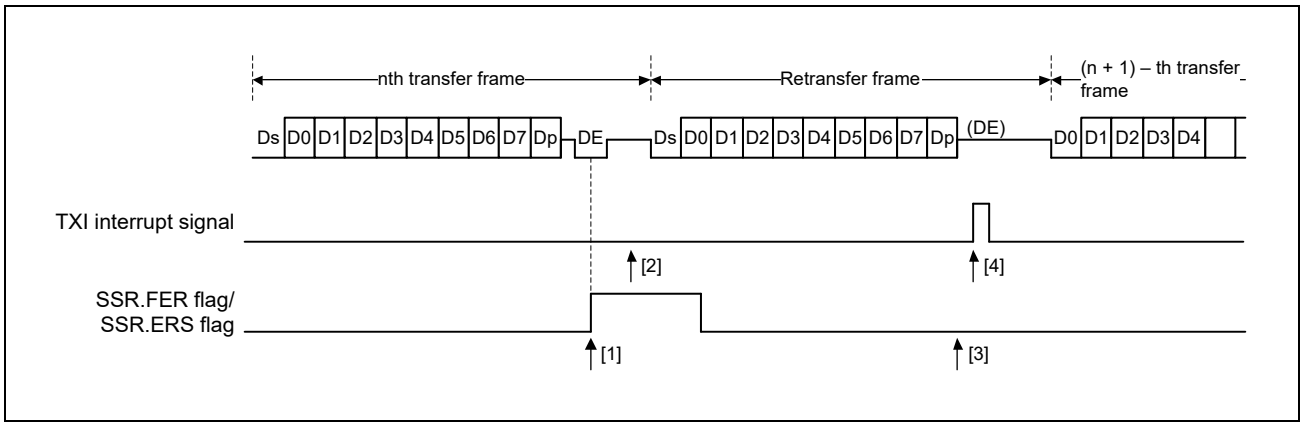

Figure 24.35 Data Retransfer Operation in SCI Transmission Mode

Note that the SSR.TEND flag is set in different timings depending on the GM bit setting in SMR. **Figure 24.36** shows the TEND flag generation timing.

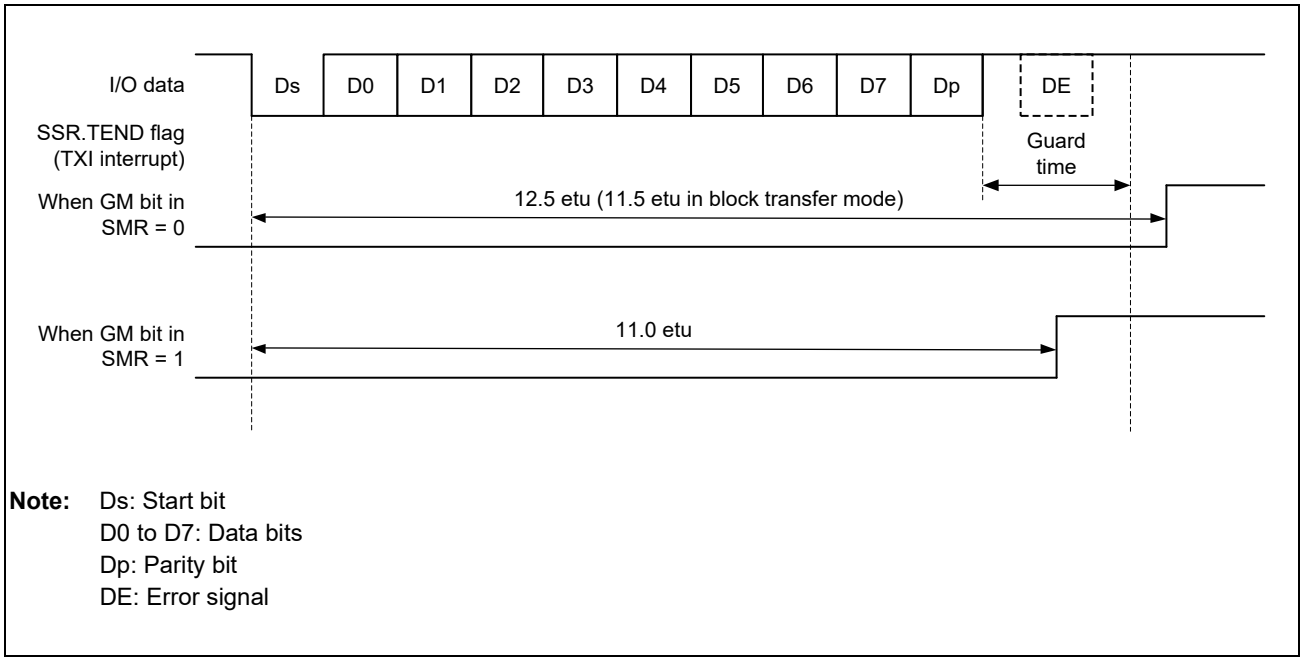

Figure 24.36 SSR.TEND Flag Generation Timing during Transmission

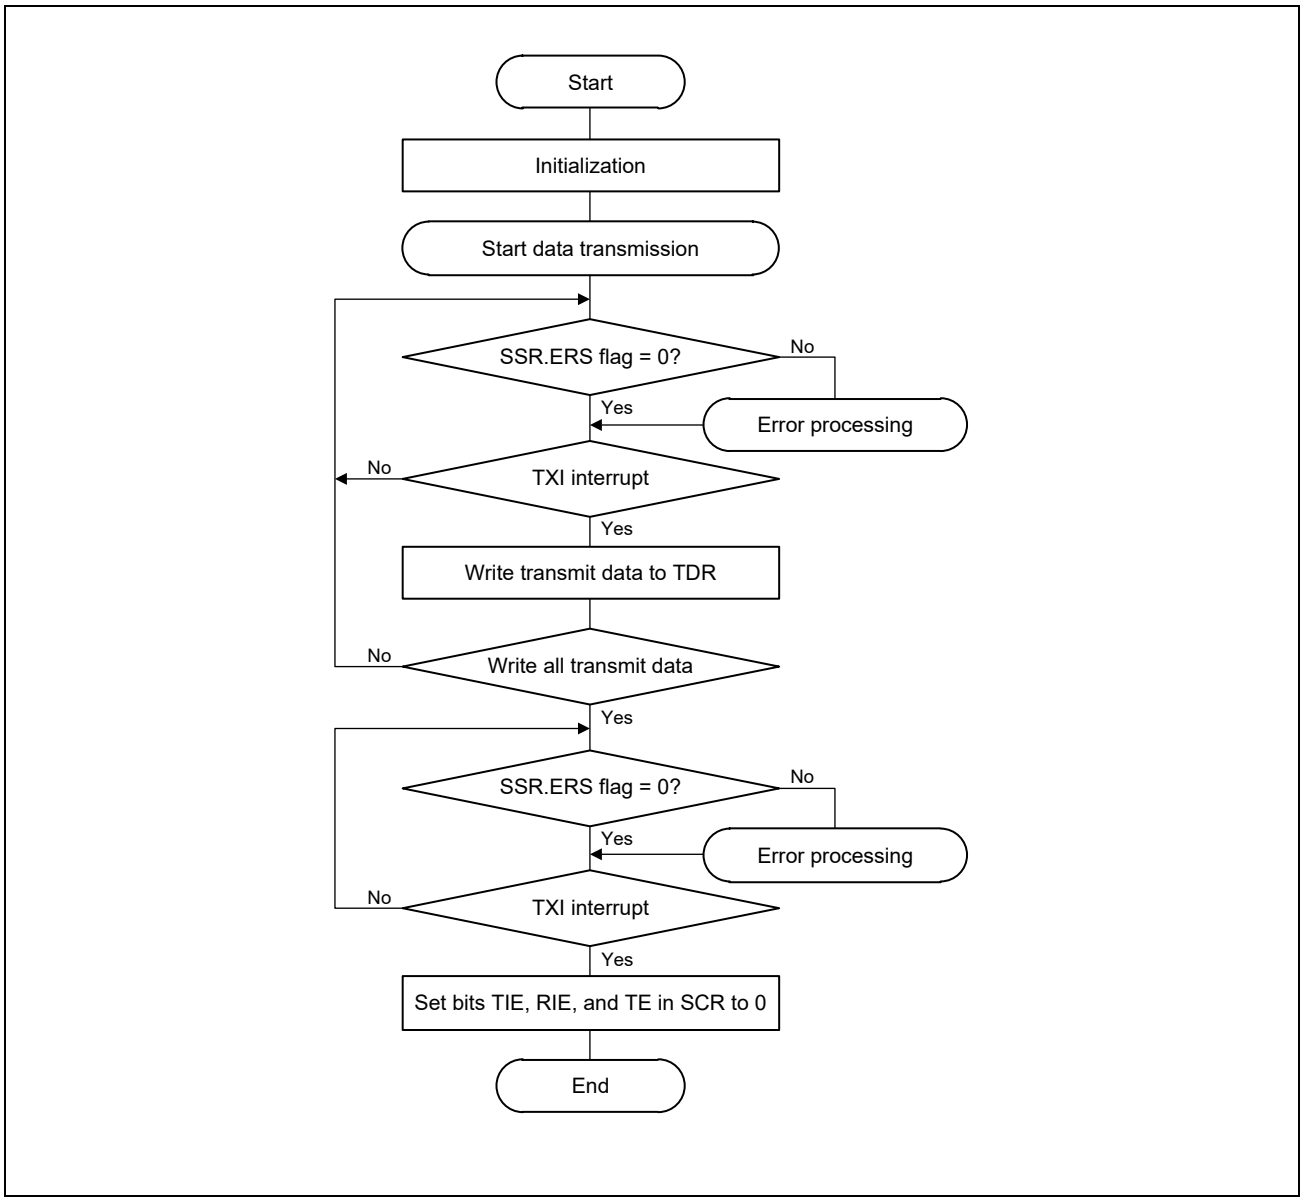

Figure 24.37 Sample Smart Card Interface Transmission Flowchart

24.6.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in non-smart card interface mode. **Figure 24.38** shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the PER flag in SSR is set to 1. When the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the PER flag to 0 before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the PER flag in SSR is not set to 1.
4. In this case, data is determined to have been received successfully. When the RIE bit in SCR is 1, an RXI interrupt request is generated.

Figure 24.39 shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC.

In reception, setting the RIE bit to 1 allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data.

If an error occurs during reception and either the ORER or PER flag in SSR is set to 1, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.

Even if a parity error occurs and the PER flag is set to 1 during reception, receive data is transferred to RDR, thus allowing the data to be read.

When a reception is forcibly terminated by setting the RE bit in SCR to 0 during operation, read the RDR register because the received data which has not yet been read may be left in RDR.

NOTE

For operations in block transfer mode, refer to **Section 24.3, Operation in Asynchronous Mode**.

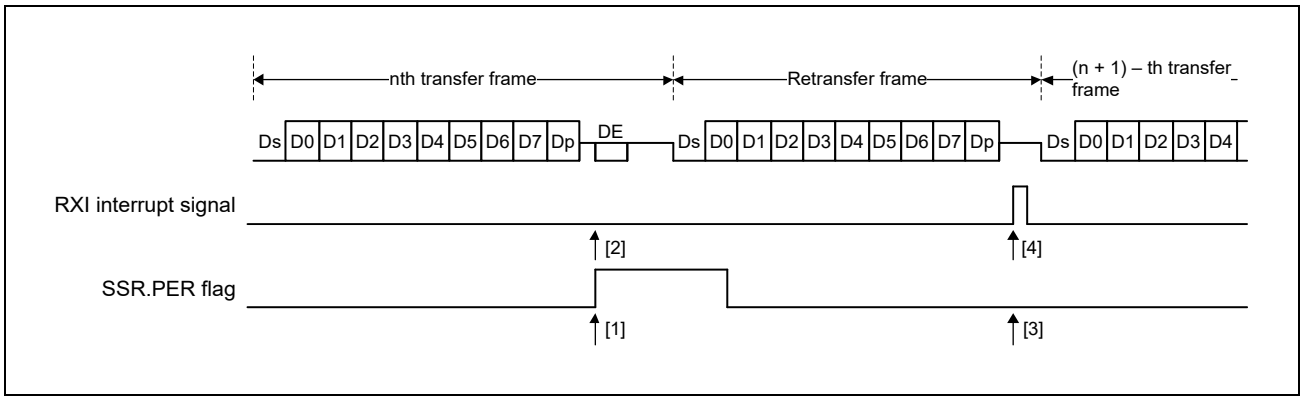

Figure 24.38 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception)

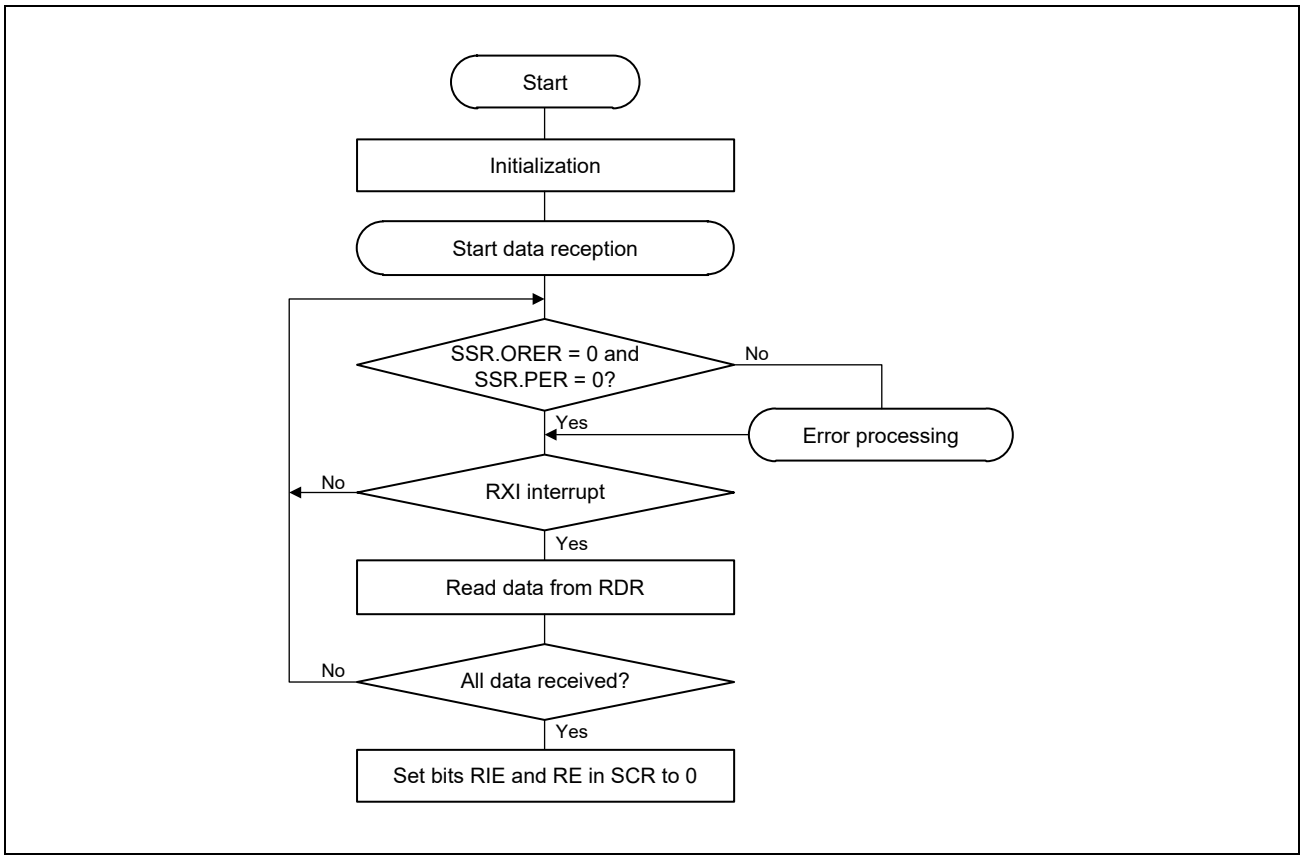

Figure 24.39 Sample Smart Card Interface Reception Flowchart

24.6.8 Clock Output Control

Clock output can be fixed using the CKE[1:0] bits in SCR when the GM bit in SMR is 1. Specifically, the minimum width of a clock pulse can be specified.

Figure 24.40 shows an example of clock output fixing timing when the CKE[0] bit is controlled with GM = 1 and CKE[1] = 0.

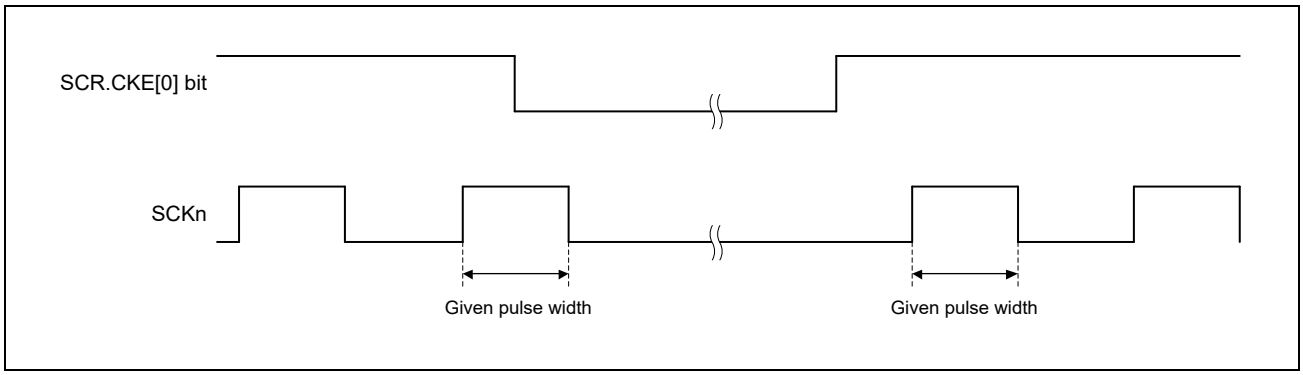

Figure 24.40 Clock Output Fixing Timing

At power-on, use the following procedure to secure the appropriate clock duty cycle.

(1) At Power-On

To secure the appropriate clock duty cycle simultaneously with power-on, use the following procedure.

1. Initially, port input is enabled in the high-impedance state. To fix the potential level, use a pull-up or pull-down resistor.
2. Fix the SCKn pin to the specified output by setting the SCR.CKE[1] bit and I/O port functions.
3. Set SMR and SCMR to enable smart card interface mode.
4. Set the SCR.CKE[0] bit to 1 to start clock output.

24.7 Noise Cancellation Function

Figure 24.41 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of two stages of flip-flop circuits and a match-detection circuit. When the level on the pin matches in three consecutive samples taken at the set sampling interval, the matching level continues to be conveyed internally until the level on the pin again matches in three consecutive samples.

In asynchronous mode, the noise cancellation function can be applied on the RXDn input signal. The period of the base clock (1/16th of a bit-period when SEMR.ABCS = 0 and 1/8th of a bit-period when SEMR.ABCS = 1) is the sampling interval.

If the base clock is stopped with the noise filter enabled and then the clock input is started again, the noise filter operation resumes from where the clock was stopped. If SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, it is determined that a level match is detected and is conveyed to the internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in three consecutive samples.

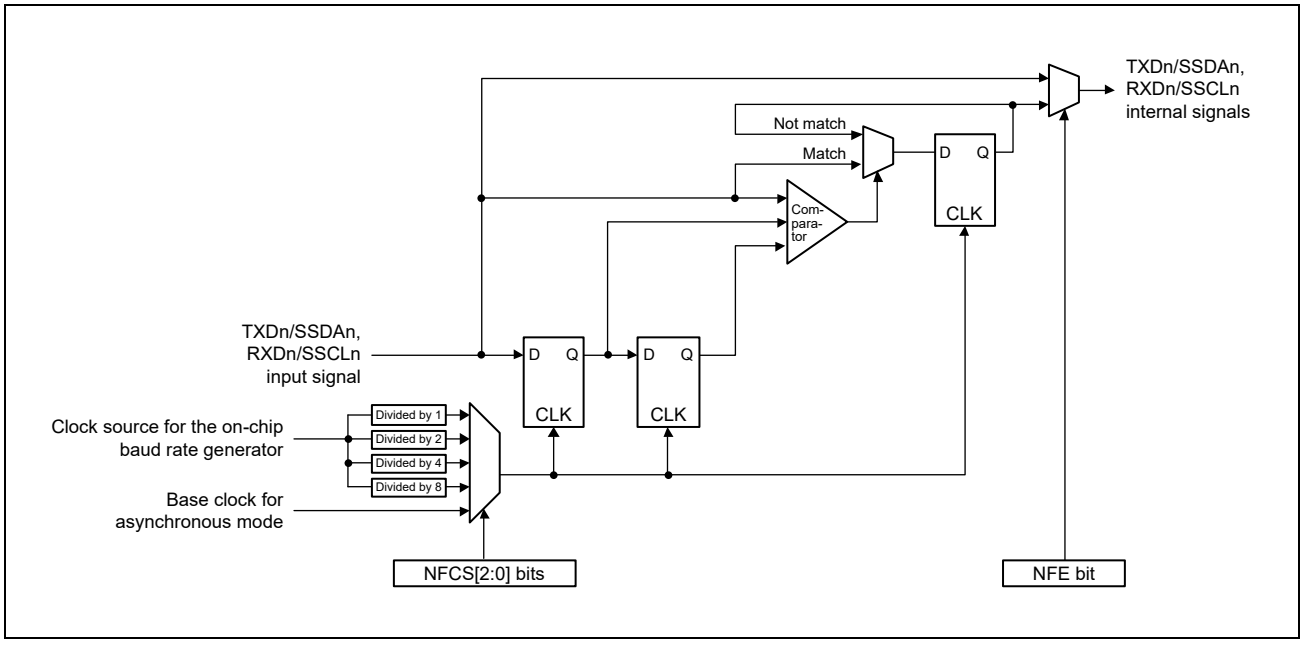

Figure 24.41 Block Diagram of Digital Noise Filter Circuit

24.8 Interrupt Sources

24.8.1 Buffer Operations for TXI and RXI Interrupts

If the conditions for a TXI and RXI interrupt are satisfied while the interrupt status flag in the interrupt controller is 1, the interrupt controller does not output the interrupt request but retains it internally (with a capacity for retention of one request per source).

When the value of the interrupt status flag in the interrupt controller becomes 0, the interrupt request retained within the interrupt controller is output. The internally retained interrupt request is automatically discarded once the actual interrupt is output. Clearing of the corresponding interrupt enable bit (the TIE or RIE bit in the SCR) can also be used to discard an internally retained interrupt request.

24.8.2 Interrupts in Asynchronous Mode and Clock Synchronous Mode

Table 24.20 lists interrupt sources in asynchronous mode and clock synchronous mode. A different interrupt vector is assigned to each interrupt source, and individual interrupt sources can be enabled or disabled with the enable bits in SCR. If the SCR.TIE bit is 1, a TXI interrupt request is generated when transmit data is transferred from the TDR or TDRL register*[1] to the TSR. A TXI interrupt request can also be generated by setting the SCR.TE bit to 1 after setting the SCR.TIE bit to 1 or by using a single instruction to set the SCR.TE and SCR.TIE bit to 1 at the same time. A TXI interrupt request can activate the DMAC to handle data transfer.

A TXI interrupt request is not generated by setting the SCR.TE bit to 1 while the setting of the SCR.TIE bit is 0 or by setting the SCR.TIE bit to 1 while the setting of the SCR.TE bit is 1.*[1]

When new data is not written by the time of transmission of the last bit of the current transmit data and the setting of the SCR.TEIE bit is 1, the SSR.TEND flag becomes 1 and a TEI interrupt request is generated. Furthermore, when the setting of the SCR.TE bit is 1, the SSR.TEND flag retains the value 1 until further transmit data are written to the TDR or TDRL register*[1], and setting the SCR.TEIE bit to 1 leads to the generation of a TEI interrupt request.

Writing data to the TDR or TDRL register*[1] leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the TEI interrupt request.

If the SCR.RIE bit is 1, an RXI interrupt request is generated when received data is stored in the RDR. An RXI interrupt request can activate the DMAC to handle data transfer.

Setting of any from among the ORER, FER, and PER flags in the SSR to 1 while the SCR.RIE bit is 1 leads to the generation of an ERI interrupt request. An RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, and PER) leads to discarding of the ERI interrupt request.

Note 1. In the case where asynchronous mode and 9-bit data length are selected

NOTE

To temporarily prohibit TXI interrupts at the time of transmission of the last of the data and so on when you wish a new round of transmission to start after handling of the transmission-completed interrupt, control prohibiting and permitting of the interrupt by using the interrupt request enable bit in the interrupt controller rather than using the SCR.TIE bit. This can prevent the suppression of TXI interrupt requests in the transfer of new data.

Table 24.20 Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	Priority
ERI	Receive error	ORER, FER, or PER	Not possible	High
RXI	Receive data full	—	Possible	↑
TXI	Transmit data empty	—	Possible	
TEI	Transmit end	TEND	Not possible	Low

24.8.3 Interrupts in Smart Card Interface Mode

Table 24.21 lists interrupt sources in smart card interface mode. A transmit end interrupt (TEI) request cannot be used in this mode.

Table 24.21 SCI Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	Priority
ERI	Receive error or error signal detection	ORER, PER, or ERS	Not possible	High
RXI	Receive data full	—	Possible	↑
TXI	Transmit data empty	TEND	Possible	Low

Data transmission/reception using the DMAC is also possible in smart card interface mode, similar to in the normal SCI mode. In transmission, when the TEND flag in SSR is set to 1, a TXI interrupt request is generated. This TXI interrupt request activates the DMAC allowing transfer of transmit data if the TXI request is specified beforehand as a source of DMAC activation. The TEND flag is automatically set to 0 when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, the ERS flag in SSR is not automatically cleared to 0 at error occurrence. Therefore, the ERS flag must be cleared by previously setting the RIE bit in SCR to 1 to enable an ERI interrupt request to be generated at error occurrence.

When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, refer to **Section 14, Direct Memory Access Controller**.

In reception, an RXI interrupt request is generated when receive data is set to RDR. This RXI interrupt request activates the DMAC allowing transfer of receive data if the RXI request is specified beforehand as a source of DMAC activation. If an error occurs, the error flag is set. Therefore, the DMAC is not activated and an ERI interrupt request is issued to the CPU instead; the error flag must be cleared.

24.9 Usage Notes

24.9.1 Break Detection and Processing

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and so the FER flag in SSR is set to 1 (framing error has occurred), and the PER flag in SSR may also be set to 1 (parity error has occurred). The SCI continues the receive operation even after a break is received. Therefore, note that even if the FER flag is set to 0 (no framing error occurred), it will be set to 1 again. When the SEMR.RXDESEL bit is 1, the SCI sets the SSR.FER flag to 1 and stops receiving operation until a start bit of the next data frame is detected. If the SSR.FER flag is set to 0 at this time, the SSR.FER flag retains 0 during the break.

When the RXDn pin is set to 1 and the break ends, detecting the beginning of the start bit at the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

24.9.2 Mark State and Production of Breaks

When the SCR.TE bit is 0 (serial transmission is disabled), setting the I/O port function makes selection of the level and direction (input or output) of the TXDn pin possible. If this is done, the TXDn pin can be placed in the mark state to send a break at the time of data transmission. Until the SCR.TE bit is set to 1 (serial transmission is enabled), the I/O port function is used to set the TXDn pin to output 1 and set the pin mode to a general I/O port pin, and thus place the communication line in the mark state (state of having the value 1). On the other hand, to output a break at the time of data transmission, set the TXDn pin to output 0 and make the pin mode settings for a general I/O port pin. When the SCR.TE bit is set to 0, the transmitter is initialized regardless of the current state of transmission.

24.9.3 Receive Error Flags and Transmit Operations (Clock Synchronous Mode)

Transmission cannot be started when a receive error flag (ORER) in SSR is set to 1, even if data is written to TDR. Be sure to set the receive error flags to 0 before starting transmission. Note also that the receive error flags cannot be set to 0 even if the RE bit in SCR is set to 0 (serial reception is disabled).

24.9.4 Writing Data to TDR

Data can be written to TDR, TDRH, and TDRL. However, if new data is written to TDR, TDRH, and TDRL when transmit data is remaining in TDR, TDRH, and TDRL, the previous data in TDR, TDRH, and TDRL is lost because it has not been transferred to TSR yet. Be sure to write transmit data to TDR, TDRH, and TDRL in the TXI interrupt request handling routine.

24.9.5 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode)

When the external clock source is used as a synchronization clock, the following restrictions apply.

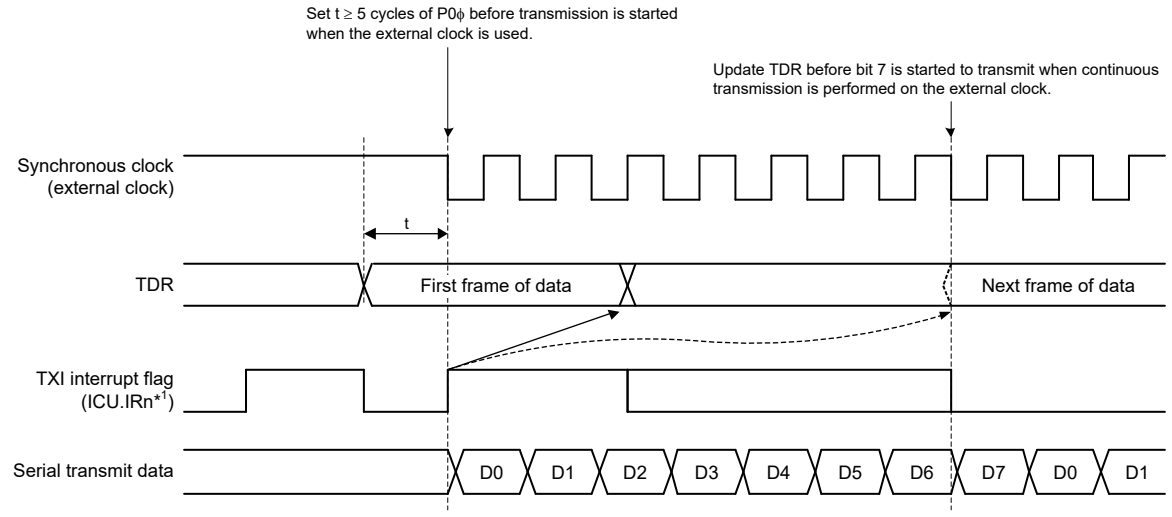
(1) Start of transmission

Update TDR by the CPU or DMAC and wait for at least five P0ϕ cycles before allowing the transmit clock to be input (see **Figure 24.42**).

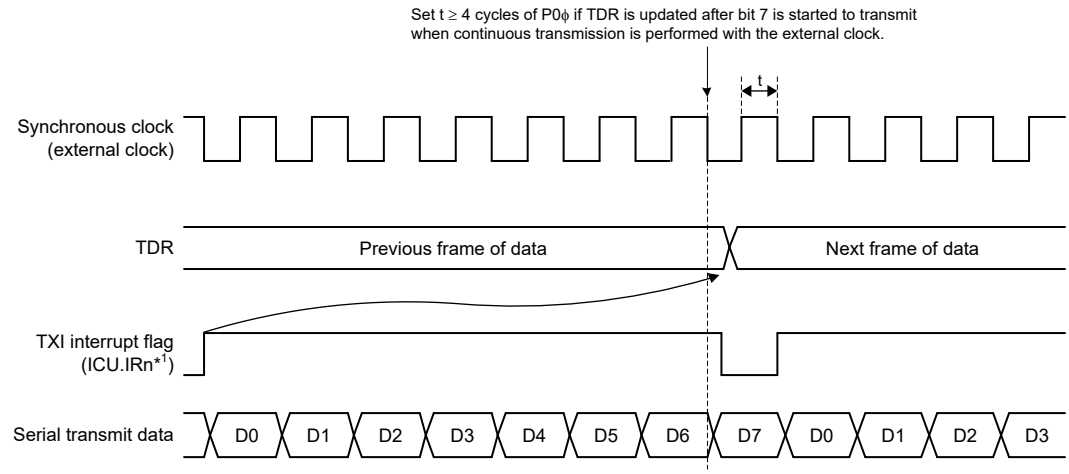
(2) Continuous transmission

(a) Write the next transmit data to TDR or TDRL before the falling edge of the transmit clock (bit 7) (see **Figure 24.42**).

(b) When updating TDR after bit 7 has started to transmit, update TDR while the synchronization clock is in the low-level period, and set the high-level width of the transmit clock (bit 7) to four P0ϕ cycles or longer (see **Figure 24.42**).



(a) Start of transmission and Continuous transmission (1)



(b) Continuous transmission (2)

Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 24.42 Restrictions on Use of External Clock in Clock Synchronous Transmission

24.9.6 Restrictions on Using DMAC

When using the DMAC or DTC to read RDR, RDRH, and RDRL, be sure to set the receive data full interrupt (RXI) as the activation source of the relevant SCI.

24.9.7 Notes on Starting Transfer

At the point where transfer starts when the interrupt status flag (IRn.IR bit) in the interrupt controller is 1, follow the procedure below to clear interrupt requests before permitting operations (by setting the SCR.TE or SCR.RE bit to 1). For details on the interrupt status flag, refer to **Section 8, Interrupt Controller**.

- Confirm that transfer has stopped (the setting of the SCR.TE or SCR.RE bits is 0).
- Set the corresponding interrupt enable bit (SCR.TIE or SCR.RIE) to 0.
- Read the corresponding interrupt enable bit (SCR.TIE or SCR.RIE bit) to check that it has become 0.
- Set the interrupt status flag (IRn.IR bit) in the interrupt controller to 0.

24.9.8 External Clock Input in Clock Synchronous Mode

In clock synchronous mode, the external clock SCKn must be input as follows:

High-pulse period, low-pulse period = 2 P0ϕ cycles or more, period = 6 P0ϕ cycles or more

24.9.9 Note on Transmit Enable Bit (TE bit)

When setting the SCR.TE bit to 0 (serial transmission is disabled) while the pin function is “TXDn”, output of the pin becomes high impedance.

Prevent the TXDn line from becoming high impedance by any of the following ways:

(1) Connect a pull-up resistor to the TXDn line.

(2) Change the pin function to “general-purpose I/O port, output” before setting the SCR.TE bit to 0. Set the SCR.TE bit to 1 before changing the pin function to “TXDn”.

24.10 IrDA Communications

The channel 0 serial communications interface (SCI) is capable of working with the Infrared Data Association (IrDA) module to handle transfer through IrDA communications in conformance with version 1.0 of the IrDA protocol.

Using the IRE bit in IRCR to enable the IrDA function leads to encoding and decoding of the SCI0_TXD and SCI0_RXD signals of the channel 0 serial communications interface, respectively, to convert them to and from waveforms in conformance with version 1.0 of the IrDA protocol. Infrared transfer in conformance with version 1.0 of the IrDA protocol can be handled by connecting a transceiver for use in infrared communications.

In version 1.0 of the IrDA protocol, IrDA transfer starts at a transfer rate of 9600 bps. The transfer rate is changeable during transfer as required. The IrDA module itself does not have a function for automatically changing the transfer rate. Accordingly, change the transfer rate by changing that for the serial communications interface.

A block diagram and pin configuration for IrDA transfer are shown in **Figure 24.43** and **Table 24.22**, respectively.

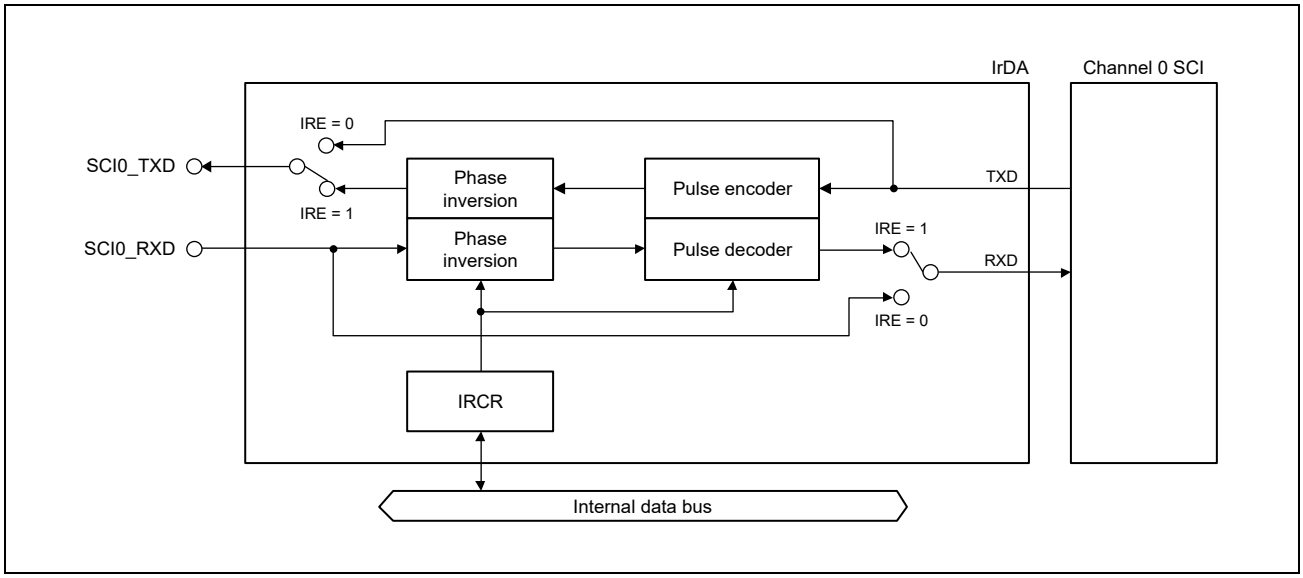


Figure 24.43 Block Diagram

Table 24.22 Pin Configuration

Pin Name	Symbol	I/O	Function
IrDA data transmission pin	SCI0_TXD	Output	IrDA data transmission output
IrDA data reception pin	SCI0_RXD	Input	IrDA data reception input

24.11 Description of the IrDA Register

Table 24.23 shows the register configuration.

BASE Address (Cortex-A55 Address Space): H'0_1004_CC00
BASE Address (Cortex-M33 Address Space Non-Secure): H'4004_CC00
BASE Address (Cortex-M33 Address Space Secure): H'5004_CC00

Table 24.23 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
IrDA Control Register	IRCR	R/W	H'00	H'0_1004_CC00	8

24.11.1 IrDA Control Register (IRCR)

IRCR sets the operation of the IrDA module.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	IRE	IRCKS[2:0]			IRTXINV	IRRXINV	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W								

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	—		R	Reserved These bits are read as 0. The write value should be 0.
b2	IRRXINV		R/W	SCI_RXD0 Data Level Switching Sets inversion of the logic level of inputs on SCI0_RXD. 0: The input on SCI0_RXD is used without change as the received data. 1: The input on SCI0_RXD is inverted before it is treated as the received data.
b3	IRTXINV		R/W	SCI_TXD0 Data Level Switching Sets inversion of the logic level of outputs on SCI0_TXD. 0: Data for transmission is output without change to SCI0_TXD. The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the high level. 1: Data for transmission is inverted before being output to SCI0_TXD. The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the low level.
b6 to b4	IRCKS[2:0]		R/W	IrDA Clock Select Selects the pulse width for use in encoding output pulses from SCI0_TXD when the setting of the IRE bit is 1. 000: Bit rate × 3/16 Settings other than above are prohibited.
b7	IRE		R/W	IrDA Enable Sets the function for use with the SCI0_TXD and SCI0_RXD pins as normal serial or IrDA. 0: Disables the IrDA function. Data from the TXD pin of the channel 0 serial communications interface is output without change to SCI0_TXD. Data on SCI0_RXD is output without change to the RXD pin of the channel 0 serial communications interface. 1: Enables the IrDA function. Data from the TXD pin of the channel 0 serial communications interface is encoded before being output through SCI0_TXD. Data on SCI0_RXD is decoded before being output to the RXD pin of the channel 0 serial communications interface.

24.12 IrDA Operation

24.12.1 Flow of Settings for IrDA Operation

Set up IrDA operation by following the procedure listed below.

1. Make the general-purpose I/O port-pin settings.
2. Set the IRCR register.
3. Set the registers related to the serial communications interface.

24.12.2 Transmission

In transmission with the IrDA function enabled, serial data (UART frames of data) from the TXD pin of the serial communications interface are converted to IR frames (see **Figure 24.44**). If the IRTXINV bit is set to 0, when the value of the serial data is 0, a high-level pulse with the width equivalent to three sixteenths of the bit period is output to the SCI0_TXD pin by default. In the IrDA protocol, the specifiable high-level pulse widths are from a minimum of 1.41 µs to a maximum of (3/16 + 2.5%) × bit period or (3/16 × bit period) + 1.08 µs. On the other hand, if the value of the serial data is 1, no high-level pulse is output.

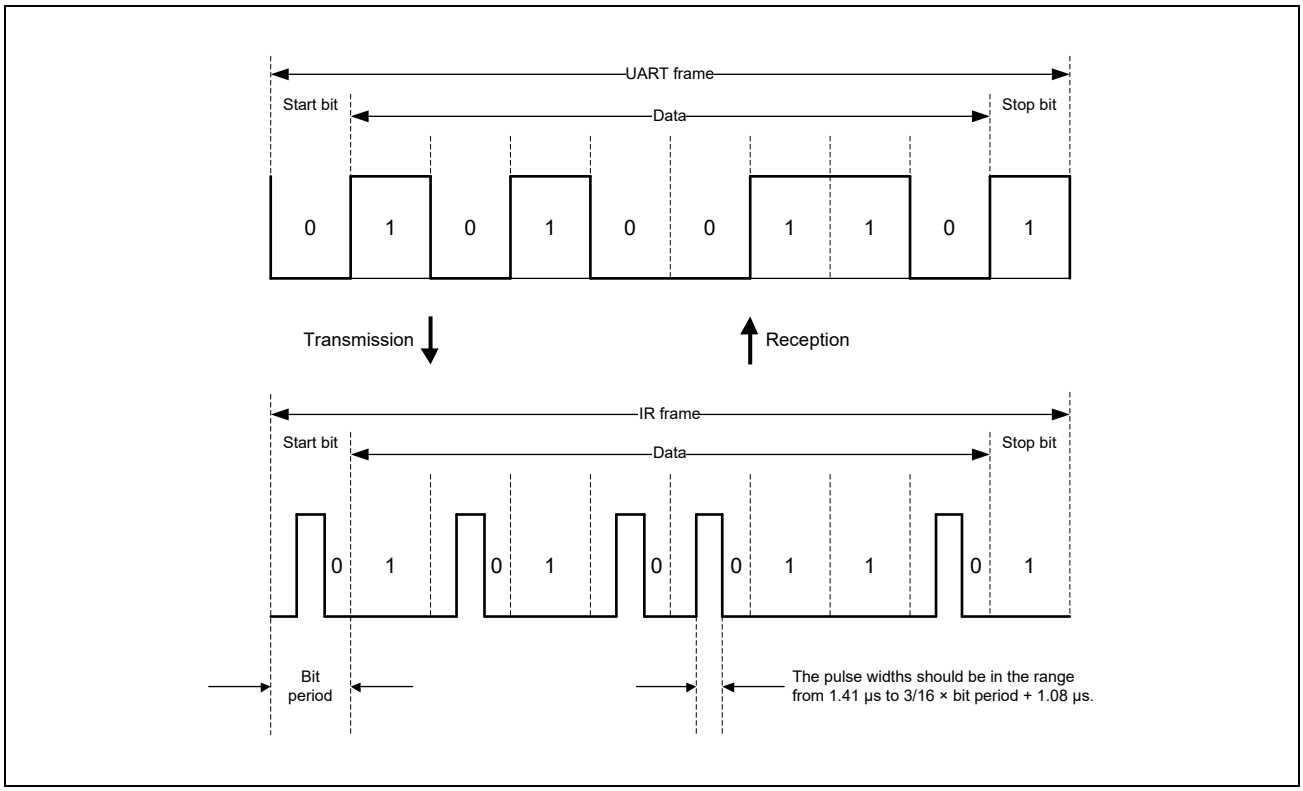

Figure 24.44 Example of the Operation in IrDA Transfer

24.12.3 Reception

In reception with the IrDA function enabled, IR frames of data from the SCI0_RXD pin are converted to serial data and output to the RXD pin of the serial communications interface. If the setting of the IRRXINV bit is 0, the value 0 is output when a high-level pulse is detected and the value 1 is output when no high-level pulse is detected during each bit period. Note that pulses with a width shorter than the minimum pulse width of 1.41 µs cannot be recognized.

24.12.4 Relationship between Bit Rate and High-Level Pulse Width

The relationship between the Bit Rate during transmission and the High-Level Pulse is shown in **Table 24.24**.

Table 24.24 Upper Row: Bit Rate (bps); Lower Row: Bit Period × 3/16 (µs)

2400	9600	19200	38400	57600	115200
78.13	19.53	9.77	4.88	3.26	1.63

24.13 Note on IrDA Usage

24.13.1 Minimum Pulse Width in Reception

Pulses with a width shorter than the minimum pulse width of 1.41 μs cannot be recognized

24.13.2 Base Clock in Asynchronous Mode for the Serial Communications Interface

The IrDA module works with the serial communications interface by receiving the base clock with a frequency 16 times the bit rate for communications from the interface. For the serial communications interface, either 16 or 8 cycles of the base clock are selectable as the bit period. On the other hand, the IrDA module is only capable of operation when the setting for the bit period of the serial communications interface is 16 cycles of the base clock.

25. I²C Bus Interface

This section gives an overall description of the I²C bus interface (RIIC).

The first section describes the features specific to this LSI, including the number of units and the register base addresses. The subsequent sections describe the RIIC's functions and registers.

25.1 Features

25.1.1 Channels

This LSI has the following number of channels of the I²C bus interface (RIIC).

Table 25.1 Channels of RIIC

Item	Description
Number of channels	4
Name	RIICn (n = 0 to 3)

Table 25.2 Index

Index	Description
n	Throughout this section, the individual channels of the I²C bus interface are identified by the index "n" (n = 0 to 3); for example, RIICnCR1 for the I²C bus control register 1.

25.1.2 Register Base Addresses

The base address <RIICn_base> of each RIICn is listed in the following table.

All RIICn register addresses are given as values obtained by adding offsets to the register base address <RIICn_base> for each channel.

Table 25.3 Register Base Address

Channel	Base Address Name	Base Address
RIIC0	<RIIC0_base>	H'0_1009_0000 (Cortex-A55 Address Space)
RIIC1	<RIIC1_base>	H'0_1009_0400 (Cortex-A55 Address Space)
RIIC2	<RIIC2_base>	H'0_1009_0800 (Cortex-A55 Address Space)
RIIC3	<RIIC3_base>	H'0_1009_0C00 (Cortex-A55 Address Space)
RIIC0	<RIIC0_base>	H'4009_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
RIIC1	<RIIC1_base>	H'4009_0400 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
RIIC2	<RIIC2_base>	H'4009_0800 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
RIIC3	<RIIC3_base>	H'4009_0C00 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
RIIC0	<RIIC0_base>	H'5009_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)
RIIC1	<RIIC1_base>	H'5009_0400 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)
RIIC2	<RIIC2_base>	H'5009_0800 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)
RIIC3	<RIIC3_base>	H'5009_0C00 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Note: Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

25.1.3 External I/O Signals

The following table shows the external I/O signals of the RIIC.

Table 25.4 RIICn Pin Configuration

Channel	Alternative Port Pin Name	Function
RIIC0	RIIC0_SCL	RIIC0 serial clock I/O pin
	RIIC0_SDA	RIIC0 serial data I/O pin
RIIC1	RIIC1_SCL	RIIC1 serial clock I/O pin
	RIIC1_SDA	RIIC1 serial data I/O pin
RIIC2	RIIC2_SCL	RIIC2 serial clock I/O pin
	RIIC2_SDA	RIIC2 serial data I/O pin
RIIC3	RIIC3_SCL	RIIC3 serial clock I/O pin
	RIIC3_SDA	RIIC3 serial data I/O pin

Table 25.5 I^2C Bus Interface

Channel Number*3	Pin Name*1	I/O	Function	This LSI Output Buffer Type*2
0	SCL	I/O	SCL: I^2C serial clock input/output pin SDA: I^2C serial data input/output pin	OD
	SDA			
1	SCL			OD
	SDA			
2	SCL			LVTTL
	SDA			
3	SCL			LVTTL
	SDA			

Note 1. The actual pin names are RIICnSCL and RIICnSDA.

Note 2. Output buffer type: “OD” is open drain buffer and “LVTTL” is low level drive only LVTTL buffer.

Note 3. AC specification is different between channel 0, 1 and channel 2, 3.

25.2 Overview

25.2.1 Functional Overview

Communications format

- I^2C bus format or SMBus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times for the transfer rate

Transfer rate

Up to 1 Mbps

SCL clock

For master operation, the duty cycle of the SCL clock is selectable in the following range. 4% < Duty cycle < 96%.

Issuing and detecting conditions

- Start, restart, and stop conditions are automatically generated.
- Start conditions (including restart conditions) and stop conditions are detected.

Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses, device ID addresses, and SMBus host addresses are detected.

Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching between the signal on the SDA line and the internal signal for the SDA line.
- Loss of arbitration due to detection of the start condition while the bus is busy is detectable (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching is detectable.
- Loss of arbitration due to non-matching of internal and line levels for data is detectable in slave transmission.

Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

Noise removal

The interface incorporates analog noise filters and digital noise filters for input on the RIICnSCL and RIICnSDA pins, and the width for noise cancellation by the digital noise filters is adjustable by software.

Interrupt sources

- Eight sources:
  - Transmission complete
  - Receive-data-full
  - Transmit-data-empty
  - Detection of a stop condition
  - Detection of a start condition
  - Reception of a NACK
  - Arbitration lost
  - Timeout

Low power consumption function

Module-stop state can be set.

25.2.2 Block Diagram

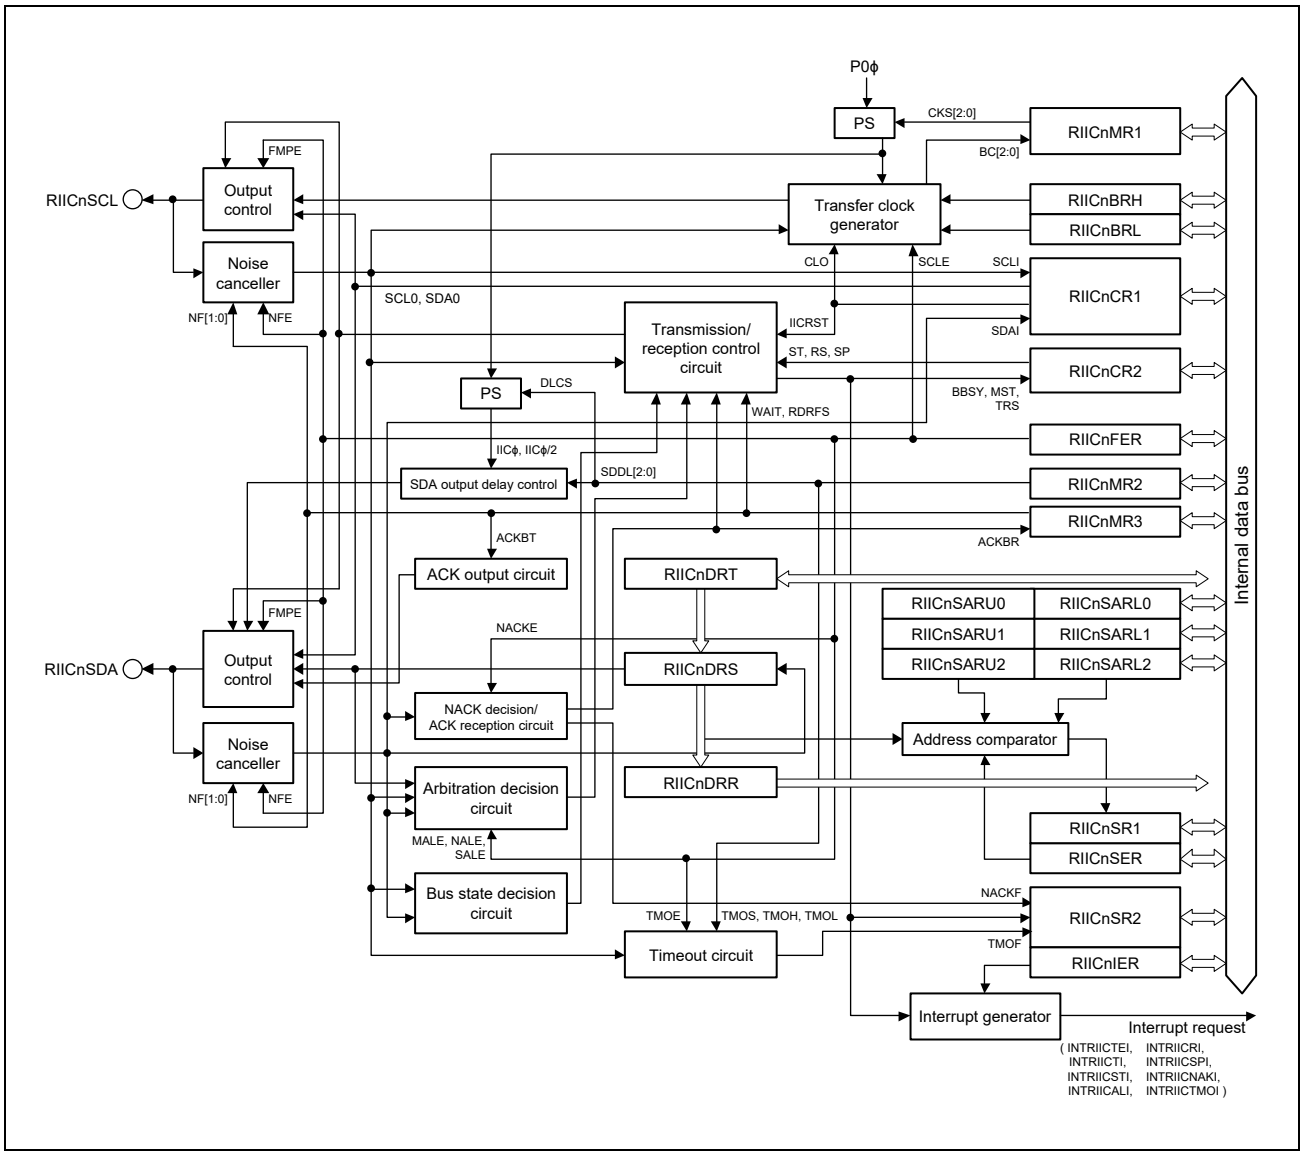

Figure 25.1 Block Diagram of RIIC

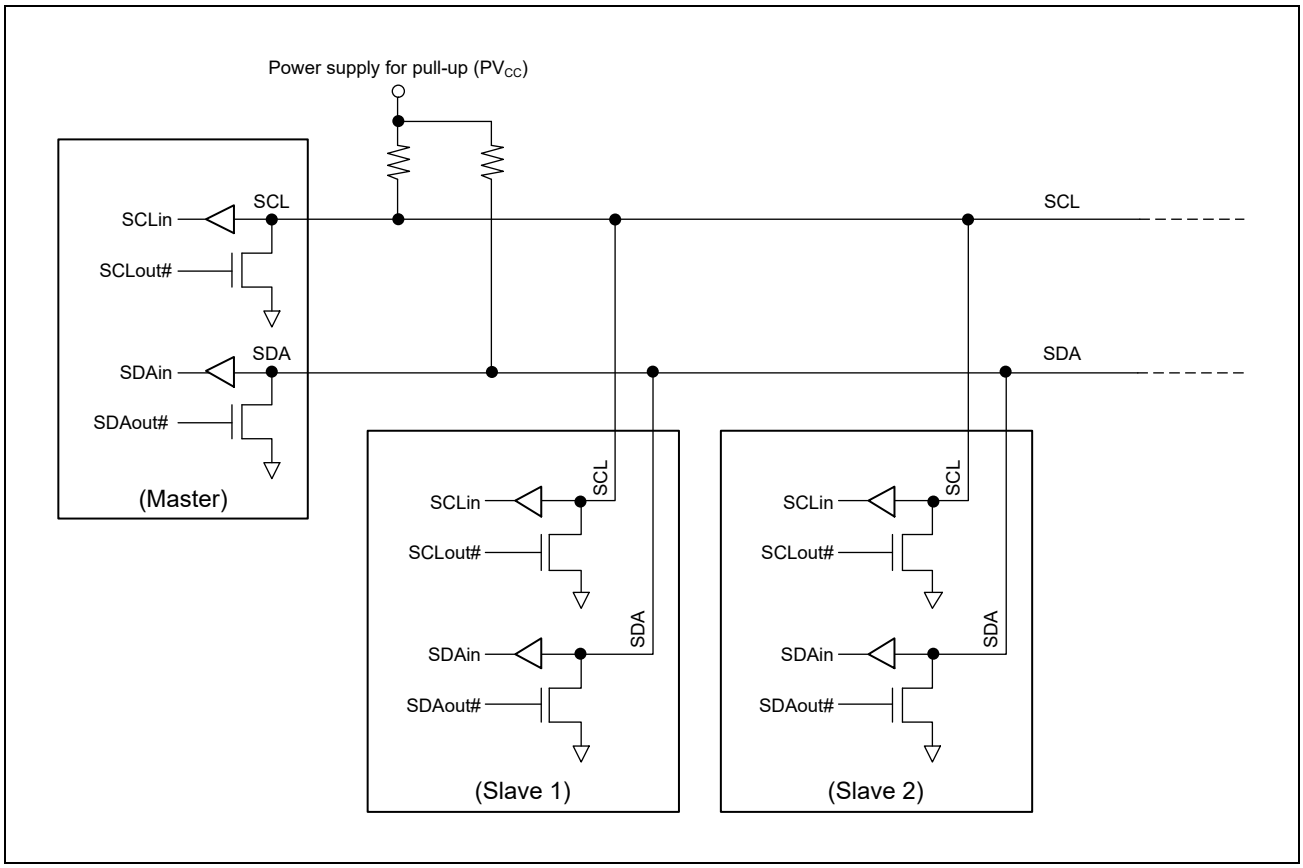

Figure 25.2 Connections to the External Circuit by the I/O Pins (I^2C Bus Configuration Example)

RIICnSCL and RIICnSDA are Schmitt input/open-drain output pins for both master and slave operations. Because the output is open drain, an external pull-up resistor is required.

25.3 Registers

Table 25.6 RIICn (n = 0 to 3) Register Configuration

Channel	Register Name	Abbreviation	Offset Address	Access Size
RIICn	I²C bus control register 1	ICCR1	H'00	8
(n = 0 to 3)	I²C bus control register 2	ICCR2	H'01	8
	I²C bus mode register 1	ICMR1	H'02	8
	I²C bus mode register 2	ICMR2	H'03	8
	I²C bus mode register 3	ICMR3	H'04	8
	I²C bus function enable register	ICFER	H'05	8
	I²C bus status enable register	ICSER	H'06	8
	I²C bus interrupt enable register	ICIER	H'07	8
	I²C bus status register 1	ICSR1	H'08	8
	I²C bus status register 2	ICSR2	H'09	8
	I²C slave address register Lower 0	ICSARL0	H'0A	8
	I²C slave address register Lower 1	ICSARL1	H'0C	8
	I²C slave address register Lower 2	ICSARL2	H'0E	8
	I²C slave address register Upper 0	ICSARU0	H'0B	8
	I²C slave address register Upper 1	ICSARU1	H'0D	8
	I²C slave address register Upper 2	ICSARU2	H'0F	8

	I²C bus shift register	ICDRS	—	—

25.3.1 I²C Bus Control Register 1 (RIICnCR1)

Access Size: RIICnCR1 is a 8-bit readable/writable register.

Address(es): RIICnCR1: <RIICn_base> + H'0000

Initial Value: H'1F. This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	ICE	IICRST	CLO	SOWP	SCLO	SDAO	SCLI	SDAI
Initial Value	0	0	0	1	1	1	1	1
R/W	R/W	R/W	R/W	W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ICE	0	R/W	I²C Bus Interface Enable 0: Output to the RIICnSCL and RIICnSDA pins is disabled. (Input to the RIICnSCL and RIICnSDA pins is enabled.) 1: Enabled (RIICnSCL and RIICnSDA pins are in the driving state) (An RIIC reset or an internal reset is selected according to the combination of this bit and IICRST bit settings.)
6	IICRST	0	R/W	I²C Bus Interface Internal Reset 0: Clears the RIIC reset or internal reset. 1: Initiates the RIIC reset or internal reset. (Clears the bit counter and the SCL/SDA output latch)
5	CLO	0	R/W	Extra SCL Clock Cycle Output 0: Does not output an extra SCL clock cycle (default). 1: Outputs an extra SCL clock cycle. (The CLO bit is cleared automatically after one clock cycle is output.)
4	SOWP*2	1	W	SCLO/SDAO Write Protect 0: Allows the SCLO and SDAO bits to be rewritten. 1: Bits SCLO and SDAO are protected. (This bit is read as 1.)
3	SCLO*1, *2	1	R/W	SCL Output Control • Read: 0: RIICnSCL pin output is at a low level. 1: RIICnSCL pin is in a high-impedance state. • Write: 0: Changes the RIICnSCL pin output to a low level. 1: Changes the RIICnSCL pin in a high-impedance state. (High level output is achieved through an external pull-up resistor.)
2	SDAO*1,*2	1	R/W	SDA Output Control • Read: 0: RIICnSDA pin output is at a low level. 1: RIICnSDA pin is in a high-impedance state. • Write: 0: Changes the RIICnSDA pin output to a low level. 1: Changes the RIICnSDA pin in a high-impedance state. (High level output is achieved through an external pull-up resistor.)
1	SCLI	1	R	SCL Bus Input Monitor 0: RIICnSCL pin input is at a low level. 1: RIICnSCL pin input is at a high level.
0	SDAI	1	R	SDA Bus Input Monitor 0: RIICnSDA pin input is at a low level. 1: RIICnSDA pin input is at a high level.

Note 1. Do not write to these bits during communication. Changing a value during communication may cause a transmission or reception failure or an AL error.

Note 2. To change the SDAO and SCLO bits, set the SOWP bit to 0 at the same timing to set the SDAO and SCLO bits to 0.

SDAO Bit (SDA Output Control/Monitor) and SCLO Bit (SCL Output Control/Monitor)

These bits are used to directly control the SDAn and SCLn signals output from the RIIC.

When writing to these bits, also write 0 to the SOWP bit. The result of setting these bits is input to the RIIC via the input buffer. When slave mode is selected, a START condition may be detected and the bus may be released depending on the bit settings.

Do not rewrite these bits during a START condition, STOP condition, repeated START condition, or during transmission or reception. Operation after rewriting under the above conditions is not guaranteed.

When reading these bits, the state of signals output from the RIIC can be read.

CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error. For details on this function, see **Section 25.13.2, Extra SCL Clock Cycle Output Function**.

IICRST Bit (I^2C Bus Interface Internal Reset)

This bit is used to reset the internal states of the RIIC. Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. **Table 25.7** lists the resets of the RIIC.

The RIIC reset resets all registers including the RIICnCR2.BBSY flag (except ICE and IICRST) and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I^2C bus shift register (RIICnDRS), and the I^2C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see **Section 25.15, Reset Function of RIIC**.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication error.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

Remark If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

Table 25.7 RIIC Resets

IICRST	ICE	State	Specifications
1	0	RIIC reset	Resets all registers (except ICE and IICRST) and internal states of the RIIC.
	1	Internal reset	Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC.

ICE Bit (I^2C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 25.7**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins. Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 disables output from the RIICnSCL and RIICnSDA pins.

25.3.2 I²C Bus Control Register 2 (RIICnCR2)

Access Size: RIICnCR2 is a 8-bit readable/writable register.

Address(es): RIICnCR2: <RIICn_base> + H'0001

Initial Value: H'00 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	BBSY	MST	TRS	—	SP	RS	ST	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R/W*1	R/W*1	R	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	BBSY	0	R	Bus Busy Detection Flag 0: The I²C bus is released (bus free state). 1: The I²C bus is occupied (bus busy state or in the bus free state).
6	MST	0	R/W*1	Master/Slave Mode 0: Slave mode 1: Master mode
5	TRS	0	R/W*1	Transmit/Receive Mode 0: Receive mode 1: Transmit mode
4	—	0	R	Reserved This bit is read as 0. The write value should be 0.
3	SP	0	R/W	Stop Condition Issuance Request 0: Does not request to issue a stop condition. 1: Requests to issue a stop condition.
2	RS	0	R/W	Restart Condition Issuance Request 0: Does not request to issue a restart condition. 1: Requests to issue a restart condition.
1	ST	0	R/W	Start Condition Issuance Request 0: Does not request to issue a start condition. 1: Requests to issue a start condition.
0	—	0	R	Reserved This bit is read as 0. The write value should be 0.

Note 1. Set RIICnMR1.MTWP bit before writing MST and TRS bits.

ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see **Section 25.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued

- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Remark Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free). Note that arbitration may be lost if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see **Section 25.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Remark 1. Do not set the RS bit to 1 while issuing a stop condition.

Remark 2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the restart condition issuance request bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see **Section 25.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected

- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Remark 1. Wring to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).

Remark 2. Do not set the SP bit to 1 while a restart condition is being issued.

TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to 1 for transmit mode or 0 for receive mode by issuing or detection of a start condition and setting or clearing of the R/W# bit. Although writing to the TRS bit is possible when the MTWP bit in RIICnMR1 is set to 1, writing to this bit is not necessary during normal usage.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the R/W# bit added to the slave address is set to 0 in master mode
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the MTWP bit in RIICnMR1 set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave mode, a match between the received address and the address enabled in RIICnSER when the value of the received R/W# bit is 0 (including cases where the received address is the general call address)
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)
- When 0 is written to the TRS bit with the MTWP bit in RIICnMR1 set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to 1 for master mode or 0 for slave mode by issuing of a start condition and issuing of detection, or of a stop condition, etc. Although writing to the MST bit is possible when the RIICnMR1.MTWP bit is set to 1, writing to this bit is not necessary during normal usage.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When 1 is written to the MST bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 0 is written to the MST bit with the RIICnMR1.MTWP bit to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the I^2C bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

- When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

25.3.3 I²C Bus Mode Register 1 (RIICnMR1)

Access Size: RIICnMR1 is a 8-bit readable/writable register.

Address(es): RIICnMR1: <RIICn_base> + H'0002

Initial Value: H'08 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	MTWP	CKS[2:0]			BCWP	BC[2:0]		
Initial Value	0	0	0	0	1	0	0	0
R/W	R/W	R/W	R/W	R/W	W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MTWP	0	R/W	MST/TRS Write Protect 0: Disables writing to the MST and TRS bits in ICCR2. 1: Enables writing to the MST and TRS bits in ICCR2.
6 to 4	CKS[2:0]	000	R/W	Internal Reference Clock (IICϕ) Selection b6 b4 0 0 0: IICϕ = P0ϕ/1 0 0 1: IICϕ = P0ϕ/2 0 1 0: IICϕ = P0ϕ/4 0 1 1: IICϕ = P0ϕ/8 1 0 0: IICϕ = P0ϕ/16 1 0 1: IICϕ = P0ϕ/32 1 1 0: IICϕ = P0ϕ/64 1 1 1: IICϕ = P0ϕ/128
3	BCWP*1	1	W	BC Write Protect 0: Enables a value to be written in the BC[2:0] bits. (This bit is read as 1.)
2 to 0	BC[2:0]	000	R/W	Bit Counter b2 b0 0 0 0: 9 bits 0 0 1: 2 bits 0 1 0: 3 bits 0 1 1: 4 bits 1 0 0: 5 bits 1 0 1: 6 bits 1 1 0: 7 bits 1 1 1: 8 bits

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames when the SCL line is at a low level.

The values of the BC[2:0] bits return to 000b at the end of a data transfer including the acknowledge bit or when a start condition including a restart condition is detected.

25.3.4 I²C Bus Mode Register 2 (RIICnMR2)

Access Size: RIICnMR2 is a 8-bit readable/writable register.

Address(es): RIICnMR2: <RIICn_base> + H'0003

Initial Value: H'06 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	DLCS	SDDL[2:0]			—	TMOH	TMOL	TMOS
Initial Value	0	0	0	0	0	1	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	DLCS	0	R/W	SDA Output Delay Clock Source Selection 0: The internal reference clock (IICϕ) is selected as the clock source of the SDA output delay counter. 1: The internal reference clock divided by 2 (IICϕ/2) is selected as the clock source of the SDA output delay counter.*1
6 to 4	SDDL[2:0]	000	R/W	SDA Output Delay Counter • When RIICnMR2.DLCS = 0 (IICϕ) b6 b4 0 0: No output delay 0 1: 1 IICϕ cycle 1 0: 2 IICϕ cycles 1 1: 3 IICϕ cycles 0 0: 4 IICϕ cycles 0 1: 5 IICϕ cycles 1 0: 6 IICϕ cycles 1 1: 7 IICϕ cycles • When RIICnMR2.DLCS = 1 (IICϕ/2) b6 b4 0 0: No output delay 0 1: 1 or 2 IICϕ cycles 1 0: 3 or 4 IICϕ cycles 1 1: 5 or 6 IICϕ cycles 0 0: 7 or 8 IICϕ cycles 0 1: 9 or 10 IICϕ cycles 1 0: 11 or 12 IICϕ cycles 1 1: 13 or 14 IICϕ cycles
3	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
2	TMOH	1	R/W	Timeout H Count Control 0: Count is disabled while the SCL line is at a high level. 1: Count is enabled while the SCL line is at a high level.
1	TMOL	1	R/W	Timeout L Count Control 0: Count is disabled while the SCL line is at a low level. 1: Count is enabled while the SCL line is at a low level.
0	TMOS	0	R/W	Timeout Detection Time Selection 0: Long mode is selected. 1: Short mode is selected.

Note 1. The setting DLCS = 1 (IICϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICϕ).

TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on the timeout function, see **Section 25.13.1, Timeout Function**.

TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see **Section 25.7, Facility for Delaying SDA Output**.

Remark Set the SDA output delay time to meet the I^2C bus standard (within the data enable time/acknowledge enable time*1) or the SMBus standard (within the data hold time: 300 [ns] or more, and SCL-clock low-level period - the data setup time: 250 [ns]). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

Note 1. Data enable time/acknowledge enable time
- 3,450 [ns] (0 to 100 [kbps]: standard mode (Sm))
- 900 [ns] (0 to 400 [kbps]: fast mode (Fm))
- 450 [ns] (0 to 1 [Mbps]: fast mode plus (Fm+))

25.3.5 I²C Bus Mode Register 3 (RIICnMR3)

Access Size: RIICnMR3 is a 8-bit readable/writable register.

Address(es): RIICnMR3: <RIICn_base> + H'0004

Initial Value: H'00 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	SMBS	WAIT	RDRFS	ACKWP	ACKBT	ACKBR	NF[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SMBS	0	R/W	SMBus/I²C Bus Selection 0: I²C bus is selected. 1: SMBus is selected.
6	WAIT*2	0	R/W	WAIT 0: No WAIT (The period between ninth clock cycle and first clock cycle is not held low.) 1: WAIT (The period between ninth clock cycle and first clock cycle is held low.) Low-hold is released by reading RIICnDRR.
5	RDRFS*2	0	R/W	RDRF Flag Set Timing Selection 0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle. (The SCL line is not held low at the falling edge of the eighth clock cycle.) 1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle. (The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit.
4	ACKWP*1	0	R/W	ACKBT Write Protect 0: Modification of the ACKBT bit is disabled. 1: Modification of the ACKBT bit is enabled.
3	ACKBT*1	0	R/W	Transmit Acknowledge 0: A 0 is sent as the acknowledge bit (ACK transmission). 1: A 1 is sent as the acknowledge bit (NACK transmission).
2	ACKBR	0	R	Receive Acknowledge 0: A 0 is received as the acknowledge bit (ACK reception). 1: A 1 is received as the acknowledge bit (NACK reception).
1, 0	NF[1:0]	00	R/W	Noise Filter Stage Selection b1 b0 0 0: Noise of up to one IICϕ cycle is filtered out (single-stage filter). 0 1: Noise of up to two IICϕ cycles is filtered out (2-stage filter). 1 0: Noise of up to three IICϕ cycles is filtered out (3-stage filter). 1 1: Noise of up to four IICϕ cycles is filtered out (4-stage filter).

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

NF[1:0] Bits (Noise Filter Stage Selection)

These bits are used to select the width of noise that can be removed from the signals input to RIICnSCL or RIICnSDA pin.

For details on the digital noise filter function, refer to **Section 25.8, Digital Noise-Filter Circuits**.

Remark Set the noise range to be filtered out by the noise filter within a range less than the SCLn line high-level period or low-level period. If the noise range is set to a value of (SCL clock width: high-level period or low-level period, whichever is shorter) − [1.5 internal reference clock (IICϕ) cycles + analog noise filter: 120 ns (reference values)] or more, the SCL clock is regarded as noise by the noise filter function of the RIIC, which may prevent the RIIC from operating normally.

ACKBR Bit (Receive knowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

- When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

- When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit with the ACKWP bit set to 1
- When stop condition issuance is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

Remark The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode. When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

Remark When the value of the WAIT bit is to be read, be sure to read the RIICnDRR beforehand.

SMBS Bit (SMBus/I^2C Selection)

Setting this bit to 1 selects the SMBus and enables the RIICnSER.HOAE bit.

25.3.6 I²C Bus Function Enable Register (RIICnFER)

Access Size: RIICnFER is a 8-bit readable/writable register.

Address(es): RIICnFER: <RIICn_base> + H'0005

Initial Value: H'72 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	FMPE	SCLE	NFE	NACKE	SALE	NALE	MALE	TMOE
Initial Value	0	1	1	1	0	0	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	FMPE*1	0	R/W	Fast-mode Plus Enable 0: No Fm+ slope control circuit is used for the SCLn pin and SDAn pin 1: An Fm+ slope control circuit is used for the SCLn pin and SDAn pin
6	SCLE	1	R/W	SCL Synchronous Circuit Enable 0: No SCL synchronous circuit is used. 1: An SCL synchronous circuit is used.
5	NFE	1	R/W	Digital Noise Filter Circuit Enable 0: No digital noise filter circuit is used. 1: A digital noise filter circuit is used.
4	NACKE	1	R/W	NACK Reception Transfer Suspension Enable 0: Transfer operation is not suspended during NACK reception (transfer suspension disabled). 1: Transfer operation is suspended during NACK reception (transfer suspension enabled).
3	SALE	0	R/W	Slave Arbitration-Lost Detection Enable 0: Slave arbitration-lost detection is disabled. 1: Slave arbitration-lost detection is enabled.
2	NALE	0	R/W	NACK Transmission Arbitration-Lost Detection Enable 0: NACK transmission arbitration-lost detection is disabled. 1: NACK transmission arbitration-lost detection is enabled.
1	MALE	1	R/W	Master Arbitration-Lost Detection Enable 0: Master arbitration-lost detection is disabled. (Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and RIICnCR2.TRS bits automatically when arbitration is lost.) 1: Master arbitration-lost detection is enabled. (Enables the arbitration-lost detection function and clears the RIICnCR2.MST and RIICnCR2.TRS bits automatically when arbitration is lost.)
0	TMOE	0	R/W	Timeout Function Enable 0: The timeout function is disabled. 1: The timeout function is enabled.

Note 1. The fast-mode plus enable bit (FMPE) is only supported by RIIC0. In RIIC2, bit 7 is reserved.

TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.

For details on the timeout function, see **Section 25.13.1, Timeout Function**.

MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to specify whether to use the arbitration-lost detection function in master mode. Normally, set this bit to 1.

NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when ACK is detected during transmission of NACK in receive mode (such as when slaves with the same address exist on the bus or when two or more masters select the same slave device simultaneously with different number of receive bytes).

SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content. For details on the NACK reception transfer suspension function, refer to **Section 25.10.2, NACK Reception Transfer Suspension Function**.

SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with the SCL input clock. Normally, set this bit to 1.

When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state.

For this reason, if the bus load of the I^2C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output.

When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

FMPE Bit (Fast-mode Plus Enable)

This bit is used to specify whether to use a slope control circuit for Fast-mode Plus [Fm+].

When this bit is set to 1, a slope control circuit conforming to the Fast-mode Plus [Fm+] slope control standard (tof) of the I^2C bus is selected. When this bit is cleared to 0, a slope control circuit conforming to the Standard-mode [Sm] and Fast- mode [Fm] slope control standard (tof) of the I^2C bus is selected.

Set this bit to 1 when using the transmission rate within a range up to 1 Mbps (Fast-mode Plus[Fm+]) of the I^2C bus standard. Clear this bit to 0 when using the transmission rate at other rates (up to 100 kbps[Sm], up to 400 kbps[Fm]) or for SMBus (10 to 100 kbps).

25.3.7 I²C Bus Status Enable Register (RIICnSER)

Access Size: RIICnSER is a 8-bit readable/writable register.

Address(es): RIICnSER: <RIICn_base> + H'0006

Initial Value: H'09 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	HOAE	—	DIDE	—	GCE	SAR2E	SAR1E	SAR0E
Initial Value	0	0	0	0	1	0	0	1
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HOAE	0	R/W	Host Address Enable 0: Host address detection is disabled. 1: Host address detection is enabled.
6	—	0	R	Reserved This bit is read as 0. The write value should be 0.
5	DIDE	0	R/W	Device-ID Address Detection Enable 0: Device-ID address detection is disabled. 1: Device-ID address detection is enabled.
4	—	0	R	Reserved This bit is read as 0. The write value should be 0.
3	GCE	1	R/W	General Call Address Enable 0: General call address detection is disabled. 1: General call address detection is enabled.
2	SAR2E	0	R/W	Slave Address Register 2 Enable 0: Slave address in RIICnSARL2 and RIICnSARU2 are disabled. 1: Slave address in RIICnSARL2 and RIICnSARU2 are enabled.
1	SAR1E	0	R/W	Slave Address Register 1 Enable 0: Slave address in RIICnSARL1 and RIICnSARU1 are disabled. 1: Slave address in RIICnSARL1 and RIICnSARU1 are enabled.
0	SAR0E	1	R/W	Slave Address Register 0 Enable 0: Slave address in RIICnSARL0 and RIICnSARU0 are disabled. 1: Slave address in RIICnSARL0 and RIICnSARU0 are enabled.

SARyE Bit (Slave Address Register y Enable) (y = 0 to 2)

This bits are used to enable or disable the received slave address and the slave address set in RIICnSAR(L,U)y.

When these bits are set to 1, the slave address set in RIICnSAR(L,U)y are enabled and are compared with the received slave address. When these bits are cleared to 0, the slave address set in RIICnSAR(L,U)y are disabled and are ignored even if it match the received slave address.

GCE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address (0000_000b + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSAR(L,U)y (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID (1111_100b) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 25.9.3, Device-ID Address Detection**.

HOAE Bit (Host Address Enable)

This bit is used to specify whether to ignore received host address (0001_000b) when the RIICnMR3.SMBS bit is 1.

When this bit is set to 1 while the RIICnMR3.SMBS bit is 1, if the received slave address matches the host address, the RIIC recognizes the received slave address as the host address independently of the slave addresses set in RIICnSAR(L,U)y (y = 0 to 2) and performs the receive operation.

When the RIICnMR3.SMBS bit or the HOAE bit is cleared to 0, the received slave address is ignored even if it matches the host address.

25.3.8 I²C Bus Interrupt Enable Register (RIICnIER)

Access Size: RIICnIER is a 8-bit readable/writable register.

Address(es): RIICnIER: <RIICn_base> + H'0007

Initial Value: H'00 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	TIE	TEIE	RIE	NAKIE	SPIE	STIE	ALIE	TMOIE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TIE	0	R/W	Transmit Data Empty Interrupt Enable 0: Transmit data empty interrupt request (INTRIICTI) is disabled. 1: Transmit data empty interrupt request (INTRIICTI) is enabled.
6	TEIE	0	R/W	Transmit End Interrupt Enable 0: Transmit end interrupt request (INTRIICTEI) is disabled. 1: Transmit end interrupt request (INTRIICTEI) is enabled.
5	RIE	0	R/W	Receive Data Full Interrupt Enable 0: Receive data full interrupt request (INTRIICRI) is disabled. 1: Receive data full interrupt request (INTRIICRI) is enabled.
4	NAKIE	0	R/W	NACK Reception Interrupt Enable 0: NACK reception interrupt request (INTRIICNAKI) is disabled. 1: NACK reception interrupt request (INTRIICNAKI) is enabled.
3	SPIE	0	R/W	Stop Condition Detection Interrupt Enable 0: Stop condition detection interrupt request (INTRIICSPI) is disabled. 1: Stop condition detection interrupt request (INTRIICSPI) is enabled.
2	STIE	0	R/W	Start Condition Detection Interrupt Enable 0: Start condition detection interrupt request (IINTRIICSTI) is disabled. 1: Start condition detection interrupt request (INTRIICSTI) is enabled.
1	ALIE	0	R/W	Arbitration-Lost Interrupt Enable 0: Arbitration-lost interrupt request (INTRIICALI) is disabled. 1: Arbitration-lost interrupt request (INTRIICALI) is enabled.
0	TMOIE	0	R/W	Timeout Interrupt Enable 0: Timeout interrupt request (INTRIICTMOI) is disabled. 1: Timeout interrupt request (INTRIICTMOI) is enabled.

TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (INTRIICTMOI) when the RIICnSR2.TMOF flag is set to 1. An INTRIICTMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (INTRIICALI) when the RIICnSR2.AL flag is set to 1. An INTRIICALI interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (INTRIICSTI) when the RIICnSR2.START flag is set to 1. An INTRIICSTI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (INTRIICSPI) when the RIICnSR2.STOP flag is set to 1. An INTRIICSPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (INTRIICNAKI) when the RIICnSR2.NACKF flag is set to 1. An INTRIICNAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

RIE Bit (Receive Data Full Interrupt Enable)

This bit is used to enable or disable receive data full interrupt requests (INTRIICRI) when the RIICnSR2.RDRF flag in ICSR2 is set to 1. An INTRIICRI interrupt request is canceled by clearing the RDRF flag or the RIE bit to 0.

TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICTEI) when the RIICnSR2.TEND flag is set to 1. An INTRIICTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICTI) when the RIICnSR2.TDRE flag is set to 1.

25.3.9 I²C Bus Status Register 1 (RIICnSR1)

Access Size: RIICnSR1 is a 8-bit readable/writable register

Address(es): RIICnSR1: <RIICn_base> + H'0008

Initial Value: H'00 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	HOA	—	DID	—	GCA	AAS2	AAS1	AAS0
Initial Value	0	0	0	0	0	0	0	0
R/W	R(/W)*1	R	R(/W)*1	R	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1

Bit	Bit Name	Initial Value	R/W	Description
7	HOA	0	R(/W)*1	Host Address Detection Flag 0: Host address is not detected. 1: Host address is detected.
6	—	0	R	Reserved This bit is read as 0. The write value should be 0.
5	DID	0	R(/W)*1	Device-ID Address Detection Flag 0: Device-ID command is not detected. 1: Device-ID command is detected.
4	—	0	R	Reserved This bit is read as 0. The write value should be 0.
3	GCA	0	R(/W)*1	General Call Address Detection Flag 0: General call address is not detected. 1: General call address is detected.
2	AAS2	0	R(/W)*1	Slave Address 2 Detection Flag 0: Slave address 2 is not detected. 1: Slave address 2 is detected.
1	AAS1	0	R(/W)*1	Slave Address 1 Detection Flag 0: Slave address 1 is not detected. 1: Slave address 1 is detected.
0	AAS0	0	R(/W)*1	Slave Address 0 Detection Flag 0: Slave address 0 is not detected. 1: Slave address 0 is detected.

Note 1. Only 0 can be written to this bit.

AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARUy.FS = 0>

- When the received slave address matches the RIICnSARLy.SVA[7:1] value with the RIICnSER.SARyE bit set to 1 (slave address y detection enabled)

  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARUy.FS = 1>

- When the received slave address matches a value of (1111_0b + RIICnSARUy.SVA[9:8]) and the following address matches the RIICnSARLy.SVA[7:0] value with the RIICnSER.SARyE bit set to 1 (slave address y detection enabled) This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARUy.FS = 0>

- When the received slave address does not match the RIICnSARLy.SVA[7:1] value with the RIICnSER.SARyE bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARUy.FS = 1>

- When the received slave address does not match a value of (1111_0b + RIICnSARUy.SVA[9:8]) with the RIICnSER.SARyE bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111_0b + RIICnSARUy.SVA[9:8]) and the following address does not match the RIICnSARLy.SVA[7:0] value with the RIICnSER.SARyE bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

GCA Flag (General Call Address Detection)

[Setting condition]

- When the received slave address matches the general call address (0000_000b + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000_000b + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111_100b) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled) This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address (1111_100b) + 1 [R] has matched with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected

- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID (1111_100b)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled) This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111_100b) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

HOA Flag (Host Address Detection)

[Setting condition]

- When the received slave address matches the host address (0001_000b) while the RIICnMR3.SMBS bit and RIICnSER.HOAE bit are set to 1 (host address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the HOA bit after reading HOA = 1
- When a stop condition is detected
- When 0 is written to the RIICnMR3.SMBS bit in ICMR3 or the RIICnSER.HOAE bit
- When the received slave address does not match the host address (0001_000b) with the RIICnSER.HOAE bit set to 1 (host address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit 1 to apply an RIIC reset or an internal reset

25.3.10 I²C Bus Status Register 2 (RIICnSR2)

Access Size: RIICnSR2 is a 8-bit readable/writable register

Address(es): RIICnSR2: <RIICn_base> + H'0009

Initial Value: H'00 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	TDRE	TEND	RDRF	NACKF	STOP	START	AL	TMOF
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1

Bit	Bit Name	Initial Value	R/W	Description
7	TDRE	0	R	Transmit Data Empty Flag 0: RIICnDRT contains transmit data. 1: RIICnDRT contains no transmit data.
6	TEND	0	R(/W)*1	Transmit End Flag 0: Data is being transmitted. 1: Data has been transmitted.
5	RDRF	0	R(/W)*1	Receive Data Full Flag 0: RIICnDRR contains no receive data. 1: RIICnDRR contains receive data.
4	NACKF	0	R(/W)*1	NACK Reception Flag 0: NACK is not received. 1: NACK is received.
3	STOP	0	R(/W)*1	Stop Condition Detection Flag 0: Stop condition is not detected. 1: Stop condition is detected.
2	START	0	R(/W)*1	Start Condition Detection Flag 0: Start condition is not detected. 1: Start condition is detected.
1	AL	0	R(/W)*1	Arbitration-Lost Flag 0: Arbitration is not lost. 1: Arbitration is lost.
0	TMOF	0	R(/W)*1	Timeout Flag 0: No timeout has occurred. 1: Timeout has occurred.

Note 1. Only 0 can be written to this bit.

TMOF Flag (Timeout Flag)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.

[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is held low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1).
- The slave address matches that of this module (RIICnSR1 register is not H'00) and the bus is busy (RIICnCR2.BBSY = 1) in slave mode (RIICnCR2.MST = 0).
- Issuing of a start condition is being requested (RIICnCR2.ST = 1) and the bus is free (RIICnCR2.BBSY = 0).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

AL Flag (Arbitration-Lost Flag)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Table 25.8 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions

RIICnFER			RIICnSR2		
MALE	NALE	SALE	AL	Error	Arbitration-Lost Generation Source
1	x	x	1	Start condition issuance error	When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1
					When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1
			1	Transmit data mismatch	When transmit data (including slave address) does not match the bus state in master transmit mode
x	1	x	1	NACK transmission mismatch	When ACK is detected during transmission of NACK in master receive mode or slave receive mode
x	x	1	1	Transmit data mismatch	When transmit data does not match the bus state in slave transmit mode

Note: x: Don't care

START Flag (Start Condition Detection Flag)

[Setting condition]

- When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

STOP Flag (Stop Condition Detection Flag)

[Setting condition]

- When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

NACKF Flag (NACK Reception Flag)

[Setting condition]

- When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Remark When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/ receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

RDRF Flag (Receive Data Full Flag)

[Setting conditions]

- Slave receive mode
  - When the received slave address matches and the RIICnCR2.TRS bit is cleared to 0 after a start condition (or a restart condition) is detected
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR
- Master receive mode
  - When the slave address and the data direction are transmitted and the receive mode is entered (the RIICnCR2.TRS bit is set to 1) after a start condition (or a restart condition) is issued
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TEND Flag (Transmit End Flag)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TDRE Flag (Transmit Data Empty Flag)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition (or a restart condition) is detected
  - When the RIIC enters transmit mode from receive mode
- When the received slave address matches while the TRS bit is 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

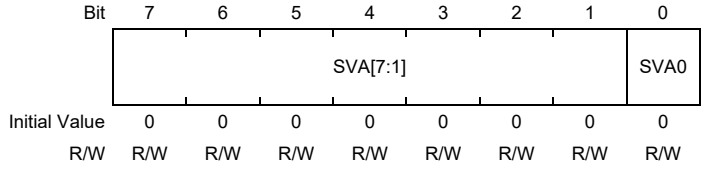
Remark When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

25.3.11 I²C Slave Address Register Lower y (y = 0 to 2) (RIICnSARLy)

Access Size: RIICnSARLy is a 8-bit readable/writable register.

Address(es): RIICnSARL0: <RIICn_base> + H'000A
RIICnSARL1: <RIICn_base> + H'000C
RIICnSARL2: <RIICn_base> + H'000E

Initial Value: H'00 This register is initialized by any reset.



Bit	Bit Name	Initial Value	R/W	Description
7 to 1	SVA[7:1]	All 0	R/W	7-Bit Address Bits [6:0]/10-Bit Address Lower Bits [7:1] A slave address is set.
0	SVA0	0	R/W	10-Bit Address LSB A slave address is set.

SVA0 Bit (10-Bit Address LSB [0])

When the 10-bit address format is selected (RIICnSARUy.FS = 1), this bit functions as the LSB of a 10-bit address and forms the lower 8 bits of a 10-bit address in combination with the SVA[7:1] bits.

When the RIICnSER.SARyE bit is set to 1 (RIICnSARLy and RIICnSARUy enabled) and the RIICnSARUy.FS bit is 1, this bit is valid.

While the RIICnSARUy.FS bit or the RIICnSER.SARyE bit is 0, the setting of this bit is ignored.

SVA[7:1] Bits (7-Bit Address Bits[6:0]/10-Bit Address Lower Bits [7:1])

When the 7-bit address format is selected (RIICnSARUy.FS = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARUy.FS = 1), these bits function as the lower 8 bits of a 10-bit address in combination with the SVA0 bit.

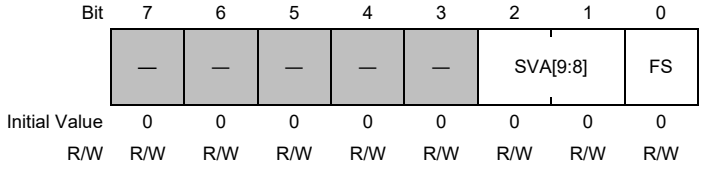
While the RIICnSER.SARyE bit is 0, the setting of these bits is ignored

25.3.12 I²C Slave Address Register Upper y (y = 0 to 2) (RIICnSARUy)

Access Size: RIICnSARy is a 8 bit readable/writable register.

Address(es): RIICnSARU0: <RIICn_base> + H'000B
RIICnSARU1: <RIICn_base> + H'000D
RIICnSARU2: <RIICn_base> + H'000F

Initial Value: H'00 This register is initialized by any reset.



Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
2, 1	SVA[9:8]	00	R/W	10-Bit Address Upper Bits [9:8] A slave address is set.
0	FS	0	R/W	7-Bit/10-Bit Address Format Selection 0: The 7-bit address format is selected. 1: The 10-bit address format is selected.

FS Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in SARLy and SARUy).

When the RIICnSER.SARyE bit is set to 1 (RIICnSARLy and RIICnSARUy enabled) and the RIICnSARUy.FS bit is 0, the 7-bit address format is selected for slave address y, the SVA[7:1] setting in RIICnSARLy is valid, and the settings of the SVA[9:8] bits and the SVA0 bit in RIICnSARLy are ignored.

When the RIICnSER.SARyE bit is set to 1 (RIICnSARLy and RIICnSARUy enabled) and the RIICnSARUy.FS bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:8] bits and RIICnSARLy are valid.

While the RIICnSER.SARyE bit is 0 (RIICnSARLy and RIICnSARUy disabled), the setting of the RIICnSARUy.FS bit is invalid.

SVA[9:8] Bits (10-Bit Address Upper Bits [9:8])

When the 10-bit address format is selected (FS = 1), these bits function as the upper 2 bits of a 10-bit address.

When the RIICnSER. SARyE bit is set to 1 (RIICnSARLy and RIICnSARUy enabled) and the RIICnSARUy.FS bit is 1, these bits are valid.

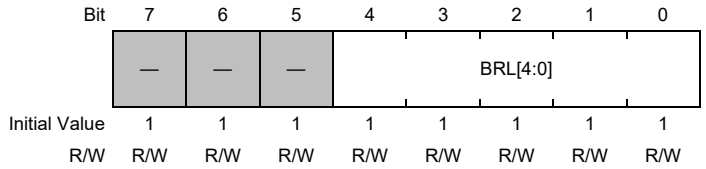
While the RIICnSARUy.FS bit or RIICnSER.SARyE bit is 0, the setting of these bits is ignored.

25.3.13 I²C Bus Bit Rate Low-Level Register (RIICnBRL)

Access Size: RIICnBRL is a 8 bit readable/writable register.

Address(es): RIICnBRL: <RIICn_base> + H'0010

Initial Value: H' FF This register is initialized by any reset.



Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	111	R/W	Reserved These bits are read as 1. The write value should be 1.
4 to 0	BRL[4:0]	H'1F	R/W	Bit Rate Low-Level Period Low-level period of SCL clock

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see **Section 25.10, Automatic Low-Hold Function for SCL**); when the RIIC is used only in slave mode, this register needs to be set to a value longer than the data setup time*[1].

RIICnBRL counts the low-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

If the digital noise filter is enabled (the RIICnFER.NFE bit is 1), set the RIICnBRL register to a value at least one greater than the number of stages in the noise filter. Regarding the number of stages in the noise filter, see the description of the RIICnMR3.NF[1:0] bits.

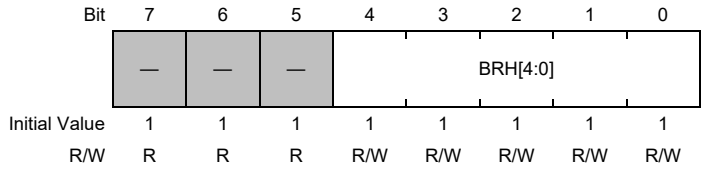
Note 1. Data setup time (t_{SU}: DAT)
- 250 [ns] (0 to 100 [kbps]: standard mode (Sm))
- 100 [ns] (0 to 400 [kbps]: fast mode (Fm))
- 50 [ns] (0 to 1 [Mbps]: fast mode plus (Fm+))

25.3.14 I²C Bus Bit Rate High-Level Register (RIICnBRH)

Access Size: RIICnBRH is a 8 bit readable/writable register..

Address(es): RIICnBRH: <RIICn_base> + H'0011

Initial Value: H' FF This register is initialized by any reset.



Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	111	R	Reserved These bits are read as 1. The write value should be 1.
4 to 0	BRH[4:0]	H'1F	R/W	Bit Rate High-Level Period High-level period of SCL clock

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits in ICMR1.

If the digital noise filter is enabled (the RIICnFER.NFE bit is 1), set the RIICnBRH register to a value at least one greater than the number of stages in the noise filter. Regarding the number of stages in the noise filter, see the description of the RIICnMR3.NF[1:0] bits.

The I²C transfer rate and the SCL clock duty cycles are calculated using one of the following expressions (1) to (5) according to the register settings.

Remark The minimum value that can be specified in RIICnBRL and RIICnBRH is determined according to the values of the SCLE and NFE bits in RIICnFER and the NF bit in RIICnMR3. For details of the minimum specifiable value, see **Table 25.9**.

(1) When SCLE = 0

Transfer rate = 1 / {[(BRH + 1) + (BRL + 1)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 1) / IICϕ} / {tr + tf + [(BRH + 1) + (BRL + 1)] / IICϕ}

(2) When SCLE = 1, NFE = 0, CKS = 000 (IICϕ = P0ϕ)

Transfer rate = 1 / {[(BRH + 3) + (BRL + 3)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 3) / IICϕ} / {tr + tf + [(BRH + 3) + (BRL + 3)] / IICϕ}

(3) When SCLE = 1, NFE = 1, CKS = 000 (IICϕ = P0ϕ)

Transfer rate = 1 / {[(BRH + 3 + nf) + (BRL + 3 + nf)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 3 + nf) / IICϕ} / {tr + tf + [(BRH + 3 + nf) + (BRL + 3 + nf)] / IICϕ}

(4) When SCLE = 1, NFE = 0, CKS ≠ 000 (IICϕ < P0ϕ)

Transfer rate = 1 / {[(BRH + 2) + (BRL + 2)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 2) / IICϕ} / {tr + tf + [(BRH + 2) + (BRL + 2)] / IICϕ}

(5) When SCLE = 1, NFE = 1, CKS ≠ 000 (IICϕ < P0ϕ)

Transfer rate = 1 / {[(BRH + 2 + nf) + (BRL + 2 + nf)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 2 + nf) / IICϕ} / {tr + tf + [(BRH + 2 + nf) + (BRL + 2 + nf)] / IICϕ}

[Symbols in the expressions]

SCLE: RIICnFER.SCLE bit

BRH: RIICnBRH.BRH[4:0] bits

BRL: RIICnBRL.BRL[4:0] bits

CKS: RIICnMR1.CKS bits

NFE: RIICnFER.NFE bit

IICϕ: Internal reference clock selected by the CKS bits*1

tf: SCL signal falling time [s]*2

tr: SCL signal rising time [s]*2

nf: Number of digital noise filter stages specified in the RIICnMR3.NF[1:0] bits*3

Note 1. IICϕ = PCLK × Division ratio

Note 2. The SCLn line rising time [tr] and SCLn line falling time [tf] depend on the total bus line capacitance [Cb] and the pull-up resistor [Rp]. For details, see the I2C bus standard from NXP Semiconductors.

Note 3. nf = Number of digital noise filter selected by ICMR3.NF bit.

Table 25.9 Minimum Specifiable Value for RIICnBRL and RIICnBRH

SCLE	NFE	nf	Minimum Pulse Width that Passes through Digital Filter	Minimum Specifiable Value for BRH and BRL	Pulse Width when Minimum Value is Specified
0	0	—	1 × IICϕ	1	2 × IICϕ
0	1	1	2 × IICϕ	2	3 × IICϕ
0	1	2	3 × IICϕ	3	4 × IICϕ
0	1	3	4 × IICϕ	4	5 × IICϕ
0	1	4	5 × IICϕ	5	6 × IICϕ
IICϕ cycle > P0ϕ cycle (CKS ≠ 000)					
1	0	—	1 × IICϕ	0	2 × IICϕ
1	1	1	2 × IICϕ	1	4 × IICϕ
1	1	2	3 × IICϕ	2	6 × IICϕ
1	1	3	4 × IICϕ	3	8 × IICϕ
1	1	4	5 × IICϕ	4	10 × IICϕ
IICϕ cycle = P0ϕ cycle (CKS = 000)					
1	0	—	2 × P0ϕ	0	3 × IICϕ
1	1	1	3 × P0ϕ	1	5 × IICϕ
1	1	2	4 × P0ϕ	2	7 × IICϕ
1	1	3	5 × P0ϕ	3	9 × IICϕ
1	1	4	6 × P0ϕ	4	11 × IICϕ

Table 25.10 and **Table 25.11** list examples of RIICnBRH/RIICnBRL settings.

Table 25.10 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE= 0)

Transfer Rate [kbps]	Peripheral Clock Operating Frequency P0ϕ [MHz]			
	100			
	RIICnMR1.CKS[2:0]	RIICnBRH.BRH	RIICnBRL.BRL	Actual transfer rate [kbps]
12	111b	30 (H'FE)	31 (H'FF)	12
50	101b	28 (H'FC)	30 (H'FE)	50.4
100	100b	28 (H'FC)	31 (H'FF)	99.2
400	010b	29 (H'FD)	30 (H'FE)	396.8
1000	001b	20 (H'F4)	25 (H'F9)	1020.4

Table 25.11 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE= 1, and Number of NF Stages = 4)

Transfer Rate [kbps]	Peripheral Clock Operating Frequency P0ϕ [MHz]			
	100			
	RIICnMR1.CKS[2:0]	RIICnBRH.BRH	RIICnBRL.BRL	Actual transfer rate [kbps]
12	111b	25 (H'F9)	28 (H'FC)	12
50	101b	23 (H'F7)	28 (H'FC)	49.6
100	100b	24 (H'F8)	27 (H'FB)	99.2
400	010b	25 (H'F9)	26 (H'FA)	396.8
1000	001b	14 (H'EE)	24 (H'F8)	1000

25.3.15 I²C Bus Transmit Data Register (RIICnDRT)

Access Size: RIICnDRT is a 8 bit readable/writable register.

Address(es): RIICnDRT: <RIICn_base> + H'0012

Initial Value: H'FF This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	DRT[7:0]							
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When RIICnDRT detects a space in the I²C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICTI) request is generated.

25.3.16 I²C Bus Receive Data Register (RIICnDRR)

Access Size: RIICnDRR is a 8 bit readable/writable register.

Address(es): RIICnDRR: <RIICn_base> + H'0013

Initial Value: H'00 This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	DRR[7:0]							
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

When 1 byte of data has been received, the received data is transferred from the I²C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive data full interrupt (INTRIICRI) request is generated.

If RIICnDRR.DRR[7:0] receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RIICnSR2.RDRF flag is set to 1 next.

25.3.17 I²C Bus Shift Register (RIICnDRS)

Access Size: This register is not accessible.

Address(es): —

Initial Value: —

Bit	7	6	5	4	3	2	1	0
	DRS[7:0]							
Initial Value	—	—	—	—	—	—	—	—
R/W	—	—	—	—	—	—	—	—

RIICnDRS is an 8-bit shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDAn pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

25.4 Interrupt Sources

The RIIC issues eight types of interrupt request: transmit end, receive data full, transmit data empty, stop condition detection, start condition detection, NACK reception, arbitration-lost, and timeout.

Table 25.12 lists details of the several interrupt requests. The receive data full and transmit data empty sources are both capable of launching data transfer by the DMAC.

Table 25.12 Interrupt Sources

Symbol	Interrupt Source	Interrupt Flag	DMAC Launching	Priority*1	Interrupt Condition
INTRIICRI	Receive-data-full	RDRF	Possible	High	RDRF = 1 • RIE = 1
INTRIICTI	Transmit-data-empty	TDRE	Possible		TDRE = 1 • TIE = 1
INTRIICTEI	Transmission complete	TEND	Not possible		TEND = 1 • TEIE = 1
INTRIICNAKI	Reception of a NACK	NACKF	Not possible		NACKF = 1 • NAKIE = 1
INTRIICSPI	Detection of a stop condition	STOP	Not possible		STOP = 1 • SPIE = 1
INTRIICSTI	Detection of a start condition	START	Not possible		START = 1 • STIE = 1
INTRIICALI	Arbitration lost	AL	Not possible		AL = 1 • ALIE = 1
INTRIICTMOI	Timeout	TMOF	Not possible	Low	TMOF = 1 • TMOIE = 1

Note 1. When the interrupt priority register (ICDIPRn) setting is the same

Clear or mask each flag during interrupt handling.

CAUTIONS

1. There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.
2. Since INTRIICRI and INTRIICTI are edge-detected interrupts, they do not require clearing.
3. When using the INTRIICTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICTEI interrupt processing.
4. When using the INTRIICSPI interrupt, clear the RIICnSR2.STOP flag in the INTRIICSPI interrupt processing.
5. When using the INTRIICSTI interrupt, clear the RIICnSR2.START flag in the INTRIICSTI interrupt processing.
6. When using the INTRIICNAKI interrupt, clear the RIICnSR2.NACKF flag in the INTRIICNAKI interrupt processing.
7. When using the INTRIICALI interrupt, clear the RIICnSR2.AL flag in the INTRIICALI interrupt processing.
8. When using the INTRIICTMOI interrupt, clear the RIICnSR2.TMOF flag in the INTRIICTMOI interrupt processing.

25.5 Operation

25.5.1 Communication Data Format

The I²C bus format consists of 8-bit data and 1-bit acknowledge (one frame). After a start condition or restart condition is issued, the master device sends the slave address and data direction in the first frame. The specified slave is valid until a stop condition is issued or a new slave is specified by a restart condition.

Figure 25.3 shows the I²C bus format, and **Figure 25.4** shows the I²C bus timing.

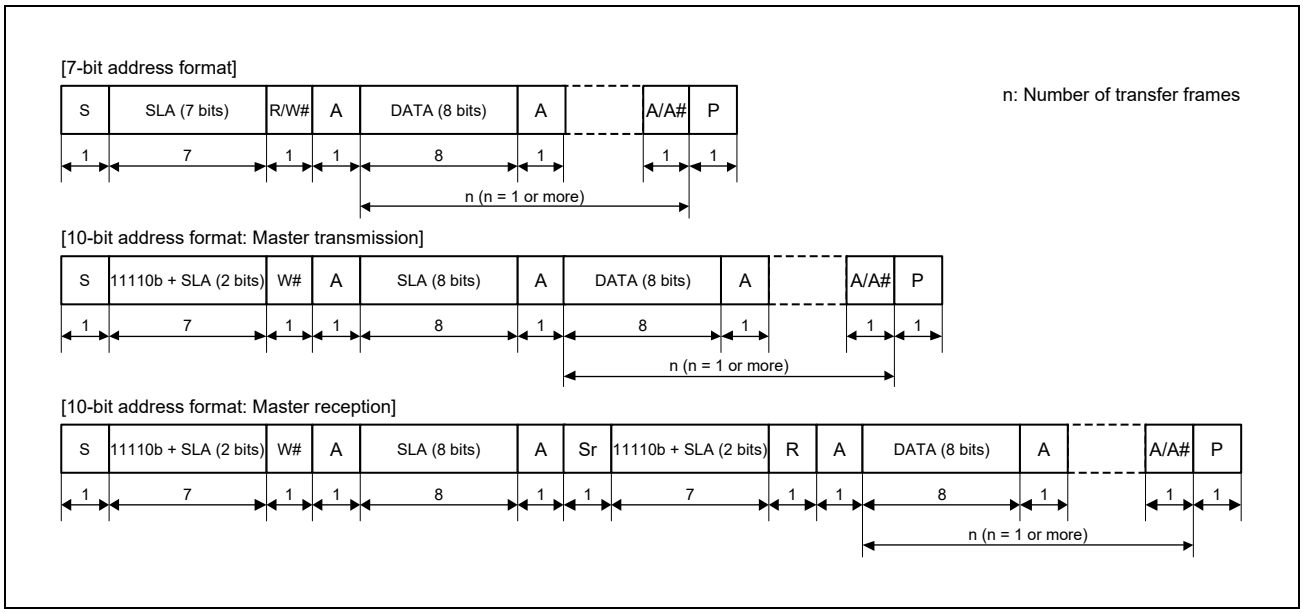


Figure 25.3 I²C Bus Format

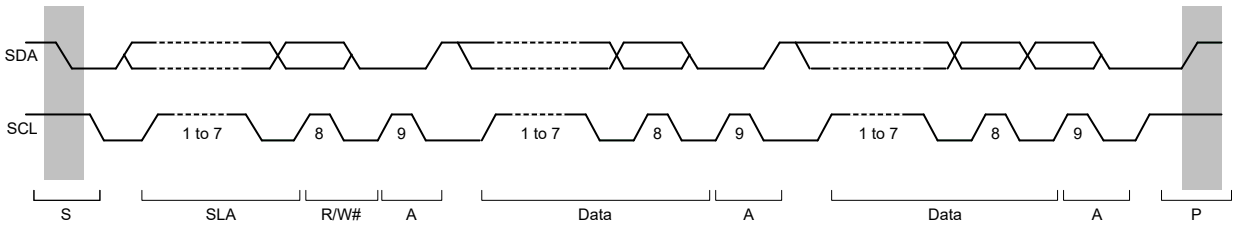


S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.

Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

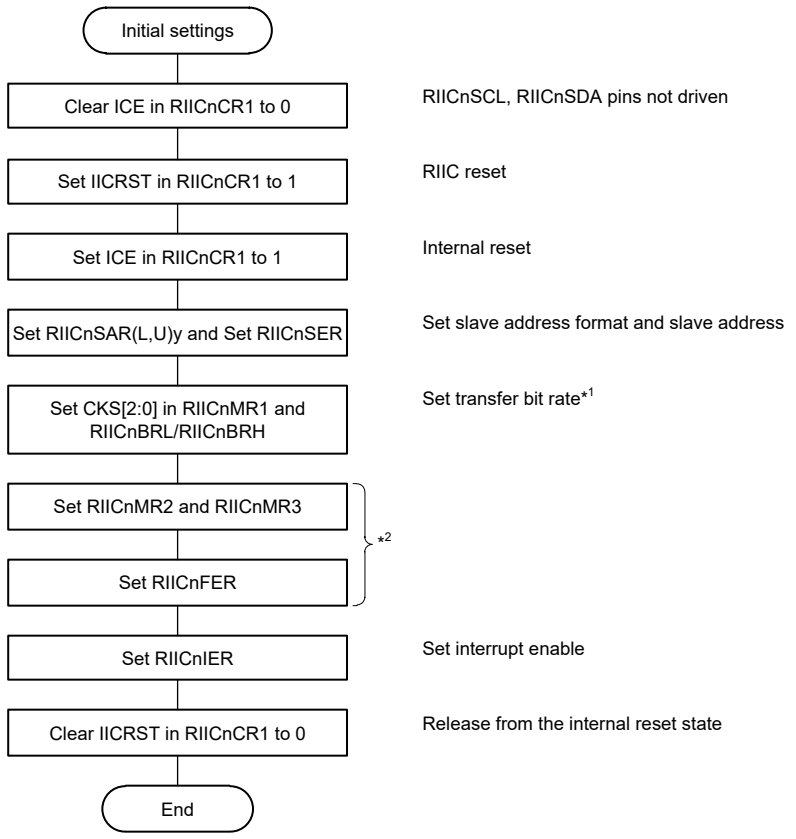
DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

Figure 25.4 I^2C Bus Timing (SLA = 7 Bits)

25.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in **Figure 25.5**.



Note: y = 0 to 2

Note 1. When the RIIC is used only in slave mode, set the RIICnBRL register to a value at least the same as the data setup time.

Note 2. Set these registers, as necessary.

Figure 25.5 Example of RIIC Initialization Flowchart

25.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. **Figure 25.6** shows an example of usage of master transmission and **Figure 25.7** to **Figure 25.9** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSAR(L,U)y, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 25.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.

Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnSR2.STOP bit and then write 1 to the RIICnCR2.SP bit to issue a stop condition.

For data transmission with an address in the 10-bit format, start by writing 1111_0b, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After the last byte of the data to be transmitted is written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, after that write 1 to the RIICnSR2.STOP bit and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00b and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, set the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

CAUTION

Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

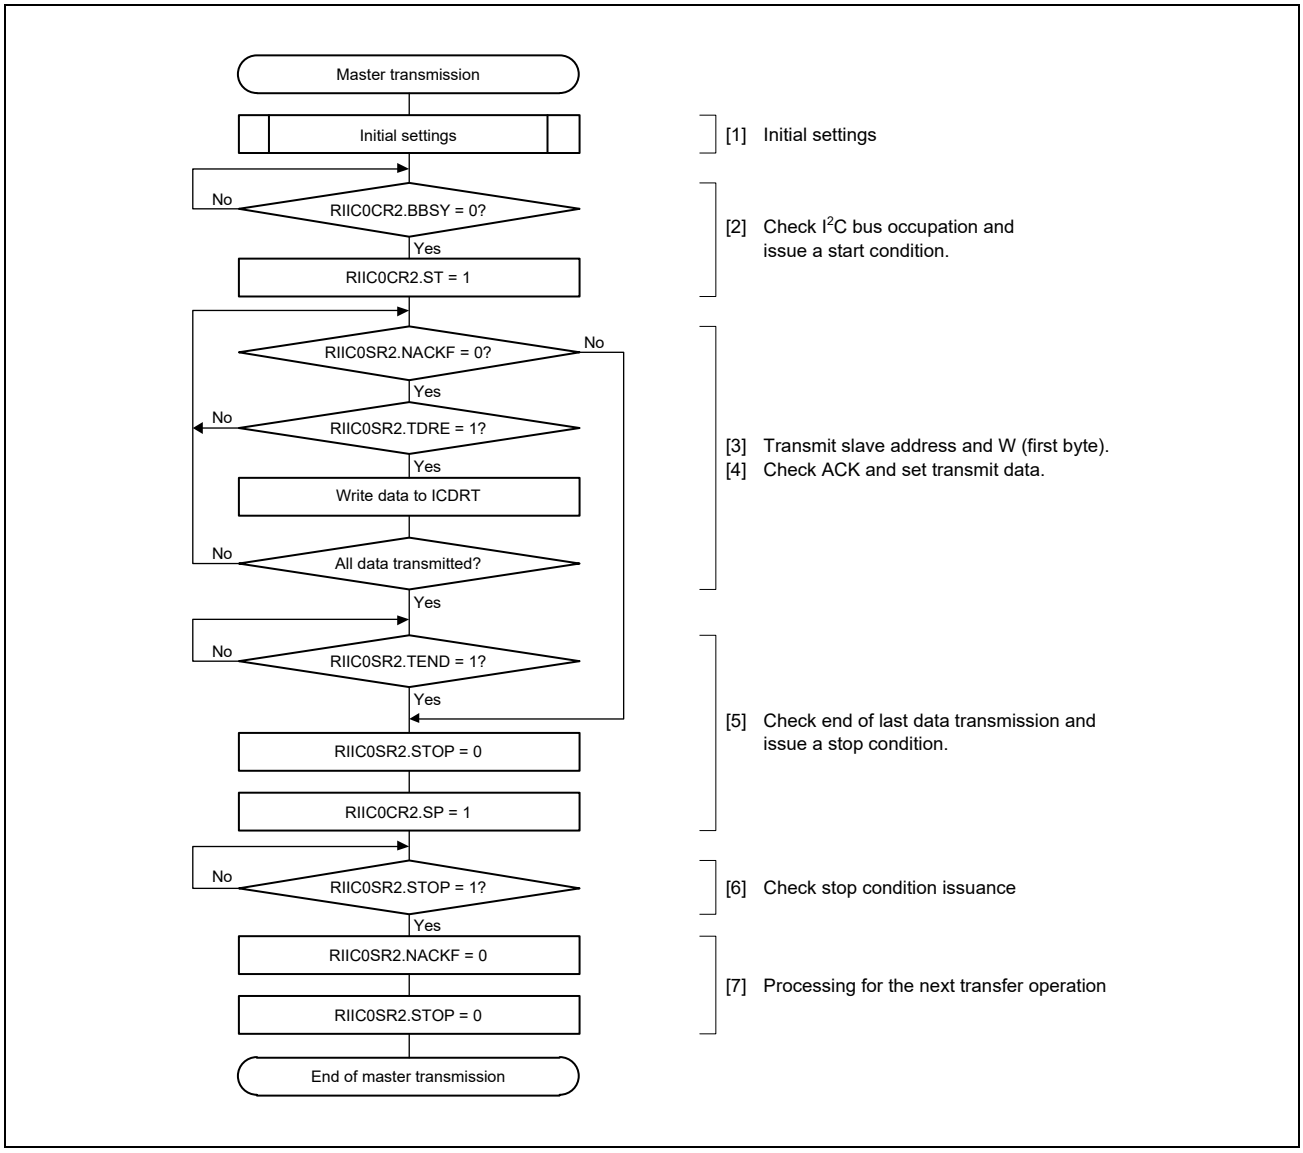


Figure 25.6 Example of Master Transmission Flowchart

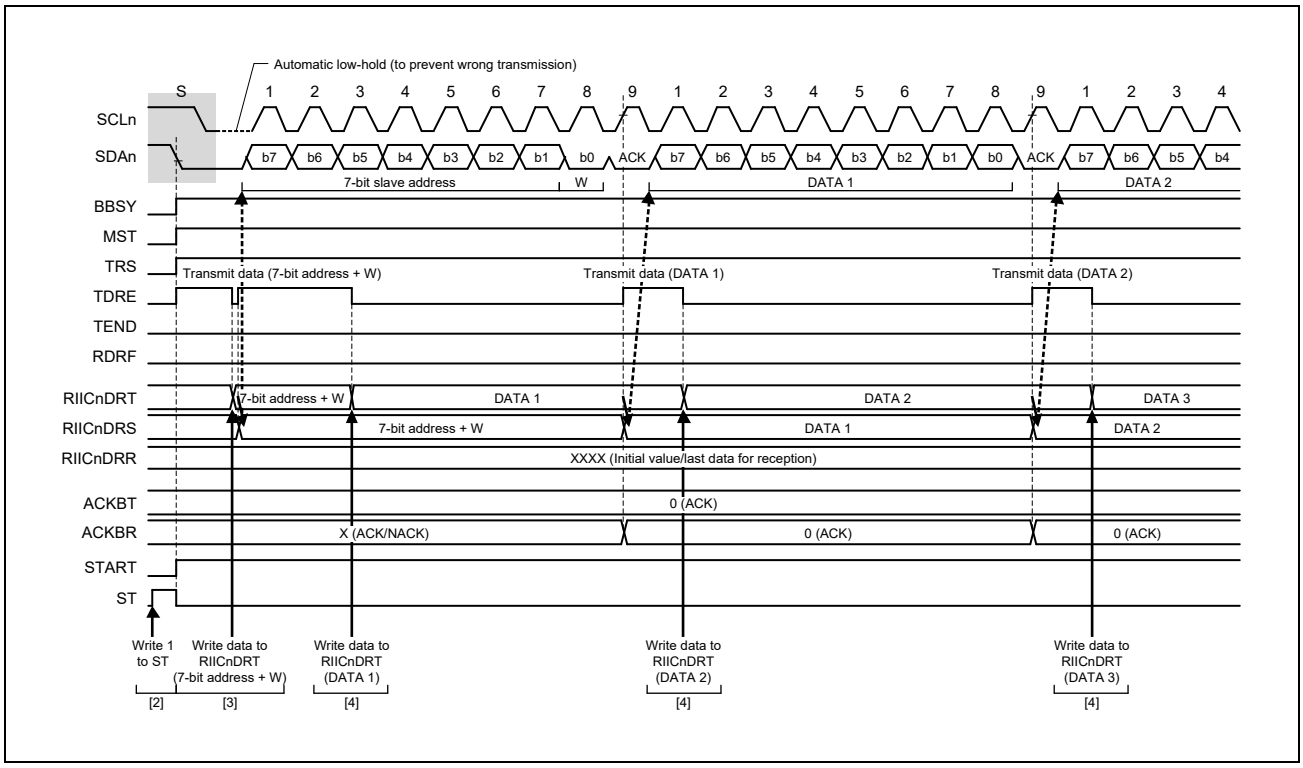

Figure 25.7 Master Transmit Operation Timing (1) (7-Bit Address Format)

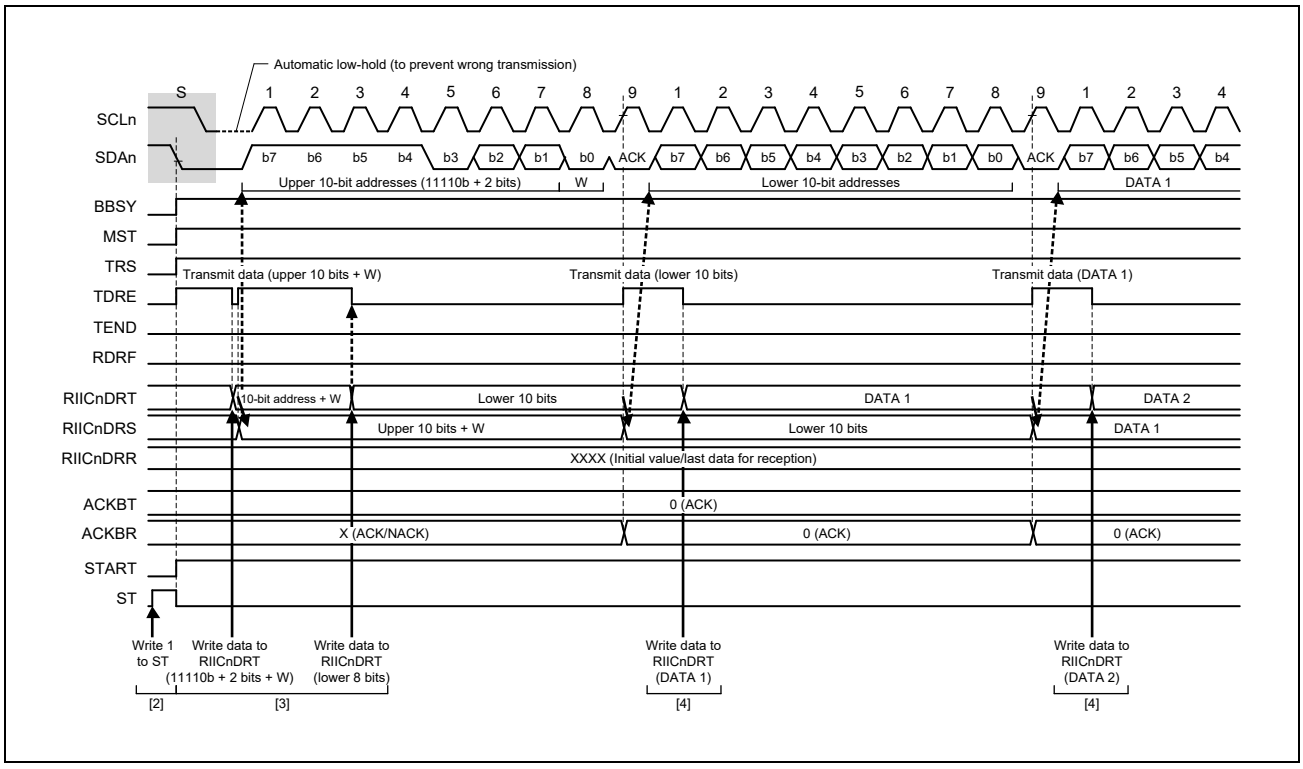

Figure 25.8 Master Transmit Operation Timing (2) (10-Bit Address Format)

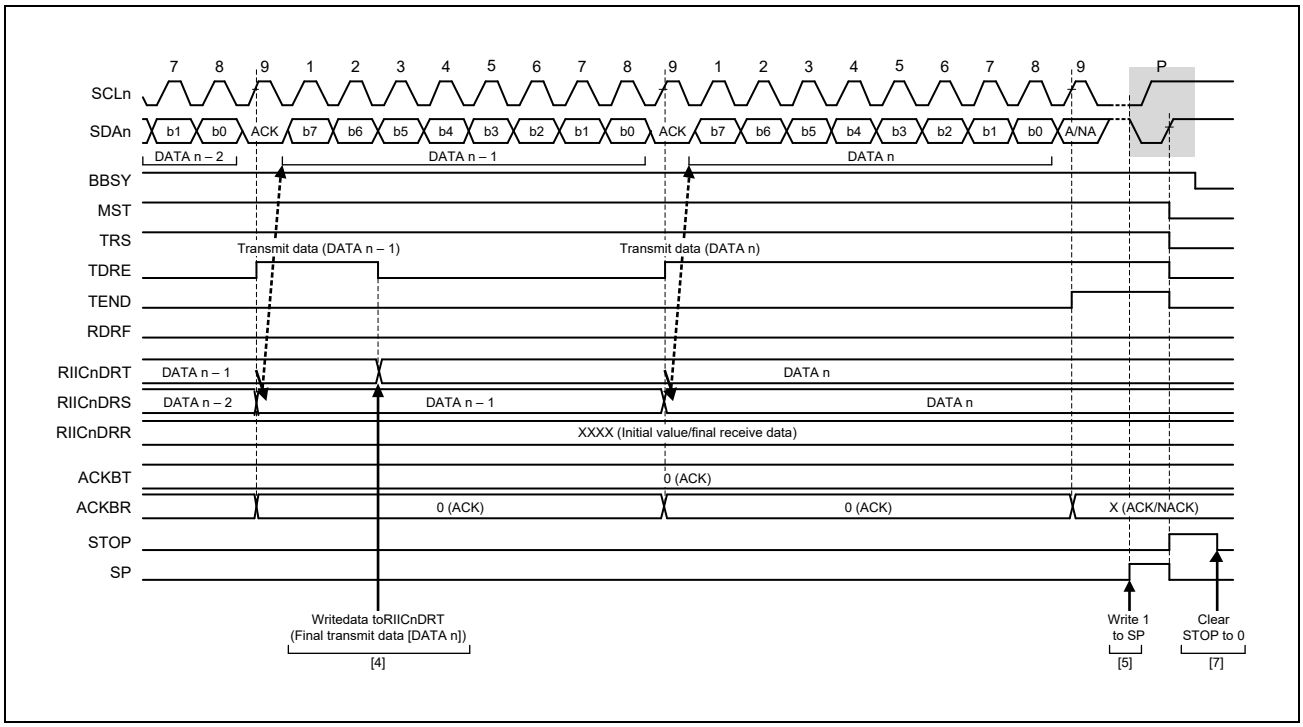

Figure 25.9 Master Transmit Operation Timing (3)

25.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 25.10 shows an example of usage for the master reception of 3 or more bytes (7-bit address format), **Figure 25.14** shows an example of usage for the master reception of 1 or 2 bytes (7-bit address format), and **Figure 25.11** to **Figure 25.13** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSAR(L,U)y, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 25.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. Once the byte containing the slave address and R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.

Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.

For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmitting 1111_0b, the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit

to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnSR2.STOP bit and then write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00b and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

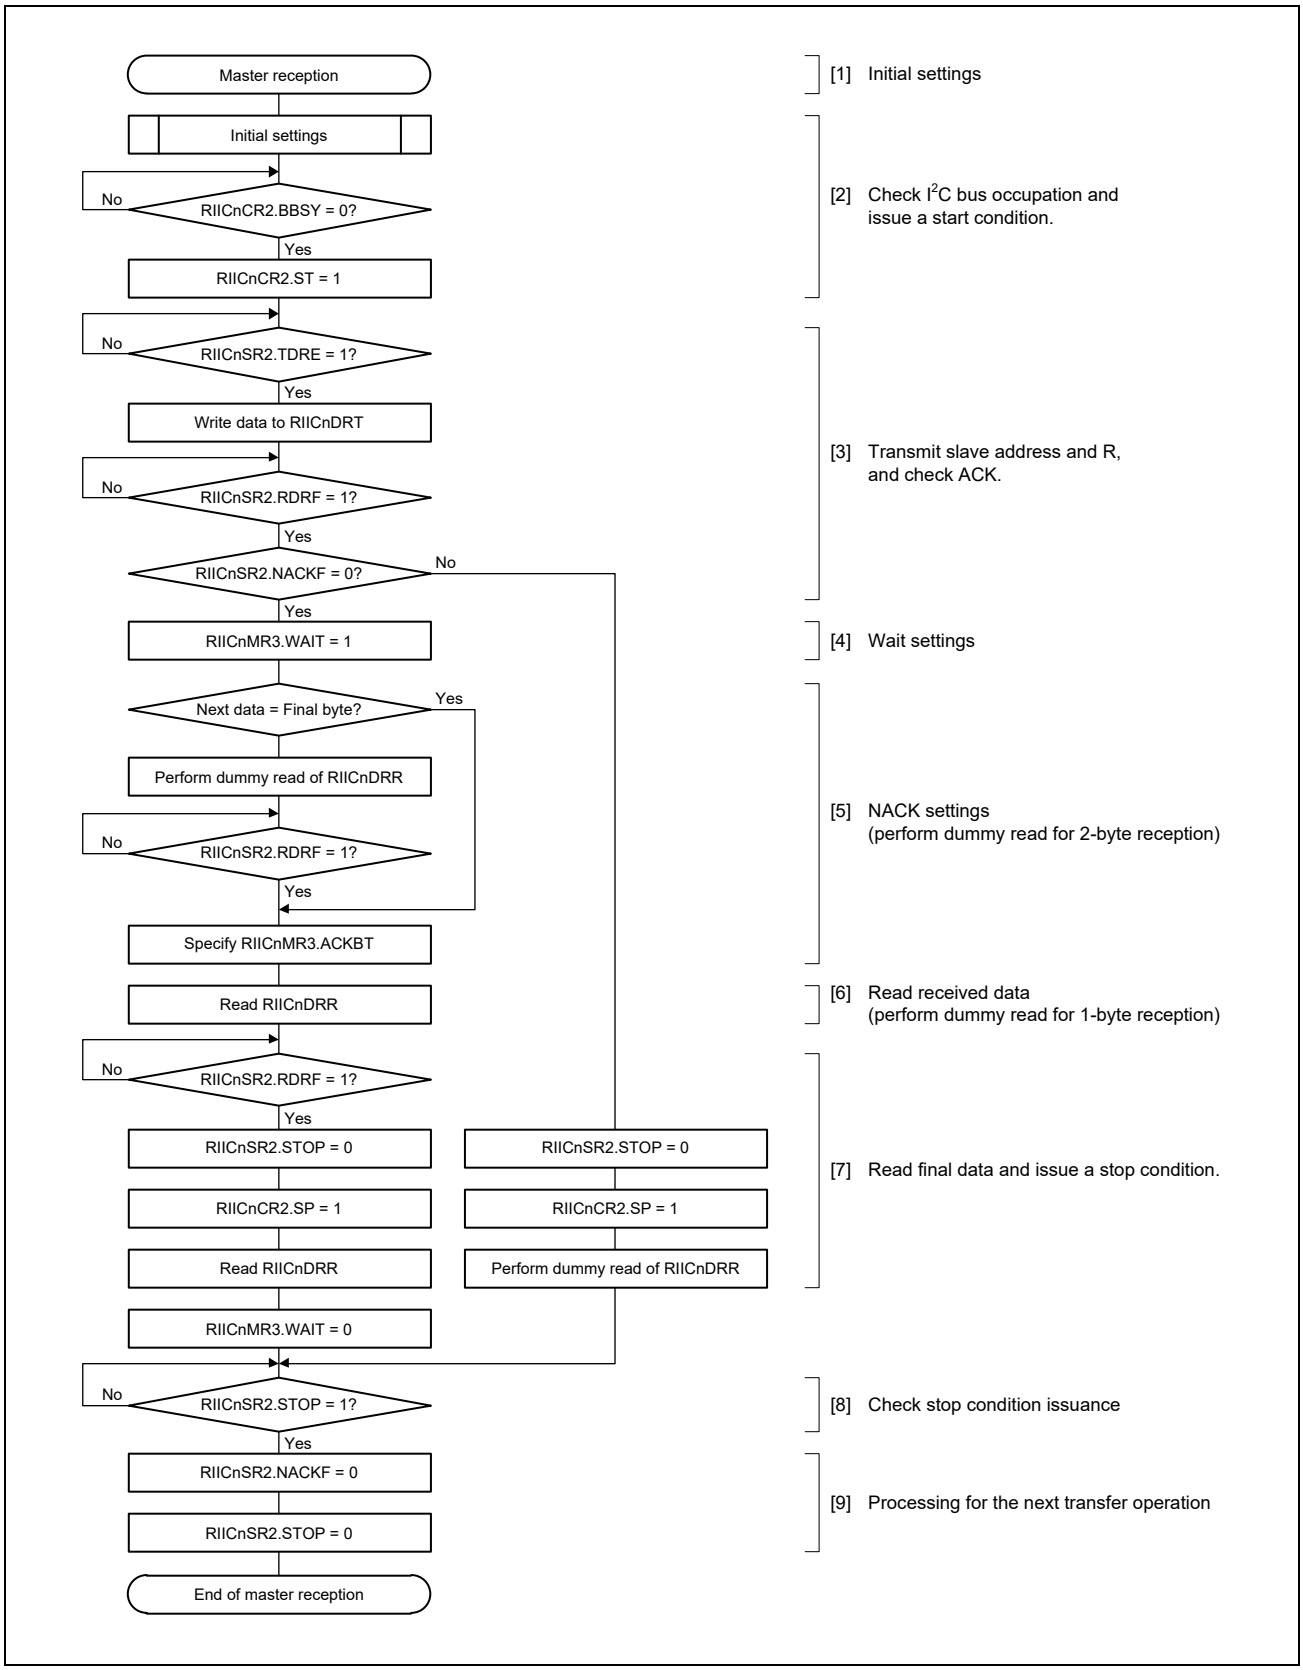

Figure 25.14 Example Flowchart for the Master Reception of 1 or 2 Bytes (7-Bit Address Format)

25.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

Figure 25.15 shows an example of usage of slave transmission and **Figure 25.16** and **Figure 25.17** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in **Figure 25.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TEND flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait unit the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode.

(7) After checking that the RIICnSR2.STOP flag is 1, set the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

CAUTION

Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

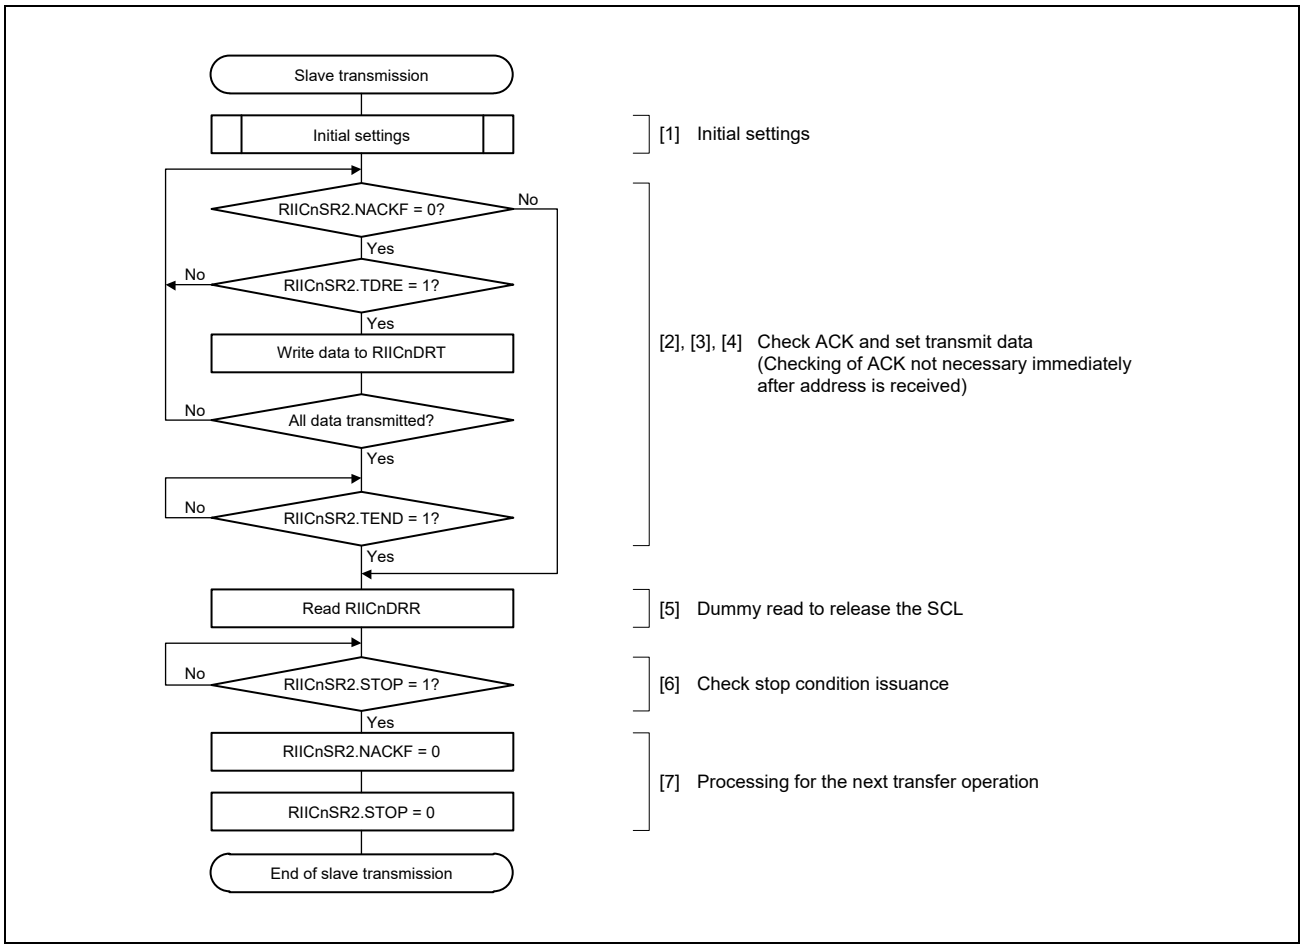

Figure 25.15 Example of Slave Transmission Flowchart

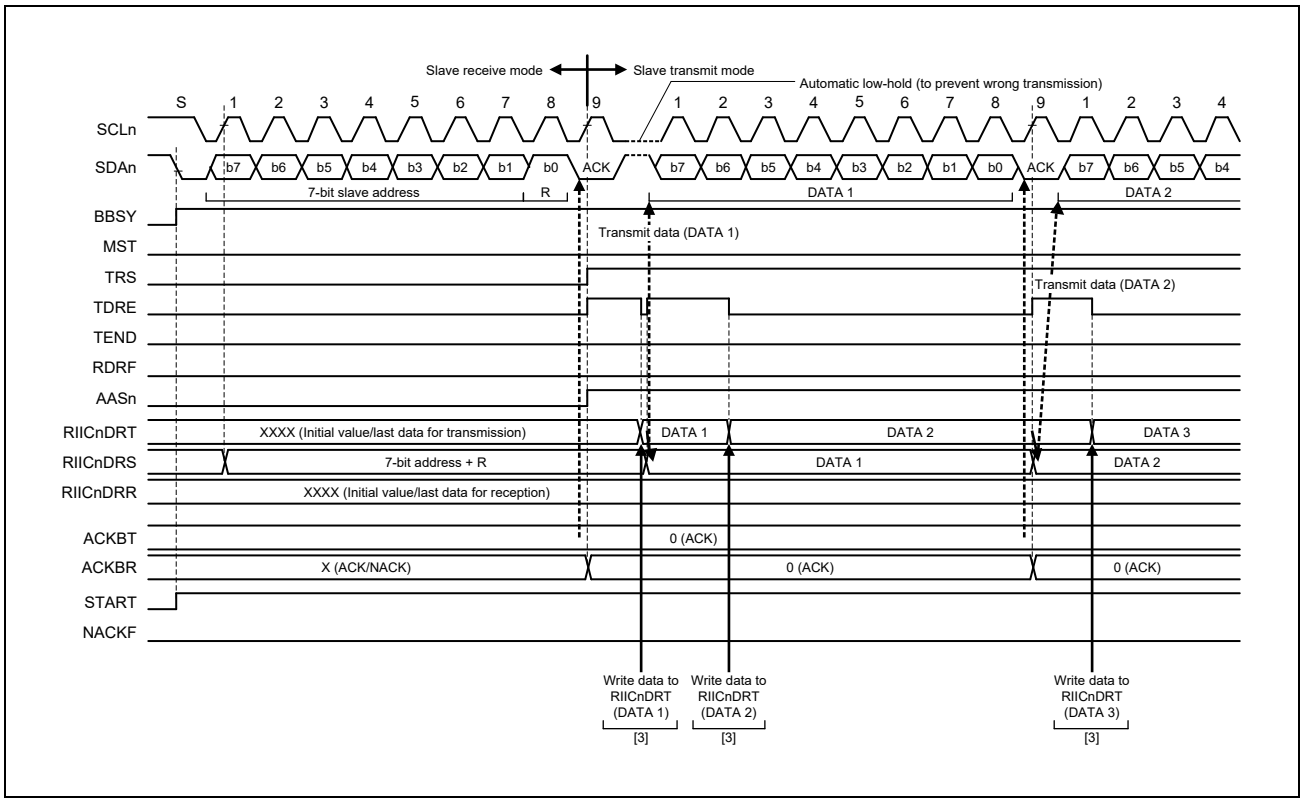

Figure 25.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)

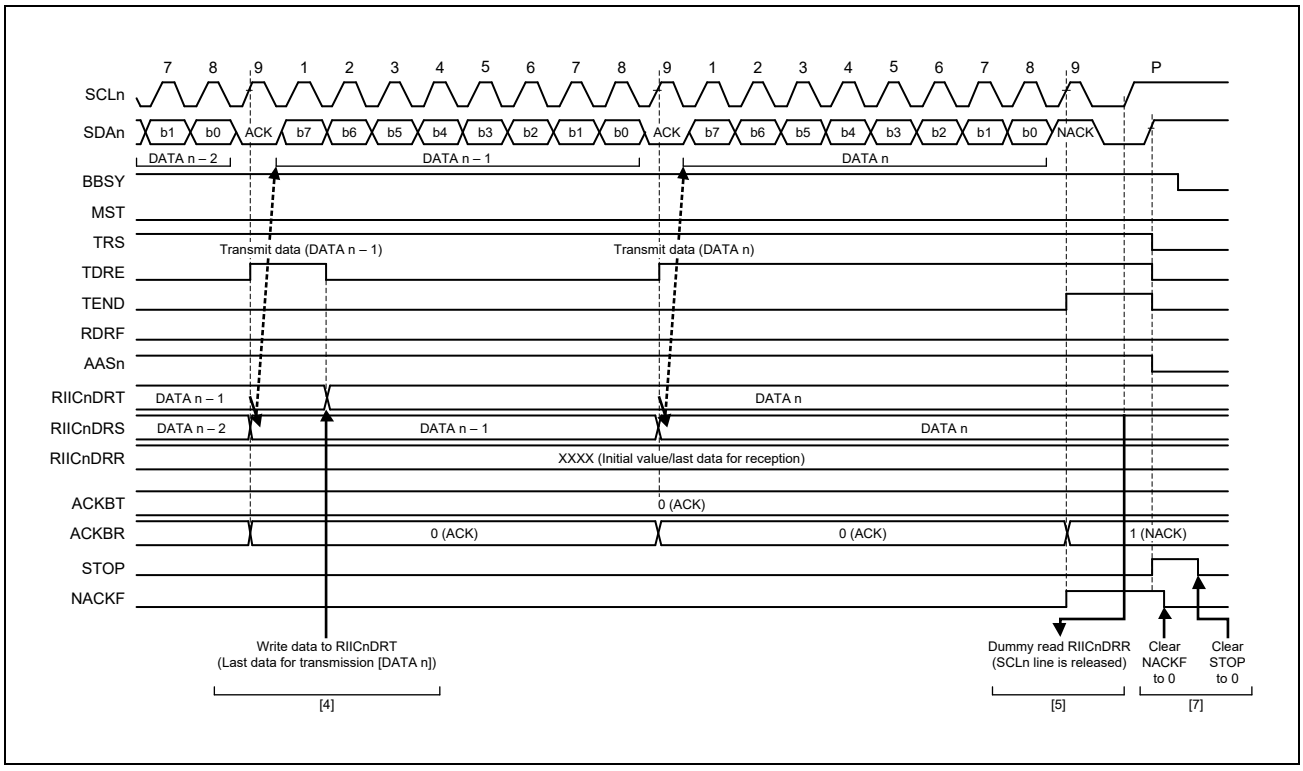

Figure 25.17 Slave Transmit Operation Timing (2)

25.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

Figure 25.18 shows an example of usage of slave reception and **Figure 25.19** and **Figure 25.20** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

(1) Follow the procedure in **Figure 25.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.

(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).

(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.

When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.

(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 0.

(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

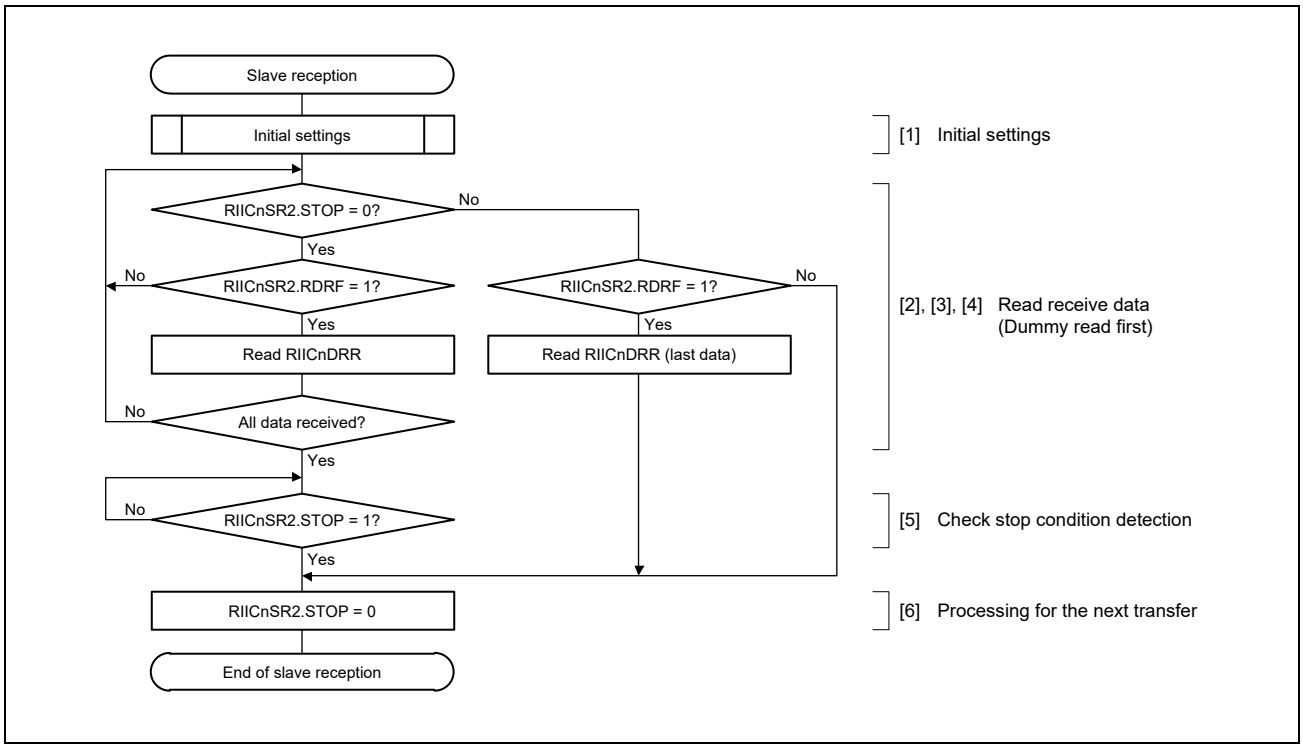

Figure 25.18 Example of Slave Reception Flowchart

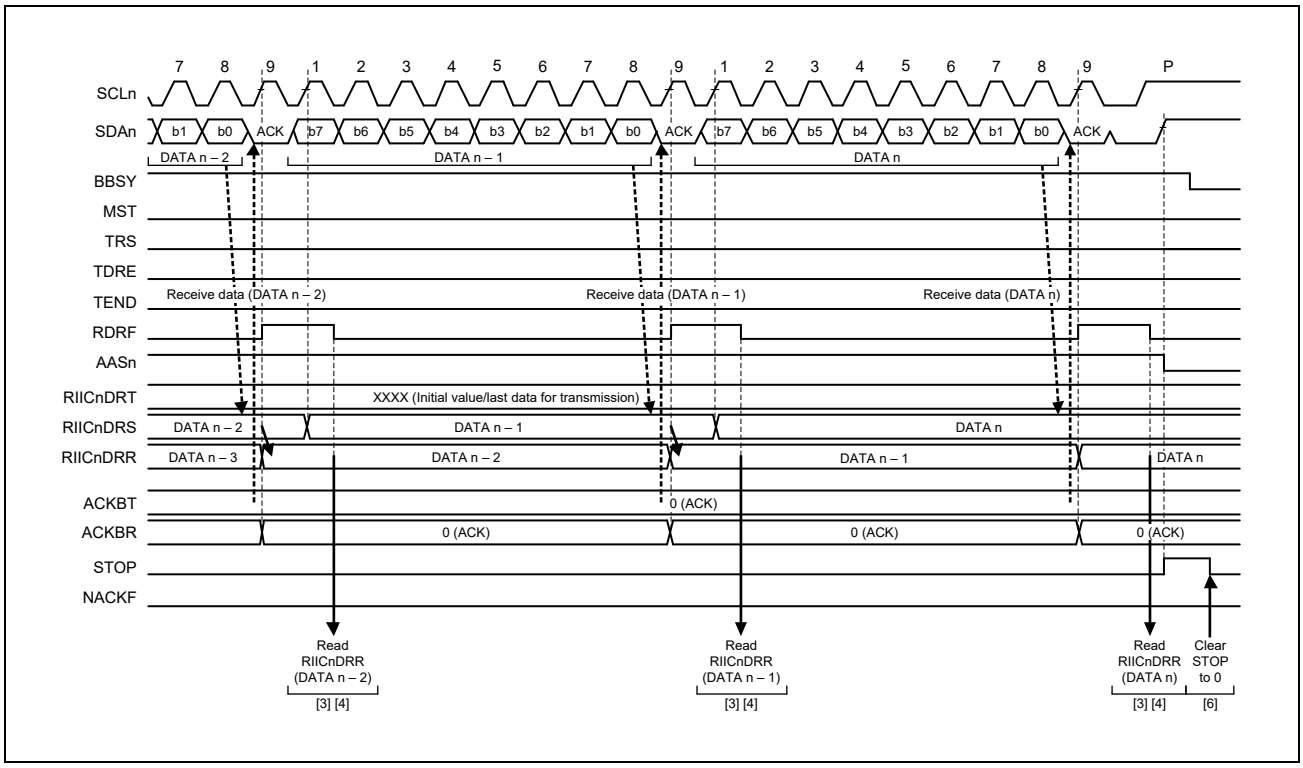

Figure 25.20 Slave Receive Operation Timing (2) (when RDRFS = 0)

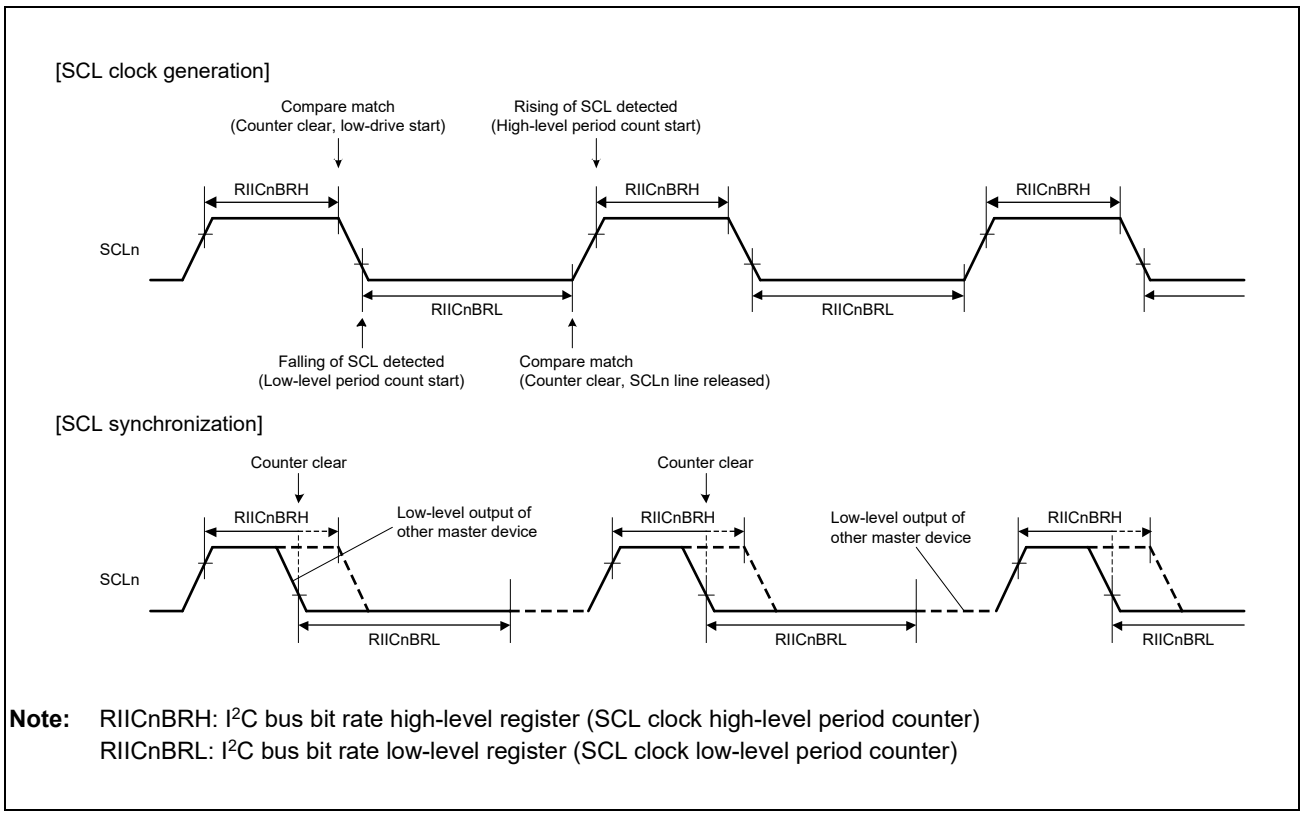
25.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I^2C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line while in master mode.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. When the RIIC finishes outputting the low-level period of the SCL clock, the SCL line is released and the SCL clock rises. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.



Note: RIICnBRH: I^2C bus bit rate high-level register (SCL clock high-level period counter)
RIICnBRL: I^2C bus bit rate low-level register (SCL clock low-level period counter)

Figure 25.21 Generation and Synchronization of the SCL Signal from the RIIC

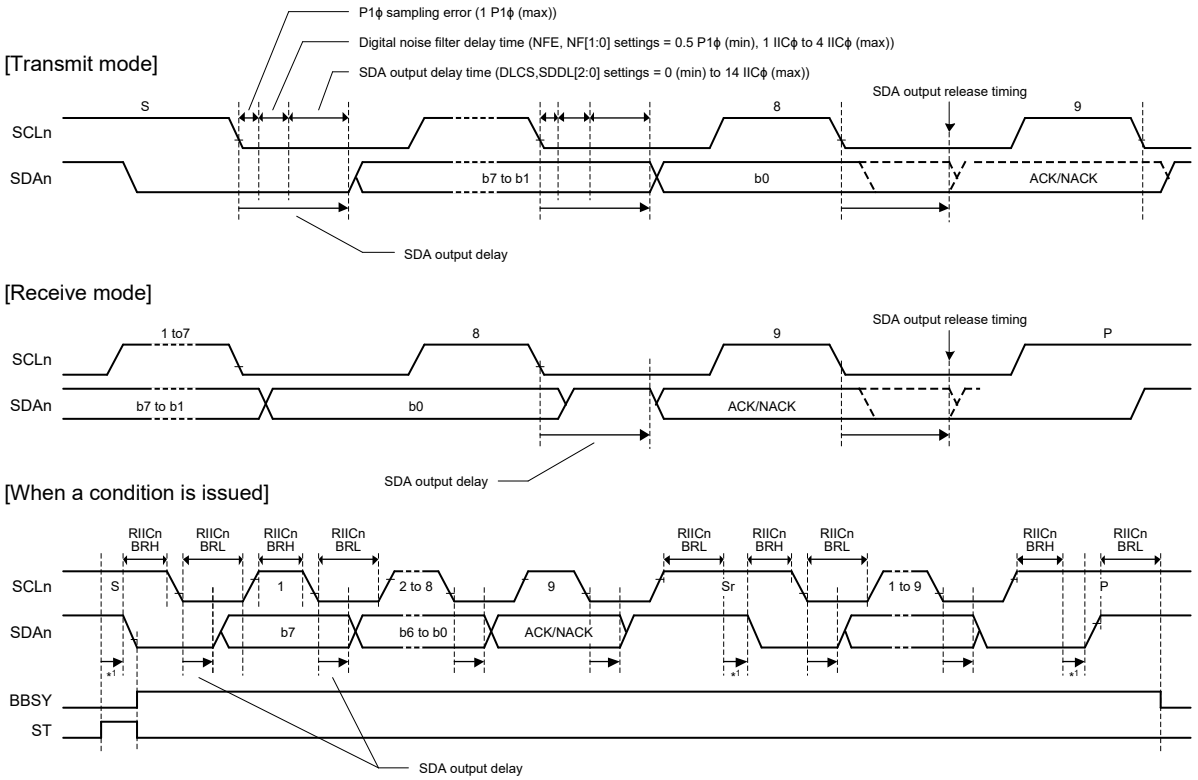
25.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices, with the aim of satisfying the 300-ns (min.) data-hold time requirement of the SMBus specification.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than 000b, and disabled by setting the same bits to 000b.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits in RIICnMR2 are set to any value other than 000b), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICϕ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in RIICnMR2. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.



Note 1. The output is delayed by the number of cycles set by the SDDL [2:0] bits when a start (S), restart (Sr), or stop (P) condition is issued.

Figure 25.22 SDA Output Delay Facility

25.8 Digital Noise-Filter Circuits

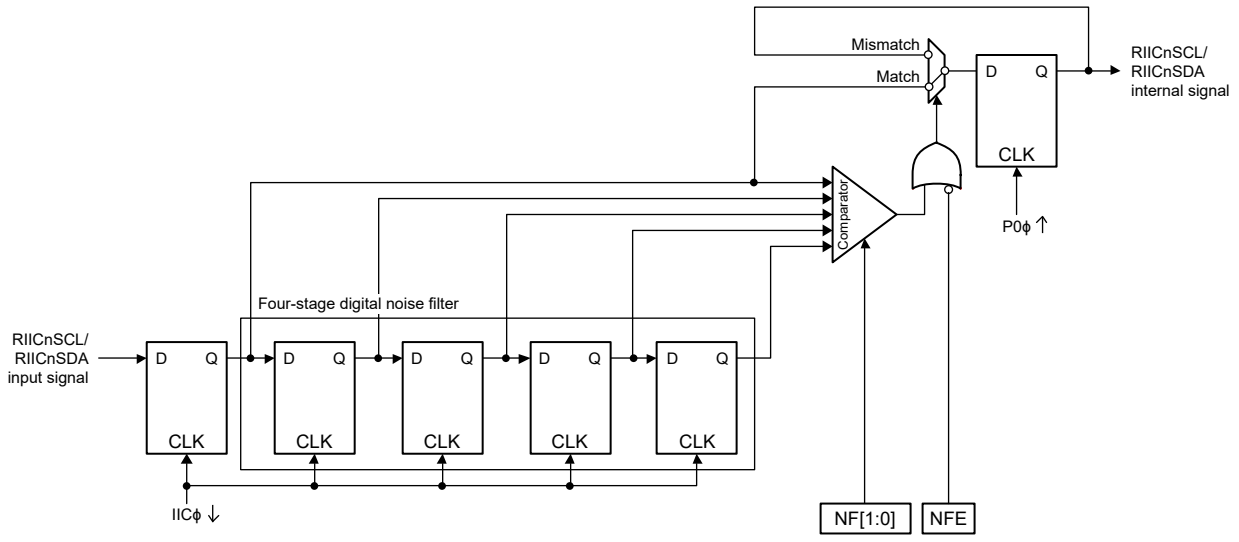
Figure 25.23 is a block diagram of the digital noise-filter circuit. When the NFE bit in the RIICnFER register is set to 1, input to the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through digital noise-filter circuits.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match- detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICϕ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed to the subsequent stage. If the signal levels do not match, the previous value is retained.

If the ratio between P0ϕ and IICϕ is small when the RIICnMR1.CKS[2:0] bits are set to 000b, note that the characteristics of the digital noise filter may lead to the elimination of needed signals as noise.



Note: NFE: Digital noise filter circuit enable bit
NF[1:0]: Digital noise filter stage selection bits

Figure 25.23 Block Diagram of Digital Noise Filter Circuit

25.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and host address, and also can set 7- bit or 10-bit slave addresses.

25.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARyE bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSAR(L,U)y (y = 0 to 2) can be detected. When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle, and the RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive data full interrupt (INTRIICRI) or transmit data empty interrupt (INTRIICTI) to be generated. The AASy flag is used to identify which slave address has been specified.

Figure 25.24 to **Figure 25.26** show the AASy flag set timing in three cases.

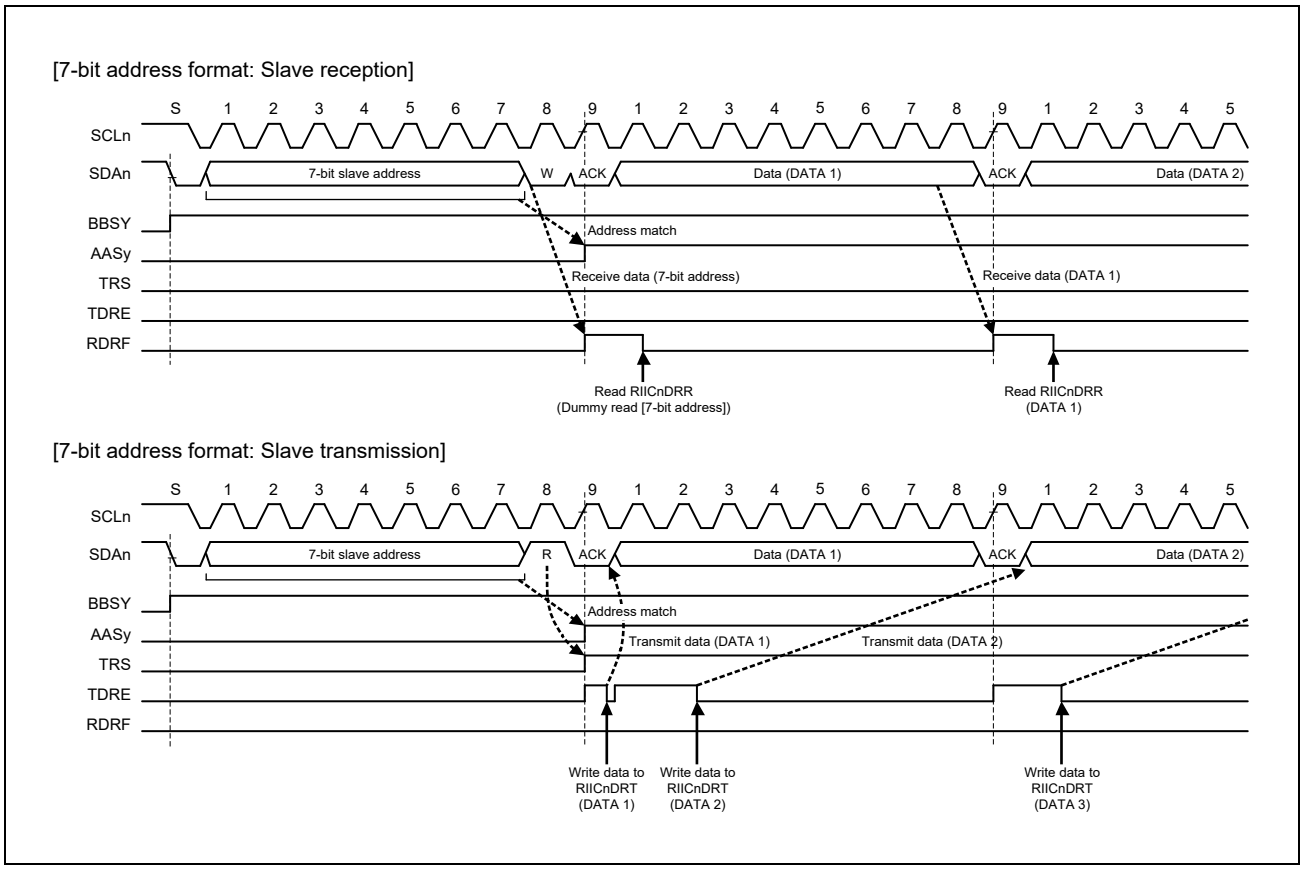


Figure 25.24 AASy Flag Set Timing with 7-Bit Address Format Selected

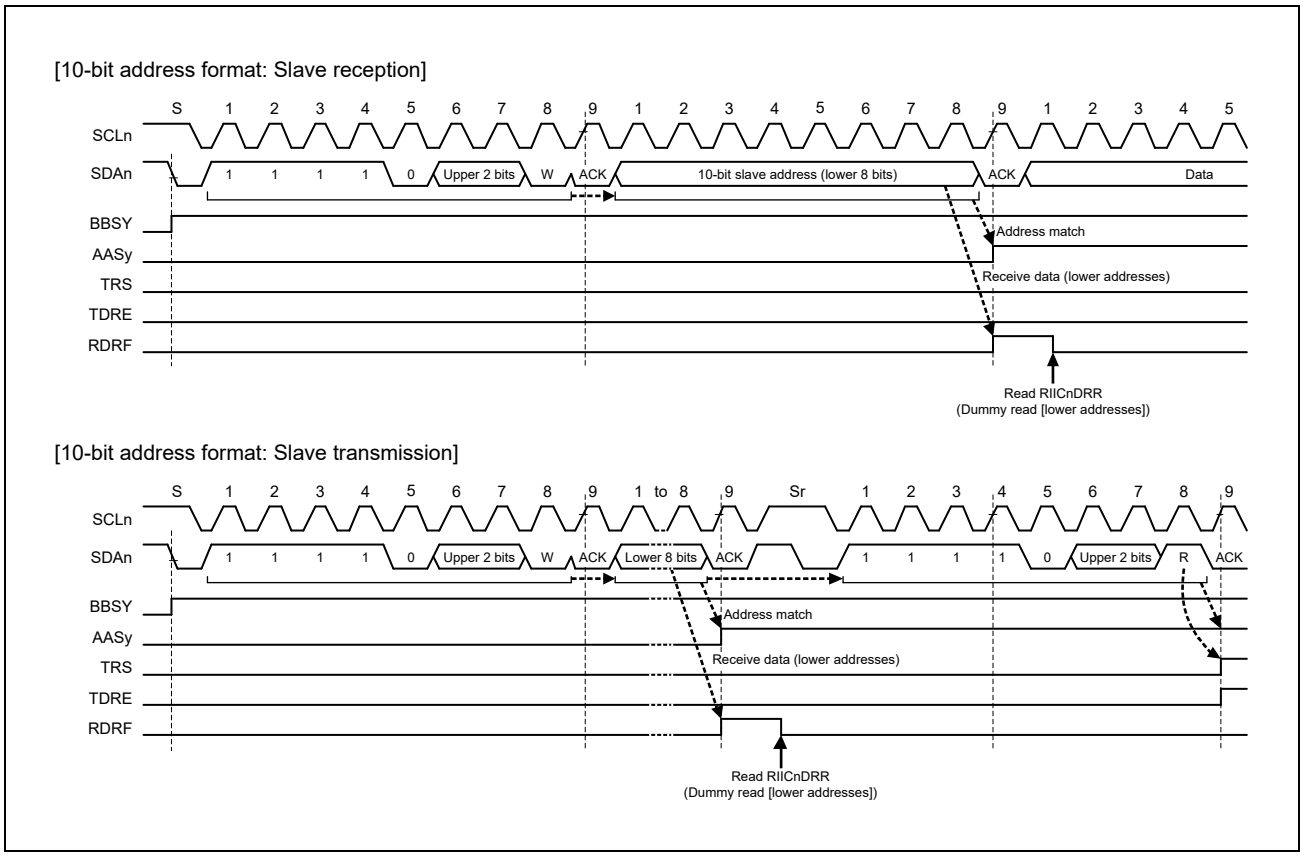

Figure 25.25 AASy Flag Set Timing with 10-Bit Address Format Selected

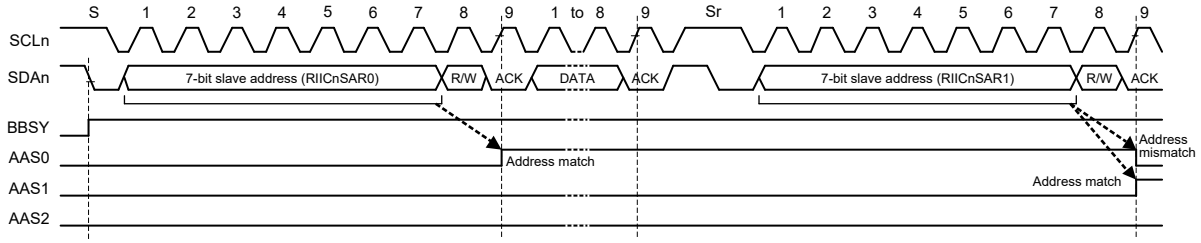
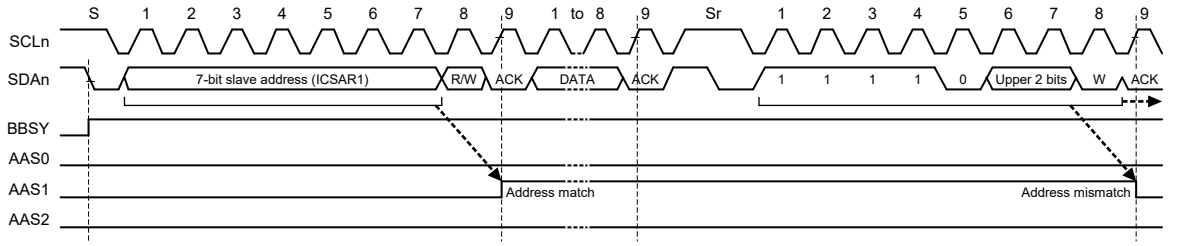
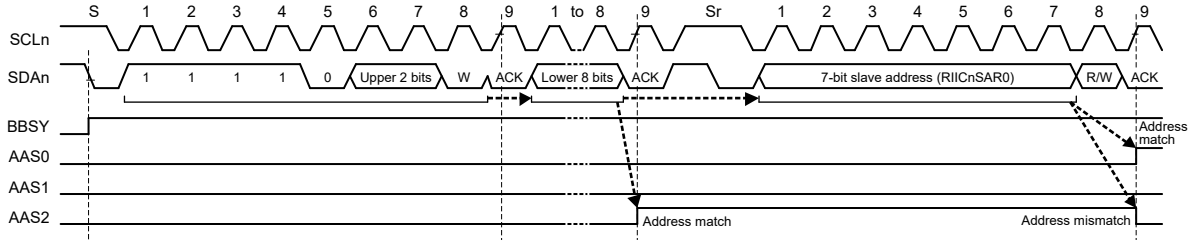
[In the case of RIICnSAR0: 7-bit address, RIICnSAR1: 7-bit address, RIICnSAR2: 10-bit address (1)]



[In the case of RIICnSAR0: 7-bit address, RIICnSAR1: 7-bit address, RIICnSAR2: 10-bit address (2)]



[In the case of RIICnSAR0: 7-bit address, RIICnSAR1: 7-bit address, RIICnSAR2: 10-bit address (3)]



Note: RIICnSARm (m = 0 to 2) indicates RIICnSARLm and RIICnSARUm (m = 0 to 2).

Figure 25.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed

25.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address (0000_000b + 0 [W]). This is enabled by setting the RIICnSER.GCE bit to 1.

If the address received after a start or restart condition is issued is 0000_000b + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive data full interrupt (INTRIICRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

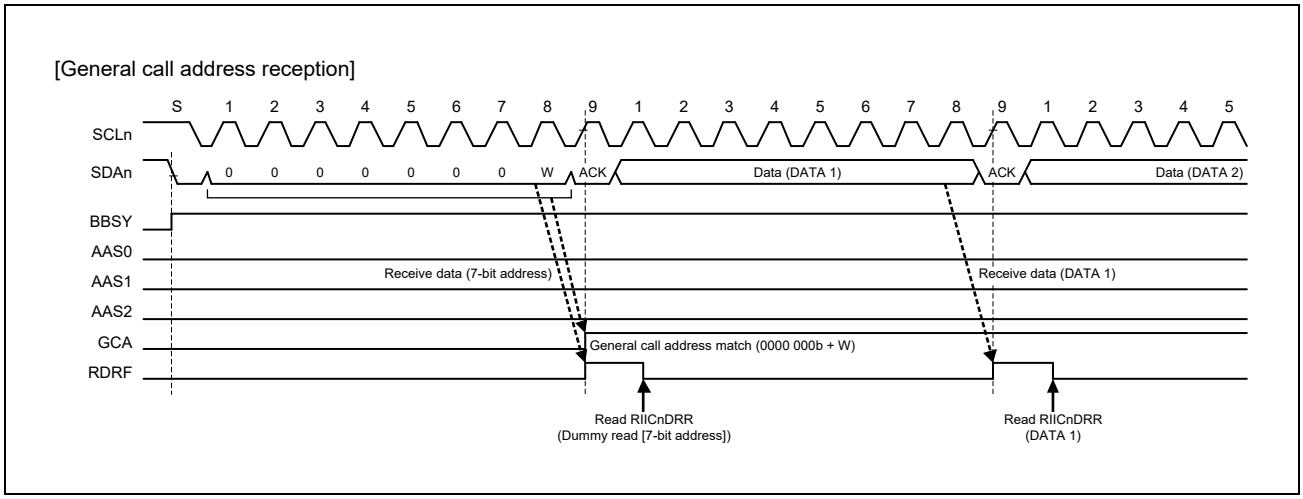


Figure 25.27 Timing of GCA Flag Setting during Reception of General Call Address

25.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conformant with the I^2C bus specification (Rev. 03). When the RIIC receives 1111_100b as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111_100b) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111_100b) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I^2C Bus Standard from NXP Semiconductors.

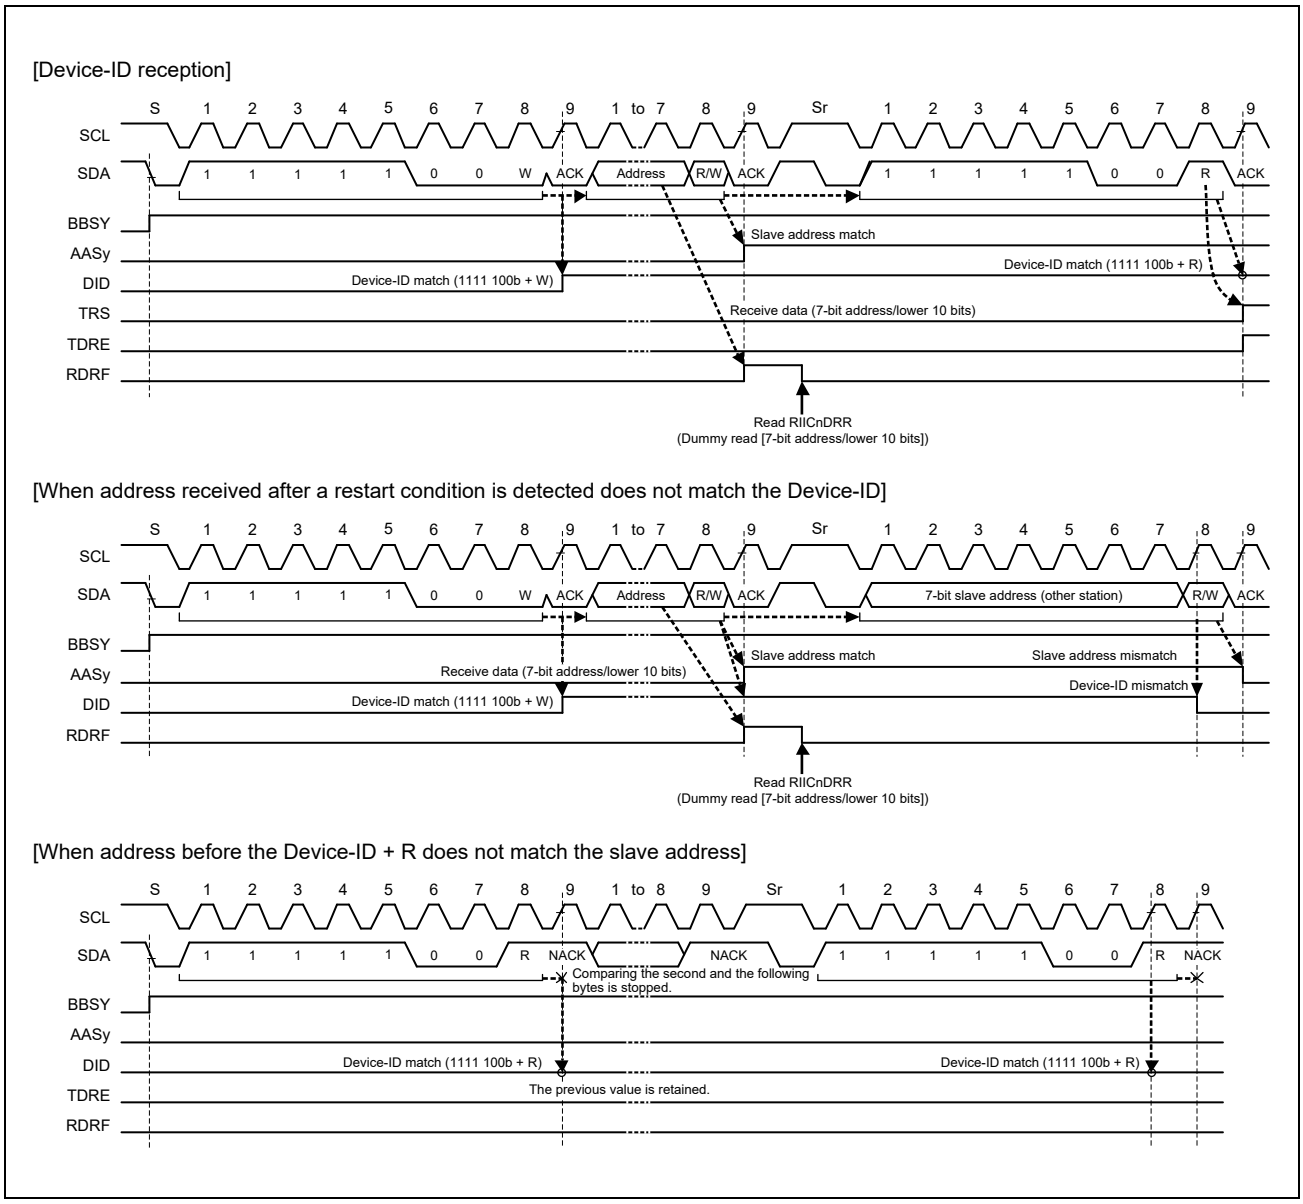

Figure 25.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID

25.9.4 Host Address Detection

The RIIC has a function to detect the host address while the SMBus is operating. When the RIICnSER.HOAE bit is set to 1 while the RIICnMR3.SMBS bit is 1, the RIIC can detect the host address (0001_000b) in slave receive mode (RIICnCR2.MST and TRS bits = 00b).

When the RIIC detects the host address, the RIICnSR1.HOA flag is set to 1 at the rising edge of the ninth SCL clock cycle, and at the same time, the RIICnSR2.RDRF flag is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (INTRIICRI) to be generated. The HOA flag is used to recognize that the host address was sent from the smart battery or other devices.

If the bit following the host address (0001_000b) is an Rd bit (R/W# bit = 1), the RIIC can also detect the host address. After the host address is detected, the RIIC operates in the same manner as normal slave operation.

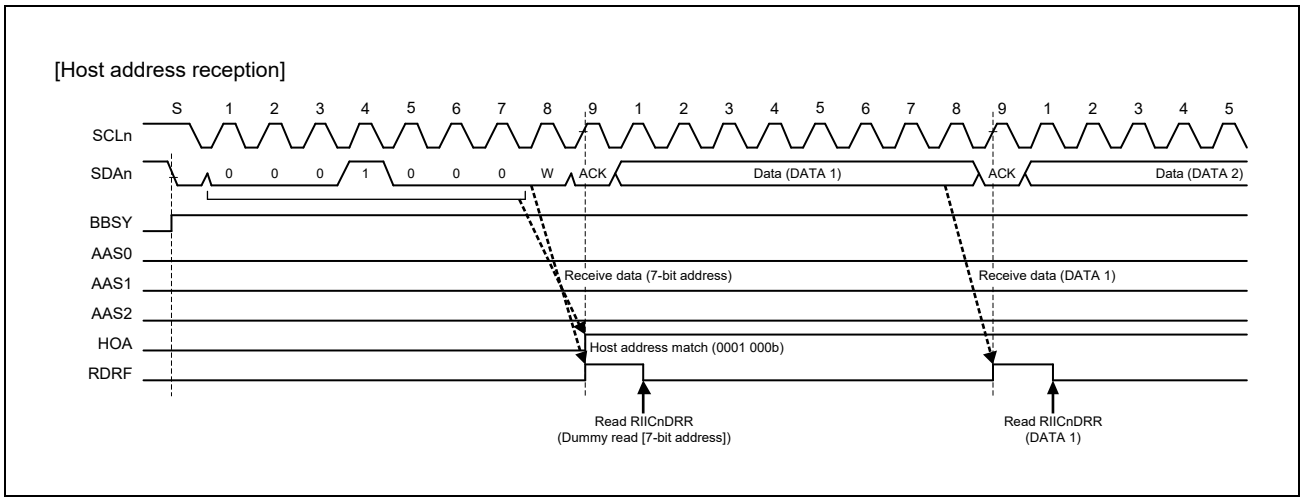

Figure 25.29 HOA Flag Set Timing during Reception of Host Address

25.10 Automatic Low-Hold Function for SCL

25.10.1 Function to Prevent Wrong Transmission of Transmit Data

If the shift register (RIICnDRS) is empty when data have not been written to the transmit data register (RIICnDRT) with the RIIC in transmission mode (RIICnCR2.TRS bit = 1), the SCL signal is automatically held at the low level over the intervals shown below. This low-hold period is extended until data for transmission have been written, which prevents the unintended transmission of erroneous data.

<Master transmit mode>

- Low-level interval after a start condition or restart condition is issued
- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

<Slave transmit mode>

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

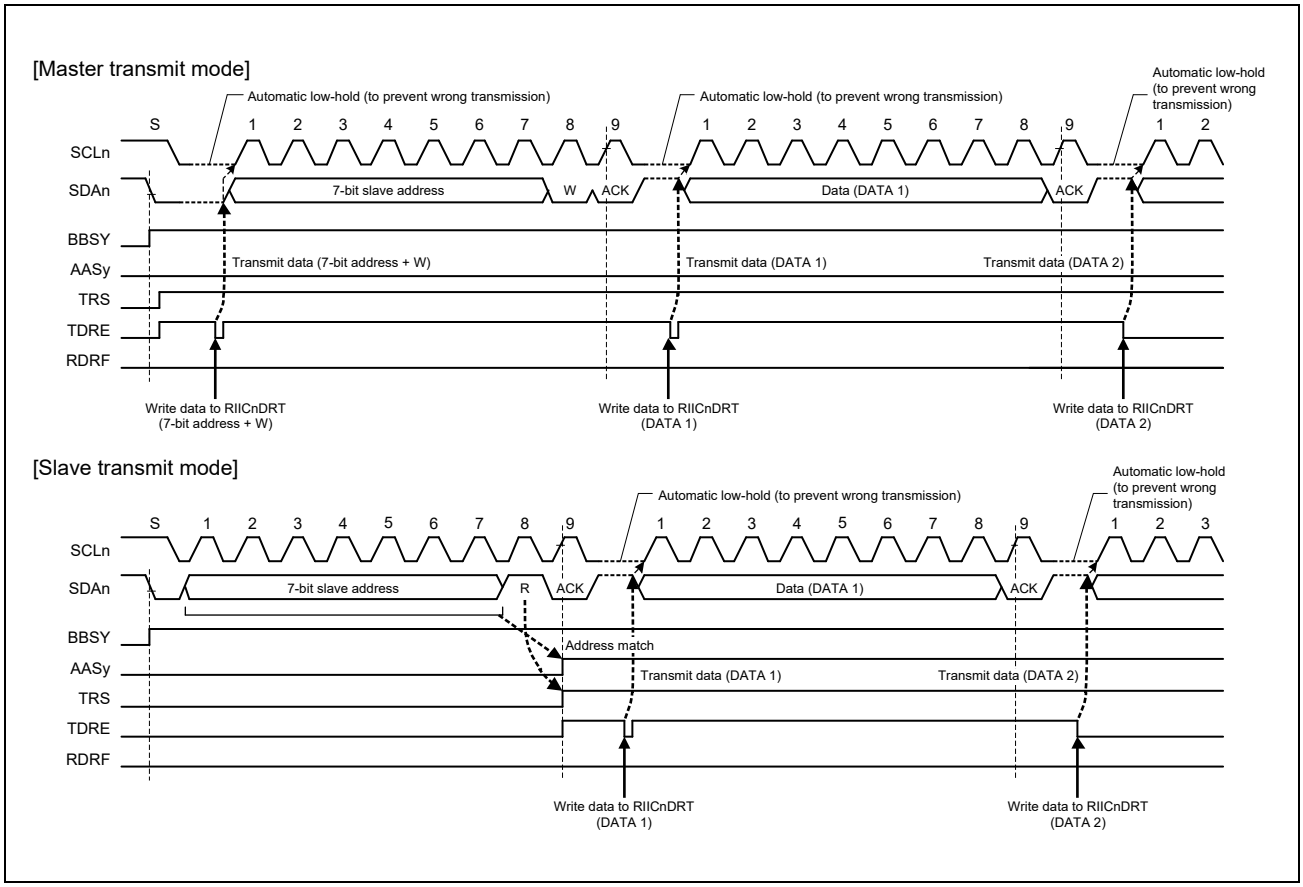

Figure 25.30 Automatic Low-Hold Operation in Transmit Mode

25.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0 after issuing a restart condition or clear the NACKF and STOP flags to 0 after confirming that a stop condition has been issued, and then issue a start condition.

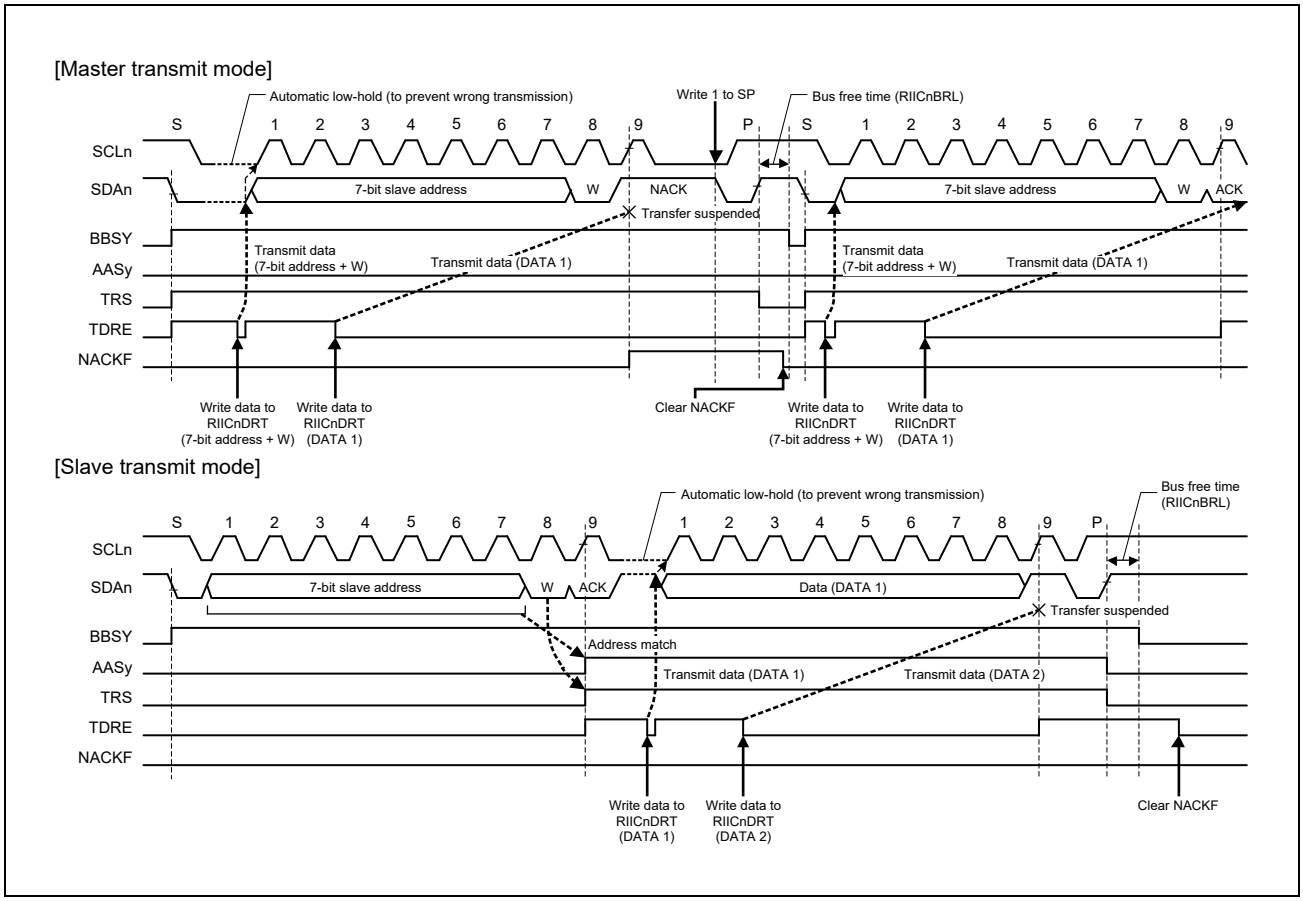

Figure 25.31 Suspension of Data Transfer when NACK is Received (NACKE = 1)

25.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive data full (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

(1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function. Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

(2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function. When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive data full) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This low hold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

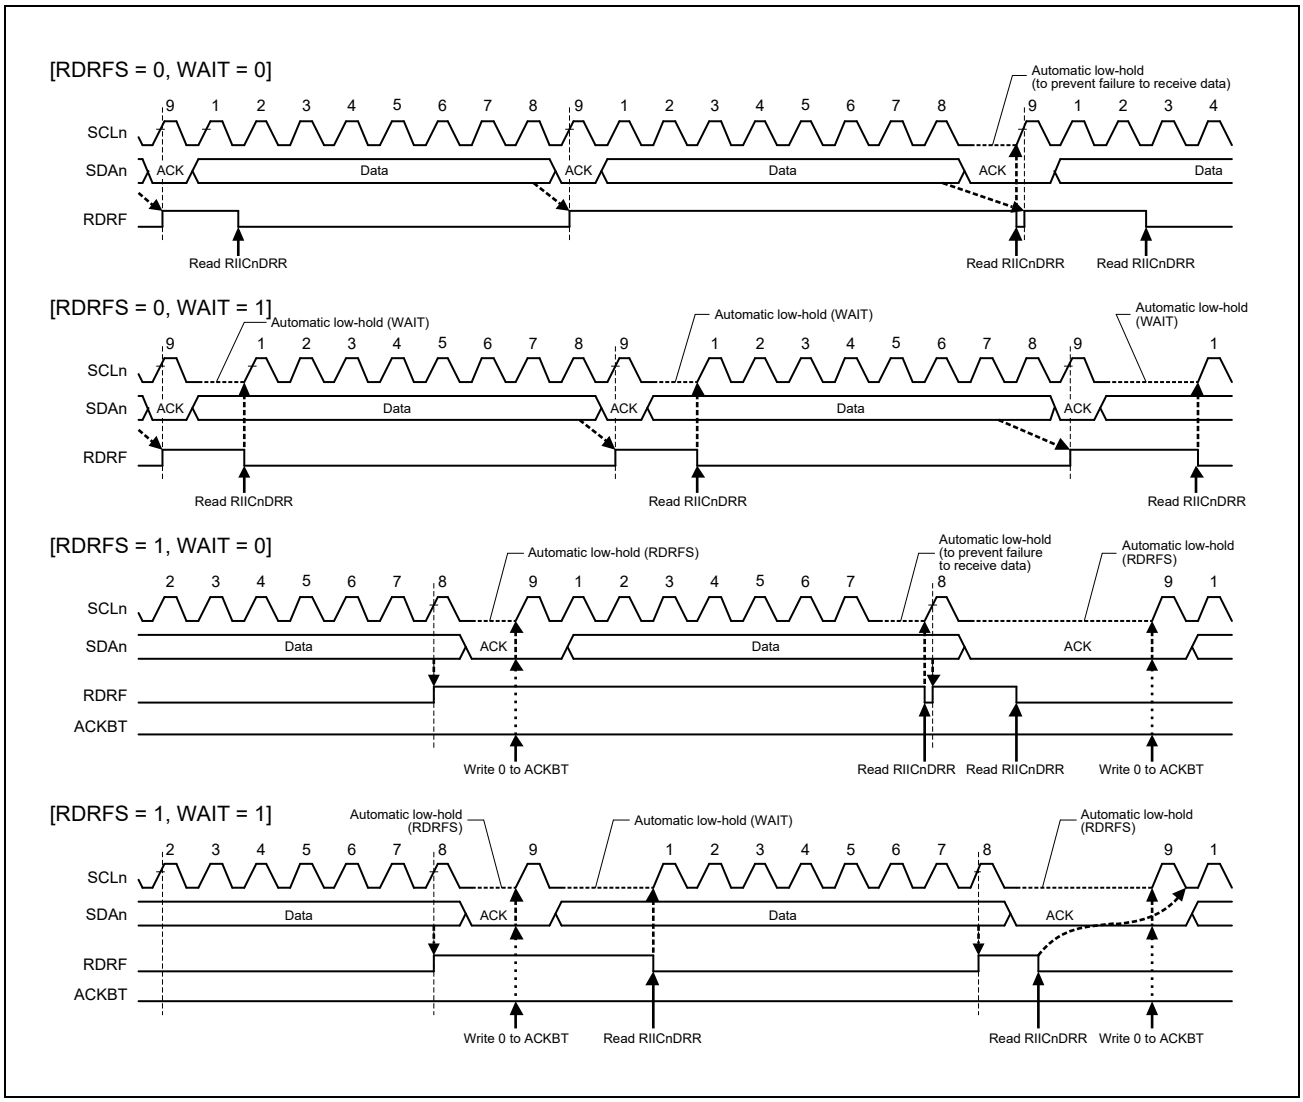

Figure 25.32 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)

25.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I^2C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

25.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC regards its own issuing of a start condition as an error and considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the RIICnCR2.ST bit to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC regards this as a double-issuing-of-start-condition error and considers itself to have lost in arbitration, thus preventing a failure of transfer due to issuing of a start condition while transfer is in progress.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line, the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = 11b)

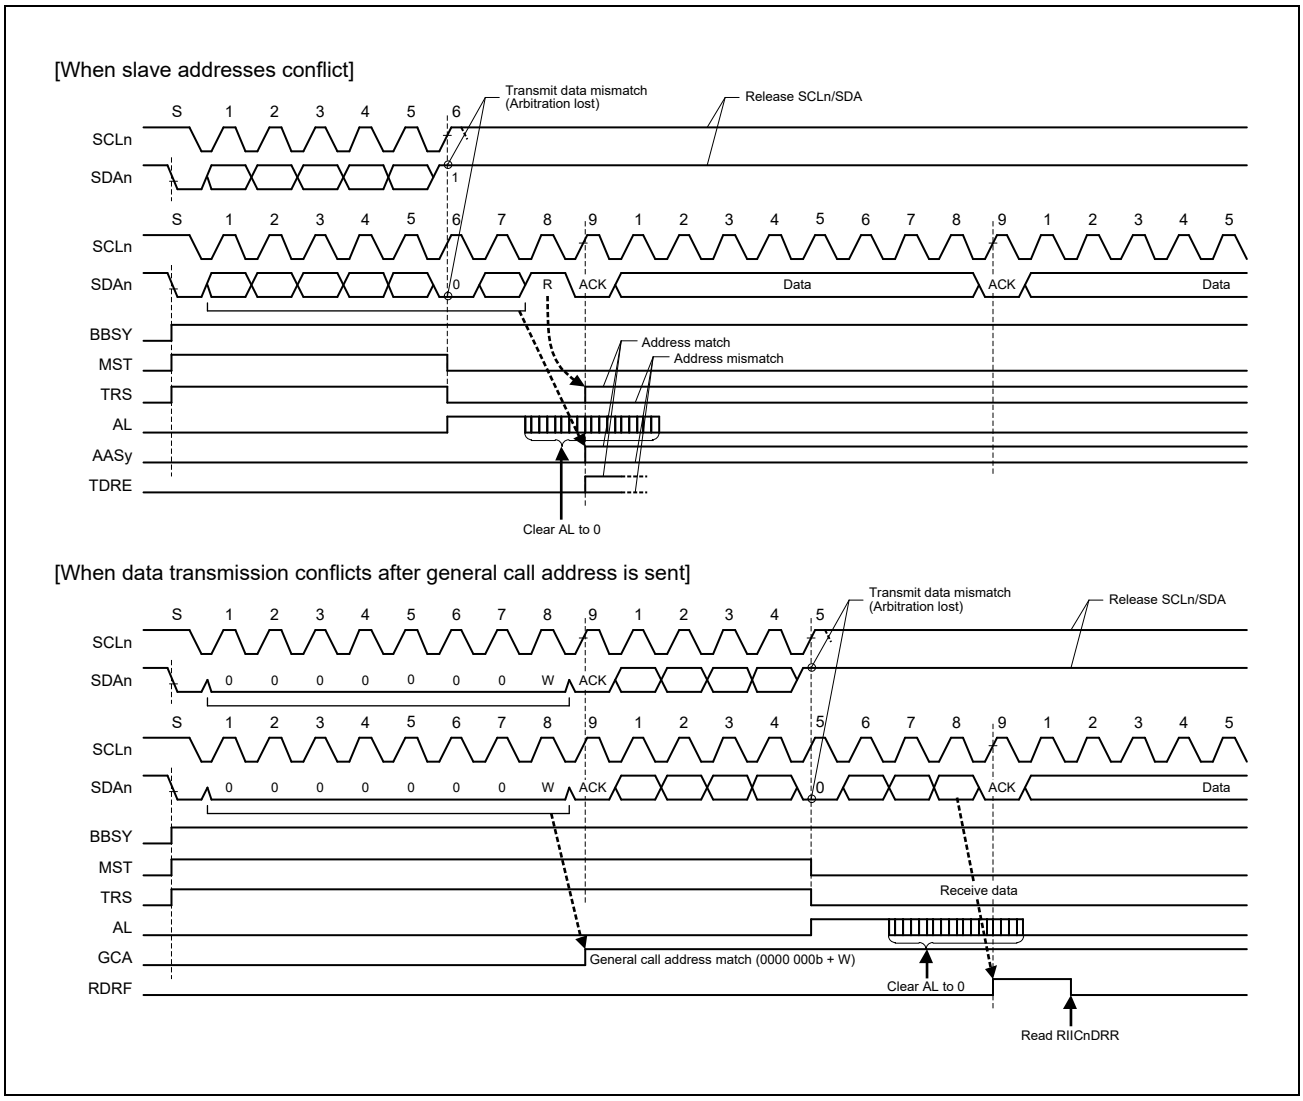

Figure 25.33 Examples of Master Arbitration-Lost Detection (MALE = 1)

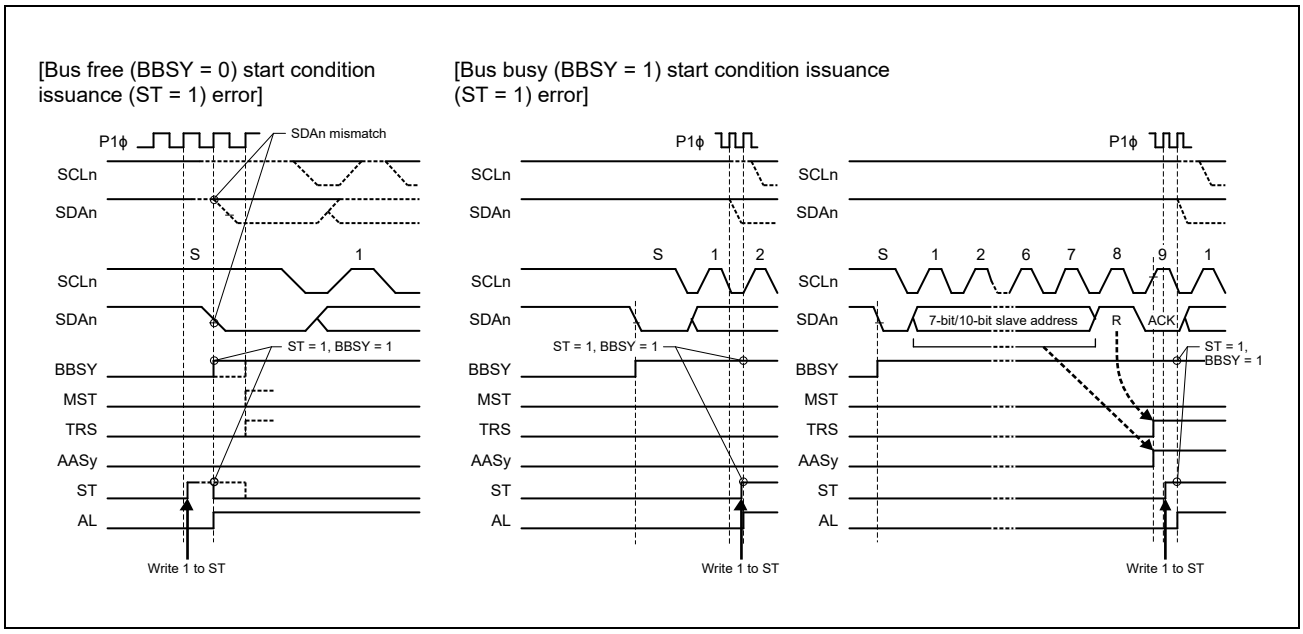

Figure 25.34 Arbitration-Lost when a Start Condition is Issued (MALE = 1)

25.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. **Figure 25.35** shows an example of arbitration-lost detection during transmission of NACK.

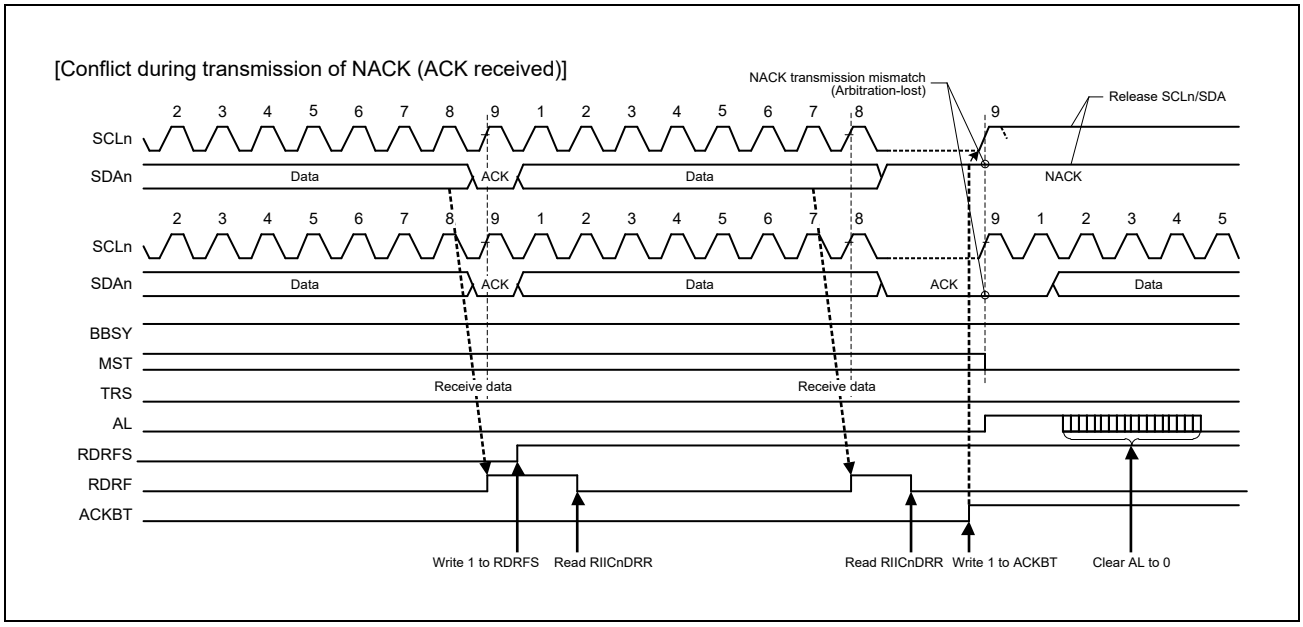

Figure 25.35 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition. Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing (such as H'FF transmission processing)

necessary if the UDID (Unique Device Identifier) of assign address does not match in the Get UDID (general) processing after the Assign address command.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1).

25.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When it loses slave arbitration, the RIIC enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing (processing for the transmission of H'FF).

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled). [Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = 01b)

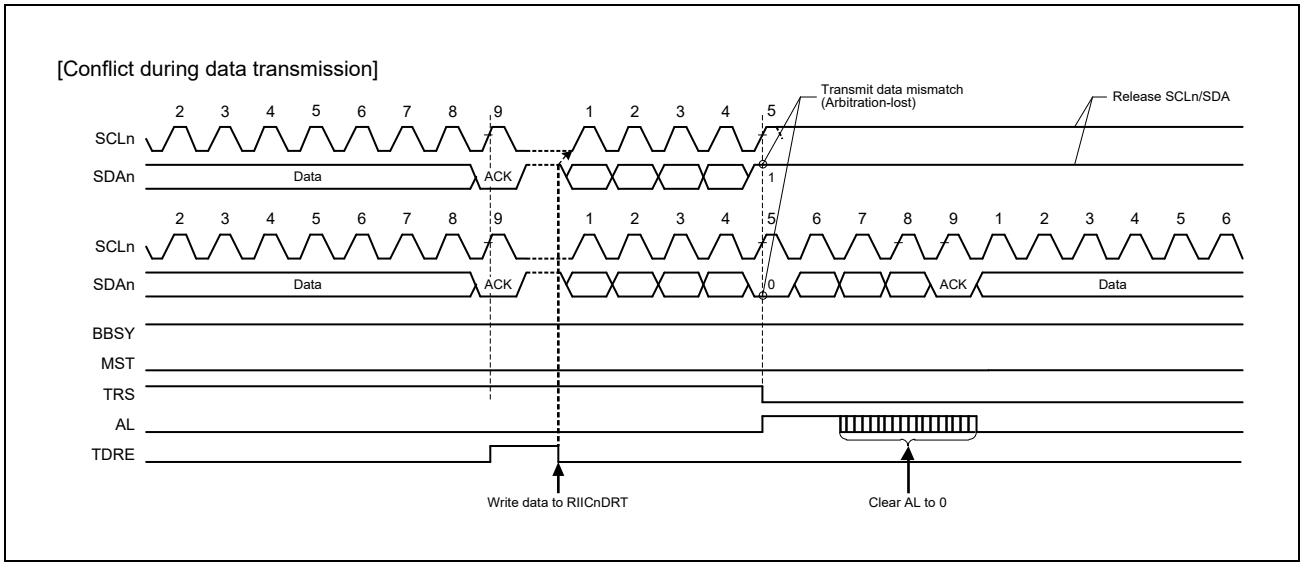

Figure 25.36 Example of Slave Arbitration-Lost Detection (SALE = 1)

25.12 Start Condition/Restart Condition/Stop Condition Issuing Function

25.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

25.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

CAUTION

To issue a restart condition request, set RIICnSR2.RS to 1 after setting RIICnSR2.START to 0. After checking that RIICnSR2.START is 1, set RIICnSR2.START to 0, and then write the slave address to RIICnDRT.

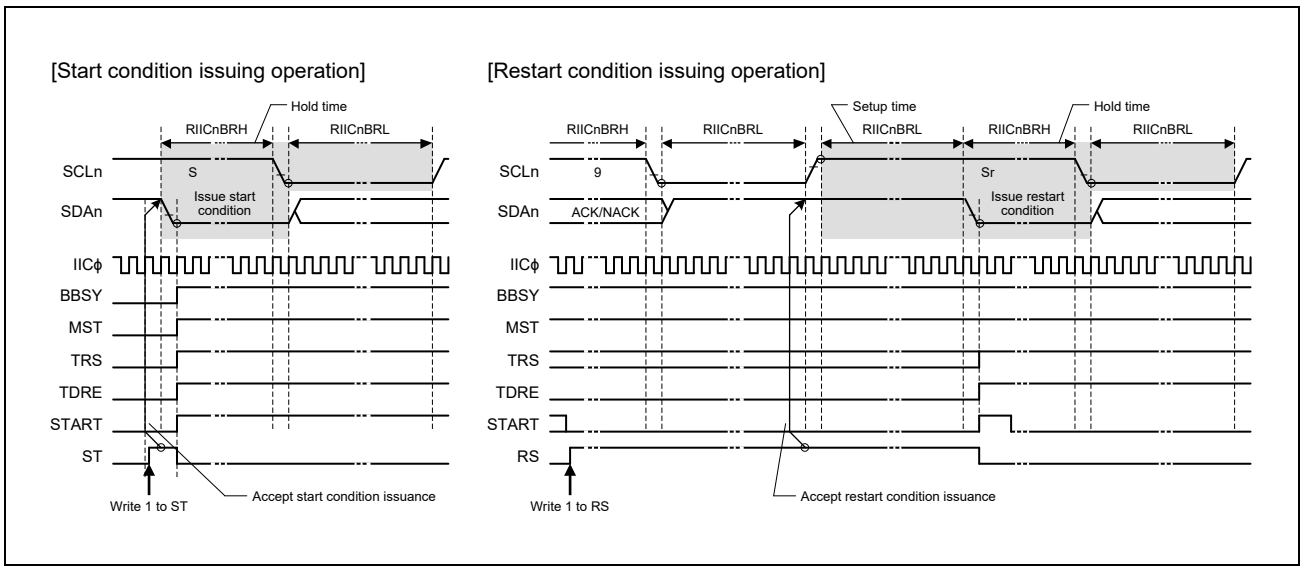

Figure 25.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits)

25.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

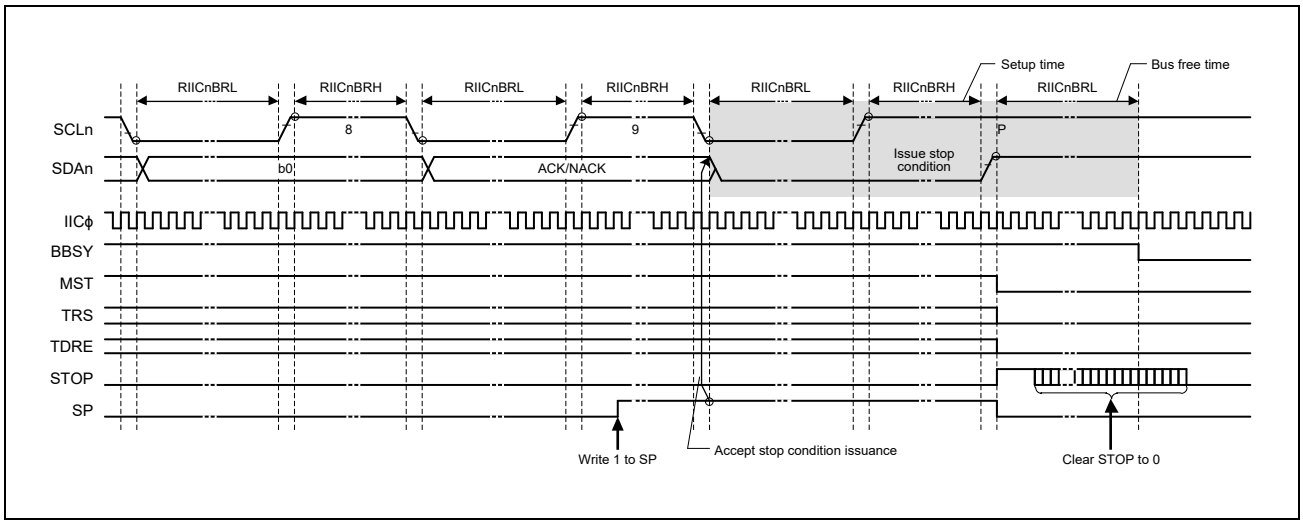

Figure 25.38 Stop Condition Issue Timing (SP Bit)

25.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I^2C bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

25.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time. The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state in which the SCL line is held low or high in the following cases.

1. When the bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1)
2. When the bus is busy (RIICnCR2.BBSY = 1) and the RIIC's own slave address matches (RIICnSR1 is not H'00) in slave mode (RIICnCR2.MST = 0)
3. While the bus is free (RIICnCR2.BBSY = 0) and issuing of a start condition is being requested (RIICnCR2.ST = 1).

The internal counter of the timeout function works using the internal reference clock (IICϕ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

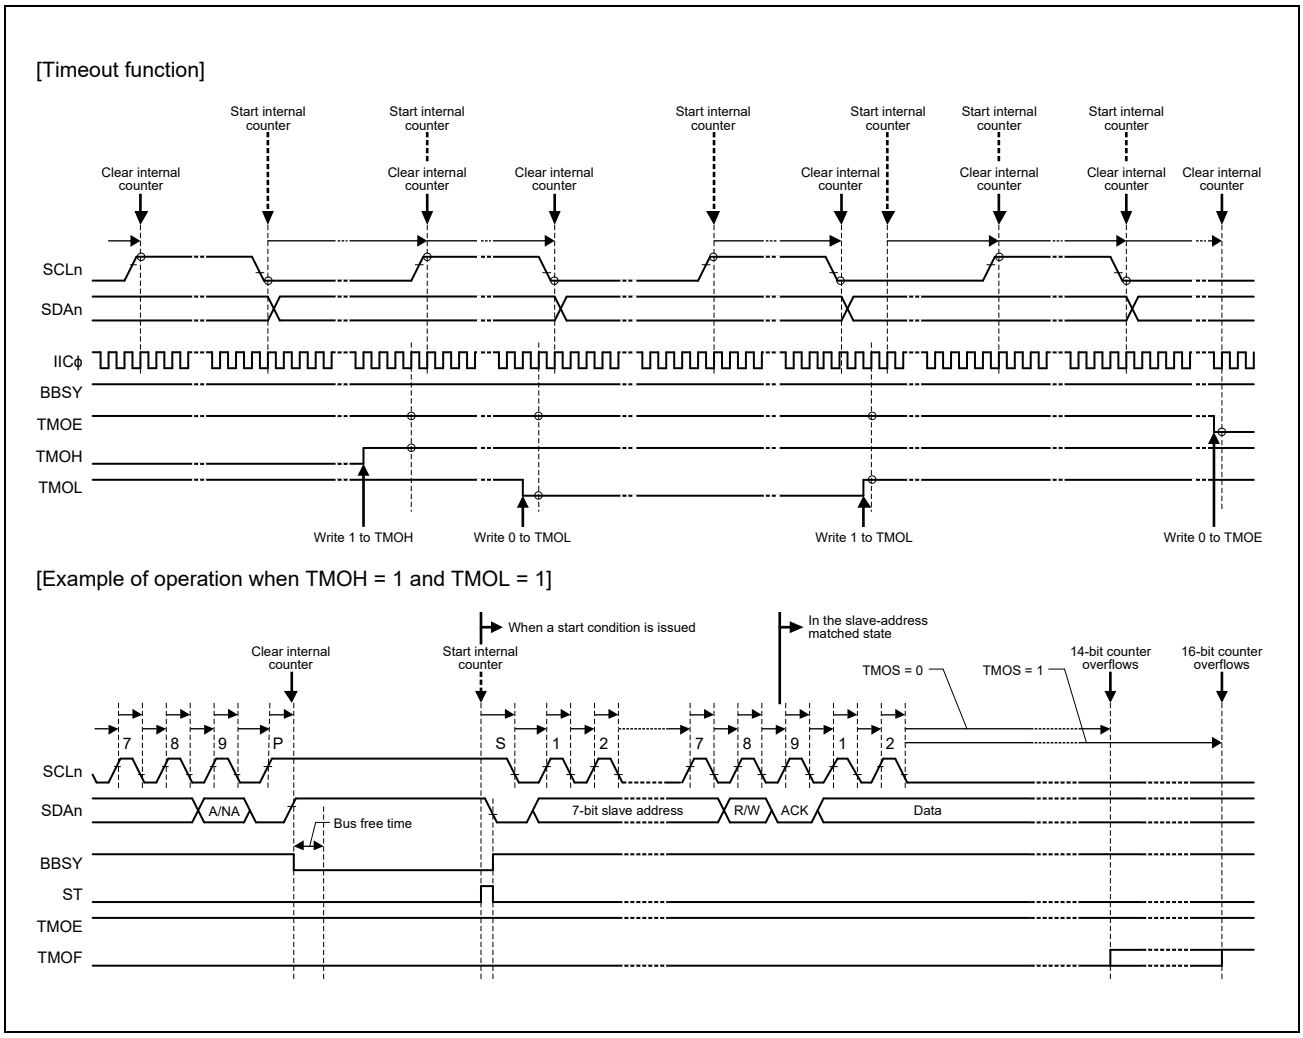

Figure 25.39 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)

25.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. At this point, the SCL pin output is held at a low level if the BBSY flag is 1, or the SCL pin outputs at high level if the BBSY flag is 0. Further clock cycles can consecutively be output by writing 1 to the CLO bit after having read CLO is 0 by software.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

[Output conditions for using the RIICnCR1.CLO bit]

- When the bus is free (RIICnCR2.BBSY flag = 0) or in master mode (RIICnCR2.MST bit = 1 and BBSY flag = 1)
- When the communication device does not hold the SCL line low

Figure 25.40 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

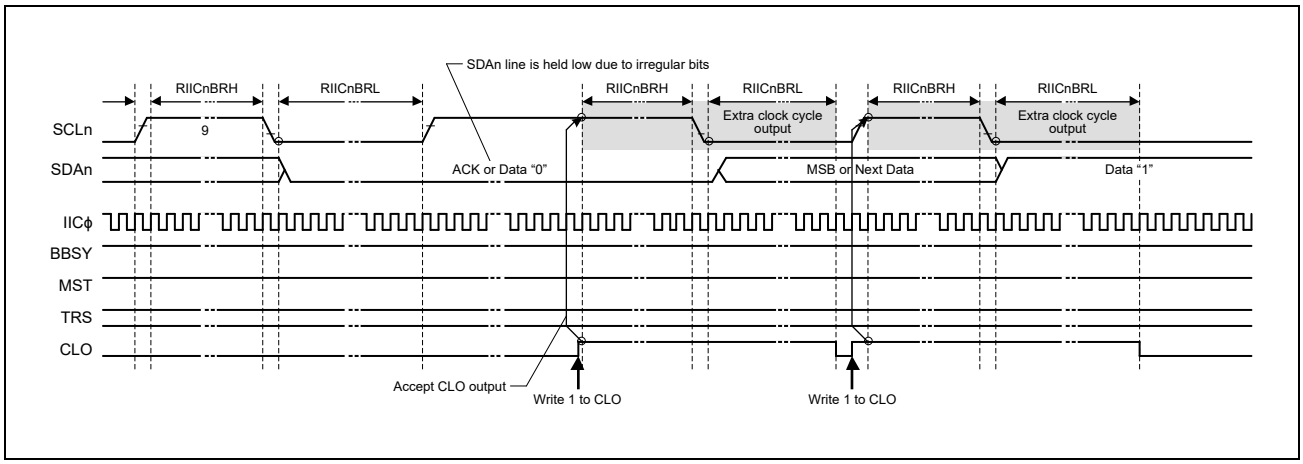

Figure 25.40 Extra SCL Clock Cycle Output Function (CLO Bit)

25.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings. After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoided this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = 01b).

For a detailed description of the RIIC and internal resets, see **Section 25.15, Reset Function of RIIC**.

25.14 SMBus Operation

The RIIC is available for data communication conforming to the SMBus (Version 2.0). To perform SMBus communication, set the RIICnMR3.SMBS bit to 1. To use the transfer rate within a range of 10 kbps to 100 kbps of the SMBus standard, set the RIICnMR1.CKS[2:0] bits, RIICnCBRH, and RIICnBRL. In addition, determine the values of the RIICnMR2.DLCS bit and the RIICnMR2.SDDL[2:0] bits to meet the data hold time specification of 300 ns or more. If the RIIC is used only as a slave device, the transfer rate setting is not necessary. When the RIIC is used only as a slave device, the transfer rate setting is not necessary, whereas the RIICnBRL needs to be set to a value at least the same as the data setup time (250 ns).

For the SMBus device default address (1100_001b), use one of the slave address registers L0 to L2 (RIICnSARL0, RIICnSARL1, and RIICnSARL2), and set the corresponding RIICnSARUy.FS bit (7-bit/10-bit address format select) (y = 0 to 2) to 0 (7-bit address format).

When transmitting the UDID (Unique Device Identifier), set the RIICnFER.SALE bit to 1 to enable the slave arbitration lost detection function.

25.14.1 SMBus Timeout Measurement

(1) Measuring timeout of slave device

The following period (timeout interval: $T_{LOW:SEXT}$) must be measured for slave devices in SMBus communication.

- From start condition to stop condition

  To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the internal timer using a start condition detection interrupt (INTRIICSTI) and stop condition detection interrupt (INTRIICSPI) of the RIIC. The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW:SEXT}$: 25 ms (max.) of the SMBus standard.

  If the time measured with the internal timer exceeds the clock low-level detection timeout TTIMEOUT: 25 ms (min.) of the SMBus standard, the slave device must release the bus by writing 1 to the RIICnCR1.IICRST bit to issue an internal reset of the RIIC. When an internal reset is issued, the RIIC stops driving the bus for the SCL pin and SDA pin and make the SCL/SDA pin outputs high impedance, which releases the bus.

(2) Measuring timeout of master device

The following periods (timeout interval: $T_{LOW:MEXT}$) must be measured for master devices in SMBus communication.

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition

To measure timeout for master devices, measure these periods with the internal timer using a start condition detection interrupt (INTRIICSTI), stop condition detection interrupt (INTRIICSPI), and transmit end interrupt (INTRIICTEI) or receive data full interrupt (INTRIICRI) of the RIIC. The measured timeout period must be within the total clock low-level extended period [master device] $T_{LOW:MEXT}$: 10 ms (max.) of the SMBus standard, and the total of all $T_{LOW:MEXT}$ from start condition to stop condition must be within $T_{LOW:SEXT}$: 25 ms (max.).

For the ACK receive timing (rising edge of the ninth SMBCLK clock cycle), monitor the RIICnSR2.TEND flag in master transmit mode (master transmitter) and the RIICnSR2.RDRF flag in master receive mode (master receiver). For this reason, perform bytewise transmit operation in master transmit mode, and hold the RIICnMR3.RDRFS bit 0 until the byte just before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 at the rising edge of the ninth SMBCLK clock cycle.

If the period measured with the internal timer exceeds the total clock low-level extended period [master device] $T_{LOW:MEXT}$: 10 ms (max.) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout TTIMEOUT: 25 ms (min.) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (writing data to RIICnDRT).

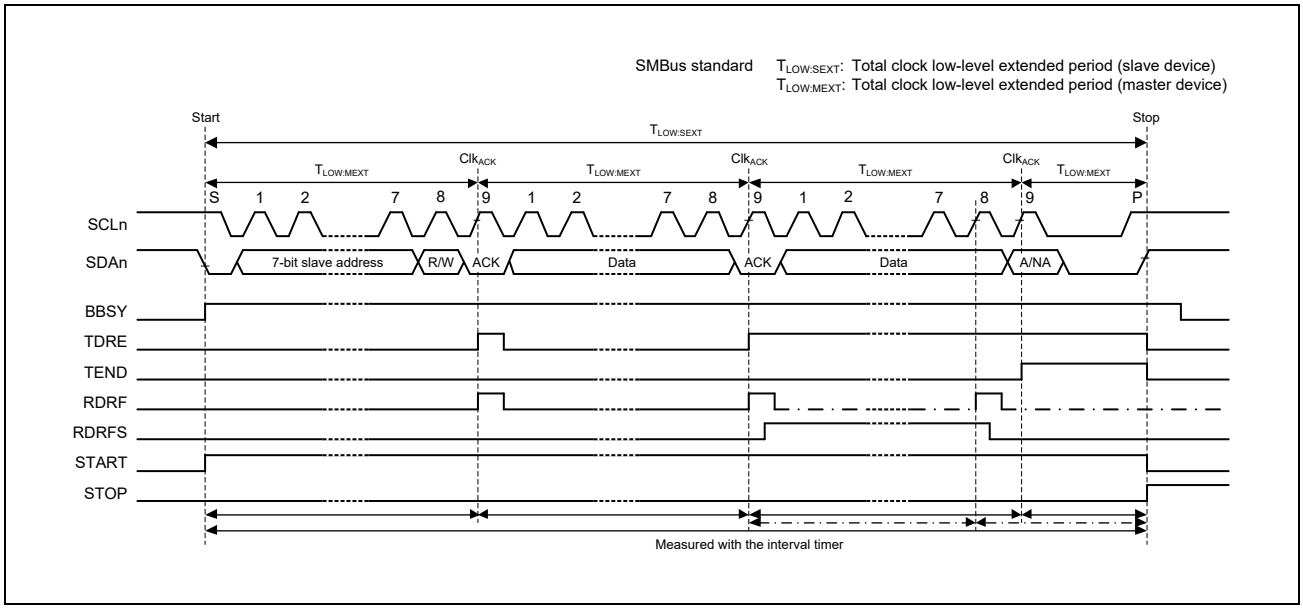

Figure 25.41 SMBus Timeout Measurement

25.14.2 SMBus Host Notification Protocol/Notify ARP Master

In communications over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of (or request the SMBus host for) its own slave address or to request its own slave address from the SMBus host.

For this LSI to operate as an SMBus host (or ARP master), the host address (0001_000b) sent from the slave device must be detected as a slave address, so the RIIC has a function for detecting the host address. To detect the host address as a slave address, set the RIICnMR3.SMBS bit and the RIICnSER.HOAE bit to 1. Operation after the host address has been detected is the same as normal slave operation.

25.15 Reset Function of RIIC

The RIIC has chip reset, RIIC reset, and internal reset functions. **Table 25.13** lists the scope of each reset and reset conditions.

Table 25.13 RIIC Reset Functions (1/2)

Register		RIIC Reset (ICE = 0, IICRST = 1)	Internal Reset (ICE = 1, IICRST = 1)	Start Condition/Restart Condition Detection	Stop Condition Detection

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

26. I3C Bus Interface (I3C)

NOTE

This LSI does not support High-speed mode (Hs-mode) for I2C mode.
Related descriptions of the Hs-mode in this section should be ignored.

26.1 Overview

26.1.1 Functional Overview

The I3C bus interface (I3C) has 1 channel. The I3C module conform with and provide a subset of the NXP I^2C (Inter-Integrated Circuit) bus interface functions and a subset of the MIPI I3C.

Table 26.1 lists the I^2C specifications, and **Table 26.2** lists the I3C specifications.

Table 26.1 I^2C Specifications

Item	Description
Operation mode	Master mode and slave mode selectable
Data handler	Single buffer transfer
Communication protocol	• I^2C bus format – Standard-mode (Sm): Up to 100 kbps – Fast-mode (Fm): Up to 400 kbps – Fast-mode Plus (Fm+): Up to 1 Mbps
Address format	• 7-bit address • 10-bit address
Address detection	• Slave address (static address) (max. 3 address) • General call address • Device ID • Host address • 10-bit slave addressing
Clock stretching	Clock stretching capability
Noise-filter	• Analog noise-filter • Digital noise-filter
Interrupt source	• Rx data buffer full • Tx data buffer empty • START condition detection • STOP condition detection • Transmit end • NACK detection • Arbitration lost • Timeout detection • Wake-up condition detection
Error detection	• NACK received • Arbitration lost error • Timeout error
Wake-Up Source	• Address detection of Slave Address
Operation mode	Master (main master/secondary master) mode and slave mode selectable
Data handler	[Master] Normal FIFO buffer transfer [Slave] Normal FIFO buffer transfer

Table 26.2 I3C Specifications

Item	Description
Communication protocol	• SDR (I3C single data rate) mode – Private message – Broadcast message (common command code) – Direct message (common command code) • Legacy I^2C message – Fast-mode (Fm): up to 400 kbps – Fast-mode Plus (Fm+): up to 1 Mbps
In-band interrupt	• Slave interrupt request • Master ship request (secondary master only) • Hot-join event
Address format	7-bit address
Address detection	• Slave address (static address or dynamic address) • Broadcast address (H'7E)
Clock stalling	Clock stalling capability
Timing Control	• Synchronous Timing Control – Sync Mode: Synchronous Basic Mode • Asynchronous Timing Control – Async Mode 0: Asynchronous Basic Mode – Async Mode 1: Asynchronous Advanced Mode
Interrupt source	• Non-recoverable internal error • Transfer error • Transfer abort • Response queue full • Command queue empty • IBI status queue full • Receive data buffer full • Transmit data buffer empty • Receive status queue full • START condition detection • STOP condition detection • HDR exit pattern detection • Timeout detection • Wake-up condition detection
Error detection	• Non-recoverable internal error • CRC error • Parity error • Frame error • Address header error • Address NACKed or dynamic address assignment NACKed • Receive overflow or transfer underflow error. • Aborted • NACK received for the I^2C write data transfer. • Timeout error
Wake-Up Source	[Master] SDA assert of IBI (START condition detection) [Slave] Address detection of Broadcast Address (H'7E) and Slave Address

Table 26.3 I3C I/O Pins

Function	Pin name	I/O	Description
I3C	I3C_SCL	I/O	Input/output pins for clock
	I3C_SDA	I/O	Input/output pins for data

26.1.2 Block Diagram [I²C/I3C common]

Figure 26.1 shows the main components of this I3C.

26.2 Registers

26.2.1 List of Registers

I3C registers are listed in the following table.

Base Address: H'0_1005_B000 (Cortex-A55 Address Space)
Base Address: H'4005_B000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base Address: H'5005_B000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 26.4 List of I3C Registers (1/3)

Register	Symbol	Offset Address
Protocol Selection Register	PRTS	H'000
Bus Control Register	BCTL	H'014
Master Device Address Register	MSDVAD	H'018
Reset Control Register	RSTCTL	H'020
Present State Register	PRSST	H'024
Internal Status Register	INST	H'030
Internal Status Enable Register	INSTE	H'034
Internal Interrupt Enable Register	INIE	H'038
Internal Status Force Register	INSTFC	H'03C
Device Characteristic Table Register	DVCT	H'044
IBI Notify Control Register	IBINCTL	H'058

	—	—	—	—	—	—	—	HJACK CTL	—	—	—	—	—	—	—	INCBA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	BUSE	0b	R/W	Bus Enable*2 0: I3C bus operation is disabled. 1: I3C bus operation is enabled.
30	RSM	0b	RW1C	Resume*2 Values when read: 0: I3C is running. 1: I3C is suspended (RW1C).
29	ABT	0b	R/W	Abort*1 0: I3C is running. 1: I3C has aborted a transfer.
28 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8	HJACKCTL	0b	R/W	Hot-Join Acknowledge Control*1 0: ACK the Hot-Join request 1: NACK and send broadcast CCC to disable Hot-Join
7	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
0	INCBA	0b	RW	Include I3C Broadcast Address*1 0: Do not include I3C broadcast address for private transfers 1: Include I3C broadcast address for private transfers

Note 1. This bit supports for I3C master mode and I3C secondary master mode.

Note 2. This bit supports for all I3C mode.

INCBA bit (Include I3C Broadcast Address)

This bit controls whether the I3C broadcast address (H'7E) is included for private transfers.

If the I3C broadcast address is not included for private transfers, then IBIs driven from Slaves might not win the arbitration, potentially delaying acceptance of the IBIs.

HJACKCTL bit (Hot-Join Acknowledge Control)

This bit acts as global control to either ACK (0) or NACK (1) all Hot-Join Requests arriving from the Devices on the I3C Bus. If set to NACK (1), then the NACK will be followed by the broadcast CCC to disable Hot-Join.

ABT bit (Abort)

When set to 1, this bit allows I3C to relinquish control of the I3C Bus before completing the currently issued transfer.

In response to an ABORT request, I3C issues the STOP condition on the I3C Bus after the complete data byte is transferred or received.

The Driver shall clear the ABT bit to allow operation on the Bus.

If BCTL.ABT is set and ABORT processing is performed, please ignore ERR_STATUS of Response Descriptor.

RSM bit (Resume)

This bit is used to resume I3C operation following the Halt state.

I3C enters the Halt state (as indicated in register PRSTDBG) as a result of any type of error occurring in a transfer.

The error type is indicated by the field ERR_STATUS in register NRSPQP, NRSQP and NIBIQP).

After I3C has entered the Halt state, the application must write the value 1 to the RSM bit to resume I3C operation. I3C shall auto clear the RSM bit once it has resumed making transfers (it has initiated the next Command).

BUSE bit (Bus Enable)

Enables or disables the operation on the I3C Bus by I3C.

Set the BUSE bit to 1 when using I3C. The SCL and SDA pins are placed in the active state when the BUSE bit is set to 1. Set the BUSE bit to 0 when I3C is not to be used. The SCL and SDA pins are placed in the inactive state when the BUSE bit is set to 0.

If the software sets this bit, then it also confirms that initialization is done, and that I3C can use the programmed register values (For example, generation of SCL on IBI detection, etc.). If this bit is not set, then I3C shall not generate SCL for incoming IBI.

Software may disable I3C bus operation while it is active, however:

- If a disabled request occurs while receiving IBI, the actual disabling will not occur until reception of the IBI is complete.
- When the software reads the value 0 from this field, this indicates that I3C bus operation disable operation has completed.
  If commands remain in the command queue, do not set BUSE = 0.

26.2.4 Master Device Address Register (MSDVAD)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MDYADV	—	—	—	—	—	—	—	—	MDYAD[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	MDYADV	0b	R/W	Master Dynamic Address Valid 0: The master dynamic address field is not valid. 1: The master dynamic address field is valid.
30 to 23	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
22 to 16	MDYAD[6:0]	All 0	R/W	Master Dynamic Address
15 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

MDYAD[6:0] bits (Master Dynamic Address)

This field is used to program I3C master dynamic address. I3C uses this address to respond to master transactions in I3C interface mode (slave or secondary master role).

In I3C main master mode, the software shall program the dynamic address as it self-assigns its dynamic address.

MDYADV bit (Master Dynamic Address Valid)

This bit indicates whether or not the value in the MDYAD field is valid.

In I3C main master mode, the user sets this bit to 1 as it self-assigns its dynamic address.

NOTE

After setting MSDVAD and setting BCTL. BUSE = 1, the device will act as main master.
Without setting MSDVAD, setting SVDCT.TBCR[7:6] = 00b (Device Role Slave), and setting BCTL.BUSE = 1, the device will act as slave.
Without setting MSDVAD, setting MSDCTm.RBCR[7:6] = 01b (Device Role Master), and setting BCTL.BUSE = 1, the device will act as slave.

26.2.5 Reset Control Register (RSTCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTLRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RSQRST	IBIQRST	RDBRST	TDBRST	RSPQRST	CMDQRST	RI3CRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	INTLRST	0b	R/W	Internal Software Reset 0: Releases of some registers and internal state. 1: Resets of some registers and internal state.
15 to 13	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
12 to 9	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8, 7	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
6	RSQRST	0b	R/W	Receive Status Queue Software Reset*2 0: The Receive Status Queue in I3C is not flushed. 1: The Receive Status Queue in I3C is flushed.
5	IBIQRST	0b	R/W	IBI Queue Software Reset*1 0: The IBI Queues in I3C is not flushed. 1: The IBI Queues in I3C is flushed.
4	RDBRST	0b	R/W	Receive Data Buffer Software Reset*1 0: The Receive Queues in I3C is not flushed. 1: The Receive Queues in I3C is flushed.
3	TDBRST	0b	R/W	Transmit Data Buffer Software Reset*1 0: The Transmit Queues in I3C is not flushed. 1: The Transmit Queues in I3C is flushed.
2	RSPQRST	0b	R/W	Response Queue Software Reset*1 0: The Response Queues in I3C is not flushed. 1: The Response Queues in I3C is flushed.
1	CMDQRST	0b	R/W	Command Queue Software Reset*1 0: The Command Queues in I3C is not flushed. 1: The Command Queues in I3C is flushed.
0	RI3CRST	0b	R/W	I3C Software Reset 0: Release I3C reset. 1: Initiate I3C reset.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I3C secondary master mode and I3C slave mode.

For details on reset for each register, refer to **Section 26.5, Reset Descriptions**.

RI3CRST bit (I3C Software Reset)

On Driver setting this bit to 1, I3C shall be reset and disabled.

All registers shall return to their reset values, and the software shall re-initialize I3C.

This field is cleared automatically upon I3C reset completion. This field also resets all Queues in I3C.

CMDQRST bit (Command Queue Software Reset)

On software setting this bit to 1, the Command Queues in I3C shall be flushed.

This field shall be cleared automatically upon Command Queue reset completion.

RSPQRST bit (Response Queue Software Reset)

On software setting this bit to 1, the Response Queues in I3C shall be flushed.

This field shall be cleared automatically upon Response Queue reset completion.

TDBRST bit (Transmit Data Buffer Software Reset)

On software setting this bit to 1, the Transmit Data Buffers in I3C shall be flushed.

This field shall be cleared automatically upon Transmit Data Buffer reset completion.

RDBRST bit (Receive Data Buffer Software Reset)

On software setting this bit to 1, the Receive Data Buffers in I3C shall be flushed.

This field shall be cleared automatically upon completion of Receive Data Buffer reset.

IBIQRST bit (IBI Queue Software Reset)

On software setting this bit to 1, the IBI Queues in I3C shall be flushed.

This field shall be cleared automatically upon completion of IBI Queue reset.

RSQRST bit (Receive Status Queue Software Reset)

On software setting this bit to 1, the Receive Status Queues in I3C shall be flushed. This field shall be cleared automatically upon Receive Status Queue reset completion.

INTLRST bit (Internal Software Reset)

When set to 1, some of registers is reset. For details on the registers to be reset, refer to **Section 26.5, Reset Descriptions**.

NOTE

Programming this field while it contains a value of 1 may result in undefined behavior.

26.2.6 Present State Register (PRSST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	PRSSTWP	—	—	TRMD	—	CRMS	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	R	R	R	R	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
7	PRSSTWP	0b	W	Present State Write Protect*2 0: CRMS bit is protected. 1: CRMS bit can be written when writing simultaneously with the value of the target bit.
6, 5	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
4	TRMD	0b	R	Transmit/Receive Mode*3 0: Receive mode 1: Transmit mode
3	—	0b	R	Reserved These bits are read as 0. The write value should be 0.
2	CRMS	0b	R/W*1	Current Master*2 0: The Master is not the Current Master and must request and acquire bus ownership before initiating any transfer. 1: The Master is the Current Master, and as a result can initiate transfers.
1, 0	—	00b	R	Reserved These bits are read as 0. The write value should be 0.

Note 1. When the PRSSTWP bit is set to 1, the CRMS bit can be written to.

Note 2. This bit supports for I^2C, I3C master, and I3C secondary master mode.

Note 3. This bit supports for I^2C mode.

CRMS bit (Current Master)

Indicates the set condition and reset condition of each operation mode.

Operation Mode [I^2C/I3C common]

[Clearing conditions]

- When 1 written to the RSTCTL.RI3CRST by the software.
- When 1 written to the RSTCTL.INTLRST by the software.
- When 0 written to the PRSST.CRMS by the software.
- When STOP is issued.
- When Master Arbitration-Lost.

[Setting conditions]

- When 1 written to the PRSST.CRMS by the software.
- When START is issued.

Operation Mode [I3C Main Master]

[Clearing conditions]

- When 0 written to the MSDVAD.MDYADV by the software.
- When GETACCMST transmission is successfully completed by issuing STOP, after responding ACK to the Mastership-Request received from the Secondary Master.

[Setting conditions]

- When 1 written to the MSDVAD.MDYADV by the software.
- When GETACCMST reception is successfully completed by issuing STOP, after the ACK is responded to the Mastership-Request transmitted to the Secondary Master.

Operation Mode [I3C Secondary Master]

[Clearing condition]

- When GETACCMST transmission is successfully completed by issuing STOP, after responding ACK to the Mastership-Request received from the Non-Current Master.

[Setting condition]

- When GETACCMST reception is successfully completed by issuing STOP, after the ACK is responded to the Mastership-Request transmitted to the Current Master.

The PRSST register returns I3C current state.

State has two parts: this register, which is mandatory, and an additional optional PRSST_DEBUG register intended for debug purposes (see the Debug Capability Registers in the Extended Capabilities list).

TRMD bit (Transmit/Receive Mode*3)

This bit indicates transmit or receive mode.

I3C is in receive mode when the TRMD bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the CRMS bit indicates the operating mode of I3C.

The value of TRMD bit is automatically changed to 1 for transmit mode or 0 for receive mode by issuing or detection of a START condition and setting of the R/W# bit.

[Setting conditions]

- When a START condition is issued normally according to the START condition issuance request (when a START condition is detected with the CNDCTL.STCND bit set to 1).
- When a Repeated START condition is issued normally according to the Repeated START condition issuance request (when a Repeated START condition is detected with the CNDCTL.SRCND bit set to 1).
- When the R/W# bit added to the slave address is set to 0 in master mode.
- When the address received in slave mode matches the address enabled in SVCTL, with the R/W# bit set to 1.

[Clearing conditions]

- When a STOP condition is detected.
- The ALF (arbitration-lost) flag in BST being set to 1.

- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended.
- In slave mode, a match between the received address and the address enabled in SVCTL when the value of the received R/W# bit is 0 (including cases where the received address is the general call address).
- In slave mode, a Repeated START condition is detected (a Repeated START condition is detected with BCST.BFREF = 0 and CRMS = 0).

PRSSTWP bit (Present State Write Protect)

PRSSTWP is always 0 when reading.

When writing to PRSST, writing 1 to this bit at the same time enables writing to CRMS bit.

26.2.7 Internal Status Register (INST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	INEF	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W*1	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10	INEF	0b	R/W*1	Internal Error Flag 0: I3C Internal Error has not detected. 1: I3C Internal Error has detected.
9 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Note: This register supports for all I3C mode.

Note 1. Clearing (to 0) condition: Writing 0 after the 1 state is read.

The Interrupt Status register reflects the status of outstanding interrupt (s).

The status fields are either RW0C (write 0 to clear), or else are cleared based on queue operations.

INEF bit (Internal Error Flag)

When this bit is 1, it indicates that I3C Internal Error has detected.

When this bit is 0, it indicates that I3C Internal Error has not detected.

[Setting conditions]

- The following 1 is satisfied and any of the following 2 to 9 are satisfied.

1. The INSTE.INEE bit = 1
2. When transmit data is written to the Transmit Data Buffer that is completely full.
3. When received data is read from the Receive Data Buffer that is completely empty.
4. When Command Descriptor is written to the Command Queue that is completely full.
5. When Response Descriptor is read from the Response Status Queue that is completely empty.
6. When Receive Status Descriptor is read from the Receive Status Queue that is completely empty.
7. When IBI Status Descriptor is read from the IBI Queue under the condition that the IBI Queue is completely empty and PRSST.CRMS = 1.
8. When IBI Data is written to the IBI Queue under the condition that the IBI Queue is completely full and PRSST.CRMS = 0.
9. When the Response Status Queue, IBI Status Queue or Receive Status Queue overflows.

[Clearing condition]

- When 0 is written to the INEF bit after reading INEF bit = 1.

26.2.8 Internal Status Enable Register (INSTE)

R/W	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10	INEE	0b	R/W	Internal Error Enable 0: Disable INST.INEF 1: Enable INST.INEF
9 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Note: This register supports for all I3C mode.

INEE bit (Internal Error Enable)

- When this bit set to 1, it enables detection of I3C Internal Error.
- When this bit set to 0, it disables detection of I3C Internal Error.

26.2.9 Internal Interrupt Enable Register (INIE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	INEIE	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10	INEIE	0b	R/W	Internal Error Interrupt Enable 0: Disables Non-recoverable Internal Error Interrupt Signal. 1: Enables Non-recoverable Internal Error Interrupt Signal.
9 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Note: This register supports for all I3C mode.

INEIE bit (Internal Error Interrupt Enable)

When set to 1 and register INEF is set, the hardware Controller asserts an interrupt to the Host.

26.2.10 Internal Status Force Register (INSTFC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10	INEFC	0b	W	Internal Error Force 0: Not force a specific interrupt 1: Force a specific interrupt
9 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Note: This register supports for all I3C mode.

INEFC bit (Internal Error Force)

For debug, helps to force this interrupt.

26.2.11 Device Characteristic Table Register (DVCT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IDX[4:0]					—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are read as 0.
23 to 19	IDX[4:0]	All 0	R	DCT Table Index Current index of the DCT, which is used as the starting index for the I3C ENTDAA CCC.
18 to 0	—	All 0	R	Reserved These bits are read as 0.

Note: This register supports for I3C master mode and I3C secondary master mode.

IDX[4:0] bits (DCT Table Index)

Once the complete characteristics of device that won the arbitration are written to the DCT (during ENTDAA using Address Assignment Command) this index is incremented by 1.

Notes: How to check the progress of ENTDAA using this bit:

1. Read the value of this bit before setting the Command Descriptor for issuing the ENTDAA command.
2. After starting the ENTDAA command, until the value of this bit is updated (that is, it changes from the value read in advance), it indicates that the Dynamic Address is being assigned to the device specified by the first index value (value set in DEV_INDEX [4:0] of Command Descriptor).
3. After the value of this bit is updated, it indicates that Dynamic Address is being assigned according to the value set in DEV_INDEX [4:0] and DEV_COUNT [3:0] of Command Descriptor to the device of the first index value or later.

26.2.12 IBI Notify Control Register (IBINCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	NRSIRCTL	—	NRMRCTL	NRHJCTL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
3	NRSIRCTL	0b	R/W	Notify Rejected Slave Interrupt Request Control 0: Do not pass rejected IBI Status to the IBI Queue/Rings, if the incoming SIR is NACKed and is auto disabled based on DVSIRRJ field in relevant DAT entry. 1: Pass rejected IBI Status to the IBI Queue/Rings, if the incoming SIR is NACKed and is auto disabled based on DVSIRRJ field in relevant DAT entry.
2	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
1	NRMRCTL	0b	R/W	Notify Rejected Master Request Control 0: Do not pass rejected IBI Status to IBI Queue/Ring, if the incoming Master Request is NACKed and is auto disabled based on DVMRRJ field in relevant DAT entry. 1: Pass rejected IBI Status to the IBI Queue, if the incoming Master Request is NACKed and is autodisabled based on DVMRRJ field in relevant DAT entry.
0	NRHJCTL	0b	R/W	Notify Rejected Hot-Join Control 0: Do not pass rejected IBI Status to IBI Queue, if the incoming HotJoin request is NACKed and is autodisabled based on field HJACKCTL of BCTL. 1: Pass rejected IBI Status to the IBI Queue, if the incoming Hot Join request is NACKed and is autodisabled based on field HJACKCTL of BCTL.

Note: This register supports for I3C master mode and I3C secondary master mode.

NRHJCTL bit (Notify Rejected Hot-Join Control)

Enables or disables reporting rejection of individual Hot Join requests.

NRMRCTL bit (Notify Rejected Master Request Control)

Enables or disables reporting rejection of individual Master Requests.

NRSIRCTL bit (Notify Rejected Slave Interrupt Request Control)

Enables or disables reporting rejection of individual Slave Interrupt Requests (SIR).

26.2.13 Bus Function Control Register (BFCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HSME	FMPE	—	—	—	—	—	SCSYNE	—	—	—	—	—	SALE	NALE	MALE
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15	HSME	0b	R/W	High Speed Mode Enable*1 0: Disable High Speed Mode. 1: Enable High Speed Mode.
14	FMPE	0b	R/W	Fast-mode Plus Enable*1 0: No Fm+ slope control circuit uses for the SCLn pin and SDAn pin. (n = 0) 1: An Fm+ slope control circuit uses for the SCLn pin and SDAn pin. (n = 0)
13	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
12	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8	SCSYNE	1b	R/W	SCL Synchronous Circuit Enable*1 0: No SCL synchronous circuit uses. 1: An SCL synchronous circuit uses.
7 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2	SALE	0b	R/W	Slave Arbitration-Lost Detection Enable*1 0: Slave arbitration-lost detection disables. 1: Slave arbitration-lost detection enables.
1	NALE	0b	R/W	NACK Transmission Arbitration-Lost Detection Enable*1 0: NACK transmission arbitration-lost detection disables. 1: NACK transmission arbitration-lost detection enables.
0	MALE	1b	R/W	Master Arbitration-Lost Detection Enable*1 0: Master arbitration-lost detection disables. Disables the arbitration-lost detection function and does not clear the CRMS and TRMD bits in PRSST automatically when arbitration is lost. 1: Master arbitration-lost detection enables. Enables the arbitration-lost detection function and clears the CRMS and TRMD bits in PRSST automatically when arbitration is lost.

Note 1. This bit supports for I^2C mode.

MALE bit (Master Arbitration-Lost Detection Enable)

This bit is used to specify whether to use the arbitration-lost detection function in master mode. Normally, set this bit to 1.

NALE bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when ACK is detected during transmission of NACK in receive mode (such as when slaves with the same address exist on the bus or when two or more masters select the same slave device simultaneously with different number of receive bytes).

SALE bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

SCSYNE bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with the SCL input clock. Normally, set this bit to 1.

When the SCSYNE bit set to 0 (no SCL synchronous circuit used), I3C does not synchronize the SCL clock with the SCL input clock. In this setting, I3C outputs the SCL clock with the transfer rate set in STDBR and EXTBR regardless of the SCLn line state. For this reason, if the bus load of the I^2C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit uses, it also affects the issuance of a START condition, Repeated START condition, and STOP condition, and the continuous output of extra SCL clock cycles.

This bit must not be set to 0 except for checking the output of the set transfer rate.

FMPE bit (Fast-mode Plus Enable*1)

This bit is used to specify whether to use a slope control circuit for Fast mode Plus [Fm+].

When this bit is set to 1, a slope control circuit conforming to the Fast-mode Plus [Fm+] slope control specification (tof) of the I3C-bus is selected. When this bit is set to 0, a slope control circuit conforming to the Standard-mode [Sm] and Fast- mode [fm] slope control specification (tof) of the I3C-bus is selected.

Set this bit to 1 when using the transmission rate within a range up to 1 Mbps (Fast-mode Plus [Fm+]) of the I3C-bus specification. Set this bit to 0 when using the transmission rate at other rates (up to 100 kbps [Sm], up to 400 kbps [Fm]).

Note: When communicating in Hs-mode, set as follows.
- Set FMPE to 0 when sending Hs-mode master code (0000_1XXXb) with Fast-mode.
- Set FMPE to 1 when sending Hs-mode master code (0000_1XXXb) with Fast-mode Plus.

HSME bit (High Speed Mode Enable)

This bit is used for communicating in Hs-mode.

When this bit is set to 1, the Hs-mode master code is recognized, and Hs-mode communication is possible.

After the START condition is detected, if Hs-mode master code (0000 1XXXb) transmission is recognized, Hs-mode communication starts from Repeated START after receiving the NACK response.

It communicates at the bit rate set in STDBR until the NACK response, and automatically switches from Repeated START condition issuance after receiving the NACK response to the bit rate set in EXTBR.

Hs-mode continues until a STOP condition is detected.

When the STOP condition is detected, the bit rate is automatically switched to the bit rate set in STDBR.

Note: When this bit is set to 1, the BST.NACKDF bit will not be set even if a NACK response is received after sending the Hs-mode master code.

26.2.14 Slave Control Register (SVCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SVAE[2:0]

	HOAE	—	—	—	—	—	—	—	—	DVIDE	HSMCE	—	—	—	—	GCAE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
18 to 16	SVAE[2:0]	000b	R/W	Slave Address Enable [2:0]*2 0: Slave [2:0] disables 1: Slave [2:0] enables
15	HOAE	0b	R/W	Host Address Enable*1 0: Host address detection disables. 1: Host address detection enables.
14 to 7	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
6	DVIDE	0b	R/W	Device-ID Address Enable*1 0: Device-ID address detection disables. 1: Device-ID address detection enables.
5	HSMCE	0b	R/W	Hs-mode Master Code Enable*1 0: Hs-mode Master Code Detection disables. 1: Hs-mode Master Code Detection enables.
4 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
0	GCAE	0b	R/W	General Call Address Enable*1 0: General call address detection disables. 1: General call address detection enables.

Note 1. This bit supports for I^2C mode.

Note 2. These bits support for I^2C, I3C secondary master, and I3C slave mode.

GCAE bit (General Call Address Enable) (y = 0 to 2)

This bit is used to specify whether to ignore the general call address (000_0000 + 0 (write): All 0) when it is received.

- When this bit is set to 1, if the received slave address matches the general call address, I3C recognizes the received slave address as the general call address independently of the slave addresses set in the SVDVADy.SVAD[9:0] bits (n = 0) and performs data receive operation.
- When this bit is set to 0, the received slave address is ignored even if it matches the general call address.

HSMCE bit (Hs-mode Master Code Enable)

This bit is used to specify whether to recognize and execute the Hs-mode master code (00001xxxb) is received in the first byte after a START condition is detected.

- When this bit is set to 1, if the received first byte matches the Hs-mode master code, IIC recognizes that the Hs-mode master code has been received.
  The first byte after Repeated START after NACK response to Hs-mode master code is recognized as a slave address and compared with the slave address set by SVDVADy.SVAD[9:0].
  If the addresses match, the transmission/reception operation continues according to the R/W# bit value.
  Hs-mode continues until a STOP condition is detected.
- When this bit is set to 0, I3C will ignore the pattern until a STOP condition is detected, even if it matches the Hs-mode master code.

Note: When this bit is set to 1, SCSTRCTL.ACKTWE bit must be set to 0 and SCSTRCTL.RWE bit must be set to 1.

DVIDE bit (Device-ID Address Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID (1111 100) is received in the first byte after a START condition or Repeated START condition is detected.

- When this bit is set to 1, if the received first byte matches the Device-ID, I3C recognizes that the Device-ID address has been received. When the following R/W# bit is 0 (write), I3C recognizes the second and the following bytes as slave addresses and continues the receive operation.
- When this bit is set to 0, I3C ignores the received first byte even if it matches the Device ID address and recognizes the first byte as a normal slave address.

For details on the Device-ID address detection, refer to **Section 26.3.2.3(4)(c), Device-ID Address Detection [I2C mode]**.

SVAE[2:0] bits (Slave Address Enable [2:0]) (y = 0 to 2)

This bit is used to enable or disable the slave address set in the SVDVADy.SVAD[9:0] bits.

- When this bit is set to 1, the slave address set in the SVAD[9:0] bits is enabled and is compared with the received slave address.
- When this bit is set to 0, the slave address set in the SVAD[9:0] bits is disabled and is ignored even if it matches the received slave address.

26.2.15 Reference Clock Control Register (REFCKCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2 to 0	IREFCKS[2:0] *1	000b	R/W	Internal Reference Clock Selection Selects the internal reference clock source (I3Cϕ) for I3C. 0 0 0: PCLKD/1 clock 0 0 1: PCLKD/2 clock 0 1 0: PCLKD/4 clock 0 1 1: PCLKD/8 clock 1 0 0: PCLKD/16 clock 1 0 1: PCLKD/32 clock 1 1 0: PCLKD/64 clock 1 1 1: PCLKD/128 clock

Note 1. Set the IREFCKS[2:0] bit to 000 in I3C mode.

26.2.16 Standard Bit Rate Register (STDBR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSBRPO	—	SBRHP[5:0]						—	—	SBRLP[5:0]					
Initial Value	0	0	1	1	1	1	1	1	0	0	1	1	1	1	1	1
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SBRHO[7:0]								SBRLO[7:0]							
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DSBRPO	0b	R/W	Double the Standard Bit Rate Period for Open-Drain*4 0: The time period set for SBRHO[7:0] and SBRLO[7:0] is not doubled. 1: The time period set for SBRHO[7:0] and SBRLO[7:0] is doubled.
30	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
29 to 24	SBRHP[5:0]	All 1	R/W	Standard Bit Rate High-Level Period Push-Pull*3 Count value of the high-level period of SCL clock
23, 22	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
21 to 16	SBRLP[5:0]	All 1	R/W	Standard Bit Rate Low-level Period Push-Pull*2 Count value of the low-level period of SCL clock
15 to 8	SBRHO[7:0]	All 1	R/W	Count value of the High-level period of SCL clock*1
7 to 0	SBRLO[7:0]	All 1	R/W	Count value of the Low-level period of SCL clock*1

Note 1. These bits support for I2C, I3C master, and I3C secondary master mode.

Note 2. These bits support for I3C master mode and I3C secondary master mode.

Note 3. These bits support for all I3C mode.

Note 4. This bit supports for I2C, I3C master, and I3C secondary master mode.

The STDBR register sets the bit rate according to the operating speed.

- I2C mode: Bit rate setting when communicating with Standard-mode / Fast-mode / Fast-mode plus
- I3C master mode: Bit rate setting selected by mode bit of command descriptor
- I3C slave mode: I3C bit rate setting

The I2C transfer rate and the SCL clock duty are calculated using the following expression.

Transfer rate = 1 / {[(High-Level Period + α*1) + (Low-Level Period + α)] / I3Cϕ*2 + SCLn line rising time [tr]*3 + SCLn line falling time [tf]*3}

Duty cycle = {SCLn line rising time [tr] + (High-Level Period + α) / I3Cϕ} / {SCLn line falling time [tf] + (Low-Level Period + α) / I3Cϕ}

Note 1. α depend on the number of stages in the noise filter.

Note 2. I3Cϕ = PCLKD × Division ratio

Note 3. The SCLn line rising time [tr] and SCLn line falling time [tf] depend on the total bus line capacitance [Cb] and the pull-up resistor [Rp]. For details, see the I2C-bus specification from NXP Semiconductors.

The I3C transfer rate and the SCL clock duty are calculated using the following expression.

Transfer rate = 1 / [(High-Level Period + Low-Level Period) / I3Cϕ + SCLn line rising time [tr] + SCLn line falling time [tf]]

Duty cycle = [SCLn line rising time [tr] + High-Level Period / I3Cϕ] / [SCLn line falling time [tf] + Low-Level Period / I3Cϕ]

SBRLO[7:0] bits (Count value of the Low-level period of SCL clock)

The SBRLO[7:0] bits are used to set the low-level period of SCL clock in Open-Drain mode.

I3C counts the low-level period with the internal reference clock source (I3Cϕ) specified by the REFCKCTL.IREFCKS[2:0] bits. It also works to generate the data setup time for automatic SCL low-hold operation (refer to **Section 26.3.2.3(6), Clock Stretching [I2C mode]**); when I3C is used in I^2C slave mode, these bits need to be set to a value longer than the data setup time*1.

If the digital noise filter is enabled (INCTL.DNFE = 1), set the SBRLO[7:0] bits to a value at least one greater than the number of stages in the noise filter. Regarding the number of stages in the noise filter, see the description of the INCTL.DNFS[3:0] bits.

Note 1. Data setup time (tSU: DAT)
250 ns (up to 100 kbps: Standard-mode [Sm])
100 ns (up to 400 kbps: Fast-mode [Fm])
50 ns (up to 1 Mbps: Fast-mode plus [Fm+])
10 ns (up to 3.4 Mbps: Hs-mode [HS])

SBRHO[7:0] bits (Count value of the High-level period of SCL clock)

The SBRHO[7:0] bits use to set the high-level period of SCL clock in Open-Drain mode. SBRHO[7:0] bits are valid in master mode. If I3C is used only in I^2C slave mode, these bits need not to set the high-level period.

I3C counts the high-level period with the internal reference clock source (I3Cϕ) specified by the REFCKCTL.IREFCKS[2:0] bits.

If the digital noise filter is enabled (the INCTL.DNFE bit = 1), set the SBRHO[7:0] bits to a value at least one greater than the number of stages in the noise filter. Regarding the number of stages in the noise filter, see the description of the INCTL.DNFS[3:0] bits.

SBRLP[5:0] bits (Standard Bit Rate Low-level Period Push-Pull)

SBRLP[5:0] bits are used to set the low-level period of SCL clock in Push-Pull.

I3C counts the low-level period with the internal reference clock source (I3Cϕ) specified by the REFCKCTL.IREFCKS[2:0] bits.

If the digital noise filter is enabled (the INCTL.DNFE bit = 1), set the SBRLP[5:0] bits to a value at least one greater than the number of stages in the noise filter. Regarding the number of stages in the noise filter, see the description of the INCTL.DNFS[3:0] bits.

SBRHP[5:0] bits (Standard Bit Rate High-Level Period Push-Pull)

SBRHP[5:0] bits is used to set the high-level period of SCL clock in Push-Pull mode.

SBRHP[5:0] bits are valid in master mode. If I3C is used only in I^2C slave mode, these bits need not to set the high-level period.

I3C counts the high-level period with the internal reference clock source (I3Cϕ) specified by the REFCKCTL.IREFCKS[2:0] bits.

If the digital noise filter is enabled (the INCTL.DNFE bit = 1), set the SBRHP[5:0] bits to a value at least one greater than the number of stages in the noise filter. Regarding the number of stages in the noise filter, see the description of the INCTL.DNFS[3:0] bits.

DSBRPO bit (Double the Standard Bit Rate Period for Open-Drain)

When DSBRPO = 1, double the high-level period that is set in SBRHO[7:0] and double the low-level period that is set in SBRLO[7:0].

Table 26.5 Requirement and Usage of Setting in Each Mode

	Device Mode				
Bit Name	I^2C Master	I^2C Slave	I3C Master	I3C Secondary Master	I3C Slave
SBRHP[5:0]	do not use	do not use	Setting required*3	Setting required*4	do not use
SBRLP[5:0]	do not use	do not use	Setting required*3	Setting required*5	do not use
SBRHO[7:0]	Setting required*1	do not use	Setting required*3	Setting required*5	do not use
SBRLO[7:0]	Setting required*1	Setting required*2	Setting required*3	Setting required*5	do not use

Note 1. The setting value is used for the data rate of ST, FM, and FM+ mode.

Note 2. The setting value is used for the data setup time of automatic SCL low-hold operation.

Note 3. The setting value is used for the data rate of each communication.

Note 4. When operating with I3C Master, the setting value is used for the data rate of each communication.

Note 5. When operating with I3C Master, the setting value is used for the data rate of each communication.
When operating with I3C Slave, do not use.

26.2.17 Extended Bit Rate Register (EXTBR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	EBRHP[5:0]						—	—	EBRLP[5:0]					
Initial Value	0	0	1	1	1	1	1	1	0	0	1	1	1	1	1	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EBRHO[7:0]								EBRLO[7:0]							
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
29 to 24	EBRHP[5:0]	All 1	R/W	Extended Bit Rate Low-Level Period Push-Pull*2 Count value of the high-level period of SCL clock
23, 22	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
21 to 16	EBRLP[5:0]	All 1	R/W	Extended Bit Rate Low-Level Period Push-Pull*2 Count value of the low-level period of SCL clock
15 to 8	EBRHO[7:0]	All 1	R/W	Extended Bit Rate High-Level Period Open-Drain*1 Count value of the high-level period of SCL clock
7 to 0	EBRLO[7:0]	All 1	R/W	Extended Bit Rate Low-Level Period Open-Drain*1 Count value of the low-level period of SCL clock

Note 1. These bits support for I^2C, I3C master, and I3C secondary master mode.

Note 2. These bits support for I3C master mode and I3C secondary master mode.

The EXTBR register sets the bit rate according to the operating speed.

- I^2C mode: Bit rate setting for communicating in high-speed mode
- I3C master mode: Bit rate setting selected by mode bit of command descriptor
- I3C slave mode: unused

EBRLO[7:0] bits (Extended Bit Rate Low-Level Period Open-Drain)

Refer to SBRLO[7:0] bits of **Section 26.2.16, Standard Bit Rate Register (STDBR)** for details. Watch SBRHO, SBRLO as EBRHO[7:0], EBRLO[7:0].

EBRHO[7:0] bits (Extended Bit Rate High-Level Period Open-Drain)

Refer to SBRHO[7:0] bits of **Section 26.2.16, Standard Bit Rate Register (STDBR)** for details. Watch SBRHO, SBRLO as EBRHO[7:0], EBRLO[7:0].

EBRLP[5:0] bits (Extended Bit Rate Low-Level Period Push-Pull)

Refer to SBRLP[5:0] bits of **Section 26.2.16, Standard Bit Rate Register (STDBR)** for details. Watch SBRHP, SBRLP as EBRHP[5:0], EBRLP[5:0].

EBRHP[5:0] bits (Extended Bit Rate Low-Level Period Push-Pull)

Refer to SBRHP[5:0] bits of **Section 26.2.16, Standard Bit Rate Register (STDBR)** for details. Watch SBRHP, SBRLP as EBRHP[5:0], EBRLP[5:0].

Table 26.6 Requirement and Usage of Setting in Each Mode

Bit Name	Device Mode				
	I^2C Master	I^2C Slave	I3C Master	I3C Secondary Master	I3C Slave
EBRHP[5:0]	do not use	do not use	Setting required*2	Setting required*3	do not use
EBRLP[5:0]	do not use	do not use	Setting required*2	Setting required*3	do not use
EBRHO[7:0]	Setting required*1	do not use	Setting required*2	Setting required*3	do not use
EBRLO[7:0]	Setting required*1	do not use	Setting required*2	Setting required*3	do not use

Note 1. The setting value is used for the data rate of High-Speed mode.

Note 2. The setting value is used for the data rate of each communication.

Note 3. When operating with I3C Master, the setting value is used for the data rate of each communication.
When operating with I3C Slave, do not use.

26.2.18 Bus Free Condition Detection Time Register (BFRECDT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FRECYC[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8 to 0	FRECYC[8:0]	All 0	R/W	Bus Free Condition Detection Cycle The count value is a period for detecting the Bus free condition.

FRECYC[8:0] bits (Bus Free Condition Detection Cycle)

I3C counts the period for detecting the Bus free condition with the I3Cϕ.

These bits set the Bus Free period. This Bus Free period is counted by the internal reference clock (I3Cϕ) selected by the REFCKCTL.IREFCKS[2:0] bits. See the BCST.BFREF flag for Bus Free detection behavior.

26.2.19 Bus Available Condition Detection Time Register (BAVLCDT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AVLCYC[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8 to 0	AVLCYC[8:0]	All 0	R/W	Bus Available Condition Detection Cycle The count value is a period for detecting the Bus available condition.

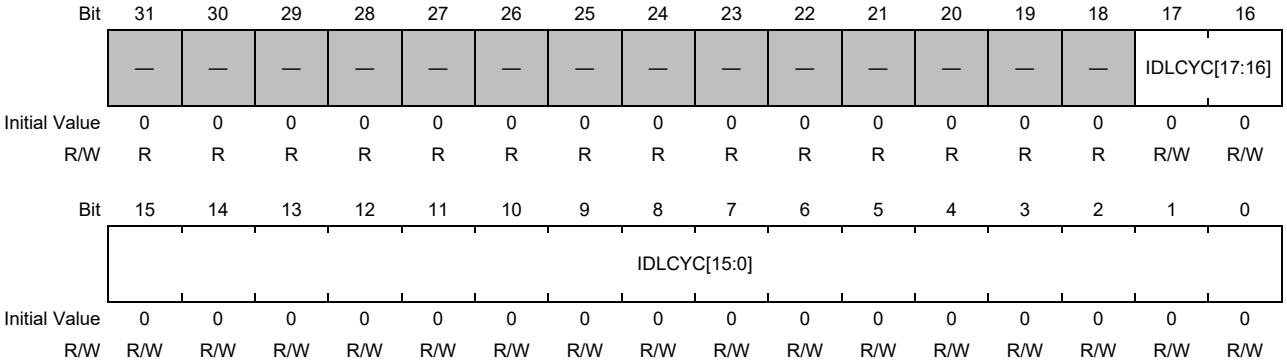
Note: This register supports for all I3C mode.

AVLCYC[8:0] bits (Bus Available Condition Detection Cycle)

I3C counts the period for detecting the Bus available condition with the I3Cϕ.

These bits set the Bus Available period. This Bus Available period is counted by the internal reference clock (I3Cϕ) selected by the REFCKCTL.IREFCKS[2:0] bits. See the BCST.BAVLF flag for Bus Available detection behavior.

26.2.20 Bus Idle Condition Detection Time Register (BIDLCDT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
17 to 0	IDLCYC[17:0]	All 0	R/W	Bus Idle Condition Detection Cycle The count value is a period for detecting the Bus idle condition.

Note: This register supports for all I3C mode.

IDLCYC[17:0] bits (Bus Idle Condition Detection Cycle)

I3C counts the period for detecting the Bus idle condition with the I3Cϕ.

These bits set the Bus Idle period. This Bus Idle period is counted by the internal reference clock (I3Cϕ) selected by the REFCKCTL.IREFCKS[2:0] bits. See the BCST.BIDLF flag for Bus Available detection behavior.

26.2.21 Output Control Register (OUTCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDODCS	—	—	—	—	SDOD[2:0]			—	—	—	EXCYC	—	SOCWP	SCOC	SDOC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R	R/W	R	W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15	SDODCS	0b	R/W	SDA Output Delay Clock Source Selection*3 0: The internal reference clock (I3Cϕ) is selected as the clock source of the SDA output delay counter. 1: The internal reference clock divided by 2 (I3Cϕ/2) is selected as the clock source of the SDA output delay counter.*4
14 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 8	SDOD[2:0]	0b	R/W	SDA Output Delay*2 000: No output delay 001: 1 I3Cϕ cycle (When OUTCTL.SDODCS = 0 (I3Cϕ)) 1 or 2 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2)) 010: 2 I3Cϕ cycles (When OUTCTL.SDODCS = 0 (I3Cϕ)) 3 or 4 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2)) 011: 3 I3Cϕ cycles (When OUTCTL.SDODCS = 0 (I3Cϕ)) 5 or 6 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2)) 100: 4 I3Cϕ cycles (When OUTCTL.SDODCS = 0 (I3Cϕ)) 7 or 8 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2)) 101: 5 I3Cϕ cycles (When OUTCTL.SDODCS = 0 (I3Cϕ)) 9 or 10 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2)) 110: 6 I3Cϕ cycles (When OUTCTL.SDODCS = 0 (I3Cϕ)) 11 or 12 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2)) 111: 7 I3Cϕ cycles (When OUTCTL.SDODCS = 0 (I3Cϕ)) 13 or 14 I3Cϕ cycles (When OUTCTL.SDODCS = 1 (I3Cϕ/2))
7 to 5	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
4	EXCYC	0b	R/W	Extra SCL Clock Cycle Output*3 The EXCYC bit is cleared automatically after one clock cycle is output. 0: Does not output an extra SCL clock cycle (default). 1: Outputs an extra SCL clock cycle.
3	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
2	SOCWP	0b	W	SCL/SDA Output Control Write Protect*1 0: Bits SCOC and SDOC are protected. 1: Bits SCOC and SDOC can be written (When writing simultaneously with the value of the target bit). This bit is read as 0.

Bit	Bit Name	Initial Value	R/W	Description
1	SCOC	1b	R/W	SCL Output Control*1 High level output is achieved through an external pull-up resistor. 0: I3C drives the SCLn pin low. 1: I3C releases the SCLn pin.
0	SDOC	1b	R/W	SDA Output Control*1 0: I3C drives the SDAn pin low. 1: I3C releases the SDAn pin.

Note 1. This bit supports for I^2C, I3C master, and I3C secondary master mode.

Note 2. These bits support for I^2C mode.

Note 3. This bit supports for I^2C mode.

Note 4. The setting SDODCS = 1 (I3Cϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting SDODCS = 1 becomes invalid and the clock source becomes the internal reference clock (I3Cϕ).

SDOC bit (SDA Output Control) and SCOC bit (SCL Output Control)

These bits are used to directly control the SDAn and SCLn signals output from this module.

When writing to these bits, also write 1 to the SOCWP bit at the same time.

The result of setting these bits is input to I3C via the input buffer. When slave mode is selected, a START condition may be detected, and the bus may be released depending on the bit settings.

Do not rewrite these bits during a START condition, STOP condition, Repeated START condition, or during transmission or reception. Operation after rewriting under the above conditions is not guaranteed.

EXCYC bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.

For details on this function, refer to **Section 26.3.2.3(11)(a), Extra SCL Clock Cycle Output Function**.

26.2.22 Input Control Register (INCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DNFE	DNFS[3:0]			
Initial Value	0	0	0	0	0	0	0	0	1	1	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
7, 6	—	11b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
4	DNFE	1b	R/W	Digital Noise Filter Circuit Enable 0: No digital noise filter circuit is used. 1: A digital noise filter circuit is used.
3 to 0	DNFS[3:0]	All 0	R/W	Digital Noise Filter Stage Selection H'0: Noise of up to one I3Cϕ cycle is filtered out (singlestage filter). H'1: Noise of up to two I3Cϕ cycles is filtered out (2-stage filter). H'2: Noise of up to three I3Cϕ cycles is filtered out (3-stage filter). H'3: Noise of up to four I3Cϕ cycles is filtered out (4-stage filter). H'4: Noise of up to five I3Cϕ cycles is filtered out (5-stage filter). ⋮ H'F: Noise of up to sixteen I3Cϕ cycles is filtered out (16-stage filter).

Note: This register supports for I²C mode.

DNFS[3:0] bits (Digital Noise Filter Stage Selection)

These bits are used to select the number of stages in the digital noise filter.

For details on the digital noise filter function, refer to **Section 26.3.2.6(3), Digital Noise-Filter Circuits [I2C mode]**.

In I²C High Speed mode, the module changes the number of noise filter stage to a quarter of the number of noise filter stage automatically.

Note: Set the noise range to be filtered out by the noise filter within a range less than the SCLn line high-level period or low-level period. If the noise range is set to a value of (SCL clock width: high-level period or low-level period, whichever is shorter) - [1.5 internal reference clock (I3Cϕ) cycles] or more, the SCL clock is regarded as noise by the noise filter function of I3C, which may prevent I3C from operating normally.

Note: In I²C High Speed mode, the lower 2 bits of the DNFS[3:0] bits are ignored, and the number of filter stages for 1 to 4 stages is selected by the upper 2 bits.

26.2.23 Timeout Control Register (TMOCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TOMDS[1:0]		TOHCTL	TOLCTL	—	—	TODTS[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
7, 6	TOMDS[1:0]	00b	R/W	Timeout Operation Mode Selection 00: Timeout is detected during the following conditions: • The bus is busy (BCST.BFREF = 0) in master mode. • I3C's own slave address is detected, and the bus is busy in slave mode. • The bus is free (BCST.BFREF = 1) while generation of a START condition is requested (CNDCTL.STCND = 1). 01: Timeout is detected while the bus is busy. 10: Timeout is detected while the bus is free. 11: Setting prohibited
5	TOHCTL	1b	R/W	Timeout H Count Control 0: Count is disabled while the SCLn line is at a high level. 1: Count is enabled while the SCLn line is at a high level.
4	TOLCTL	1b	R/W	Timeout L Count Control 0: Count is disabled while the SCLn line is at a low level. 1: Count is enabled while the SCLn line is at a low level.
3, 2	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
1, 0	TODTS[1:0]	00b	R/W	Timeout Detection Time Selection 0 0: 16bit-timeout 0 1: 14bit-timeout 1 0: 8bit-timeout 1 1: 6bit-timeout

TODTS[1:0] bits (Timeout Detection Time Selection)

These bits are used to select for the timeout detection time when the timeout function is enabled (BSTE.TODE bit = 1).

- When these bits are set to 00b, the timeout detection internal counter functions as a 16-bit counter.
- When these bits are set to 01b, the counter functions as a 14-bit counter.
- When these bits are set to 10b, the counter functions as a 8-bit counter.
- When these bits are set to 11b, the counter functions as a 6-bit counter.

While the SCLn line is in the state that enables this counter as specified by bits TOHCTL and TOLCTL, the counter counts up in synchronization with the internal reference clock (I3Cϕ) as a count source.

For details on the timeout function, refer to **Section 26.3.2.4(3), Timeout Error Detection**.

TOLCTL bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCLn line is held low when the timeout function is enabled (BSTE.TODE = 1).

TOHCTL bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCLn line is held high when the timeout function is enabled (BSTE.TODE = 1).

TOMDS[1:0] bits (Timeout Operation Mode Selection)

These bits are used to select the detection condition for timeout when the timeout function is enabled.

NOTE

When working with I^2C Slave, during 10-bit address communication, the timeout count starts when the upper address match is detected.

26.2.24 Wake Up Unit Control Register (WUCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	WUFE	WUFSYNE	—	WUANFS	—	—	—	WUACKS
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
7	WUFE	0b	R/W	Wake Up function enable 0: Wake-up function disables 1: Wake-up function enables. Do not set WUFE = 0 during WakeUp operation.
6	WUFSYNE	1b	R/W	Wake-Up function Synchronous Enable 0: This IP asynchronous circuit enable 1: This IP synchronous circuit enable
5	—	0b	R	Reserved These bits are read as 0. The write value should be 0.
4	WUANFS	0b	R/W	Wake-Up Analog Noise Filter Selection 0: Do n1ot add the Wake-Up analog filter. 1: Add the Wake-Up analog filter.
3 to 1	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
0	WUACKS	1b	R/W	Wake-Up Acknowledge Selection Choice of four response mode with a combination of RSTCTL.INTLRST bit and WUACKS bit. Shown in the **Table 26.7**.

Table 26.7 Wake-Up Mode

INTLRST	WUACKS	Operation Mode	Description
0	0	Normal Wake-Up mode 1	ACK response at 9th SCL and SCL low hold after at 9th SCL.
0	1	Normal Wake-Up mode 2	No ACK response immediately and SCL low hold between 8th and 9th SCL. Release SCL low hold and ACK response at 9th SCL.
1	0	Command recovery mode	ACK response at 9th SCL and not SCL low hold.
1	1	EEP response mode	NACK response at 9th SCL and not SCL low hold.

WUFSYNE bit (Wake-Up function PCLK synchronous enable bit)

This bit is used to switch between the PCLK synchronous operation and the PCLK asynchronous operation.

The bit is used in combination with the WUASYNF flag at Wake-Up effective function (WUCTL.WUFE bit = 1).

[When switching from the PCLK synchronous operation to the PCLK asynchronous operation]

This IP operation changes into the PCLK asynchronous operation during BCST.BFREF flag = “1”, when the WUASYNF flag set to “1” during WUFSYNE bit = “0”.

The reception can operate without depending on the state of operation of PCLK (With PCLK stopped) after it switches to the PCLK asynchronous operation (Wake-Up event detection operation).

[When switching from the PCLK asynchronous operation to the PCLK synchronous operation]

- This IP operation changes into the PCLK synchronous operation at the following conditions.
  (At the same timing when WUASYNF flag becomes “0”)
  - In the case Wake-Up event detects: right after WUFSYNE bit is set to “1”.
  - In the case Wake-Up event does not detect: when STOP condition is detected after WUFSYNE bit is set to “1”.

[Setting condition]

- When 1 is written to the WUFSYNE bit.
- WUCTL.WUFE = 0

[Clearing conditions]

- When 0 is written to the WUFSYNE bit.

26.2.25 Acknowledge Control Register (ACKCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ACKTWP	ACKT	ACKR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2	ACKTWP	0b	W	ACKT Write Protect 0: The ACKT bit are protected. 1: The ACKT bit can be written (when writing simultaneously with the value of the target bit). This bit is read as 0.
1	ACKT	0b	R/W	Acknowledge Transmission 0: A 0 is sent as the acknowledge bit (ACK transmission). 1: A 1 is sent as the acknowledge bit (NACK transmission).
0	ACKR	0b	R	Acknowledge Reception 0: A 0 is received as the acknowledge bit (ACK reception). 1: A 1 is received as the acknowledge bit (NACK reception).

Note: This register supports for I^2C mode.

ACKR bit (Acknowledge Reception)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

- When 1 is received as the acknowledge bit with the PRSST.TRMD bit set to 1.

[Clearing condition]

- When 0 is received as the acknowledge bit with the PRSST.TRMD bit set to 1.

ACKT bit (Acknowledge Transmission)

[Setting condition]

- When 1 is written to the ACKT bit and 1 is written to the ACKTWP bit at the same time.

[Clearing conditions]

- When 0 is written to the ACKT bit and 1 is written to the ACKTWP bit at the same time.
- When a STOP condition is detected. (When a STOP condition is detected with the CNDCTL.SPCND bit set to 1.)

Note: Set the ACKT bit to 0 in I^2C Slave mode.

ACKTWP bit (ACKT Write Protect)

This bit is used to control the modification of the ACKT bit.

When changing the ACKT bit, setting this bit to 1 at the same time can change the ACKT bit.

When this bit is read, 0 is always read.

26.2.26 SCL Stretch Control Register (SCSTRCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RWE	ACKTWE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
1	RWE	0b	R/W	Receive Wait Enable 0: No WAIT (The period between ninth clock cycle and first clock cycle is not held low.) 1: WAIT (The period between ninth clock cycle and first clock cycle is held low.) Low hold is released by reading NTDTBP0NTDTBP.
0	ACKTWE	0b	R/W	Acknowledge Transmission Wait Enable 0: NTST.RDBFF0 is set at the rising edge of the ninth SCL clock cycle. (The SCLn line is not held low at the falling edge of the eighth clock cycle.) 1: NTST.RDBFF0 is set at the rising edge of the eighth SCL clock cycle. (The SCLn line is held low at the falling edge of the eighth clock cycle.) Low hold is released by writing a value to the ACKCTL.ACKT bit.

Note: This register supports for I^2C mode.

ACKTWE bit (Acknowledge Transmission Wait Enable)

This bit is used to select the NTST.RDBFF0 flag set timing in receive mode and also to select whether to hold the SCLn line low at the falling edge of the eighth SCL clock cycle.

- When ACKTWE = 0, the SCLn line is not held low at the falling edge of the eighth SCL clock cycle, and the NTST.RDBFF0 flag is set to 1 at the rising edge of the ninth SCL clock cycle.
- When ACKTWE = 1, the NTST.RDBFF0 flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCLn line is held low at the falling edge of the eighth SCL clock cycle. The low hold of the SCLn line is released by writing a value to the ACKCTL.ACKT bit.

After data is received with this setting, the SCLn line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKCTL.ACKT = 0) or NACK (ACKCTL.ACKT = 1) according to receive data.

RWE bit (Receive Wait Enable)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (NTDTBP0) is completely read each time single-byte data is received in receive mode.

- When RWE = 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the ACKTWE and RWE bits = 0, continuous receive operation is enabled with the double buffer.
- When RWE = 1, the SCLn line is held low from the falling edge of the ninth clock cycle until the NTDTBP0 value is read each time single-byte data is received.

This enables receive operation in byte units.

Note: When the value of the RWE bit is to be read, be sure to read the NTDTBP0 beforehand.

26.2.27 SCL Stalling Control Register (SCSTLCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ACKPE	PARPE	—	AAPE	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STLCYC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	ACKPE	0b	R/W	ACK phase Enable Stall enable bit during ACK/NACK phase 0: Does not stall the SCL clock during the ACK/NACK phase. 1: Stall the SCL clock during the ACK/NACK phase.
30	PARPE	0b	R/W	Parity Phase Enable Stall enable bit in parity bit period 0: Does not stall the SCL clock during the parity bit period. 1: Stall the SCL clock during the parity bit period.
29	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28	AAPE	0b	R/W	Assigned Address Phase Enable Enable bit that allows stall by the first bit at address assignment 0: Does not stall the SCL clock during the address assignment phase. 1: Stall the SCL clock during address assignment phase.
27 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	STLCYC [15:0]	All 0	R/W	Stalling Cycle Counter setting of stall period (I3Cϕ cycle). Common use for each phase.

Note: This register supports for I3C master mode and I3C secondary master mode.

When setting this register, follow *Chapter 5.1.2.5 Master Clock Stalling of MIPI I3C Spec V1.0*, and use it only when necessary, because of its negative impacts on bus performance.

STLCYC[15:0] bits (Stalling Cycle)

These bits set the SCL stall period. The SCL stall period is counted by the internal reference clock (I3Cϕ). This is a counter common to the enable bits of each phase.

AAPE bit (Assigned Address Phase Enable)

The master can stall SCL during the low period of the first bit of the assigned address phase of the Enter Dynamic Address Assignment CCC command. It can gain time in assigning dynamic address to the device based on the BCR and DCR of the slave. However, because the Dynamic Address Assignment procedure sends the dynamic address set in the DATBASm register in sequence, it is not necessary to set this bit and it is prohibited.

PARPE bit (Parity Phase Enable)

The parity bit of the transmission data of I3C write transfer can be used for SCL stalling to avoid underrun of the transmission data FIFO. However, when the transmission data FIFO of the I3C master becomes empty, SCL stalling is performed regardless of the setting of this bit, it is not necessary to set this bit and it is prohibited. It is necessary to set this bit when the I3C slave requires preparation time to receive data.

ACKPE bit (ACK phase Enable)

Determine the need to perform SCL stalling in the ACK/NACK phase based on the following criteria:

- It is necessary to set this bit when the I3C and I^2C slaves connected to the bus require preparation time to receive or transmit data.
- In legacy I^2C communication, if there is a possibility that the data FIFO of the I3C master might underrun or overflow, it is not necessary to set this bit because SCL Stalling is performed by FIFO Empty or Full regardless of the setting of this bit.
- Other than legacy I^2C communication, the data FIFO of I3C master might underrun or overflow, and if SCL stalling is required in ACK phase, this bit can be set. However, it is necessary to build the software so that the FIFO does not underrun or overflow due to the interrupt generated according to the FIFO threshold setting (NQTHCTL, NTBTHCTL, NRQTHCTL).
- When I3C master responds ACK/NACK to IBI, it is not necessary to set this bit because ACK/NACK response can be set in advance by BCTL.HJACK, DATBASm.DVMRRJ and DATBASm.DVS IRRJ.
- It is necessary to set this bit when the I3C slave connected to the bus requires preparation time to transmit data for Direct GET CCC.

26.2.28 Slave Transfer Data Length Register 0 (SVTDLG0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STDLG[15:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
0	ATCE	0b	R/W	Asynchronous Timing Counter Enable for MREF, MC2, SC1, SC2. 0: Disable 1: Enable

26.2.33 Condition Control Register (CNDCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	SPCND	SRCND	STCND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2	SPCND	0b	R/W	STOP (P) Condition Issuance 0: Does not request to issue a STOP condition. 1: Requests to issue a STOP condition.
1	SRCND	0b	R/W	Repeated START (Sr) Condition Issuance 0: Does not request to issue a Repeated START condition. 1: Requests to issue a Repeated START condition.
0	STCND	0b	R/W	START (S) Condition Issuance 0: Does not request to issue a START condition. 1: Requests to issue a START condition.

Note: This register supports for I^2C mode.

STCND bit (START (S) Condition Issuance)

This bit is used to request transition to master mode and issuance of a START condition.

For details on the START condition issuance, refer to **Section 26.3.2.3(3), START Condition / Repeated START Condition / STOP Condition Issuing Function**.

[Setting condition]

- When 1 is written to the STCND bit

[Clearing conditions]

- When 0 is written to the STCND bit
- When a START condition has been issued (A START condition is detected)
- When the BST.ALF (arbitration-lost) flag is set to 1

Note: Set the STCND bit to 1 (START condition issuance request) when the BCST.BFREF flag is set to 1 (bus free state). Note that arbitration may be lost due to a START condition issuance error if the STCND bit is set to 1 (START condition issuance request) when the BFREF flag is set to 0 (bus busy state).

SRCND bit (Repeated START (Sr) Condition Issuance)

This bit is used to request that a Repeated START condition be issued in master mode.

When this bit is set to 1 to request to issue a Repeated START condition, a Repeated START condition is issued when the BFREF flag is set to 0 (bus busy state) and the PRSST.CRMS bit is set to 1 (master mode).

For details on the Repeated START condition issuance, refer to **Section 26.3.2.3(3), START Condition / Repeated START Condition / STOP Condition Issuing Function**.

[Setting condition]

- When 1 is written to the SRCND bit with the BCST.BFREF flag set to 0

[Clearing conditions]

- When 0 is written to the SRCND bit
- When a Repeated START condition has been issued (A Repeated START condition is detected)
- When the BST.ALF (arbitration-lost) flag is set to 1

Note: Do not set the SRCND bit to 1 while issuing a STOP condition.
If 1 (requests to issue a Repeated START condition) is written to the SRCND bit in slave mode, the Repeated START condition is not issued but the SRCND bit remains set to 1.
If the operating mode changes to master mode with the bit not being cleared, note that the Repeated START condition may be issued.

SPCND bit (STOP (P) Condition Issuance)

This bit is used to request that a STOP condition be issued in master mode.

When this bit is set to 1 to request to issue a STOP condition, a STOP condition is issued when the BCST.BFREF flag is set to 0 (bus busy state) and the PRSST.CRMS bit is set to 1 (master mode).

For details on the STOP condition issuance, refer to **Section 26.3.2.3(3), START Condition / Repeated START Condition / STOP Condition Issuing Function**.

[Setting condition]

- When 1 is written to the SPCND bit with the BCST.BFREF flag set to 0 and the PRSST.CRMS bit set to 1

[Clearing conditions]

- When 0 is written to the SPCND bit
- When a STOP condition has been issued (A STOP condition is detected)
- When the BST.ALF (arbitration-lost) flag is set to 1
- When a START condition and a Repeated START condition are detected

Note: Writing to the SPCND bit is not possible while the setting of the BCST.BFREF flag = 1 (bus free state).
Do not set the SPCND bit to 1 while a Repeated START condition is being issued.

26.2.34 Normal Command Queue Port Register (NCMDQP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	W	Normal Command Queue Port

Note: This register supports for all I3C mode.

32-bit mailbox register NCMDQP contains a command descriptor structure that depends on the requested transfer type:

1. Address Assignment Command (refer to **Section 26.3.1.1(1), Address Assign Command**)
2. Immediate Data Transfer (refer to **Section 26.3.1.1(2), Immediate Transfer Command**)
3. Regular Data Transfer (refer to **Section 26.3.1.1(3), Regular Transfer Command**)
4. Write + Write/Read Combo Transfer (refer to **Section 26.3.1.1(4), Combo Transfer Command**)
5. Internal Control Command (refer to **Section 26.3.1.1(5), Internal Control Command**)

Within the command descriptor, DWORDs appear starting with the Least Significant DWORD, in order until the Most Significant DWORD.

26.2.35 Normal Response Queue Port Register (NRSPQP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	R	Normal Response Queue Port

Note: This register supports for all I3C mode.

32-bit mailbox register NRSPQP contains a response structure (refer to **Section 26.3.1.4, Receive Status Descriptor**).

26.2.36 Normal Transfer Data Buffer Port Register 0 (NTDTBP0/NTDTBP0_BY)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	R/W	Normal Transfer Data Buffer Port NTDTBP0 is a 32-bit read/write register. NTDTBP0_BY (NTDTBP0[7:0]) is a 8-bit read/write register.

Note: NTDTBP0 is 32-bit access in I3C mode.
NTDTBP0_BY is 8-bit access in I^2C mode.

32-bit mailbox register NTDTBP0 is a 32-bit bi-directional data transfer register which is used both to read from the Normal Receive Data Buffer, and to write to the Normal Transmit Data Buffer.

In other words, the Normal Receive Data Buffer and the Normal Transmit Data Buffer have the same offset, forming a single bidirectional port for transmitting or receiving I3C data.

Read Operations:

[I3C protocol mode]

Data Read from the Normal Receive Data Buffer. Its should be read based on Normal Queue Status Level indications. The Receive data is always aligned to a 4-byte boundary and stored in the Normal Receive Data Buffer. If the length of the data transfer is not aligned to a 4-byte boundary, then there will be extra (unused) bytes at the end of the transferred data. The valid data must be identified using the DATA_LENGTH field in the Response Descriptor.

[I^2C protocol mode]

When 1 byte of data has been received, the received data is transferred from the internal shift register to NTDTBP0 to enable the next data to be received. The double-buffer structure of the internal shift register and NTDTBP0 allows continuous receive operation if the received data has been read from NTDTBP0 while the internal shift register is receiving data. Read data from NTDTBP0 once when a receive data full interrupt (I3Cn_RX) request is generated. If NTDTBP0 receives the next receive data before the current data is read from NTDTBP0 (while the RDBFF0 flag in NTST is 1), this module automatically holds the SCL clock low one cycle before the RDBFF0 flag is set to 1 next. The lower 8 bits of the read 32-bit data are valid as received data.

Write Operations:

[I3C protocol mode]

Data Written to the Normal Tx Data Buffer. Data DWORDs written to the Normal Transmit Data Buffer are placed onto the I3C bus one byte at a time, with the DWORD LSB first. Within each byte, bits are placed onto the I3C bus in big-endian order, with bit 7 going out first on the bus. The transmit data should always start aligned to a 4-byte boundary and written to the NTDTBP0 register. If the length of the transfer is not aligned to a 4-byte boundary, then

there will be extra (unused) bytes at the end of the transferred data. I3C shall only send the valid number of bytes indicated in the DATA_LENGTH field of the Command Descriptor.

[I^2C protocol mode]

When NTDTBP0 detects a space in the internal shift register, it transfers the transmit data that has been written to NTDTBP0 to the internal shift register and starts transmitting data in transmit mode. The double-buffer structure of NTDTBP0 and the internal shift register allows continuous transmit operation if the next transmit data has been written to NTDTBP0 while the the internal shift register data is being transmitted. Write transmit data to NTDTBP0 once when a transmit data empty interrupt (I3Cn_TX) request is generated. The lower 8 bits of the written 32-bit data are valid as transmission data.

26.2.37 Normal IBI Queue Port Register (NIBIQP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	R/W	Normal IBI Queue Port

Note: This register supports for all I3C mode.

When receiving an IBI, 32-bit mailbox register NIBIQP is used for both:

- Read the IBI status descriptor (refer to **Section 26.3.1.3, IBI Status Descriptor**)
- Read the IBI data (which is raw/opaque data).

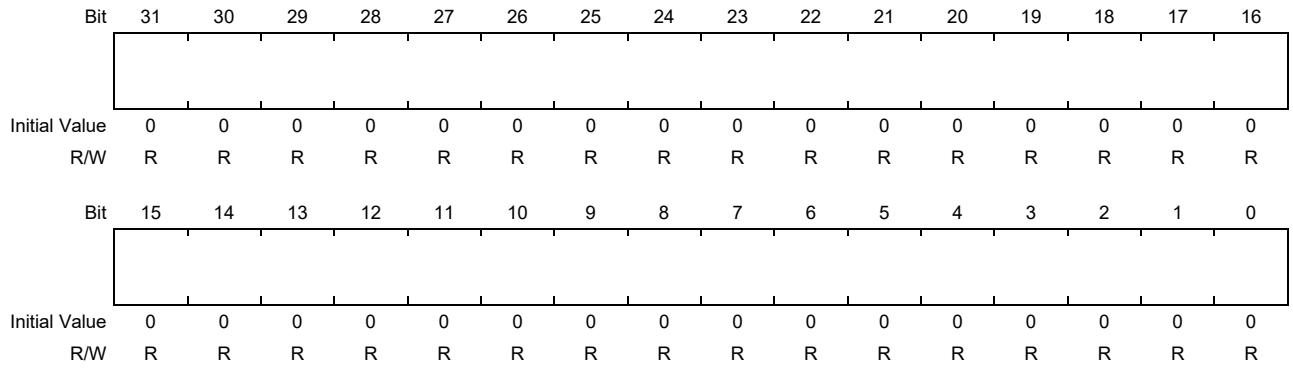
The IBI status descriptor is a read-only structure describing an IBI event received from a Slave device on the I3C bus.

NOTE

If the I3C HCI auto-read feature is used, then the IBI data includes the data received from the auto-generated private read operation.

Even if LAST_STATUS is set to 0, the driver software still evaluates the data payload length by examining the CHUNKS field.

26.2.38 Normal Receive Status Queue Port Register (NRSQP)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	R	Normal Receive Status Queue Port

Note: This register supports for I3C secondary master mode and I3C slave mode.

32-bit mailbox register NRSQP contains a receive status structure (refer to **Section 26.3.1.4, Receive Status Descriptor**).

26.2.39 Normal Queue Threshold Control Register (NQTHCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IBIQTH[7:0]								IBIDSSZ[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSPQTH[7:0]								CMDQTH[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	IBIQTH[7:0]	H'01	R/W	Normal IBI Queue Threshold*1 H'00: I3C Protocol mode (Master): Interrupt is generated when the Outstanding IBI Status count is 1 or more. I3C Protocol mode (Slave): Interrupt is issued when IBI Data Buffer is completely empty. Others: I3C Protocol mode (Master): Interrupt is generated when the Outstanding IBI Status count is N + 1 or more. (N = CMDQTH[7:0]) I3C Protocol mode (Slave): Interrupt is issued when IBI Data Buffer contains N empties.
23 to 16	IBIDSSZ[7:0]	H'01	R/W	Normal IBI Data Segment Size*2 Supported Values: Minimum: 1 (4 bytes) Maximum: 63 (252 bytes), provided that the configured IBI Queue depth is 64 or more. When ATCCNTE.ATCE = 1, restrict to the number of slices ≥ 2.
15 to 8	RSPQTH[7:0]	H'01	R/W	Normal Response Queue Threshold*1 H'00: Interrupt is issued when Response Queue contains 1 entry (DWORD). Others: Interrupt is triggered when Response Queue contains N + 1 entries (DWORD). (N = CMDQTH[7:0])
7 to 0	CMDQTH[7:0]	H'01	R/W	Normal Command Ready Queue Threshold*1 H'00: Interrupt is issued when Command Queue is completely empty. Others: Interrupt is issued when Command Queue contains N empties. (N = CMDQTH[7:0])

Note: This register supports for I3C secondary master mode and I3C slave mode.

Note 1. These bits support for all I3C mode.

Note 2. These bits support for I3C master mode and I3C secondary master mode.

The Queue Threshold Control register controls the interrupt trigger thresholds for the Command Queue, the Response Queue, and the IBI Queue.

The specific reset values are indicative and could be hardware implementation specific.

CMDQTH[7:0] bits (Normal Command Ready Queue Threshold)

Controls the minimum number of Command Queue empties needed to trigger the INTCMD interrupt.

If this field is greater than (Command Queue size – 1), then only the number of bits required to address the full buffer depth will be considered.

Note: It is assumed that I3C has exactly one Command Queue, exactly one Response Queue, and exactly one IBI Queue.

RSPQTH[7:0] bits (Normal Response Queue Threshold)

Controls the minimum number of Response Queue entries needed to trigger the INTRESP interrupt.

If this field is greater than (Response Status Queue size – 1), then only the number of bits required to address the full buffer depth will be considered.

IBIDSSZ[7:0] bits (Normal IBI Data Segment Size)

This is the IBI data segment size, in DWORDs (4 bytes).

In PIO mode, this field allows the incoming IBI data to be sliced into multiple segments generating status individually, to support cutthrough readout of a long IBI payload data.

IBIQTH[7:0] bits (Normal IBI Queue Threshold)

For I3C protocol mode (Master): PRTS.PRTMD = 0 and PRSST.CRMS = 1.

Controls generation of the INTIBI interrupt, based on the value of the IBI Queue's Outstanding IBI status count.

Each IBI status entry can represent either the complete IBI payload (if the IBI payload byte size is 4×IBIDSSZ or less), or a segment of the IBI payload (if the IBI payload byte size is more than 4×IBIDSSZ).

For I3C protocol mode (Slave): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 0.

Controls the minimum number of IBI Data Buffer empties needed to trigger the INTIBI interrupt.

If this field is greater than (IBI Data Buffer size? 1), then only the number of bits required to address the full buffer depth will be considered.

26.2.40 Normal Transfer Data Buffer Threshold Control Register 0 (NTBTHCTL0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	RXSTTH[2:0]			—	—	—	—	—	TXSTTH[2:0]

Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
26 to 24	RXSTTH [2:0]*3	001b	R/W	Normal Rx Start Threshold*2 000: Wait for 2 empty DWORDs 001: Reserved Others: Setting prohibited
23 to 19	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
18 to 16	TXSTTH [2:0]*3	001b	R/W	Normal Tx Start Threshold*2 000: Wait for 2 DWORDs 001: Reserved Others: Setting prohibited
15 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 8	RXDBTH[2:0]	001b	R/W	Normal Receive Data Buffer Threshold*1 000: Interrupt triggers at 2 Rx Buffer entries, DWORDs 001: Reserved Others: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2 to 0	TXDBTH[2:0]	001b	R/W	Normal Transmit Data Buffer Threshold*1 000: Interrupt triggers at 2 Tx Buffer empties, DWORDs 001: Reserved Others: Setting prohibited

Note 1. These bits support for all I3C mode.

Note 2. These bits support for I3C master mode and I3C secondary master mode.

Note 3. The RXSTTH[2:0] and TXSTTH[2:0] bits are only present in NTBTHCTL0.

The Data Buffer Control register controls the interrupt trigger thresholds for the Receive Data Buffer Queue and the Transmit Data Buffer Queue.

TXDBTH[2:0] bits (Normal Transmit Data Buffer Threshold)

Minimum number of Transmit FIFO empties, in DWORDs, that will trigger the INTTXn interrupt.

The software must program a value less than Transmit Data Buffer size in this register.

RXDBTH[2:0] bits (Normal Receive Data Buffer Threshold)

Minimum number of Receive FIFO entries in DWORDs that will trigger the INTRXn interrupt.

The software must program a value less than Receive Data Buffer size in this register.

TXSTTH[2:0] bits (Normal Tx Start Threshold)

When preparing to initiate a Write Transfer on the I3C Bus, I3C shall wait until the Transmit Buffer has at least the indicated number of locations available.

Two optional configurable Modes are available:

1. Store and Forward Mode
   If the TXSTTH[2:0] field is set to the Transmit Buffer size, then I3C shall delay initiation of the Write Command as follows:
   - If the data length to be transferred is more than the Transmit Buffer size, then this module shall wait until the Transmit FIFO is completely full.
   - If the data length to be transferred is less than the Transmit Buffer size, then I3C shall wait until enough Transmit FIFO locations are available to store the data to be transferred.
2. Threshold Mode
   If the TXSTTH[2:0] field value is less than the Transmit Buffer size, then I3C shall initiate the Write Command as soon as the indicated number of Transmit FIFO locations are entries.

RXSTTH[2:0] bits (Normal Rx Start Threshold)

When preparing to initiate a Read Transfer on the I3C bus, I3C shall wait until the Receive Buffer has at least the indicated number of empty locations in DWORDs.

Two optional configurable Modes are available:

1. Store and Forward Mode If the RXSTTH[2:0] field is set to the Receive Buffer size, then I3C shall delay initiation of the Read Command as follows:
   - If the data length to be transferred is more than the Receive Buffer size, then this module shall wait until the Receive FIFO is completely empty.
   - If the data length to be transferred is less than the Receive Buffer size, then I3C shall wait until enough Receive FIFO locations are available to store the data to be transferred.
2. Threshold Mode
   If the RXSTTH[2:0] field value is less than the Receive Buffer size, then I3C shall initiate the Read Command as soon as the indicated number of Receive FIFO locations are empty.

26.2.41 Normal Receive Status Queue Threshold Control Register (NRQTHCTL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 25	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
24	WUCNDDF	0b	R/W*3	Wake-Up Condition Detection Flag 0: Wake-Up Condition is not detected. 1: Wake-Up Condition is detected.
23 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20	TODF	0b	R/W*3	Timeout Detection Flag 0: Timeout is not detected. 1: Timeout is detected.
19 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	ALF	0b	R/W*3	Arbitration Lost Flag*2 0: Arbitration is not lost 1: Arbitration is lost.
15 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8	TENDF	0b	R/W*3	Transmit End Flag*2 0: Data is being transmitted. 1: Data has been transmitted.
7 to 5	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
4	NACKDF	0b	R/W*3	NACK Detection Flag*2 0: NACK is not detected. 1: NACK is detected.
3	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
2	HDREXDF	0b	R/W*3	HDR Exit Pattern Detection Flag*1 0: HDR Exit Pattern Detection Interrupt does not occur. 1: HDR Exit Pattern Detection Interrupt occurs.
1	SPCNDDF	0b	R/W*3	STOP Condition Detection Flag 0: STOP condition is not detected. 1: STOP condition is detected.
0	STCNDDF	0b	R/W*3	START Condition Detection Flag 0: START condition is not detected. 1: START condition is detected.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I^2C mode.

Note 3. Clearing (to 0) condition: Writing 0 after 1 is read.

STCNDDF bit (START Condition Detection Flag)

[Setting conditions]

- All of the followings are satisfied:
  1. The BSTE.STCNDDE bit = 1.
  2. When a START condition (or a Repeated START condition) is detected.

[Clearing conditions]

- When 0 is written to the STCNDDF flag after reading STCNDDF flag = 1.
- When a STOP condition is detected.

SPCNDDF bit (STOP Condition Detection Flag)

[Setting conditions]

- All of the followings are satisfied:
  1. The BSTE.SPCNDDE bit = 1.
  2. When a STOP condition is detected.

[Clearing condition]

- When 0 is written to the SPCNDDF flag after reading SPCNDDF flag = 1.

HDREXDF bit (HDR Exit Pattern Detection Flag)

[Setting conditions]

- All of the followings are satisfied:
  1. The BSTE.HDREXDE bit = 1.
  2. When a HDR EXIT pattern is detected.

[Clearing condition]

- When 0 is written to the HDREXDF flag after reading HDREXDF flag = 1.

NACKDF bit (NACK Detection Flag)

[Setting conditions]

- All of the followings are satisfied:
  1. The PRTS.PRTMD bit = 1 (I^2C protocol mode).
  2. The BSTE.NACKDE bit = 1 (Enables NACK detection interrupt status logging).
  3. When acknowledge is not received (NACK is received) from the receive device in transmit mode.

[Clearing condition]

- When 0 is written to the NACKDF flag after reading NACKDF flag = 1.

TENDF bit (Transmit End Flag)

[Setting conditions]

- All of the followings are satisfied:

1. The PRTS.PRTMD bit = 1 (I^2C protocol mode).
2. The BSTE.TENDE bit = 1 (Enables Transmit End Interrupt Status logging).
3. At the rising edge of the ninth SCL clock cycle while the NTST.TDBEF0 flag = 1. Excluding when sending an address.

[Clearing conditions]

- When 0 is written to the TENDF flag after reading TENDF flag = 1.
- When data is written to the NTDTBP0 register.
- When a STOP condition is detected.

ALF bit (Arbitration Lost Flag)

[Setting conditions]

When master arbitration-lost detection is enabled: BSTE.ALE bit = 1, BFCTL.MALE = 1.

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high impedance state)).
- All of the followings are satisfied.
  1. When the START condition is detected while the CNDCTL.STCND bit = 1.
  2. When the internal SDA output state does not match the SDA line level.
- When the CNDCTL.STCND bit is set to 1 (START condition issuance request) while the BCST.BFREF flag = 0.

When NACK arbitration-lost detection is enabled: BSTE.ALE bit = 1, BFCTL.NALE = 1.

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode.

When slave arbitration-lost detection is enabled: BSTE.ALE bit = 1, BFCTL.SALE = 1.

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode.

[Clearing condition]

- When 0 is written to the ALF flag after reading ALF flag = 1.

TODF bit (Timeout Detection Flag)

[Setting conditions]

- All of the followings are satisfied.
  1. The BSTE.TODE bit = 1 (Enables Timeout Detection Interrupt Status logging).
  2. When the master mode or the received slave address matches the slave address n in Slave mode.
  3. When the SCL line state remains unchanged for the period specified by TMOCTL register.

[Clearing condition]

- When 0 is written to the TODF flag after reading TODF flag = 1.

26.2.43 Bus Status Enable Register (BSTE)

1	SPCNDDE	0b	R/W	STOP Condition Detection Enable 0: Disables STOP condition Detection Interrupt Status logging. 1: Enables STOP condition Detection Interrupt Status logging.
0	STCNDDE	0b	R/W	START Condition Detection Enable 0: Disables START condition Detection Interrupt Status logging. 1: Enables START condition Detection Interrupt Status logging.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I^2C mode.

STCNDDE bit (START Condition Detection Enable)

When this bit is 1, operation of BST.STCNDDF is enabled. For the setting conditions and clearing conditions of the BST.STCNDDF flag, see the details of BST.STCNDDF.

SPCNDDE bit (STOP Condition Detection Enable)

When this bit is 1, operation of BST.SPCNDDF is enabled. For the setting conditions and clearing conditions of the BST.SPCNDDF flag, see the details of BST.SPCNDDF.

HDREXDE bit (HDR Exit Pattern Detection Enable)

When this bit is 1, the operation of BST.HDREXDF is enabled. For the setting conditions and clearing conditions of the BST.HDREXDF flag, see the details of BST.HDREXDF.

NACKDE bit (NACK Detection Enable)

When this bit is 1, the operation of BST.NACKDF is enabled. This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received from the slave device in transmit mode. Normally, set this bit to 1. For the setting conditions and clearing conditions of the BST.NACKDF flag, see the details of BST.NACKDF.

TENDE bit (Transmit End Enable)

When this bit is 1, the operation of BST.TENDF is enabled. For the setting conditions and clearing conditions of the BST.TENDF flag, see the details of BST.TENDF.

ALE bit (Arbitration Lost Enable)

When this bit is 1, the operation of BST.ALF is enabled. For the setting conditions and clearing conditions of the BST.ALF flag, see the details of BST.ALF.

TODE bit (Timeout Detection Enable)

When this bit is 1, the operation of BST.TODF is enabled. For the setting conditions and clearing conditions of the BST.TODF flag, see the details of BST.TODF.

26.2.44 Bus Interrupt Enable Register (BIE)

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
24	WUCNDDIE	0b	R/W	Wake-Up Condition Detection Interrupt Enable 0: Disables Wake-Up Condition Detection Interrupt Signal. 1: Enables Wake-Up Condition Detection Interrupt Signal.
23 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20	TODIE	0b	R/W	Timeout Detection Interrupt Enable*2 0: Disables Timeout Detection Interrupt Signal. 1: Enables Timeout Detection Interrupt Signal.
19 to 17	—	All 0	R	Reserved This bit is read as 0. The write value should be 0.
16	ALIE	0b	R/W	Arbitration Lost Interrupt Enable*2 0: Disables Arbitration Lost Interrupt Signal. 1: Enables Arbitration Lost Interrupt Signal.
15 to 9	—	All 0	R	Reserved This bit is read as 0. The write value should be 0.
8	TENDIE	0b	R/W	Transmit End Interrupt Enable*2 0: Disables Transmit End Interrupt Signal. 1: Enables Transmit End Interrupt Signal.
7 to 5	—	000b	R	Reserved This bit is read as 0. The write value should be 0.
4	NACKDIE	0b	R/W	NACK Detection Interrupt Enable*2 0: Disables NACK Detection Interrupt Signal. 1: Enables NACK Detection Interrupt Signal.
3	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
2	HDREXDIE	0b	R/W	HDR Exit Pattern Detection Interrupt Enable*1 0: Disables HDR Exit Pattern Detection Interrupt Signal. 1: Enables HDR Exit Pattern Detection Interrupt Signal.
1	SPCNDDIE	0b	R/W	STOP Condition Detection Interrupt Enable 0: Disables STOP condition Detection Interrupt Signal. 1: Enables STOP condition Detection Interrupt Signal.
0	STCNDDIE	0b	R/W	START Condition Detection Interrupt Enable 0: Disables START condition Detection Interrupt Signal. 1: Enables START condition Detection Interrupt Signal.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I^2C mode.

The BIE register enables signaling of outstanding bus interrupts received by I3C.

STCNDDIE bit (START Condition Detection Interrupt Enable)

This bit enables or disables the START Condition Detection interrupt requests when the BST.STCNDDF flag is set to 1.

SPCNDDIE bit (STOP Condition Detection Interrupt Enable)

This bit enables or disables the STOP Condition Detection interrupt requests when the BST.SPCNDDF flag is set to 1.

HDREXDIE bit (HDR Exit Pattern Detection Interrupt Enable)

This bit enables or disables the HDR Exit Pattern Detection interrupt requests when the BST.HDREXDF flag is set to 1.

NACKDIE bit (NACK Detection Interrupt Enable)

This bit enables or disables the NACK Detection interrupt requests when the BST.NACKDF flag is set to 1.

TENDIE bit (Transmit End Interrupt Enable)

This bit enables or disables the Transmit End interrupt (I3C_TEND) requests when the BST.TENDF flag is set to 1.

ALIE bit (Arbitration Lost Interrupt Enable)

This bit enables or disables the Arbitration Llost interrupt requests when the BST.ALF flag is set to 1.

TODIE bit (Timeout Detection Interrupt Enable)

This bit enables or disables the Timeout Detection interrupt requests when the BST.TODF flag is set to 1.

WUCNDDIE Bit

This bit is used to enable or disable the Wake-up condition detection interrupt (INTWU) requests when the BST.WUCNDDF flag is set to 1.

26.2.45 Bus Status Force Register (BSTFC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	WUCNDDFC	—	—	—	TODFC	—	—	—	ALFC

R/W	R	R	R	R	R	R	R	W	R	R	R	W	R	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
24	WUCNDDFC	0b	W	Wake-Up Condition Detection Force 0: not Force Wake-Up Condition Detection Interrupt for software testing. 1: Force Wake-Up Condition Detection Interrupt for software testing.
23 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20	TODFC	0b	W	Timeout Detection Force*2 0: Not Force Timeout Detection Interrupt for software testing. 1: Force Timeout Detection Interrupt for software testing.
19 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	ALFC	0b	W	Arbitration Lost Force*2 0: Not Force Arbitration Lost Interrupt for software testing. 1: Force Arbitration Lost Interrupt for software testing.
15 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8	TENDFC*3	0b	W	Transmit End Force*2 0: Not Force Transmit End Interrupt for software testing. 1: Force Transmit End Interrupt for software testing.
7 to 5	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
4	NACKDFC	0b	W	NACK Detection Force*2 0: Not Force NACK Detection Interrupt for software testing. 1: Force NACK Detection Interrupt for software testing.
3	—	0b	R	Reserved These bits are read as 0. The write value should be 0.
2	HDREXDFC	0b	W	HDR Exit Pattern Detection Force*1 0: Not Force HDR Exit Pattern Detection Interrupt for software testing. 1: Force HDR Exit Pattern Detection Interrupt for software testing.
1	SPCNDDFC	0b	W	STOP condition Detection Force 0: Not Force STOP condition Detection Interrupt for software testing. 1: Force STOP condition Detection Interrupt for software testing.
0	STCNDDFC	0b	W	START condition Detection Force 0: Not Force START condition Detection Interrupt for software testing. 1: Force START condition Detection Interrupt for software testing.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I^2C mode.

Note 3. TENDFC does not work unless TDBEF0 = 1.

26.2.46 Normal Transfer Status Register (NTST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	RSQFF	—	—	—	—

R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20	RSQFF	0b	R/W*3	Normal Receive Status Queue Full Flag*2 0: The number of Receive Status Queue entries is the NRQTHCTL.RSQTH threshold or less. 1: The number of Receive Status Queue entries is more than the NRQTHCTL.RSQTH threshold.
19 to 10	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
9	TEF	0b	R/W*3	Normal Transfer Error Flag*1 0: Transfer Error does not occur. 1: Transfer Error occurs. To clear, write 0 to this bit after 1 state is read.
8 to 6	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
5	TABTF	0b	R/W*3	Normal Transfer Abort Flag*1 0: Transfer Abort does not occur. 1: Transfer Abort occur. To clear, write 0 to this bit after 1 state is read.
4	RSPQFF	0b	R/W*3	Normal Response Queue Full Flag*1 0: The number of Response Queue entries is the NQTHCTL.RSPQTH threshold or less. 1: The number of Response Queue entries is more than the NQTHCTL.RSPQTH threshold.
3	CMDQEF	0b	R/W*3	Normal Command Queue Empty Flag*1 0: If the NQTHCTL.CMDQTH = 0: The number of Command Queue empties is less than the Command Queue size. If the NQTHCTL.CMDQTH is other than 0: The number of Command Queue empties is less than the NQTHCTL.CMDQTH threshold. 1: If the NQTHCTL.CMDQTH = 0: The number of Command Queue empties is the Command Queue size. If the NQTHCTL.CMDQTH is other than 0: 1: The number of Command Queue empties is the NQTHCTL.CMDQTH threshold or more.

Bit	Bit Name	Initial Value	R/W	Description
2	IBIQEFF	0b	R/W*3	Normal IBI Queue Empty/Full Flag*1 0: For I3C protocol mode (Master): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 1. The number of IBI Status Queue entries is the NQTHCTL.IBIQTH threshold or less. For I3C protocol mode (Slave) : PRTS.PRTMD bit = 0, PRSST.CRMS bit = 0. If the NQTHCTL.IBIQTH = 0: The number of IBI Data Buffer empties is less than the IBI Data Buffer size. If the NQTHCTL.IBIQTH is other than 0: The number of IBI Data Buffer empties is less than the NQTHCTL.IBIQTH threshold. 1: For I3C protocol mode (Master): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 1. The number of IBI Status Queue entries is more than the NQTHCTL.IBIQTH threshold. For I3C protocol mode (Slave) : PRTS.PRTMD bit = 0, PRSST.CRMS bit = 0. If the NQTHCTL.IBIQTH = 0: The number of IBI Data Buffer empties is the IBI Data Buffer size. If the NQTHCTL.IBIQTH is other than 0: The number of IBI Data Buffer empties is the NQTHCTL.IBIQTH threshold or more.
1	RDBFF0	0b	R/W*3	Normal Receive Data Buffer Full Flag 0*1 0: For I2C protocol mode: PRTS.PRTMD bit = 1. Normal Receive Data Buffer0 contains no receive data. For I3C Protocol mode: PRTS.PRTMD bit = 0. The number of entries in the Normal Receive Data Buffer 0 is less than the NTBTHCTL0.RXDBTH[2:0] threshold. 1: For I2C protocol mode: PRTS.PRTMD bit = 1. Normal Receive Data Buffer0 contains receive data. For I3C Protocol mode: PRTS.PRTMD bit = 0. The number of entries in the Normal Receive Data Buffer 0 is the NTBTHCTL0.RXDBTH[2:0] threshold or more.
0	TDBEF0	0b	R/W*3	Normal Transmit Data Buffer Empty Flag 0*1 0: For I2C protocol mode: PRTS.PRTMD bit = 1. Normal Transmit Data Buffer 0 contains transmit data. For I3C protocol mode: PRTS.PRTMD bit = 0. The number of empties in the Normal Transmit Data Buffer 0 is less than the NTBTHCTL0.TXDBTH[2:0] threshold. 1: For I2C protocol mode: PRTS.PRTMD bit = 1. Normal Transmit Data Buffer 0 contains no transmit data. For I3C protocol mode: PRTS.PRTMD bit = 0. The number of empties in the Normal Transmit Data Buffer 0 is the NTBTHCTL0.TXDBTH[2:0] threshold or more.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I3C secondary master mode and I3C slave mode.

Note 3. Clearing (to 0) condition: Writing 0 after the 1 state is read.

TDBEF0 bit (Normal Transmit Data Buffer Empty Flag 0)

[Setting conditions]

For I2C Protocol mode: PRTS.PRTMD bit = 1.

The following condition 1 is satisfied and any of the following conditions 2 to 4 are satisfied:

1. The NTSTE.TDBEE0 bit = 1 (enables Tx0 Data Buffer Empty Interrupt Status logging).
2. When data has been transferred from the Normal Transmit Data Buffer 0 to the Shift Register and the Normal Transmit Data Buffer 0 becomes empty*1.
3. When the PRSST.TRMD bit is set to 1.
4. When the received slave address matches while the TRMD bit = 1.

For I3C Protocol mode: PRTS.PRTMD bit = 0.

The following conditions 1 and 2 are satisfied:

1. The NTSTE.TDBEE0 bit = 1 (enables Tx0 Data Buffer Empty Interrupt Status logging).
2. When the number of empties in the Normal Transmit Data Buffer 0 is the NTBTHCTL0.TXDBTH[2:0] threshold or more (refer to NTBTHCTL0 register).

[Clearing conditions]

For I^2C Protocol mode: PRTS.PRTMD bit = 1.

- When data is written to NTDTBP0.
- When the TRMD bit in PRSST is set to 0.

For I3C protocol mode: PRTS.PRTMD bit = 0.

- Write 0 to this bit after 1 is read.
- On completion of the last write access to Normal Transmit Data by DTC.
- When the number of empties in the Normal Transmit Data Buffer 0 is less than the NTBTHCTL0.TXDBTH[2:0] threshold (refer to NTBTHCTL0 register).

Note 1. When the BST.NACKDF flag is set to 1 while the BSTE.NACKDE bit = 1, I3C aborts data transmission/reception. If the TDBEF0 flag = 0 (next transmit data has been written), data is transferred to the Shift Register and the Normal Transmit Data Buffer 0 register becomes empty at the rising edge of the 9th clock cycle, but the TDBEF0 flag is not set to 1.

RDBFF0 bit (Normal Receive Data Buffer Full Flag 0)

[Setting conditions]

For I^2C Protocol mode: PRTS.PRTMD bit = 1.

The following condition 1 is satisfied and any of the following condition 2 or 3 is satisfied:

1. The NTSTE.RDBFE0 bit = 1 (enables Rx0 Data Buffer Full Interrupt Status logging).
2. When receive data is transferred from Shift Register to Normal Receive Data Buffer 0.
   The RDBFF0 flag is set to 1 on the rising edge of the 8th or 9th SCL clock cycle (selected in the ACKTWE bit in SCSTRCTL).
3. When the received slave address matches after a START (or Repeated START) condition is detected with the TRMD bit in PRSST set to 0.

For I3C Protocol mode: PRTS.PRTMD bit = 0. The following conditions 1 and 2 are satisfied:

1. The NTSTE.RDBFE0 bit = 1 (enables Rx0 Data Buffer Full Interrupt Status logging).
2. When the number of Normal Receive Data Buffer 0 entries is the NTBTHCTL0.RXDBTH[2:0] threshold or more (refer to NTBTHCTL0 register).

[Clearing conditions]

For I^2C Protocol mode: PRTS.PRTMD bit = 1.

- When data is read from NTDTBP0.

For I3C Protocol mode: PRTS.PRTMD bit = 0.

- Write 0 to this bit after 1 is read.
- On completion of the last read access to Normal Receive Data by DTC.

- When the number of Normal Receive Data Buffer 0 entries is less than the NTBTHCTL0.RXDBTH[2:0] threshold (refer to NTBTHCTL0 register).

IBIQEFF bit (Normal IBI Queue Empty/Full Flag)

[Setting conditions]

The following 2 conditions are satisfied:

1. The NTSTE.IBIQEFE bit = 1 (enables IBI Status Buffer Empty/Full Interrupt Status logging)
2. For I3C protocol mode (master): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 1.
   - When the number of IBI Status Queue entries is more than the NQTHCTL.IBIQTH threshold (refer to NQTHCTL register).

   For I3C protocol mode (slave): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 0.
   If the NQTHCTL.IBIQTH = 0:
   - When IBI Data Buffer is completely empty.

   If the NQTHCTL.IBIQTH is other than 0:
   - When the number of IBI Data Buffer empties is the NQTHCTL.IBIQTH threshold or more (refer to NQTHCTL register).

[Clearing conditions]

For I3C protocol mode (master): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 1.

- Write 0 to this bit after 1 is read.
- On completion of the last read access to IBI Status by DTC.
- When the number of IBI Status Queue entries is the NQTHCTL.IBIQTH threshold or less (refer to NQTHCTL register).

For I3C protocol mode (slave): PRTS.PRTMD bit = 0, PRSST.CRMS bit = 0.

- Write 0 to this bit after 1 is read.
- On completion of the last write access to IBI Status by DTC.

If the NQTHCTL.IBIQTH = 0:

- When IBI Data Buffer is not completely empty.

If the NQTHCTL.IBIQTH is other than 0:

- When the number of IBI Data Buffer empties is less than the NQTHCTL.IBIQTH threshold (refer to NQTHCTL register).

CMDQEF bit (Normal Command Queue Empty Flag)

[Setting conditions]

The following 2 conditions are satisfied:

1. The NTSTE.CMDQEE bit = 1 (enables Command Buffer Empty Interrupt Status logging).
2. If the NQTHCTL.CMDQTH = 0:
   - When Command Queue is completely empty.

   If the NQTHCTL.CMDQTH is other than 0:

- When the number of Command Queue empties is the NQTHCTL.CMDQTH threshold or more (refer to NQTHCTL register).

[Clearing conditions]

- Write 0 to this bit after 1 is read.
- On completion of the last write access to Normal Command by DTC.

If the NQTHCTL.CMDQTH = 0:

- When Command Queue is not completely empty.

If the NQTHCTL.CMDQTH is other than 0:

- When the number of Command Queue empties is less than the NQTHCTL.CMDQTH threshold (refer to NQTHCTL register).

RSPQFF bit (Normal Response Queue Full Flag)

[Setting conditions]

The following 2 conditions are satisfied:

1. The NTSTE.RSPQFE bit = 1 (enables Response Buffer Full Interrupt Status logging).
2. When the number of Response Queue entries is more than the NQTHCTL.RSPQTH threshold (refer to NQTHCTL register).

[Clearing conditions]

- Write 0 to this bit after 1 is read.
- On completion of the last read access to Normal Receive Status by DTC.
- When the number of Response Queue entries is the NQTHCTL.RSPQTH threshold or less (refer to NQTHCTL register).

TABTF bit (Normal Transfer Abort Flag)

[Setting conditions]

The following 2 conditions are satisfied:

1. The NTSTE.TABTE bit = 1 (enables Ttransfer Abort Interrupt Status logging).
2. When any transfer is aborted.

[Clearing condition]

- Write 0 to this bit after 1 is read.

TEF bit (Normal Transfer Error Flag)

[Setting conditions]

The following 2 conditions are satisfied:

1. The NTSTE.TEE bit = 1 (enables Ttransfer Error Interrupt Status logging).
2. When any transfer error occurs on the I3C bus. The Error type for this error is available in the Response or Receive Status structure corresponding to the Transfer command.

[Clearing condition]

- Write 0 to this bit after 1 is read.

RSQFF bit (Normal Receive Status Queue Full Flag)

[Setting conditions]

The following 2 conditions are satisfied:

1. The NTSTE.RSQFE bit = 1 (Normal Receive Status Queue Full Enable).
2. When the number of Receive Status Queue entries is more than the NRQTHCTL.RSQTH threshold (refer to NRQTHCTL register).

[Clearing conditions]

- Write 0 to this bit after 1 is read.
- On completion of the last read accsess to Normal Receive Status by DTC.
- When the number of Receive Status Queue entries is the NRQTHCTL.RSQTH threshold or less (refer to NRQTHCTL register).

26.2.47 Normal Transfer Status Enable Register (NTSTE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	RSQFE	—	—	—	—

R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20	RSQFE	0b	R/W	Normal Receive Status Queue Full Enable*2 0: Disables Receive Status Buffer Full Interrupt Status logging. 1: Enables Receive Status Buffer Full Interrupt Status logging.
19 to 10	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
9	TEE	0b	R/W	Normal Transfer Error Enable*1 0: Disables Transfer Error Interrupt Status logging. 1: Enables Transfer Error Interrupt Status logging.
8 to 6	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
5	TABTE	0b	R/W	Normal Transfer Abort Enable*1 0: Disables Transfer Abort Interrupt Status logging. 1: Enables Transfer Abort Interrupt Status logging.
4	RSPQFE	0b	R/W	Normal Response Queue Full Enable*1 0: Disables Response Buffer Full Interrupt Status logging. 1: Enables Response Buffer Full Interrupt Status logging.
3	CMDQEE	0b	R/W	Normal Command Queue Empty Enable*1 0: Disables Command Buffer Empty Interrupt Status logging. 1: Enables Command Buffer Empty Interrupt Status logging.
2	IBIQEFE	0b	R/W	Normal IBI Queue Empty/Full Enable*1 0: Disables IBI Status Buffer Empty/Full Interrupt Status logging. 1: Enables IBI Status Buffer Empty/Full Interrupt Status logging.
1	RDBFE0	0b	R/W	Normal Receive Data Buffer Full Enable 0 0: Disables Rx0 Data Buffer Full Interrupt Status logging. 1: Enables Rx0 Data Buffer Full Interrupt Status logging.
0	TDBEE0	0b	R/W	Normal Transmit Data Buffer Empty Enable 0 0: Disables Tx0 Data Buffer Empty Interrupt Status logging. 1: Enables Tx0 Data Buffer Empty Interrupt Status logging.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I3C secondary master mode and I3C slave mode.

TDBEE0 bit (Normal Transmit Data Buffer Empty Enable 0)

When this bit is 1, the operation of NTST.TDBEF0 is enabled.

For the setting conditions and clearing conditions of the NTST.TDBEF0 flag, see the details of NTST.TDBEF0.

RDBFE0 bit (Normal Receive Data Buffer Full Enable 0)

When this bit is 1, the operation of NTST.RDBFF0 is enabled.

For the setting conditions and clearing conditions of the NTST.RDBFF0 flag, see the details of NTST.RDBFF0.

IBIQEFE bit (Normal IBI Queue Empty/Full Enable)

When this bit is 1, the operation of NTST.IBIQEFF is enabled.

For the setting conditions and clearing conditions of the NTST.IBIQEFF flag, see the details of NTST.IBIQEFF.

CMDQEE bit (Normal Command Queue Empty Enable)

When this bit is 1, the operation of NTST.CMDQEF is enabled.

For the setting conditions and clearing conditions of the NTST.CMDQEF flag, see the details of NTST.CMDQEF.

RSPQFE bit (Normal Response Queue Full Enable)

When this bit is 1, the operation of NTST.RSPQFF is enabled.

For the setting conditions and clearing conditions of the NTST.RSPQFF flag, see the details of NTST.RSPQFF.

TABTE bit (Normal Transfer Abort Enable)

When this bit is 1, the operation of NTST.TABTF is enabled.

For the setting conditions and clearing conditions of the NTST.TABTF flag, see the details of NTST.TABTF.

TEE bit (Normal Transfer Error Enable)

When this bit is 1, the operation of NTST.TEF is enabled.

For the setting conditions and clearing conditions of the NTST.TEF flag, see the details of NTST.TEF.

RSQFE bit (Normal Receive Status Queue Full Enable)

When this bit is 1, the operation of NTST.RSQFF is enabled.

For the setting conditions and clearing conditions of the NTST.RSQFF flag, see the details of NTST.RSQFF.

26.2.48 Normal Transfer Interrupt Enable Register (NTIE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	RSQFIE	—	—	—	—

R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20	RSQFIE	0b	R/W	Normal Receive Status Queue Full Interrupt Enable*2 0: Disables Receive Status Buffer Full Interrupt Signal. 1: Enables Receive Status Buffer Full Interrupt Signal.
19 to 10	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
9	TEIE	0b	R/W	Normal Transfer Error Interrupt Enable*1 0: Disables Transfer Error Interrupt Signal. 1: Enables Transfer Error Interrupt Signal.
8 to 6	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
5	TABTIE	0b	R/W	Normal Transfer Abort Interrupt Enable*1 0: Disables Transfer Abort Interrupt Signal. 1: Enables Transfer Abort Interrupt Signal.
4	RSPQFIE	0b	R/W	Normal Response Queue Full Interrupt Enable*1 0: Disables Response Buffer Full Interrupt Signal. 1: Enables Response Buffer Full Interrupt Signal.
3	CMDQEIE	0b	R/W	Normal Command Queue Empty Interrupt Enable*1 0: Disables Command Buffer Empty Interrupt Signal. 1: Enables Command Buffer Empty Interrupt Signal.
2	IBIQEFIE	0b	R/W	Normal IBI Queue Empty/Full Interrupt Enable*1 0: Disables IBI Status Buffer Empty/Full Interrupt Signal. 1: Enables IBI Status Buffer Empty/Full Interrupt Signal.
1	RDBFIE0	0b	R/W	Normal Receive Data Buffer Full Interrupt Enable 0 0: Disables Rx0 Data Buffer Full Interrupt Signal. 1: Enables Rx0 Data Buffer Full Interrupt Signal.
0	TDBEIE0	0b	R/W	Normal Transmit Data Buffer Empty Interrupt Enable 0 0: Disables Tx0 Data Buffer Empty Interrupt Signal. 1: Enables Tx0 Data Buffer Empty Interrupt Signal.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I3C secondary master mode and I3C slave mode.

The PIO Interrupt Signal Enable register enables signaling of outstanding interrupts received by I3C.

TDBEIE0 bit (Normal Transmit Data Buffer Empty Interrupt Enable 0)

This bit is used to enable or disable the Normal Tx Data buffer 0 empty interrupt (I3Cn_TX) requests when the NTST.TDBEF0 flag is set to 1.

RDBFIE0 bit (Normal Receive Data Buffer Full Interrupt Enable 0)

This bit is used to enable or disable the Normal Rx Data buffer 0 full interrupt (I3Cn_RX) requests when the NTST.RDBFF0 flag is set to 1.

IBIQEFIE bit (Normal IBI Queue Empty/Full Interrupt Enable)

This bit is used to enable or disable the Normal IBI Status buffer full interrupt (INTIBI) requests when the NTST.IBIQEFF flag is set to 1.

CMDQEIE bit (Normal Command Queue Empty Interrupt Enable)

This bit is used to enable or disable the Normal Command buffer empty interrupt (INTCMD) requests when the NTST.CMDQEF flag is set to 1.

RSPQFIE bit (Normal Response Queue Full Interrupt Enable)

This bit is used to enable or disable the Normal Response Status buffer full interrupt (INTRESP) requests when the NTST.RSPQFF flag is set to 1.

TABTIE bit (Normal Transfer Abort Interrupt Enable)

This bit is used to enable or disable the Normal Transfer Abort interrupt (INTABORT) requests when the NTST.TABTF flag is set to 1.

TEIE bit (Normal Transfer Error Interrupt Enable)

This bit is used to enable or disable the Normal Transfer Error interrupt (INTTERR) requests when the NTST.TEF flag is set to 1.

RSQFIE bit (Normal Receive Status Queue Full Interrupt Enable)

This bit is used to enable or disable the Normal Receive Status buffer full interrupt (INTRCV) requests when the NTST.RSQFF flag is set to 1.

26.2.49 Normal Transfer Status Force Register (NTSTFC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	W	R	R	R	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The write value should be 0.
20	RSQFFC	0b	W	Normal Receive Status Queue Full Force*2 0: Not Force Receive Status Buffer Full Interrupt for software testing. 1: Force Receive Status Buffer Full Interrupt for software testing.
19 to 10	—	All 0	R	Reserved The write value should be 0.
9	TEFC	0b	W	Normal Transfer Error Force*1 0: Not Force Transfer Error Interrupt for software testing. 1: Force Transfer Error Interrupt for software testing.
8 to 6	—	000b	R	Reserved The write value should be 0.
5	TABTFC	0b	W	Normal Transfer Abort Force*1 0: Not Force Transfer Abort Interrupt for software testing. 1: Force Transfer Abort Interrupt for software testing.
4	RSPQFFC	0b	W	Normal Response Queue Full Force*1 0: Not Force Response Buffer Full Interrupt for software testing. 1: Force Response Buffer Full Interrupt for software testing.
3	CMDQEFC	0b	W	Normal Command Queue Empty Force*1 0: Not Force Command Buffer Empty Interrupt for software testing. 1: Force Command Buffer Empty Interrupt for software testing.
2	IBIQEFFC	0b	W	Normal IBI Queue Empty/Full Force*1 0: Not Force IBI Status Buffer Full Interrupt for software testing. 1: Force IBI Status Buffer Full Interrupt for software testing.
1	RDBFFC0	0b	W	Normal Receive Data Buffer Full Force 0 0: Not Force Rx0 Data Buffer Full Interrupt for software testing. 1: Force Rx0 Data Buffer Full Interrupt for software testing.
0	TDBEFC0	0b	W	Normal Transmit Data Buffer Empty Force 0 0: Not Force Tx0 Data Buffer Empty Interrupt for software testing. 1: Force Tx0 Data Buffer Empty Interrupt for software testing.

Note 1. This bit supports for all I3C mode.

Note 2. This bit supports for I3C secondary master mode and I3C slave mode.

The PIO Interrupt Force register is used to force specific interrupt. It can be used for debug purposes.

TDBEFC0 bit (Normal Transmit Data Buffer Empty Force 0)

For software testing, when set to 1, forces the corresponding interrupt, subject to TDBEE0 and TDBEIE0 configuration.

RDBFFC0 bit (Normal Receive Data Buffer Full Force 0)

For software testing, when set to 1, forces the corresponding interrupt, subject to RDBFE0 and RDBFIE0 configuration.

IBIQEFFC bit (Normal IBI Queue Empty/Full Force)

For software testing, when set to 1, forces the corresponding interrupt, subject to IBIQEFE and IBIQEFIE configuration.

CMDQEFC bit (Normal Command Queue Empty Force)

For software testing, when set to 1, forces the corresponding interrupt, subject to CMDQEE and CMDQEIE configuration.

RSPQFFC bit (Normal Response Queue Full Force)

For software testing, when set to 1, forces the corresponding interrupt, subject to RSPQFEand RSPQFIE configuration.

TABTFC bit (Normal Transfer Abort Force)

For software testing, forces the corresponding interrupt, subject to TABTE and TABTIE configuration.

TEFC bit (Normal Transfer Error Force)

For software testing, when set to 1, forces the corresponding interrupt, subject to TEE and TEIE configuration.

RSQFFC bit (Normal Receive Status Queue Full Force)

For software testing, when set to 1, forces the corresponding interrupt, subject to RSQFE and RSQFIE configuration.

26.2.50 Bus Condition Status Register (BCST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BIDLF	BAVLF	BFREF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as 0.
2	BIDLF	0b	R	Bus Idle Detection Flag*1 0: Have not Detected Bus Idle 1: Have Detected Bus Idle
1	BAVLF	0b	R	Bus Available Detection Flag*1 0: Have not Detected Bus Available 1: Have Detected Bus Available
0	BFREF	0b	R	Bus Free Detection Flag 0: Have not Detected Bus Free 1: Have Detected Bus Free

Note 1. This bit supports for all I3C mode.

BFREF bit (Bus Free Detection Flag)

The Bus Free Condition is a period occurring after a STOP and before a START, and with the following duration:

- For Pure Bus: A duration of at least tCAS
- For Mixed Bus (at least one Legacy I^2C is present on the I3C Bus): A duration of at least tBUF

[Setting conditions]

- After a STOP condition is detected, when the number of cycles (I3Cϕ) that are set by BFRECDT.FRECYC[8:0] has passed in the state of SCL = SDA = 1.
- After setting BCTL.BUSE to 1, when the number of cycles (I3Cϕ) that are set by BFRECDT.FRECYC[8:0] has passed in the state of SCL = SDA = 1.

[Clearing conditions]

- When SCL and SDA are other than high.
- When the BCTL.BUSE bit is set to 0.

BAVLF bit (Bus Available Detection Flag)

The Bus Available Condition is a period during which the Bus Free Condition is sustained continuously for a duration of at least tAVAL. A Slave can only issue a START Request (for an In-Band Interrupt, or for a Master Handoff Request) after a Bus Available Condition.

[Setting conditions]

- After a STOP condition is detected, when the number of cycles (I3Cϕ) that are set by BAVLCDT.AVLCYC[8:0] has passed in the state of SCL = SDA = 1.
- After setting BCTL.BUSE to 1, when the number of cycles (I3Cϕ) that are set by BAVLCDT.AVLCYC[8:0] has passed in the state of SCL = SDA = 1.

[Clearing conditions]

- When SCL and SDA are other than high.
- When the BCTL.BUSE bit is set to 0.

BIDLF bit (Bus Idle Detection Flag)

The I3C Bus Idle Condition is in order to help ensure Bus stability during Hot-Join events. The Bus Idle Condition is a period during which the Bus Available Condition is sustained continuously for a duration of at least tIDLE.

If a Hot-Join Device is powered up onto the I3C Bus at the same time as the Main Master, then the Hot-Join Device may pull SDA Low after 1 ms if (1) the Main Master has SCL and SDA pulled up, and (2) the Master does not act on the I3C Bus within the same Idle period.

[Setting conditions]

- After a STOP condition is detected, when the number of cycles (I3Cϕ) that are set by BIDLCDT.IDLCYC[17:0] has passed in the state of SCL = SDA = 1.
- After setting BCTL.BUSE to 1, when the number of cycles (I3Cϕ) that are set by BIDLCDT.IDLCYC[17:0] has passed in the state of SCL = SDA = 1.

[Clearing conditions]

- When SCL and SDA are other than high.
- When the BCTL.BUSE bit is set to 0.

26.2.51 Slave Status Register (SVST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SVAF[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HOAF	—	—	—	—	—	—	—	—	DVIDF	HSMCF	—	—	—	—	GCAF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
18 to 16	SVAF[2:0]	000b	R/W*1	Slave Address Detection Flag [2:0] 0: Slave [2:0] does not detect 1: Slave [2:0] detect
15	HOAF	0b	R/W*1	Host Address Detection Flag 0: Host address does not detect. 1: Host address detects. • This bit set to 1 when the received slave address matches the host address (000_1000).
14 to 7	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
6	DVIDF	0b	R/W*1	Device-ID Address Detection Flag 0: Device-ID command does not detect. 1: Device-ID command detects. • This bit set to 1 when the first frame received immediately after a START condition is detected matches a value of (device ID (111_1100) + 0[W]).
5	HSMCF	0b	R/W*1	Hs-mode Master Code Detection Flag 0: Hs-mode Master Code does not detect. 1: Hs-mode Master Code detects.
4 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
0	GCAF	0b	R/W*1	General Call Address Detection Flag 0: General call address does not detect. 1: General call address detects.

Note: This register supports for I^2C mode.

Note 1. Clearing (to 0) condition: Writing 0 after the 1 state is read.

GCAF flag (General Call Address Detection Flag)

[Setting conditions]

- This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.

  1. The SVCTL.GCAE bit = 1 (General call address detection is enabled).

  2. When the received slave address matches the general call address (000_0000 + 0 (write)).

[Clearing conditions]

- When 0 is written to the GCAF flag after reading GCAF flag to be 1.
- When a STOP condition is detected.
- When a Repeated START condition is detected.

HSMCF flag (Hs-mode Master Code Detection Flag)

[Setting conditions]

- This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.

  1. The SVCTL.HSMCE bit = 1 (Hs-mode master code detection is enabled).

  2. When the first byte received immediately after a START condition is detected matches a value of Hs-mode master code (0000_1XXX) + 1 (NACK).

[Clearing conditions]

- When 0 is written to the HSMCF flag after reading HSMCF flag to be 1.
- When a STOP condition is detected.

DVIDF flag (Device-ID Address Detection Flag)

[Setting conditions]

- This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.

  1. The SVCTL.DVIDE bit = 1 (Device-ID address detection is enabled).

  2. When the first byte received immediately after a START condition or Repeated START condition is detected matches a value of Device ID (111_1100) + 0 (write).

[Clearing conditions]

- When 0 is written to the DVIDF flag after reading DVIDF flag to be 1.
- When a STOP condition is detected.
- This flag is set to 0 at the rising edge of the ninth SCL clock cycle in the first byte when the following 1 and 2 or 1 and 3 are satisfied.

  1. The SVCTL.DVIDE bit = 1 (Device-ID address detection is enabled).

  2. When the first byte received immediately after a START condition or Repeated START condition is detected does not match a value of Device ID (111_1100).

  3. When the first byte received immediately after a START condition or Repeated START condition is detected matches a value of (device ID (111_1100) + 0 [W]) and the second byte does not match any of slave addresses 0 to 2.

HOAF flag (Host Address Detection Flag)

[Setting conditions]

- This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.

  1. The SVCTL.HOAE bit = 1 (Host address detection is enabled).

  2. When the received slave address matches the host address (000_1000).

[Clearing conditions]

- When 0 is written to the HOAF flag after reading HOAF flag to be 1.
- When a STOP condition is detected.
- When a Repeated START condition is detected.

SVAFy flags (Slave Address Detection Flag y) (y = 0 to 2)

[Setting conditions]

For 7-bit address format: SVDVADy.SADLG bit = 0.

- This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.
  1. The SVCTL.SVAEy bit = 1 (Slave n enabled).
  2. When the received slave address matches the SVDVADy.SVAD[6:0] bits value.

For 10-bit address format: SVDVADy.SADLG bit = 1.

- This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the second byte when all of the followings are satisfied.
  1. The SVCTL.SVAEy bit = 1 (Slave n enabled).
  2. When the received slave address matches a value of 1_1110 + SVDVADy.SVAD[9:8] bits and the following address matches the SVDVADy.SVAD[7:0] value.

[Clearing conditions]

- When 0 is written to the SVAFy flag after reading SVAFy flag to be 1.
- When a STOP condition is detected.

For 7-bit address format: SVDVADy.SADLG bit = 0.

- This flag is set to 0 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.
  1. The SVCTL.SVAEy bit = 1 (Slave n enabled).
  2. When the received slave address does not match SVDVADy.SVAD[6:0] bits value.

For 10-bit address format: SVDVADy.SADLG bit = 1.

- This flag is set to 0 at the rising edge of the ninth SCL clock cycle in the first byte when all of the followings are satisfied.
  1. The SVCTL.SVAEy bit = 1 (Slave n enabled).
  2. When the received slave address does not match a value of 1_1110 + SVDVADy.SVAD[9:8] bits.
- This flag is set to 0 at the rising edge of the ninth SCL clock cycle in the second byte when all of the followings are satisfied.
  1. The SVCTL.SVAEn bit = 1 (Slave n enabled).
  2. When the received slave address matches a value of 1_1110 + SVDVADy.SVAD[9:8] bits and the following address does not match the SVDVADy.SVAD[7:0] value.

26.2.52 Wake Up Unit Operating Status Register (WUST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
0	WUASYNF	0b	R	Wake-Up function Asynchronous operation status Flag 0: This IP synchronous circuit enable condition 1: This IP asynchronous circuit enable condition

WUASYNF Flag (Wake-Up function asynchronous operation status flag)

This bit shows whether this IP is in the TCLK asynchronous operation (WUCTL.WUFE bit = 1).

[Setting condition]

The following 1 and 2 are satisfied.

1. The WUCTL.WUFE bit = 1 (Wake-up function is enabled)
2. When the BCST.BFREF flag = 1 after 0 is written to the WUCTL.WUFSYNE bit

[Clearing condition: I^2C slave]

The WUCTL.WUFE bit = 0 (Wake-up function is disabled)

All of the following 1 to 3 are satisfied.

1. The WUCTL.WUFE bit = 1 (Wake-up function is enabled)
2. Wake-Up event is detected
3. When 1 is written to the WUCTL.WUFSYNE bit during WUASYNF flag = 1

[Clearing condition: I3C slave]

The WUCTL.WUFE bit = 0 (Wake-up function is disabled)

All of the following 1 to 4 are satisfied.

1. The WUCTL.WUFE bit = 1 (Wake-up function is enabled)
2. Wake-Up event is detected
3. When 1 is written to the WUCTL.WUFSYNE bit during WUASYNF flag = 1
4. When a STOP condition is detected.

[Clearing condition: I^2C/I3C slave]

All of the following 1 to 5 are satisfied.

1. The WUCTL.WUFE bit = 1 (Wake-up function is enabled)
2. Wake-Up event is not detected
3. The WUASYNF flag = 1
4. The WUCTL.WUFSYNE bit = 1
5. When a STOP condition is detected.

[Clearing condition: I3C master]

The WUCTL.WUFE bit = 0 (Wake-up function is disabled)

All of the following 1 to 4 are satisfied.

1. The WUCTL.WUFE bit = 1 (Wake-up function is enabled)
2. Wake-Up event is detected
3. The WUASYNF flag = 1
4. The WUCTL.WUFSYNE bit = 1

26.2.53 MsyncCNT Counter Capture Register (MRCCPT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	R/W	MSyncCNT Counter Capture Used in Async Mode 1, not used in Async Mode0.

Note: This register supports for I3C secondary master mode and I3C slave mode.

MRCCPT[31:0] Bits

Async Mode 1 (Asynchronous Advanced Mode)

When ATCCNTE.ATCE is enabled, it starts counting. It captures as MSyncCNT for each aME (SDA falling edge of START condition) and store it in the capture register.

26.2.54 Device Address Table Basic Register m (DATBASm) (m = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

30, 29	DVNACK[1:0]	00b	R/W	Device NACK Retry Count Device-specific retry count
28 to 24	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
23 to 16	DVDYAD[7:0]	All 0	R/W	Device I3C Dynamic Address Bit 23 is the parity bit, per the I3C specification, computed and updated by the software driver.
15	DVIBITS	0b	R/W	Device IBI Time-stamp 0: The Master shall not time-stamp IBIs from this Device with Master Time-stamps. 1: The Master shall time-stamp IBIs for this Device with Master Time-stamps.
14	DVMRRJ	0b	R/W	Device In-Band Master Request Reject 0: This Device shall ACK Master Requests. 1: This Device shall NACK Master Requests and send the auto-disable command.
13	DVSIRRJ	0b	R/W	Device In-Band Slave Interrupt Request Reject 0: This Device shall ACK the SIR. 1: This Device shall NACK the SIR and send the auto-disable CCC.
12	DVIBIPL	0b	R/W	Device IBI Payload 0: IBIs from this Device do not carry a Data Payload. 1: IBIs from this Device do carry a Data Payload.
11 to 7	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
6 to 0	DVSTAD[6:0]	All 0	R/W	Device Static Address I3C Static Address

Note: This register supports for I3C master mode and I3C secondary master mode.

DVIBIPL bit (Device IBI Payload)

Indicates whether IBIs from this Device have a Data Payload. This field reflects the IBI Payload bit in the Device's Bus Characteristics Register (BCR).

During IBI handling for this Device, the Master shall use this field to determine whether or not to drive reception of the IBI Data Payload. Data continuation is indicated by the T-Bit.

DVSIRRJ bit (Device In-Band Slave Interrupt Request Reject)

Controls whether this Device, when operating in the Master role, will accept vs. reject Slave Interrupt Requests from other Devices.

DVMRRJ bit (Device In-Band Master Request Reject)

Controls whether this Device, when operating in the Master role, will accept vs. reject Master requests from other Devices. This bit is only valid if I3C declares Non-Current Master Capability.

DVIBITS bit (Device IBI Time-stamp)

Enables or disables IBI time-stamping for a specific Device.

Note: The IBI Status Descriptor for each IBI event indicates whether or not the individual IBI event was actually time- stamped. Set to 0 except for Async mode 0 and Async mode 1 of timing control.

DVNACK[1:0] bits (Device NACK Retry Count)

These bits set the number of retries when a NACK response is received from the slave for the transaction set in the Command Descriptor.

Note: When ENTDAA is executed by Address Assign Command, the setting of this bit is ignored and the transaction ends when NACK is received once.

26.2.55 Slave Device Address Table Basic Register n (SDATBASn) (n = 0 to 2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SDDYAD[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SDIBIPL	—	SDADLS	SDSTAD[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
22 to 16	SDDYAD[6:0] *1	All 0	R/W	Slave Device I3C Dynamic Address*5
15 to 13	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
12	SDIBIPL*1	0b	R	Slave Device IBI Payload*4 This bit is the mirror bit of the SVDCT.TBCR[2]. 0: IBIs from this device do not carry a data payload. 1: IBIs from this device carry a data payload.
11	—	0b	R	Reserved These bits are read as 0. The write value should be 0.
10	SDADLS	0b	R/W	Slave Device Address Length Selection*3 0: Slave device address length 7 bits selected. 1: Slave device address length 10 bits selected. (I^2C device only)
9 to 0	SDSTAD[9:0]	All 0	R/W	Slave Device Static Address*2 I3C / I^2C Static Address

Note: SW write to the SDATBAS register of the main master is prohibited.

Note 1. This bit is valid only in SDATBAS0 register.

Note 2. These bits support for I^2C, I3C secondary master, and I3C slave mode.

Note 3. This bit supports for I^2C mode.

Note 4. This bit supports for I3C secondary master mode and I3C slave mode.

Note 5. These bits support for I3C secondary master mode and I3C slave mode.

SDSTAD[9:0] bits (Slave Device Static Address)

When the 7-bit address format is selected (SDADLS bit is 0), the lower 7 bits of SDSTAD[9:0] function as the 7-bit address.

When the 10-bit address format is selected (SDADLS bit is 1), the SDSTAD[9:0] function as the 10-bit address. While the SVCTL.SVAEn bit is 0, the setting of this bit is ignored.

SDIBIPL bit (Slave Device IBI Payload)

Indicates whether IBIs from this Device have a Data Payload. This field reflects the IBI Payload bit in the Device's Bus Characteristics Register (BCR).

During IBI handling for this Device, the Master shall use this field to determine whether or not to drive reception of the IBI Data Payload. Data continuation is indicated by the T-Bit.

SDDYAD[6:0] bits (Slave Device I3C Dynamic Address)

[Update conditions]

- When writing Dynamic Address value.
- When Slave Address value is its own Static Address in receiving SETDASA CCC (Direct), these bits are updated to Dynamic Address value.*1
- When Dynamic Address Assignment procedure that starts by receiving ENTDAA CCC (Broadcast) is established.*1
- When receiving RSTDAA CCC (Broadcast), all bits are cleared to 0.*1
- When Slave Address value is its own Dynamic Address in receiving RSTDAA CCC (Direct), all bits are cleared to 0.*1
- When Slave Address value is its own Dynamic Address in receiving SETNEWDA CCC (Direct), these bits are updated to the Dynamic Address value.*1
- When receiving SETAASA CCC (Broadcast), these bits are updated to the value of SDSTAD[6:0] bits*2.

Note 1. See *the MIPI I3C Specification v1.0*.

Note 2. See *the MIPI I3C Basic Specification v1.0*.

26.2.56 Master Device Characteristic Table Register m (MSDCTm) (m = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15, 14	RBCR76[1:0]	00b	R/W	Device Role 0 0: I3C Slave 0 1: I3C Master*3 Others: Setting prohibited
13	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	RBCR4	0b	R/W	Bridge Identifier 0: Not a Bridge Device 1: Is a Bridge Device
11	RBCR3	0b	R/W	Offline Capable*2 0: Device will always respond to I3C bus commands. 1: Device will not always respond to I3C bus commands.
10	RBCR2	0b	R/W	IBI Payload 0: No data byte follows the accepted IBI. 1: Mandatory one or more data bytes follow the accepted IBI. Data byte continuation is indicated by T-Bit.
9	RBCR1	0b	R/W	IBI Request Capable 0: Not Capable 1: Capable
8	RBCR0	0b	R/W	Max Data Speed Limitation*1 0: No Limitation 1: Limitation
7 to 0	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Note: This register supports for I3C master mode and I3C secondary master mode.

Note 1. Master shall use the GETMXDS CCC to interrogate the Slave for specific limitation.

Note 2. Offline Capable Devices retain the Dynamic Address.

Note 3. For an I3C Device acting as I3C Main Master, the BCR Device Role bits will contain the value 01.

The DCT table captures the Device characteristics (PID, BCR, DCR) and assigned Dynamic Address of each Device on the I3C Bus that participates in the Dynamic Address Allocation (ENTDAA) procedure.

RBCRn bits (Received Bus Characteristic Register)

Each I3C Device that is connected to the I3C Bus shall have an associated read-only Bus Characteristics Register (BCR). This read-only register describes the I3C compliant Device's role and capabilities for use in Dynamic Address assignment and Common Command Codes.

Note: When RBCR[2] is 0 and when ACK response to Slave Interrupt Request from I3C Slave by DATBASm.DVSIRR J = 0, STOP Condition is issued after ACK response. When RBCR[2] is 1 and when ACK response to Slave Interrupt Request from I3C Slave by DATBASm.DVSIRRJ = 0, IBI Payload is received after ACK response. STOP Condition is issued after end of IBI Payload.

[Update condition]

- When receiving of Bus Characteristics Register (BCR) from Device in the Dynamic Address Assignment procedure starting by receiving ENTDAA CCC (Broadcast).*[1]

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.57 Extended Device Address Table Basic Register (EXDATBAS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 to 14	TBCR76[1:0]	00b	R/W	Device Role 0 0: I3C Slave 0 1: I3C Master*3 1 0: Reserved for future definition by MIPI Sensor WG 1 1: Reserved for future definition by MIPI Sensor WG
13	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	TBCR4	0b	R/W	Bridge Identifier 0: Not a Bridge Device 1: Is a Bridge Device
11	TBCR3	0b	R/W	Offline Capable*2 0: Device will always respond to I3C bus commands. 1: Device will not always respond to I3C bus commands.
10	TBCR2	0b	R/W	IBI Payload 0: No data byte follows the accepted IBI. 1: Mandatory one or more data bytes follow the accepted IBI. Data byte continuation is indicated by T-Bit.
9	TBCR1	0b	R/W	IBI Request Capable 0: Not Capable 1: Capable
8	TBCR0	0b	R/W	Max Data Speed Limitation*1 0: No Limitation 1: Limitation
7 to 0	TDCR[7:0]	All 0	R/W	Transfar Device Characteristic Register 255 available codes for describing the type of sensor, or device. Examples: Accelerometer, gyroscope, composite devices Default value is 0: Generic Device

Note: This register supports for I3C secondary master mode and I3C slave mode.

Note 1. Master shall use the GETMXDS CCC to interrogate the Slave for specific limitation.

Note 2. Offline Capable Devices retain the Dynamic Address.

Note 3. For an I3C Device acting as I3C Main Master, the BCR Device Role bits will contain the value 01.

The DCT table captures the Device characteristics (PID, BCR, DCR) and assigned Dynamic Address of each device on the I3C bus that participates in the Dynamic Address Allocation (ENTDAA) procedure.

TDCR[7:0] bits (Transfar Device Characteristic Register)

Each I3C device that is connected to the I3C bus has an associated Device Characteristics Register (DCR). This register describes the I3C compliant device type such as accelerometer and gyroscope, for use in Dynamic Address assignment and Common Command Codes.

TBCRn bits (Transfar Bus Characteristic Register)

Each I3C device that is connected to the I3C bus has an associated Bus Characteristics Register (BCR). This register describes the role and capabilities of the I3C compliant device for use in Dynamic Address assignment and Common Command Codes.

When I3C Slave issues IBI by Command Descriptor, the condition of TBCR[7:0] is described as follows:

[Slave Interrupt Request: No IBI Payload follow the accepted IBI]

- TBCR1 = 1
- TBCR2 = 0

Note: Set DATA_LENGTH[15:0] of Command Descriptor to 0.

[Slave Interrupt Request: IBI Payload follow the accepted IBI]

- TBCR1 = 1
- TBCR2 = 1

Note: Set DATA_LENGTH[15:0] of Command Descriptor to any value.

[Mastership Request]

- TBCR1 = 1
- TBCR76[1:0] = 01b

[Hot-join Event]

- TBCR1 = 1

When I3C Slave receives CCC from I3C Master, it performs the following operations according to the setting of TBCR[7:0]:

- When TBCR2 = 1, CMRLG.IBIPSZ[7:0] is sent as the 3rd byte data to GETMRL CCC from I3C Master
- When TBCR0 = 0, NACK responses to GETMXDS CCC from I3C Master
- When TBCR0 = 1, ACK responses to GETMXDS CCC from I3C Master and sends data from CMDSPW, CMDSPR, and CMDSPT registers

26.2.59 Slave Device Characteristic Table Provisional ID Low Register (SDCTPIDL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	n/a	All 0	R/W	Transfar Device Provisional ID High Bits [47:16] of device's I3C PID.

Note: This register supports for I3C secondary master mode and I3C slave mode.

26.2.61 Slave Device Address Register n (SVDVADn) (n = 0 to 2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SDYADV*4	SSTADV	—	—	SADLG	—	SVAD[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SDYADV*4	0b	R	Slave Dynamic Address Valid*3 0: Dynamic Address is disabled. 1: Dynamic Address is enabled.
30	SSTADV	0b	R	Slave Static Address Valid*1 0: Slave address is disabled. 1: Slave address is enabled.
29, 28	—	00b	R	Reserved These bits are read as 0.
27	SADLG	0b	R	Slave Address Length*2 0: The 7-bit address format is selected. 1: The 10-bit address format is selected.
26	—	0b	R	Reserved This bit is read as 0.
25 to 16	SVAD[9:0]	All 0	R	Slave Address*1 A slave address is set. When rewriting SVAD, change to SVAE = 0 and rewrite.
15 to 0	—	All 0	R	Reserved These bits are read as 0.

Note 1. These bits support for I^2C, I3C secondary master, and I3C slave mode.

Note 2. This bit supports for I^2C mode.

Note 3. This bit supports for I3C secondary master mode and I3C slave mode.

Note 4. This bit is valid only in SVDVAD0 register.

SVAD[9:0] bits (Slave Address)

The SVAD[9:0] bits indicate a valid slave address.

[The SVDVAD0.SDYADV bit = 1]

Note: This condition is only for SVDVAD0.SVAD[9:0].

- The SVAD[9:7] bits = 0
- The SVAD[6:0] bits = the SDATBAS0.SDDYAD[6:0] bits

[The SVDVADy.SSTADV bit = 1 and the SVDVADy.SADLG bit = 0]

- The SVAD[9:7] bits = 0
- The SVAD[6:0] bits = the SDATBASy.SDSTAD[6:0] bits

[The SVDVADy.SSTADV bit = 1 and the SVDVADy.SADLG bit = 1]

- The SVAD[9:0] bits = the SDATBASy.SDSTAD[9:0] bits

SADLG bit (Slave Address Length)

[Setting conditions]

- All of the followings are satisfied:

1. The PRTS.PRTMD bit = 1 (I^2C Protocol mode)
2. The SVCTL.SVAEy bit = 1 (Slave y is enabled)
3. The SDATBASy.SDADLS bit = 1 (The address length is 10 bits)

[Clearing condition]

- [Setting condition] is not satisfied.

SSTADV bit (Slave Static Address Valid)

[Setting conditions]

- All of the followings are satisfied:

1. The SVCTL.SVAEy bit = 1 (Slave y is enabled)
2. The SVDVAD0.SDYADV bit = 0 (Dynamic Address is disabled)

   Note: This condition is only for SVDVAD0.SSTADV.
3. If the SVDVADy.SADLG bit = 0, the SDATBASy.SDSTAD[6:0] bits are not all 0
   If the SVDVADy.SADLG bit = 1, the SDATBASy.SDSTAD[9:0] bits are not all 0

[Clearing condition]

- [Setting condition] is not satisfied.

SDYADV*4 bit (Slave Dynamic Address Valid)

[Setting conditions]

- All of the followings are satisfied:

1. The PRTS.PRTMD bit = 0 (I3C Protocol mode)
2. The SVCTL.SVAEy bit = 1 (Slave y is enabled)
3. The SDATBAS0.SDDYAD[6:0] bits are not all 0

   Note: This condition is only for SVDVAD0.SDYADV.

[Clearing condition]

- [Setting condition] is not satisfied.

26.2.62 CCC Slave Events Command Register (CSECMD)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	HJEVE	—	MSRQE	SVIRQE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
3	HJEVE	0b	R/W	Hot-Join Event Enable 0: DISABLED: Slave-initiated Hot-Join is Disabled by the Master to control. 1: ENABLED: Slave-initiated Hot-Join is Enabled by the Master to control.
2	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
1	MSRQE	0b	R/W	Mastership Requests Enable 0: DISABLED: Mastership requests from Secondary master's is Disabled by the Current Master to control. 1: ENABLED: Mastership requests from Secondary master's is Enabled by the Current Master to control.
0	SVIRQE	0b	R/W	Slave Interrupt Requests Enable 0: DISABLED: Slave-initiated Interrupts is Disabled by the Master to control. 1: ENABLED: Slave-initiated Interrupts is Enabled by the Master to control.

Note: This register supports for I3C secondary master mode and I3C slave mode.

SVIRQE bit (Slave Interrupt Requests Enable)

This bit allows the Master to control when Slave-initiated Interrupts are allowed on the I3C Bus.

These four Direct (ENEC/DISEC Format 1) or Broadcast (ENEC/DISEC Format 2) CCCs allows the Master to control when Slave- initiated traffic is (Enable) vs. is not (Disable) allowed on the I3C Bus. This control governs a Slave's attempts to request an Interrupt (ENI), to request Mastership (ENMR), or to signify a Hot-Join event (ENHJ).

[Setting conditions]

- When writing 1
- When receiving ENEC CCC (Broadcast) with ENINT bit = 1.*1
- When ENINT bit = 1 with own Slave Address in receiving ENEC CCC (Direct).*1

[Clearing conditions]

- When writing 0.
- When receiving DISEC CCC (Broadcast) with DISINT bit = 1.*1
- When DISINT bit = 1 with own Slave Address in receiving DISEC CCC (Direct).*1

MSRQE bit (Mastership Requests Enable)

This bit allows the Current Master to control when Mastership requests from Secondary masters are allowed on the I3C Bus.

[Setting conditions]

- When writing 1.
- When receiving ENEC CCC (Broadcast) with ENMR bit = 1.*1
- When ENMR bit = 1 with own Slave Address in receiving ENEC CCC (Direct).*1

[Clearing conditions]

- When writing 0.
- When receiving DISEC CCC (Broadcast) with DISMR bit = 1.*1
- When DISMR bit = 1 with own Slave Address in receiving DISEC CCC (Direct).*1

HJEVE bit (Hot-Join Event Enable)

This bit allows the Master to control when Slave-initiated Hot-Join is allowed on the I3C Bus.

[Setting conditions]

- When writing 1.
- When receiving ENEC CCC (Broadcast) with ENHJ bit = 1.*1
- When ENHJ bit = 1 with own Slave Address in receiving ENEC CCC (Direct).*1

[Clearing conditions]

- When writing 0.
- When receiving DISEC CCC (Broadcast) with DISHJ bit = 1.*1
- When DISHJ bit = 1 with own Slave Address in receiving DISEC CCC (Direct).*1

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.63 CCC Enter Activity State Register (CEACTST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ACTST[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
3 to 0	ACTST[3:0]	All 0	R/W	Activity State H'1: ENTAS0 (1 µs: Latency-free operation) H'2: ENTAS1 (100 µs) H'4: ENTAS2 (2 ms) H'8: ENTAS3 (50 ms: Lowest-activity operation) Others: Setting prohibited

Note: This register supports for I3C secondary master mode and I3C slave mode.

ACTST[3:0] bits (Activity State)

[Update conditions]

- When writing Activity State value.
- When receiving ENTAS0 CCC (Broadcast), these bits are updated to H'1.*1
- When receiving ENTAS1 CCC (Broadcast), these bits are updated to H'2.*1
- When receiving ENTAS2 CCC (Broadcast), these bits are updated to H'4.*1
- When receiving ENTAS3 CCC (Broadcast), these bits are updated to H'8.*1
- When Slave Address value is its own Slave Addres in receiving ENTAS0 CCC (Direct), these bits are updated to H'1.*1
- When Slave Address value is its own Slave Addres in receiving ENTAS1 CCC (Direct), these bits are updated to H'2.*1
- When Slave Address value is its own Slave Addres in receiving ENTAS2 CCC (Direct), these bits are updated to H'4.*1
- When Slave Address value is its own Slave Addres in receiving ENTAS3 CCC (Direct), these bits are updated to H'8.*1

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.64 CCC Max Write Length Register (CMWLG)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWLG[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MWLG[15:0]	All 0	R/W	Max Write Length

Note: This register supports for I3C secondary master mode and I3C slave mode.

MWLG[15:0] bits (Max Write Length)

These bits use for the I3C Master to set or get a maximum data write length in bytes for one Slave Device.

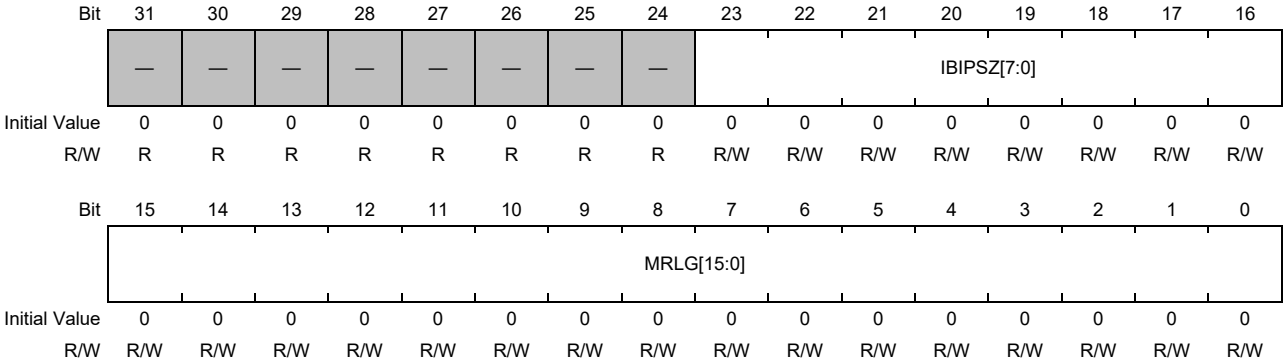
This Max Write Length does not affect data write lengths for Broadcast CCCs. The Set/Get Max Write Length value is transmitted over two bytes, with the most significant byte (MSB) transmitted first. The minimum value that Maxes Write Length can be set to is 8.

[Update conditions]

- When writing Max Write Length value.
- When receiving SETMWL CCC (Broadcast), these bits are updated to MWL value.*[1]
- When Slave Address value is its own Slave Address in receiving SETMWL CCC (Direct), these bits are updated to MWL value.*[1]

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.65 CCC Max Read Length Register (CMRLG)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
23 to 16	IBIPSZ[7:0]	All 0	R/W	IBI Payload Size
15 to 0	MRLG[15:0]	All 0	R/W	Max Read Length

Note: This register supports for I3C secondary master mode and I3C slave mode.

MRLG[15:0] bits (Max Read Length)

These bits use for the I3C Master to set or get a maximum data read length for one Slave Device.

The Set/Get Max Read Length value is transmitted over the first two bytes, with most significant byte (MSB) transmitted first. The minimum value to which Max Read Length can be set is 16.

[Update conditions]

- When writing Max Read Length value.
- When receiving SETMRL CCC (Broadcast), these bits are updated to MRL value.*[1]
- When Slave Address value is its own Slave Address in receiving SETMRL CCC (Direct), these bits are updated to MRL value.*[1]

IBIPSZ[7:0] bits (IBI Payload Size)

These bits use for the I3C Master to set or get optionally a maximum IBI payload size.

For devices with BCR bit 2 set to 1, the Max IBI payload size value is added as a third byte, where a value of 0 indicates an unlimited payload size.

This CCC is optional for the Slave, with two exceptions:

1. This CCC is required if both (a) any private Read Request Message (s) and/or any extended Read Request CCC (s) implemented by the Slave support a variable limit on the maximum number of data bytes that the Slave may return per Message, and (b) this limit is greater than 16 bytes.
2. This CCC is required if the Slave both (a) supports an IBI Payload (as indicated with BCR bit 1), and (b) will transmit more than one byte of private payload.

[Update conditions]

- When writing Max IBI payload size value.
- When receiving SETMRL CCC (Broadcast), these bits are updated to IBI payload size value.*[1]

- When Slave Address value is its own Slave Address in receiving SETMRL CCC (Direct), these bits are updated to IBI payload size value.*[1]

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.66 CCC Enter Test Mode Register (CETSTMD)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TSTMD[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0.
7 to 0	TSTMD[7:0]	All 0	R	Test Mode H'00: Exit Test Mode This value removes all I3C devices from Test Mode. H'01: Vendor Test Mode This value indicates that I3C devices shall return a random 32bit value in the provisional ID during the Dynamic Address Assignment procedure. Others: MIPI reserved Reserved for future use by the MIPI Alliance

Note: This register supports for I3C secondary master mode and I3C slave mode.

TSTMD[7:0] bits (Test Mode)

When these bits set to H'00, all I3C Devices remove from Test Mode.

When these bits set to H'01, I3C Devices shall return a random 32bit value in the Provisional ID during the Dynamic Address Assignment procedure.

The Broadcast CCC informs all I3C Devices that the Master is entering a specified Test Mode during manufacturing or Device test. The Enter Test Mode command Frame format includes a byte that specifies which Test Mode to enter.

Supporting I3C Devices shall enter the indicated Test Mode upon receipt of the Enter Test Mode CCC.

[Update condition]

- When receiving ENTTM CCC (Broadcast), these bits are updated to Test Mode Byte value.*[1]

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.67 CCC Get Device Status Register (CGDVST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VDRSV[7:0]								ACTMD[1:0]		PRTE	—	PNDINT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 8	VDRSV[7:0]	All 0	R/W	Vendor Reserved Reserved for vendor-specific meaning
7, 6	ACTMD[1:0]	00b	R/W	Slave Device's current Activity Mode 0 0: Activity Mode 0 0 1: Activity Mode 1 1 0: Activity Mode 2 1 1: Activity Mode 3
5	PRTE	0b	R	Protocol Error 0: The Slave has not detected a protocol error since the last Status read. 1: The Slave has detected a protocol error since the last Status read.
4	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
3 to 0	PNDINT[3:0]	All 0	R/W	Pending Interrupt Contains the interrupt number of any pending interrupt, or 0 if no interrupts are pending. This encoding allows for up to 15 numbered interrupts. If more than one interrupt is set, then the highest priority interrupt shall be returned.

Note: This register supports for I3C secondary master mode and I3C slave mode.

PRTE bit (Protocol Error)

If this bit set to 1, then the Slave detects a protocol error since the last Status read.

The Slave checks for such errors. Note that this value self-clears by the hardware upon every successful completion of a Master read of the Slave's Status.

The Direct CCC is a Get request for one I3C Slave Device to return its current Status, in the two-byte format detailed. Note that byte 0 is the LSb, and byte 1 is the MSB.

[Setting condition]

- When the Slave detected a protocol error.*1

[Clearing condition]

- When transmission by own Slave Address is completed without error after receiving GETSTATUS CCC (Direct).*1

ACTMD[1:0] bits (Slave Device's current Activity Mode)

Contains the two-bit ID of the Slave Device's current Activity Mode (readiness to support data read of sensor or related information).

Note 1. See *the MIPI I3C Specification v1.0*.

26.2.68 CCC Max Data Speed W (Write) Register (CMDSPW)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
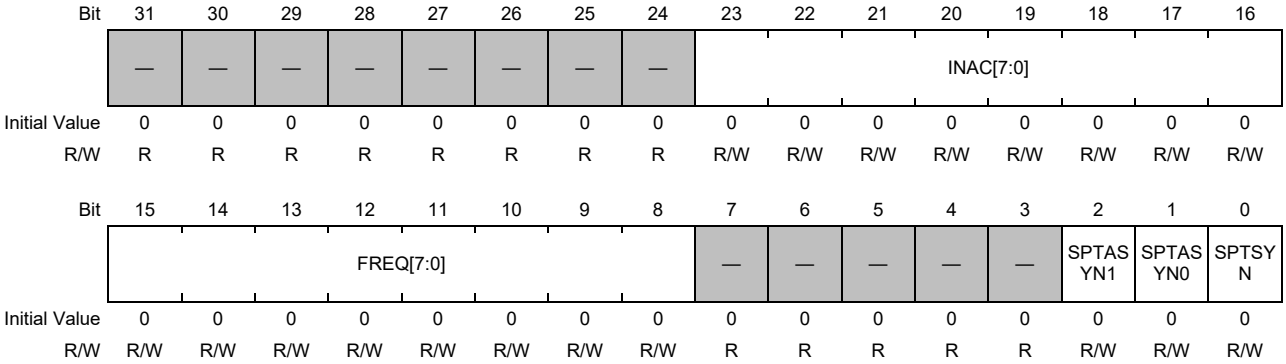
31	MRTE	0b	R/W	Maximum Read Turnaround Time Enable 0: Disables transmission of the Maximum Read Turnaround Time. (GETMXDS Format 1: Without Turnaround) 1: Enables transmission of the Maximum Read Turnaround Time. (GETMXDS Format 2: With Turnaround)
30 to 24	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
23 to 0	MRTTIM [23:0]	All 0	R/W	Maximum Read Turnaround Time 24-bit field can encode turnaround times from 0.0 seconds to 16 seconds. H'F4_0000: 0 µs (minimum value) H'F4_0001: 1 µs (resolution) ⋮ H'F4_2400: 16 seconds (maximum value) H'F4_2401: Setting prohibited ⋮ H'FF_FFFF: Setting prohibited

Note: This register supports for I3C secondary master mode and I3C slave mode.

26.2.71 CCC Exchange Timing Support Information M (Mode) Register (CETSM)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
23 to 16	INAC[7:0]	All 0	R/W	Inaccuracy Byte H'00: 0.0% H'0F: 1.5% H'1F: 3.1% H'2F: 4.7% H'3F: 6.3% H'4F: 7.9% H'5F: 9.5% H'6F: 11.1% H'7F: 12.7% H'8F: 14.3% H'9F: 15.9% H'AF: 17.5% H'BF: 19.1% H'CF: 20.7% H'DF: 22.3% H'EF: 23.9% H'FF: 25.5%
15 to 8	FREQ[7:0]	All 0	R/W	Frequency Byte This byte represents the Slave's internal oscillator frequency in increments of 0.5 MHz (500 kHz), up to 127.5 MHz. H'00: 32.0 KHz H'0F: 7.5 MHz H'1F: 15.5 MHz H'2F: 23.5 MHz H'3F: 31.5 MHz H'4F: 39.5 MHz H'5F: 47.5 MHz H'6F: 55.5 MHz H'7F: 63.5 MHz Others: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2	SPTASYN1	0b	R/W	Support Async Mode 1 0: Async Mode 1 is not supported. 1: Async Mode 1 is supported.

Bit	Bit Name	Initial Value	R/W	Description
1	SPTASYN0	0b	R/W	Support Async Mode 0 0: Async Mode 0 is not supported. 1: Async Mode 0 is supported.
0	SPTSYN	0b	R/W	Supports Sync Mode 0: Sync Mode is not supported. 1: Sync Mode is supported.

Note: This register supports for I3C secondary master mode and I3C slave mode.

The Directed CCC provides the framework for the Master to query the Exchange Timing capabilities supported by the I3C Slaves. The Get Exchange Timing Support Information CCC causes the addressed Slave to return four data bytes containing key information on supported current state, and internal oscillator/clock frequency and inaccuracy.

26.2.72 CCC Exchange Timing Support Information S (State) Register (CETSS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
7	ICOVF	0b	R/W	Internal Counter Overflow 0: Slave has not experienced a counter overflow since the most recent previous check. 1: Slave experienced a counter overflow since the most recent previous check.
6 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2, 1	ASYNE[1:0]	00b	R/W	Async Mode Enabled 00: All Mode Disable 01: Async Mode 0 Enabled. 10: Async Mode 1 Enabled. Other Setting prohibited
0	SYNE	0b	R/W	Sync Mode Enabled 0: Sync Mode Disabled. 1: Sync Mode Enabled.

Note: This register supports for I3C secondary master mode and I3C slave mode.

ASYNE[0] Bit

Slave Timing Control Async Mode 0 is enabled.

[Setting condition]

- When writing “1”.
- When CETSM.SPTASYN[0] bit = 1 and either of the following 1 or 2 are satisfied.

1. When receiving SETXTIME CCC (Broadcast) with Defining byte value H’DF.
2. When Slave Address value is its own Slave Address in receiving SETXTIME CCC (Direct) with Defining byte value H’DF.

[Clearing condition]

- When writing “0”.
- When CETSM.SPTASYN[0] bit = 1 and either of the following 1 or 2 are satisfied.

1. When receiving SETXTIME CCC (Broadcast) with Defining byte value H’EF.
2. When Slave Address value is its own Slave Address in receiving SETXTIME CCC (Direct) with Defining byte value H’EF.

ASYNE[1] Bit

Slave Timing Control Async Mode 1 is enabled.

[Setting condition]

- When writing “1”.
- When CETSM.SPTASYN[1] bit = 1 and either of the following 1 or 2 are satisfied.

1. When receiving SETXTIME CCC (Broadcast) with Defining byte value H’EF.
2. When Slave Address value is its own Slave Address in receiving SETXTIME CCC (Direct) with Defining byte value H’EF.

[Clearing condition]

- When writing “0”.
- When CETSM.SPTASYN[1] bit = 1 and either of the following 1 or 2 are satisfied.

1. When receiving SETXTIME CCC (Broadcast) with Defining byte value H’DF.
2. When Slave Address value is its own Slave Address in receiving SETXTIME CCC (Direct) with Defining byte value H’DF.

ICOVF bit

Bit mask indicating which Timing Control Mode (if any) is currently enabled for the target Slave, and whether any counter overflows have occurred since the most recent previous check. If a Timing Control Mode bit is set (has value 1b), then that Slave has currently enabled the corresponding Timing Control Mode. If the Overflow bit is set (has value 1b), then that Slave experienced a counter overflow since the most recent previous check.

26.2.73 Bit Count Register (BITCNT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

BCNT[4:0]	Transmission	Reception	Command/Data	CRC	HDR-TS
H'00	1 bit	2 to 1 bits	19, 1 bits	11, 1 bits	1 Symbol
H'01	2 bits	3 bits	20, 2 bits	12, 2 bits	2 Symbols
H'02	3 bits	4 bits	3 bits	3 bits	3 Symbols
H'03	4 bits	5 bits	4 bits	4 bits	4 Symbols
H'04	5 bits	6 bits	5 bits	5 bits	5 Symbols
H'05	6 bits	7 bits	6 bits	6 bits	6 Symbols
H'06	7 bits	8 bits	7 bits	7 bits	7 Symbols
H'07	8 bits	9 bits	8 bits	8 bits	8 Symbols
H'08	9 bits	—	9 bits	9 bits	9 Symbols
H'09	—	—	10 bits	10 bits	10 Symbols
H'0A	—	—	11 bits	—	11 Symbols
H'0B	—	—	12 bits	—	12 Symbols
H'0C	—	—	13 bits	—	—
H'0D	—	—	14 bits	—	—
H'0E	—	—	15 bits	—	—
H'0F	—	—	16 bits	—	—
H'10	—	—	17 bits	—	—
H'11	—	—	18 bits	—	—

Note 1. The address phase is the same as in **Table 26.8**.

26.2.74 Normal Queue Status Level Register (NQSTLV)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	IBISCNT[4:0]					IBIQLV[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSPQLV[7:0]								CMDQFLV[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0.
28 to 24	IBISCNT[4:0]	All 0	R	Normal IBI Status Count*2 Number of IBI Status entries currently in the IBI Queue.
23 to 16	IBIQLV[7:0]	All 0	R	Normal IBI Queue Level*1 Number of buffer entries currently in the IBI Queue.
15 to 8	RSPQLV[7:0]	All 0	R	Normal Response Queue Level*1 Number of buffer entries currently in the Response Queue.
7 to 0	CMDQFLV [7:0]	H'04	R	Normal Command Queue Free Level*1 Number of free buffer entries currently in the Command Queue. Reset value is the depth of the Command Queue.

Note 1. These bits support for all I3C mode.

Note 2. These bits support for I3C master mode and I3C secondary master mode.

26.2.75 Normal Data Buffer Status Level Register 0 (NDBSTLV0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDBLV[7:0]								TDBFLV[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0.
15 to 8	RDBLV[7:0]	All 0	R	Normal Receive Data Buffer Level Indicates the number of Receive Data Buffer entries in the Receive Data Queue.
7 to 0	TDBFLV[7:0]	H'01	R	Normal Transmit Data Buffer Free Level Indicates the number of free Transmit Data Buffer entries in the Transmit Data Queue. Reset value is the depth of the Transmit Data Queue.

Note: This register supports for all I3C mode.

26.2.76 Normal Receive Status Queue Status Level Register (NRSQSTLV)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RSQLV[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0.
7 to 0	RSQLV[7:0]	All 0	R	Normal Receive Status Queue Level

Note: This register supports for I3C secondary master mode and I3C slave mode.

26.2.77 Present State Debug Register (PRSTDBG)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SDOLV	SCOLV	SDILV	SCILV
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	SDOLV	1b	R	SDA Output Level 0: I3C has driven the SDA pin low. 1: I3C has released the SDA pin.
2	SCOLV	1b	R	SCL Output Level 0: I3C has driven the SCL pin low. 1: I3C has released the SCL pin.
1	SDILV	1b	R	SDA Line Signal Level This bit is used to check the SDA Line level, in order to recover from errors and for debugging.
0	SCILV	1b	R	SCL Line Signal Level This bit is used to check the SCL Line level, in order to recover from errors and for debugging.

SDOLV bit (SDA Output Level) and SCOLV bit (SCL Output Level)

When reading these bits, the state of signals output from I3C can be read.

SCILV bit (SCL Line Signal Level)

This bit is used to check the SCL Line level, in order to recover from errors and for debugging.

SDILV bit (SDA Line Signal Level)

This bit is used to check the SDA Line level, in order to recover from errors and for debugging.

SCOLV bit (SCL Output Level)

This bit is used to select the output level of SCL pin.

SDOLV bit (SDA Output Level)

This bit is used to select the output level of SDA pin.

26.2.78 Master Error Counters Register (MSERRCNT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	M2ECNT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
30 to 8	—	All 0	R	Reserved These bits are read as 0.
7 to 0	M2ECNT[7:0]	All 0	R	M2 Error Counter Counts I3C Type M2 errors on the I3C Bus. Cleared upon read out.

Note: This register supports for I3C master mode and I3C secondary master mode.

26.2.79 SC1 Capture monitor Register (SC1CPT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0.
15 to 0	SC1C[15:0]	All 0	R	SC1 Capture

Note: This register supports for all I3C mode.

SC1C[15:0] Bits

- Async Mode 0 (Asynchronous Basic Mode)

  After enabling ATCCNTE.ATCE, SC1 Counter counts up from SC1 count trigger*1 to SCL rise edge next to ACK for the IBI and capture it as SC1.

- Async Mode 1 (Asynchronous Advanced Mode)

  After enabling ATCCNTE.ATCE, SC1 Counter counts up from SC1 count trigger*1 to the first aME and capture it as SC1.

Note 1. SW or external trigger can be selected by selection bits.

CAUTION

As the timing control specification, the SC1 counter value is included in the IBI frame as IBI data and is sent to I3C Master, therefore it is not necessary for the I3C Slave to read this register. If the I3C Slave needs to read this register, read it after completing the IBI frame.

26.2.80 SC2 Capture monitor Register (SC2CPT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC2C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0.
15 to 0	SC2C[15:0]	All 0	R	SC2 Capture

Note: This register supports for all I3C mode.

SC2C[15:0] Bits

- Async Mode 0 (Asynchronous Basic Mode)

  After enabling ATCCNTE.ATCE, SC2 Counter counts up from SC2 count trigger*1 to SCL rise edge next to ACK for the IBI and capture it as SC2.

- Async Mode 1 (Asynchronous Advanced Mode)

  After enabling ATCCNTE.ATCE, SC2 Counter counts up from SC2 count trigger*1 to the first aME and capture it as SC2.

Note 1. SW or external trigger can be selected by selection bits.

CAUTION

As the timing control specification, the SC2 counter value is included in the IBI frame as IBI data and is sent to I3C Master, therefore it is not necessary for the I3C Slave to read this register. If the I3C Slave needs to read this register, read it after completing the IBI frame.

26.3 Operation

26.3.1 Data Structures

26.3.1.1 Command Descriptor

The write-only Command Descriptor structure is 64 bits in length. The Command Descriptor is put to the Command Queue with writes to the Command Queue Port.

Write to the Command Queue Port in the following order:

1. First write: The least significant DWORD (Command Descriptor Structure Low).
2. Second write: The most significant DWORD (Command Descriptor Structure High).

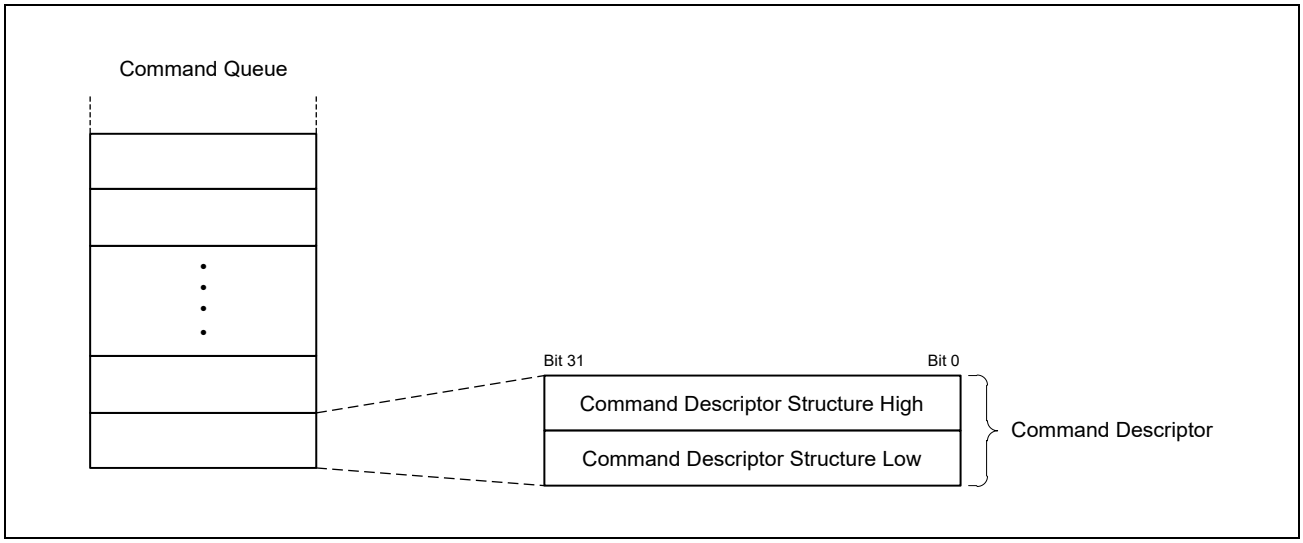

Figure 26.2 Command Descriptor Data Structure

I3C provides a Command Descriptor structure for each command type as follows:

- Address Assign Command
- Immediate Transfer Command
- Regular Transfer Command
- Combo Transfer Command
- Internal Control Command

Details are explained in the following sections.

(1) Address Assign Command

This command is used for address assignment (ENTDAA, SETDASA).

Remark When issuing SETAASA CCC, use the Immediate Transfer command.

The I3C provides an address assign command for the following mode:

- I3C Master Mode

Details of the Address Assign command structure are as follows.

Bit position	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
Bit field	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Bit field	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field	TOC	ROC	DEV_COUNT[3:0]				—	—	—	—	EXT_DEVICE	DEV_INDEX[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field	—	CMD[7:0]								TID[3:0]				CMD_ATTR[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	R/W	Description
63 to 32	—	W	The write value should be 0.
31	TOC	W	Terminate on Completion 0: RESTART: Issue Repeated START (Sr) at end of transfer 1: STOP: Issue STOP (P) at end of transfer
30	ROC	W	Response on Completion 0: NOT_REQUIRED: Response Status is not required. 1: REQUIRED: Response Status is required.
29 to 26	DEV_COUNT[3:0]	W	Device Count
25 to 22	—	W	The write value should be 0.
21	EXT_DEVICE	W	Extended Device Index 0: Use the DATBASm table indicated by DEV_INDEX[4:0]. 1: Use the EXDATBAS table.
20 to 16	DEV_INDEX[4:0]	W	Device Index
15	—	W	The write value should be 0.
14 to 7	CMD[7:0]	W	Transfer Command CCC Value
6 to 3	TID[3:0]	W	Transaction ID

Bit	Bit Name	R/W	Description
2 to 0	CMD_ATTR[2:0]	W	Command Attributes 000: XFER: Regular Transfer 001: IMMED_DATA_XFER: Immediate Data Transfer 010: ADDR_ASSGN_CMD: Address Assignment Command 011: WWR_COMBO_XFER: Write + Write/Read Combo Transfer 111: INTERNAL_CONTROL: Internal Control command Others: Setting prohibited

CMD_ATTR[2:0] bits (Command Attributes)

Command Type, defining the format of the other fields.

TID[3:0] bits (Transaction ID)

is reflected in the Response Descriptor.

CMD[7:0] bits (Transfer Command CCC Value)

Specifies CCC code indicating whether Address Assignment uses ENTDAA or SETDASA commands. The field comprises the entire command code (ENTDAA or SETDASA).

DEV_INDEX[4:0] bits (Device Index)

Indicates the DATBASm table index for the Slave device being addressed with the transfer. Static and device addressing related information are stored to this index in the DATBASm.

DEV_COUNT[3:0] bits (Device Count)

Indicates the number of devices that a dynamic address is assigned to.

ROC bit (Response on Completion)

Controls whether Response Status is sent after successful completion of the Transfer command. The successful completion is read from register NRSPQP. Upon unsuccessful transfer the Response Status is sent.

TOC bit (Terminate on Completion)

Controls what bus condition to issue after the Transfer command completes.

For ENTDAA, a STOP condition is issued regardless of the setting value of TOC. It is meaningful for SETDASA transfers.

When sending SETDASA CCC by TOC = 0 (RESTART), the next command must be set to SETDASA CCC with the Address Assign Command.

When the next command is not the same SETDASA CCC flame, it must be set to TOC = 1 (STOP).

(2) Immediate Transfer Command

This structure directly contains data (max 4 bytes) to be transferred, and as a result is only useful for Transfers/CCCs that write data. This structure shall not be used for Read operations (for example, to receive data).

When transmitting data of 4 bytes or less, use this Immediate Transfer Command to communicate.

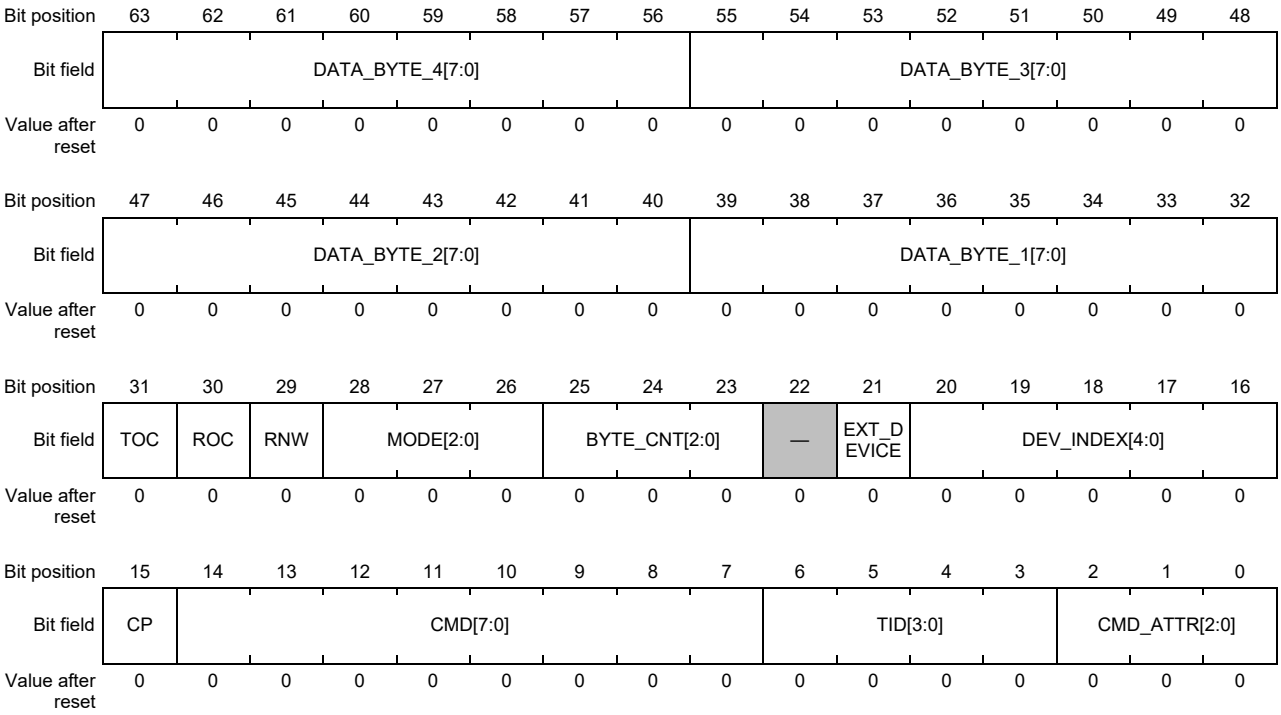
When transmitting data of 5 bytes or more, use the Regular Transfer Command to communicate.

For the Regular Transfer Command, refer to **Section 26.3.1.1(3), Regular Transfer Command**.

I3C provides an Immediate Transfer Command for the following mode:

- I3C Master Mode

Details of the Immediate Transfer Command Structure of each mode are shown in this section.



Bit	Bit Name	R/W	Description
63 to 56	DATA_BYTE_4[7:0]	W	Immediate Data Transfer Data Byte 4 Direct argument
55 to 48	DATA_BYTE_3[7:0]	W	Immediate Data Transfer Data Byte 3 Direct argument
47 to 40	DATA_BYTE_2[7:0]	W	Immediate Data Transfer Data Byte 2 Direct argument
39 to 32	DATA_BYTE_1[7:0]	W	Immediate Data Transfer Data Byte 1 Direct argument
31	TOC	W	Immediate Data Transfer Terminate on Completion 0: RESTART: Issue Repeated START (Sr) at end of data transfer 1: STOP: Issue STOP (P) at end of data transfer
30	ROC	W	Immediate Data Transfer Response on Completion 0: NOT_REQUIRED: Response Status is not required. 1: REQUIRED: Response Status is required.
29	RNW	W	Immediate Data Transfer R/W 0: WRITE: Write transfer 1: READ: Read transfer

Bit	Bit Name	R/W	Description
28 to 26	MODE[2:0]	W	Immediate Data Transfer Mode and Speed Values for I3C Mode: 000: I3C SDR0 Data rate: STDBR (e.g., 12.5 MHz) 001: I3C SDR1 Data rate: EXTBR (e.g., 8 MHz) 010: I3C SDR2 Data rate: STDBR × 2 (e.g., 6.25 MHz) 011: I3C SDR3 Data rate: EXTBR × 2 (e.g., 4 MHz) 100: I3C SDR4 Data rate: EXTBR × 4 (e.g., 2 MHz) Others: Setting prohibited Values for I^2C Mode: 000: Legacy I2C Message 0 Data rate: STDBR (e.g., 400 kHz) 001: Legacy I^2C Message 0 Data rate: EXTBR (e.g., 1 MHz) Others: Setting prohibited
25 to 23	BYTE_CNT[2:0]	W	Immediate Data Transfer Byte Count 000: No payload 001 to 100: N bytes are valid. Others: Setting prohibited
22	—	W	The write value should be 0.
21	EXT_DEVICE	W	Immediate Data Transfer Extended Device Index 0: Use the DATBASm table indicated by DEV_INDEX[4:0]. 1: Use the EXDATBAS table.
20 to 16	DEV_INDEX[4:0]	W	Immediate Data Transfer Device Index
15	CP	W	Immediate Data Transfer Command Present 0: TRANFSER: This structure describes an SDR transfer, so the CMD field is not valid. 1: CCC: This structure describes a CCC transfer, so the CMD field is valid.
14 to 7	CMD[7:0]	W	Immediate Data Transfer CCC Value For CCC: 8 bits
6 to 3	TID[3:0]	W	Immediate Data Transfer Transaction ID
2 to 0	CMD_ATTR[2:0]	W	Immediate Data Transfer Command Attribute 000: XFER: Regular Transfer 001: IMMED_DATA_XFER: Immediate Data Transfer 010: ADDR_ASSGN_CMD: Address Assignment Command 011: WWR_COMBO_XFER: Write + Write/Read Combo Transfer 111: INTERNAL_CONTROL: Internal Control command Others: Setting prohibited

CMD_ATTR[2:0] bits (Immediate Data Transfer Command Attribute)

Command Type, defining the format of the other fields.

TID[3:0] bits (Immediate Data Transfer Transaction ID)

Used as an identification tag for this command. This field shall be populated by the software Driver, and the same value shall be reflected in the Response Descriptor.

CP bit (Immediate Data Transfer Command Present)

Indicates whether CMD field is valid for CCC Transfer.

DEV_INDEX[4:0] bits (Immediate Data Transfer Device Index)

Indicates the DATBASm Table index for the Slave Device being addressed with the transfer. Static and Device addressing related information will be stored to this index in the DATBASm.

BYTE_CNT[2:0] bits (Immediate Data Transfer Byte Count)

Number of valid data bytes to use in this Immediate Data Transfer Descriptor.

This field must be set to non-zero value, except for CCCs that does not have payload defined.

MODE[2:0] bits (Immediate Data Transfer Mode and Speed Values)

Sets the mode and speed for the I3C or I^2C transfer.

Interpretation of this field depends on whether the Device is in I3C Mode vs. I^2C Mode (see the DEVICE field in the DATBASm Table entry indexed by field DEV_INDEX).

RNW bit (Immediate Data Transfer R/W)

Identifies direction of the transfer.

This field shall always be set to 0, because Immediate transfers are valid for Write transactions only.

ROC bit (Immediate Data Transfer Response on Completion)

Controls whether Response Status is required after successful completion of the data transfer command. The successful completion shall be read from NRSPQP register. Upon unsuccessful transfer the Response Status shall always be sent.

TOC bit (Immediate Data Transfer Terminate on Completion)

Controls what Bus condition is issued after completion of the data transfer.

When sending Direct CCC by TOC = 0 (RESTART), next command must be set to same Direct CCC.

When the next command is not the same Direct CCC, must be set to TOC = 1 (STOP).

(3) Regular Transfer Command

This structure does not contain data to be transferred.

For Master Mode, the data buffer is available through Transfer Data Queue Port (Receive Data Queue Port and Transmit Data Queue Port).

When transmitting data of 5 bytes or more, use this Regular Transfer Command to communicate.

When transmitting data of 4 bytes or less, use the Immediate Transfer Command to communicate.

For the Regular Transfer Command, refer to **Section 26.3.1.1(2), Immediate Transfer Command**.

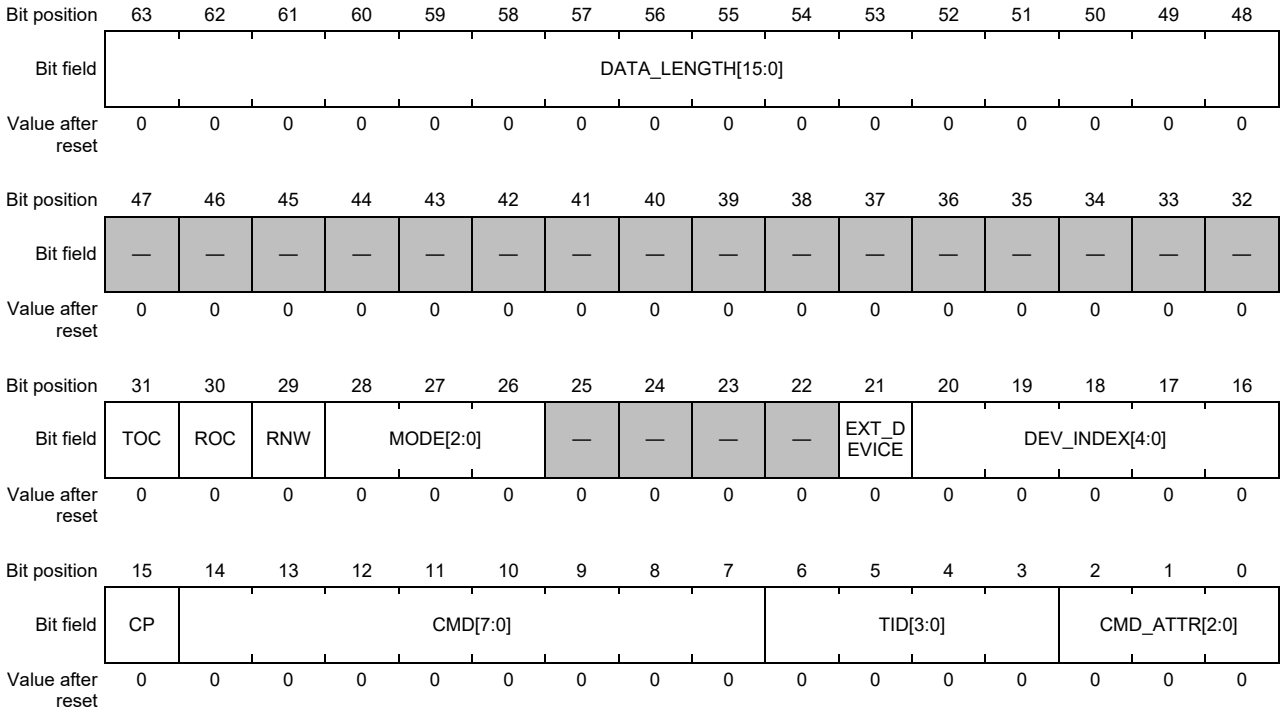
For I3C Slave Mode, the IBI Payload buffer is available through IBI Status Queue Port.

I3C provides a Regular Transfer Command for each mode below.

- I3C Master Mode
- I3C Slave Mode

Details of the regular transfer command structure of each mode are shown below.

(a) I3C Master Mode



Bit	Bit Name	R/W	Description
63 to 48	DATA_LENGTH[15:0]	W	Data Transfer Data Length Indicates the number of bytes to be transferred. This field must be set to non-zero value, except for CCCs that does not have payload defined.
47 to 32	—	W	The write value should be 0.
31	TOC	W	Data Transfer Terminate on Completion 0: RESTART: Issue Repeated START (Sr) at end of transfer 1: STOP: Issue STOP (P) at end of transfer

Bit	Bit Name	R/W	Description
30	ROC	W	Data Transfer Response on Completion 0: NOT_REQUIRED: Response Status is not required. 1: REQUIRED: Response Status is required.
29	RNW	W	Data Transfer R/W 0: WRITE: Write transfer 1: READ: Read transfer
28 to 26	MODE[2:0]	W	Data Transfer Speed and Mode Values for I3C Mode: 000: I3C SDR0 Data rate: STDBR (e.g., 12.5 MHz) 001: I3C SDR1 Data rate: EXTBR (e.g., 8 MHz) 010: I3C SDR2 Data rate: STDBR × 2 (e.g., 6.25 MHz) 011: I3C SDR3 Data rate: EXTBR × 2 (e.g., 4 MHz) 100: I3C SDR4 Data rate: EXTBR × 4 (e.g., 2 MHz) Others: Setting prohibited Values for I^2C Mode: 000: Legacy I^2C Message 0 Data rate: STDBR (e.g., 400 kHz) 001: Legacy I^2C Message 0 Data rate: EXTBR (e.g., 1 MHz) Others: Setting prohibited
25 to 22	—	W	The write value should be 0.
21	EXT_DEVICE	W	Data Transfer Extended Device Index 0: Use the DATBASm Table indicated by DEV_INDEX[4:0]. 1: Use the EXDATBAS table.
20 to 16	DEV_INDEX[4:0]	W	Data Transfer Device Index
15	CP	W	Data Transfer Command Present 0: TRANFSER: This structure describes an SDR transfer, so the CMD field is not valid. 1: CCC: This structure describes a CCC transfer, so the CMD field is valid.
14 to 7	CMD[7:0]	W	Data Transfer CCC Code Value Specifies the I3C Command code. For CCC: 8 bits
6 to 3	TID[3:0]	W	Data Transfer Transaction ID Identification tag for this command
2 to 0	CMD_ATTR[2:0]	W	Data Transfer Command Attribute Command Type, defining the format of the other fields. Values: 000: XFER: Regular Transfer 001: IMMED_DATA_XFER: Immediate Data Transfer 010: ADDR_ASSGN_CMD: Address Assignment Command 011: WWR_COMBO_XFER: Write + Write/Read Combo Transfer 111: INTERNAL_CONTROL: Internal Control command Others: Setting prohibited

CMD_ATTR[2:0] bits (Data Transfer Command Attribute)

Command Type, defining the format of the other fields.

TID[3:0] bits (Data Transfer Transaction ID Identification tag for this command)

Used as an identification tag for this command. This field shall be populated by the software Driver, and the same value shall be reflected in the Response Descriptor.

CP bit (Data Transfer Command Present)

Indicates whether he contents of the CMD field is valid for a CCC Transfer.

DEV_INDEX[4:0] bits (Data Transfer Device Index)

Indicates the DATBASm Table index for the Slave Device being addressed with the transfer. Static and Device addressing related information will be stored to this index in the DATBASm.

MODE[2:0] bits (Data Transfer Speed and Mode)

Sets the mode and speed for the I3C or I^2C transfer.

Interpretation of this field depends on whether the Device is in I3C Mode vs. I^2C Mode (see the DEVICE field in the DATBASm Table entry indexed by field DEV_INDEX).

RNW bit (Data Transfer R/W)

Identifies direction of the transfer.

ROC bit (Data Transfer Response on Completion)

Controls whether Response Status is required after successful completion of the transfer command. The successful completion shall be read from NRSPQP register. Upon unsuccessful transfer the Response Status shall always be sent.

TOC bit (Data Transfer Terminate on Completion)

Controls what Bus condition will be issued after completion of the transfer.

When sending Direct CCC by TOC = 0 (RESTART), next command must be set to same Direct CCC.

When the next command is not the same Direct CCC b , must be set to TOC = 1 (STOP).

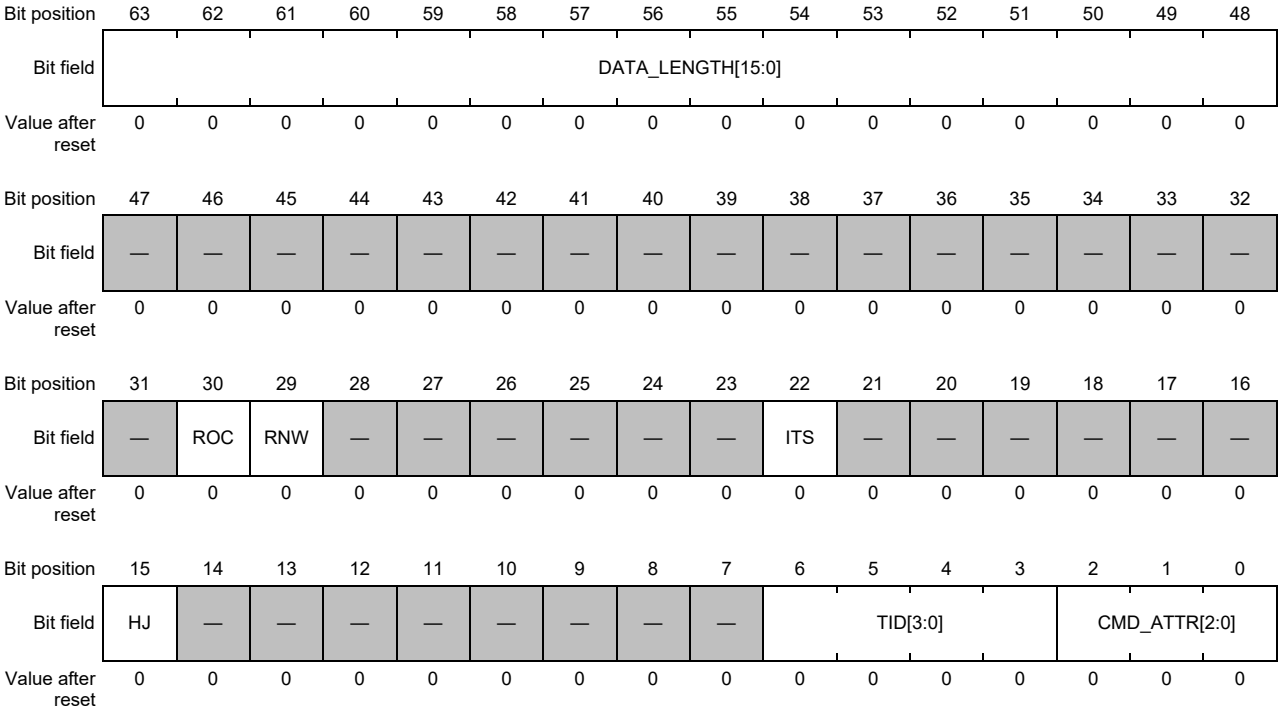
DATA_LENGTH[15:0] bits (Data Transfer Data Length)

Number of valid data bytes to use in this Regular Transfer Descriptor.

This field must be set to non-zero value, except for CCCs that does not have payload defined.

Length setting of GETMXDS command should be fixed to 5.

(b) I3C Slave Mode



Bit	Bit Name	R/W	Description
63 to 48	DATA_LENGTH[15:0]	W	Data Transfer Data Length Indicates the number of bytes to be transferred. This field must be set to non-zero value, except for CCCs that does not have payload defined.
47 to 31	—	W	The write value should be 0.
30	ROC	W	Data Transfer Response on Completion 0: NOT_REQUIRED: Response Status is not required. 1: REQUIRED: Response Status is required.
29	RNW	W	Data Transfer R/W 0: WRITE: Write transfer (Mastership Request) 1: READ: Read transfer (Slave Interrupt Request)
28 to 23	—	W	The write value should be 0.
22	ITS	W	Include timestamp for Async Mode 0: Do not include timestamp. 1: Include timestamp.
21 to 16	—	W	The write value should be 0.
15	HJ	W	Data Transfer Hot-Join Event 0: Slave Interrupt Request or Mastership Request, so the RNW field is valid. 1: Hot-Join Event, so the RNW field is not valid.
14 to 7	—	W	The write value should be 0.
6 to 3	TID[3:0]	W	Data Transfer Transaction ID Identification tag for this command
2 to 0	CMD_ATTR[2:0]	W	Data Transfer Command Attribute Command Type, defining the format of the other fields. Values: 000: XFER: Regular Transfer 001: IMMED_DATA_XFER: Immediate Data Transfer 010: ADDR_ASSGN_CMD: Address Assignment Command 011: WWR_COMBO_XFER: Write + Write/Read Combo Transfer 100 to 110: Reserved, do not use 111: INTERNAL_CONTROL: Internal Control command

CMD_ATTR[2:0] bits (Data Transfer Command Attribute)

Command Type, defining the format of the other fields.

TID[3:0] bits (Data Transfer Transaction ID Identification tag for this command)

Used as an identification tag for this command. This field shall be populated by the software Driver, and the same value shall be reflected in the Response Descriptor.

HJ bit (Data Transfer Hot-Join Event)

Indicates whether Hot-Join Event is valid in this IBI Data transfer.

RNW bit (Data Transfer R/W)

Identifies direction of the transfer.

ROC bit (Data Transfer Response on Completion)

Controls whether Response Status is required after successful completion of the transfer command. The successful completion shall be read from NRSPQP register. Upon unsuccessful transfer the Response Status shall always be sent.

(4) Combo Transfer Command

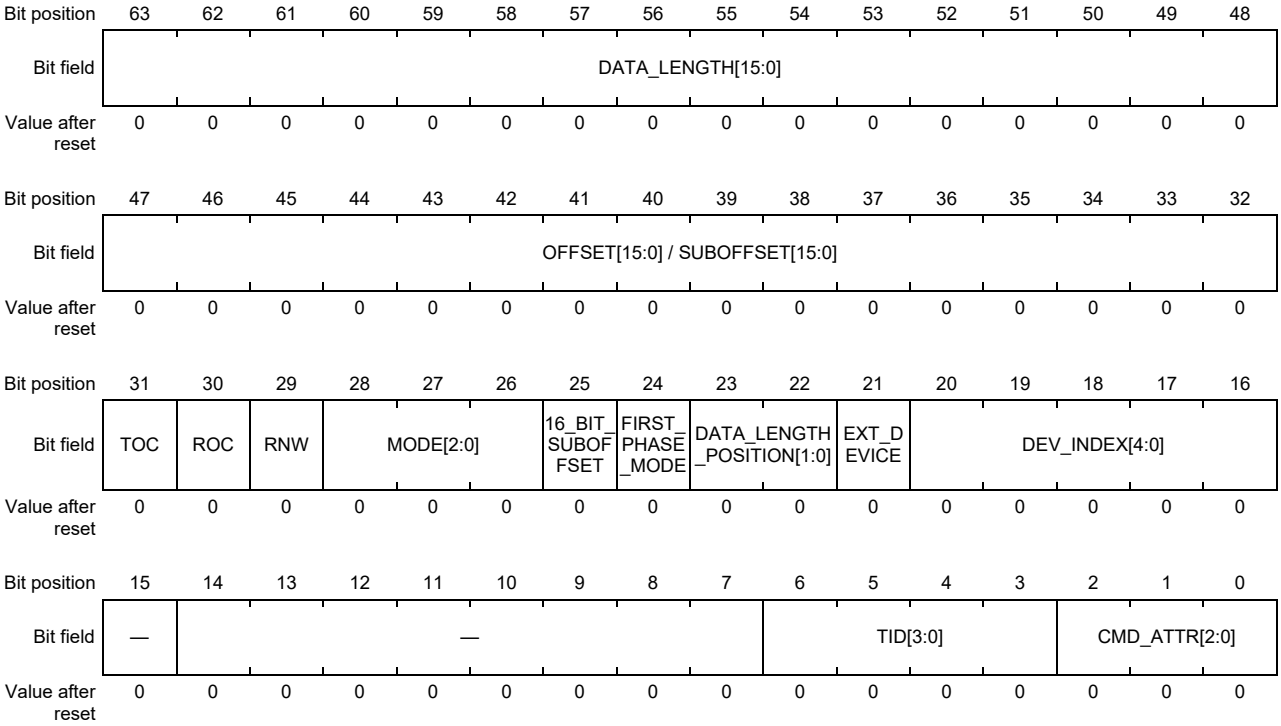
This structure contains a combined Write + Read/Write operation.

The data buffer is available through Transfer Data Queue Port (Receive Data Queue Port and Transmit Data Queue Port).

I3C provides a Combo Transfer Command for the following mode:

- I3C Master Mode

Details of the Combo Transfer Command Structure of each mode are as follows.



Bit	Bit Name	R/W	Description
63 to 48	DATA_LENGTH[15:0]	W	Combo Transfer Data Length Number of bytes to be transferred. This field must be set to non-zero value.
47 to 32	OFFSET[15:0]/ SUBOFFSET[15:0]	W	Combo Transfer Offset/Sub-Offset Offset of the target operation
31	TOC	W	Combo Transfer Terminate on Completion 0: RESTART: Issue Repeated START (Sr) at end of transfer 1: STOP: Issue STOP (P) at end of transfer
30	ROC	W	Combo Transfer Response on Completion 0: NOT_REQUIRED: Response Status is not required. 1: REQUIRED: Response Status is required.
29	RNW	W	Combo Transfer R/W Identifies direction of the transfer. 0: WRITE: Write transfer 1: READ: Read transfer

Bit	Bit Name	R/W	Description
28 to 26	MODE[2:0]	W	Combo Transfer Speed and Mode Values for I3C Mode: 000: I3C SDR0 Data rate: STDBR (e.g., 12.5 MHz) 001: I3C SDR1 Data rate: EXTBR (e.g., 8 MHz) 010: I3C SDR2 Data rate: STDBR × 2 (e.g., 6.25 MHz) 011: I3C SDR3 Data rate: EXTBR × 2 (e.g., 4 MHz) 100: I3C SDR4 Data rate: EXTBR × 4 (e.g., 2 MHz) Others: Setting prohibited
25	16_BIT_SUBOFFSET	W	Combo Transfer Sub Offset Size 0: 8_BIT_SUBOFFSET: Sub-offset is 8-bits long. Value is encoded in Lower Byte of OFFSET/SUBOFFSET field. 1: 16_BIT_SUBOFFSET: Sub-offset is 16-bits long.
24	FIRST_PHASE_MODE	W	Combo Transfer First Phase Mode 0: SDR: First phase is executed in SDR mode. 1: MODE: First phase is executed in the mode indicated by the MODE field.
23, 22	DATA_LENGTH_POSITION[1:0]	W	Data Length Field Position 0 0: NO: Do not put length field. 0 1: FIRST: Put length as first field. 1 0: SECOND: Put length as second field. Others: Setting prohibited
21	EXT_DEVICE	W	Combo Transfer Extended Device Index 0: Use the DAT table indicated by DEV_INDEX[4:0]. 1: Use the EXDATBAS table.
20 to 16	DEV_INDEX[4:0]	W	Combo Transfer Device Index Indicates the DAT table index for the Slave device being addressed with the transfer. Static and device addressing related information are stored to this index in the DAT.
15 to 7	—	W	The write value should be 0.
6 to 3	TID[3:0]	W	Combo Transfer Transaction ID Identification tag for the command
2 to 0	CMD_ATTR[2:0]	W	Combo Transfer Command Attribute Command Type, defining the format of the other fields. 000: XFER: Regular Transfer 001: IMMED_DATA_XFER: Immediate Data Transfer 010: ADDR_ASSGN_CMD: Address Assignment Command 011: WWR_COMBO_XFER: Write + Write/Read Combo Transfer 111: INTERNAL_CONTROL: Internal Control command Others: Setting prohibited

CMD_ATTR[2:0] bits (Combo Transfer Command Attribute)

Command Type, defining the format of the other fields.

TID[3:0] bits (Combo Transfer Transaction ID Identification tag for the command)

Used as an identification tag for this command. This field shall be populated by the software Driver, and the same value shall be reflected in the Response Descriptor.

DEV_INDEX[4:0] bits (Combo Transfer Device Index)

Indicates the DAT table index for the Slave Device being addressed with the transfer. Static and Device addressing related information will be stored to this index in the DAT.

DATA_LENGTH_POSITION[1:0] bits (Data Length Field Position)

Indicates whether and where to put Data Length (DATA_LENGTH) in the first phase of the transfer.

Whether 8-bit or 16-bit of Data Length field is used is indicated with 16_BIT_SUBOFFSET field. In case of 8-bit value, it is encoded in Lower Byte of DATA_LENGTH field.

FIRST_PHASE_MODE bits (Combo Transfer First Phase Mode)

Indicates whether the first phase of the Combo Transfer is executed in SDR Mode, vs. the Mode indicated by the MODE field.

MODE[2:0] bits (Combo Transfer Speed and Mode Values for I3C Mode)

Sets the mode and speed for the I3C or I^2C transfer.

Interpretation of this field depends on whether the Device is in I3C Mode vs. I^2C Mode (see the DEVICE field in the DAT Table entry indexed by field DEV_INDEX).

RNW bit (Combo Transfer R/W Identifies direction of the transfer)

Identifies direction of the transfer.

ROC bit (Combo Transfer Response on Completion)

Controls whether Response Status is required after successful completion of the data transfer command. The successful completion shall be read from NRSPQP register. Upon unsuccessful transfer the Response Status shall always be sent.

TOC bit (Combo Transfer Terminate on Completion)

Controls what Bus condition is issued after completion of the data transfer.

When the next command is SDR mode, must be set to TOC = 1 (STOP).

DATA_LENGTH[15:0] bit (Combo Transfer Data Length Number of bytes to be transferred. This field must be set to non-zero value.)

Number of valid data bytes to use in this Combo Transfer Descriptor.

This field must be set to non-zero value.

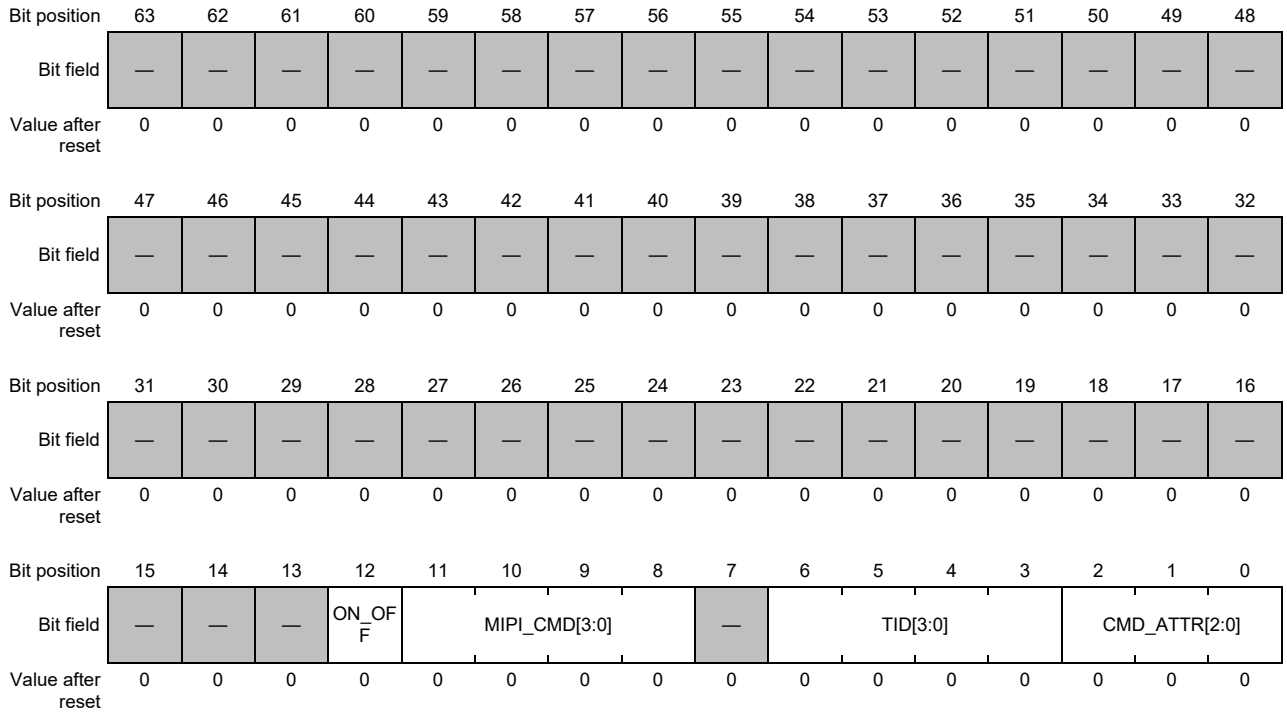
(5) Internal Control Command

This structure is used for controlling I3C itself (not for transfer commands).

I3C provides an Internal Control Command for the following mode:

- I3C Master Mode

Details of the Internal Control Command Structure are as follows:



Bit	Bit Name	R/W	Description
63 to 13	—	W	The write value should be 0.
12	ON_OFF	W	Bus Instance 7E On/Off*1 Enables or disables automatic transmission of the I3C Broadcast Header after every START condition on this I3C Bus instance. 0: IBA_INCLUDE off 1: IBA_INCLUDE on
11 to 8	MIPI_CMD[3:0]	W	MIPI Alliance Command H'0: NoOp, so the ON_OFF field is not valid. H'2: Include 7E (IBA), so the ON_OFF field is valid. Others: Setting prohibited
7	—	W	The write value should be 0.
6 to 3	TID[3:0]	W	Transaction ID Identification tag for the command
2 to 0	CMD_ATTR[2:0]	W	Command Attribute*2 Command Type, defining the format of the other fields. 000: XFER: Regular Transfer 001: IMMED_DATA_XFER: Immediate Data Transfer 010: ADDR_ASSGN_CMD: Address Assignment Command 011: WWR_COMBO_XFER: Write + Write/Read Combo Transfer 111: INTERNAL_CONTROL: Internal Control command Others: Setting prohibited

Note 1. The IBA_INCLUDE on state set by MIPI_CMD[3:0] = 0010b and ON_OFF = 1 is cleared by setting RSTCTL.INTLRST to 1.

Note 2. The Response descriptor is not stored when the Internal Control Command is executed.

26.3.1.2 Response Descriptor

The Response Descriptor is a read-only structure describing the success or failure of a command, and the amount of data transferred.

The Response Descriptor is read from Response Queue with reads from Response Queue Port.

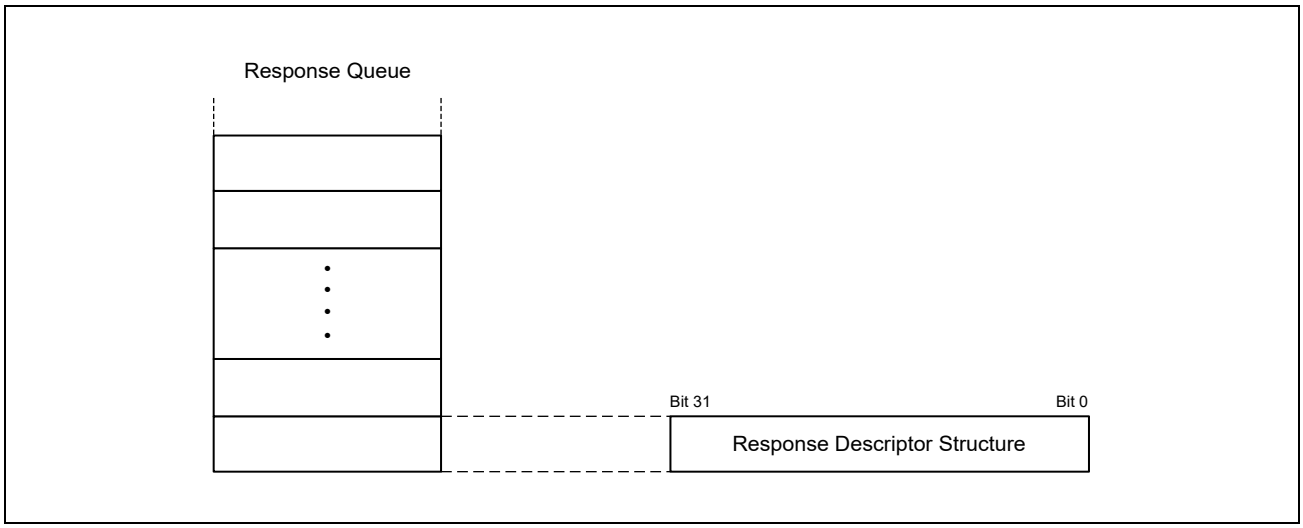


Figure 26.3 Response Descriptor Data Structure

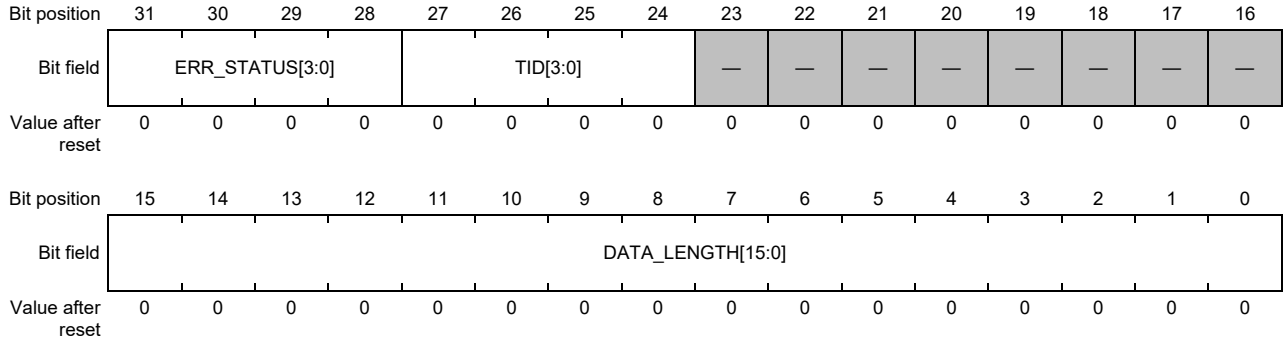
I3C provides a Response Descriptor for the following modes:

- I3C Master Mode
- I3C Slave Mode

Details of the Response Descriptor structure of each mode are shown in the following sections.

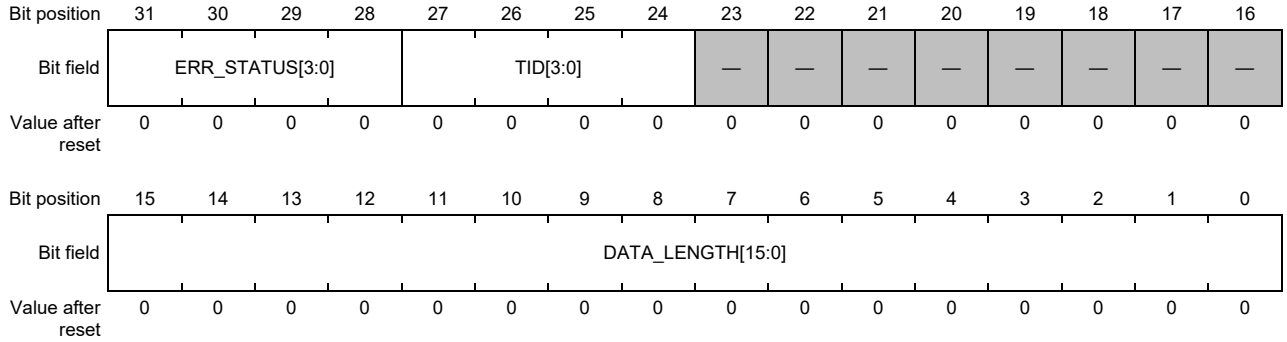
(a) I3C Master Mode



Bit	Bit Name	R/W	Description
31 to 28	ERR_STATUS[3:0]	R	MIPI Alliance Command H'0: SUCCESS: Transfer successful, no error H'1: CRC: CRC Error H'2: PARITY: Parity Error H'3: FRAME: Frame Error H'4: ADDR_HEADER: Address Header Error H'5: NACK: Address NACKed or Dynamic Address Assignment NACKed H'6: OVL: Receive Overflow or Transfer Underflow Error H'8: ABORTED: Aborted H'9: I^2C_WR_DATA_NACK: NACK received for the I^2C Write Data transfer H'A: NOT_SUPPORTED: Command with specific parameters not supported by I3C implementation (for example, specific Internal Control codes may not be supported) Others: Setting prohibited
27 to 24	TID[3:0]	R	Command/Response Transaction ID Identification tag for the command. This value shall match one of commands sent on the Bus. H'0 to H'7: Valid Transaction IDs Others: Setting prohibited
23 to 16	—	R	These bits are read as 0.
15 to 0	DATA_LENGTH[15:0]	R	Data Length/Device Count The meaning of this field depends on the context: For Write Transfer: Remaining data length (in bytes) For Read Transfer: Received data length (in bytes) For Address Assignment: Remaining Device count

Note: In I3C Master mode, when an abnormal command with a specific parameter that is not supported is stored in Command Descriptor, it is indicated as NOT_SUPPORTED (H'A) in ERR_STATUS[3:0].

(b) I3C Slave Mode



Bit	Bit Name	R/W	Description
31 to 28	ERR_STATUS[3:0]	R	Response Error Status H'0: SUCCESS: Transfer successful, no error. H'3: FRAME: Frame Error H'4: ADDR_HEADER: Address Header Error H'5: NACK: Address NACK'ed or Dynamic Address Assignment NACK'ed H'6: OVL: Receive Overflow or Transfer Underflow Error H'8: ABORTED: Aborted H'A: NOT_SUPPORTED: Command with specific parameters not supported by I3C implementation (for example, specific Internal Control codes may not be supported) Others: Setting prohibited
27 to 24	TID[3:0]	R	Command/Response Transaction ID Identification tag for the command. This value matches one of commands sent on the bus. H'0 to H'7: Valid Transaction IDs Others: Setting prohibited
23 to 16	—	R	These bits are read as 0.
15 to 0	DATA_LENGTH[15:0]	R	Data Length Remaining data length (in bytes) for Slave Interrupt Request

Note: In I3C Slave mode, it is indicated as NOT_SUPPORTED (H'A) in ERR_STATUS[3:0] in the following cases:
- When an abnormal command with a specific parameter that is not supported is stored in the Command Descriptor.
- When the IBI to be transmitted is disabled in the CSECMD register.
- After the normal command for IBI transmission is prepared in the Command Queue, when that IBI is disabled in the CSECMD register by the DISEC CCC frame from the I3C Master.

26.3.1.3 IBI Status Descriptor

The IBI Status Descriptor is a read-only structure describing an IBI event received from a Slave device on the I3C Bus.

The IBI Status Descriptor is read from IBI Status Queue with reads from IBI Status Queue Port.

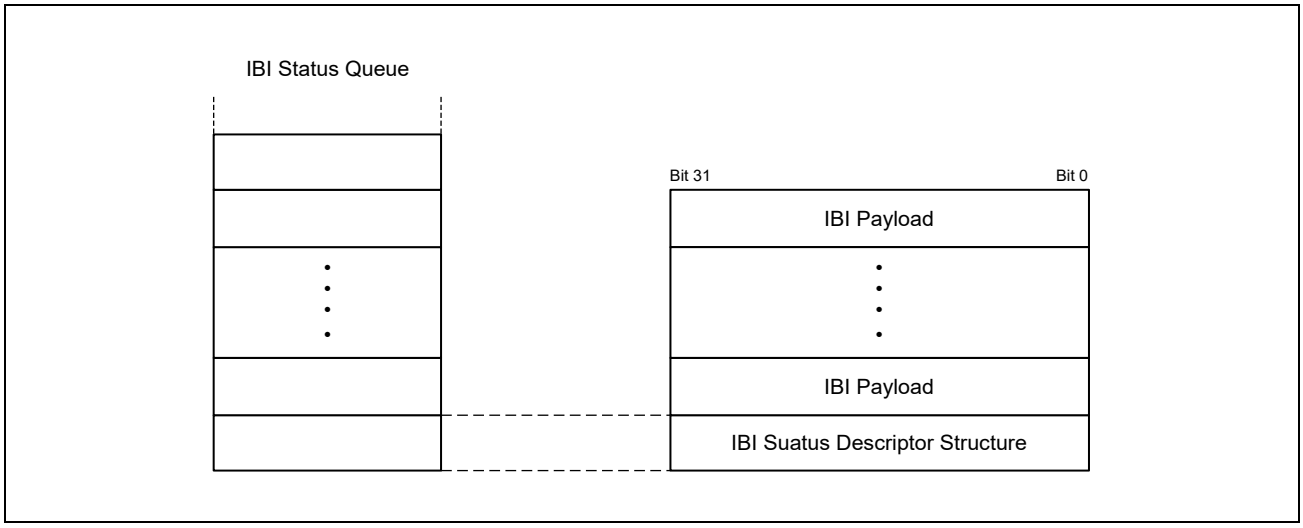


Figure 26.4 IBI Status Descriptor Data Structure

I3C provides a IBI Status Descriptor for the following mode:

- I3C Master Mode

Details of the IBI Status Descriptor Structure are as follows.

Bit position	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field	IBI_ST	—	—	ERR_STATUS[2:0]			TS	LAST_STATUS	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field	IBI_ID[7:0]								DATA_LENGTH[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	R/W	Description
31	IBI_ST	R	IBI Received Status Indicates how the received IBI was handled. 0: The IBI was handled with ACK. 1: NACK: The IBI was handled with NACK, and then Auto-Disabled.
30, 29	—	R	These bits are read as 0. The write value should be 0.
28:26	ERR_STATUS[2:0]	R	IBI Error Status 000: SUCCESS 011: ERROR: FRAME (Frame Error) 100: ERROR: ADDR_HEADER (Address Header Error) 101: NACK: Address NACKed 111: ERROR: ABORT (Aborted to Master) Others: Setting prohibited

Bit	Bit Name	R/W	Description
25	TS	R	IBI Time-stamp Present Indicates whether a timestamp is available for the IBI. 0: OFF: IBI is not time-stamped. 1: ON: IBI is time-stamped.
24	LAST_STATUS	R	Last IBI Status Last IBI status for the IBI transaction.
23:16	—	R	These bits are read as 0. The write value should be 0.
15:8	IBI_ID[7:0]	R	IBI Received ID The meaning of this field depends on the context: For Slave Interrupt or Master Request: Bits 15:9 contain the Slave's Device Address, and bit 8 contains the R/W bit. For Hot-Join IBI: Bits 15:8 contain the Hot-Join ID for the IBI.
7:0	DATA_LENGTH[7:0]	R	IBI Data Length Number of data bytes in IBI Data.

LAST_STATUS bits (Last IBI Status)

Even if LAST_STATUS is set to 0, the software driver still evaluates the data payload length by examining the CHUNKS field.

26.3.1.4 Receive Status Descriptor

The Receive Status Descriptor is a read-only structure describing the success or failure of read/write operation from the master, and the amount of data transferred.

The Receive Status Descriptor is read from Receive Status Queue with reads from Receive Status Queue Port.

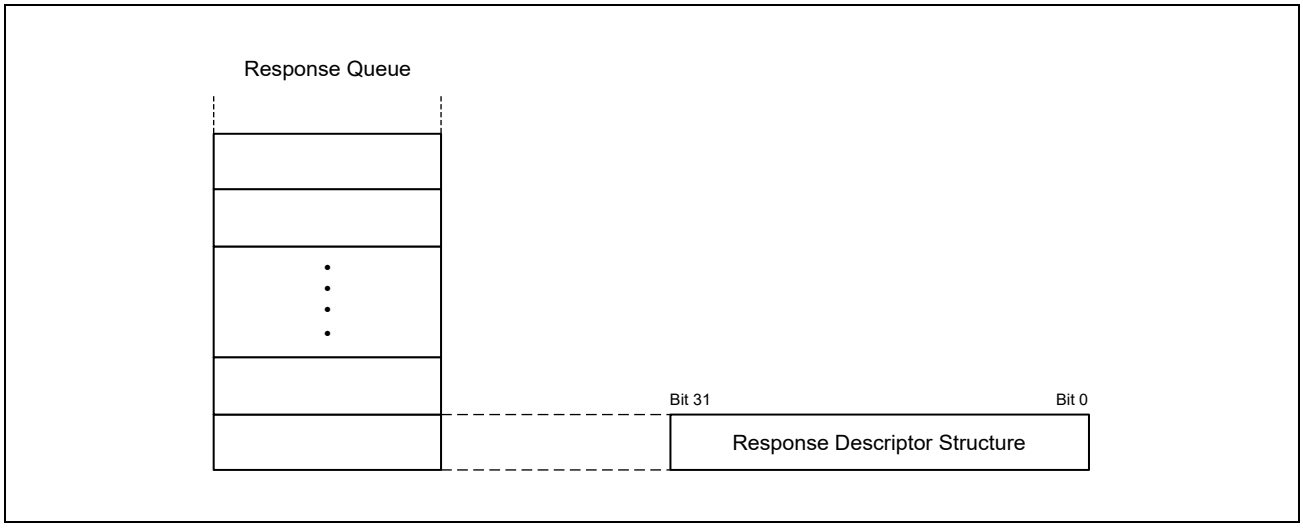

Figure 26.5 Receive Status Descriptor Data Structure

I3C provides a Receive Status Descriptor for the following mode:

- I3C Slave Mode

Details of the Receive Status Descriptor structure of each mode are as follows.

Bit position	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field	DEV_INDEX[2:0]			TRANSFER_TYPE[1:0]		ERR_STATUS[2:0]			CMD[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field	DATA_LENGTH[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	R/W	Description
31 to 29	DEV_INDEX[2:0]	R	Device Index Indicates the SVDVADn index for the response with the transfer.
28, 27	TRANSFER_TYPE [1:0]	R	Transfer Type 00: I3C SDR/I^{2}C Message 01: I3C CCC 10: Setting prohibited 11: Setting prohibited

Bit	Bit Name	R/W	Description
26 to 24	ERR_STATUS[2:0]	R	Error Status 000: SUCCESS 001: ERROR: CRC (CRC Error) 010: ERROR: PARITY (Parity Error) 011: ERROR: FRAME (Frame Error) 100: ERROR: ADDR_HEADER (Address Header Error) 101: ERROR: NACK (Slave NACKed) 110: ERROR: OVL (FIFO Overflow/Underflow) 111: ERROR: ABORT (Aborted to Master)
23 to 16	CMD[7:0]	R	The contents are different depending on the operation mode. Details are are follows: [SDR Private Message Mode] Bit 23: R/W Type Bits 22 to 20: Setting prohibited Bit 19: I3C_I^2C Type Bits 18 to 16: Setting prohibited [SDR CCC Mode] CCC code[7:0]
15 to 0	DATA_LENGTH[15:0]	R	Data Length The meaning of this field depends on the context. For Write Transfer: Received data length (in bytes) For Read Transfer: Transmitted data length (in bytes)

26.3.2 Details of Function

26.3.2.1 Operation Mode

The support relationship between the mode selects (I3C mode/I²C mode) and operation mode (Master/Slave) on the I3C bus or the I²C bus is shown in **Table 26.10**.

Table 26.10 Support of Operating Mode

I3C/I²C Bus	I3C Mode		I²C Mode	
	Master	Slave	Master	Slave
I3C Bus	✓	✓	—	✓
I²C Bus	—	—	✓	✓

Note: ✓: Supported
— : Un-Supported

(1) Master Mode Operation

(a) I²C Master Operation

1) Data Write Transfer (Single Buffer transfer)

In master transmit operation, I3C outputs the SCL clock and transmitted data signals as the master device, and the slave device returns acknowledgments. **Figure 26.6** shows an example of usage of master transmission and **Figure 26.6** to **Figure 26.8** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

1. Initial settings. For details, refer to **Section 26.3.3.1, Initial Setting Flow**.
2. Read the BCST.BFREF flag to check that the bus is open, and then set the CNDCTL.STCND bit to 1 (START condition issuance request). Upon receiving the request, I3C issues a START condition. At the same time, the BFREF flag bit is automatically set to 0, the BST.STCNDDF flag is automatically set to 1 and the STCND bit is automatically set to 0. At this time, if the START condition is detected and the internal levels for the SDA output state and the levels on the SDAn line have matched while the STCND bit = 1, I3C recognizes that issuing of the START condition as requested by the STCND bit has been successfully completed, and bits CRMS and TRMD in the PRSST register are automatically set to 1, placing I3C in master transmit mode. The NTST.TDBEF0 flag is also automatically set to 1 in response to setting of the TRMD bit to 1.
3. Check that the NTST.TDBEF0 flag = 1, and then write the value for transmission (the slave address and the R/W# bit) to the NTDTBP0 register. Once the data for transmission are written to the NTDTBP0 register, the TDBEF0 flag is automatically set to 0, the data are transferred from the Normal Transmit Data Buffer 0 to the Shift Register, and the TDBEF0 flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRMD bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, I3C continues in master transmit mode. Because the BST.NACKDF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the CNDCTL.SPCND bit to issue a STOP condition. For data transmission with an address in the 10-bit format, start by writing 1_1110, the 2 higher-order bits of the slave address, and W to the NTDTBP0 register as the first address transmission. Then, as the second address transmission, write the 8 lower-order bits of the slave address to the NTDTBP0 register.
4. After confirming that the NTST.TDBEF0 flag = 1, write the data for transmission to the NTDTBP0 register. I3C automatically holds the SCLn line low until the data for transmission are ready or a STOP condition is issued.

5. After all bytes of data for transmission have been written to the NTDTBP0 register, wait until the value of the BST.TENDF flag returns to 1, and then set the CNDCTL.SPCND bit to 1 (STOP condition issuance request). Upon receiving a STOP condition issuance request, I3C issues the STOP condition.
6. Upon detecting the STOP condition, I3C automatically sets bits CRMS and TRMD in the PRSST register to 00 and enters slave receive mode. Furthermore, it automatically sets the TDBEF0 and TENDF flags to 0, and sets the BST.SPCNDDF flag to 1.
7. After checking that the BST.SPCNDDF flag = 1, set the BST.NACKDF and SPCNDDF flags to 0 for the next transfer operation.

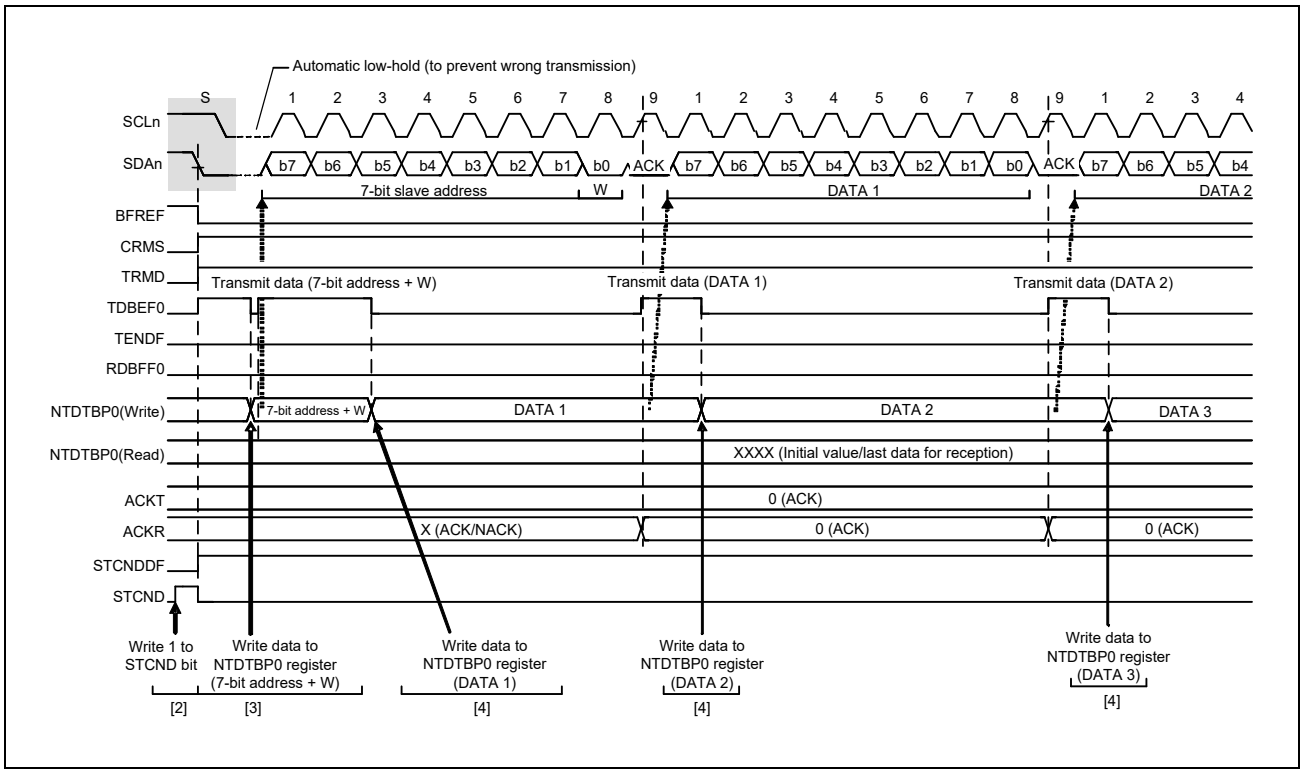

Figure 26.6 Master Transmit Operation Timing (1) (7-bit Address Format)

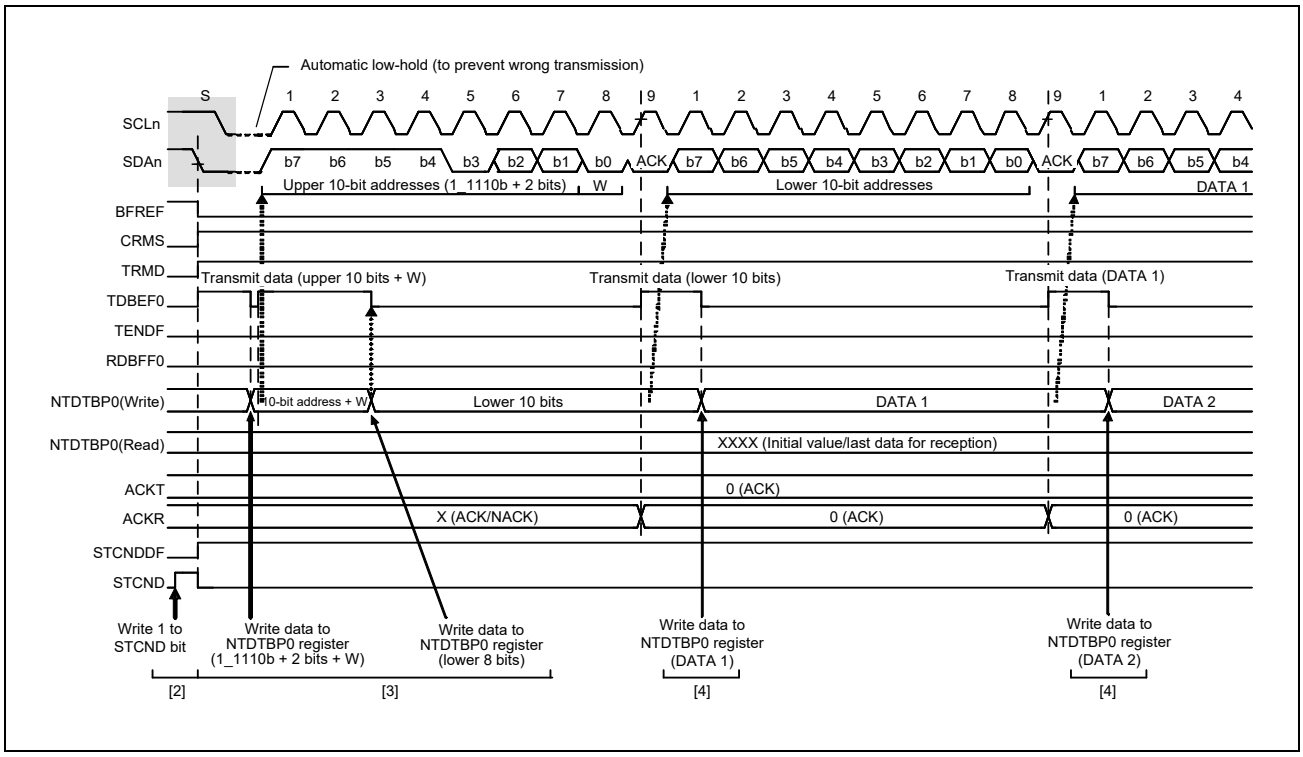

Figure 26.7 Master Transmit Operation Timing (2) (10-bit Address Format)

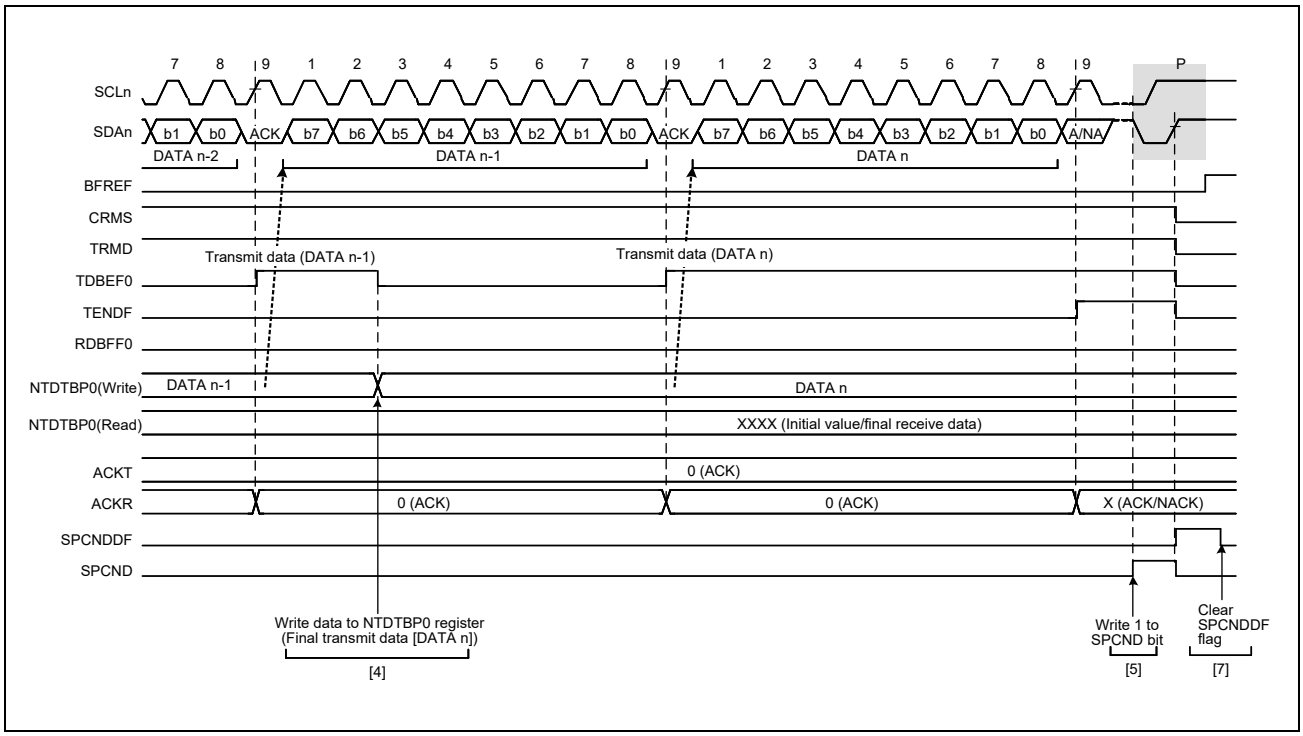

Figure 26.8 Master Transmit Operation Timing (3)

2) Data Read Transfer (Single Buffer transfer)

In master receive operation, I3C as a master device outputs the SCL clock, receives data from the slave device, and returns acknowledgments. Because I3C must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 26.119 and **Figure 26.120** show examples of usage of master reception (7-bit address format) and **Figure 26.9** to **Figure 26.11** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

1. Initial settings. For details, refer to **Section 26.3.3.1, Initial Setting Flow**.
2. Read the BCST.BFREF flag to check that the bus is open, and then set the CNDCTL.STCND bit to 1 (START condition issuance request). Upon receiving the request, I3C issues a START condition. When I3C detects the START condition, the BFREF flag is automatically set to 0 and the BST.STCNDDF flag is automatically set to 1 and the STCND bit is automatically set to 0. At this time, if the START condition is detected and the levels for the SDA output and the levels on the SDAn line have matched while the STCND bit = 1, I3C recognizes that issuing of the START condition as requested by the STCND bit has been successfully completed, and bits CRMS and TRMD in the PRSST register are automatically set to 1, placing I3C in master transmit mode. The NTST.TDBEF0 flag is also automatically set to 1 in response to setting of the TRMD bit to 1.
3. Check that the NTST.TDBEF0 flag = 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to the NTDTBP0 register. Once the data for transmission are written to the NTDTBP0 register, the TDBEF0 flag is automatically set to 0, the data are transferred from the Normal Transmit Data Buffer 0 to the Shift Register, and the TDBEF0 flag is again set to 1. Once the byte containing the slave address and R/W# bit has been transmitted, the value of the PRSST.TRMD bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the TRMD bit is set to 0 on the rising edge of the ninth cycle of SCL clock, placing I3C in master receive mode. At this time, the TDBEF0 flag is set to 0. The NTST.RDBFF0 flag is automatically set to 1 when ACK response is received from the slave device. If the slave device is not recognized or a communication failure occurs, the BST.NACKDF flag will be set to 1. At this time, set 1 to the CNDCTL.SPCND bit to issue a STOP condition. For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a Repeated START condition. After that, transmitting 1_1110, the two higher-order bits of the slave address, and the R bit places I3C in master receive mode.
4. Dummy read the NTDTBP0 register after confirming that the NTST.RDBFF0 flag = 1; this makes I3C start output of the SCL clock and start data reception.
5. After 1 byte of data has been received, the NTST.RDBFF0 flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the SCSTRCTL.ACKTWE bit. Reading the NTDTBP0 register at this time will produce the received data, and the RDBFF0 flag is automatically set to 0 at the same time. Furthermore, the value of the acknowledgment field received during the ninth cycle of SCL clock is returned as the value set in the ACKCTL.ACKT bit. Furthermore, if the next byte to be received is the next to last byte, set the SCSTRCTL.RWE bit to 1 (for wait insertion) before reading the NTDTBP0 register (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the ACKCTL.ACKT bit to 1 (NACK) in step 6, due to other interrupts, etc., this fixes the SCLn line to the low level on the falling edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a STOP condition is possible.
6. When the SCSTRCTL.ACKTWE bit = 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the ACKCTL.ACKT bit to 1 (NACK).
7. After reading the byte before last from the NTDTBP0 register, if the value of the NTST.RDBFF0 flag is confirmed to be 1, write 1 to the CNDCTL.SPCND bit (STOP condition issuance request) and then read the last

byte from the NTDTBP0 register. When 1 is written to the CNDCTL.SPCND bit, I3C is released from the wait state and issues the STOP condition after low-level output in the ninth clock cycle is completed or the SCLn line is released from the low- hold state.

8. Upon detecting the STOP condition, I3C automatically sets bits CRMS and TRMD in the PRSST register to 00 and enters slave receive mode. Furthermore, detection of the STOP condition leads to setting of the BST.SPCNDDF flag to 1.

9. After checking that the BST.SPCNDDF flag = 1, set the BST.NACKDF and SPCNDDF flags to 0 for the next transfer operation.

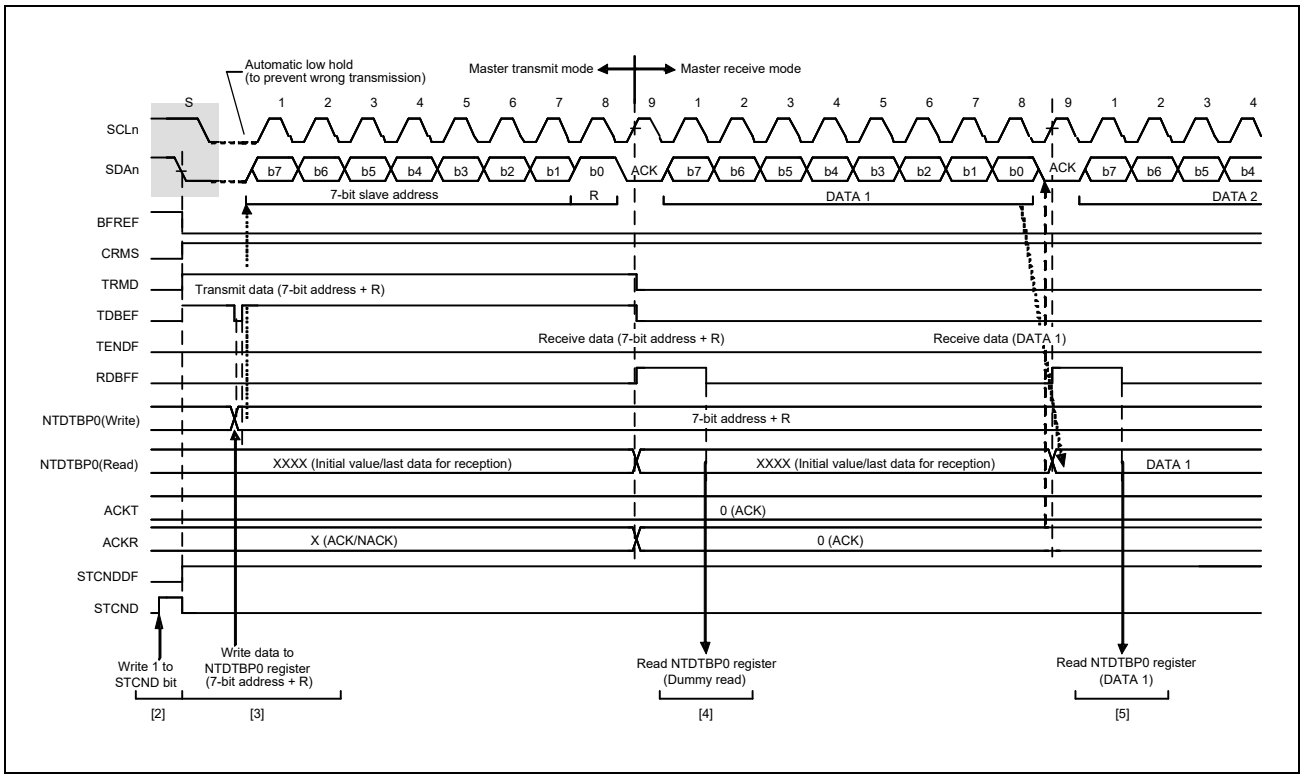

Figure 26.9 Master Receive Operation Timing (1) (7-bit Address Format, When ACKTWE = 0)

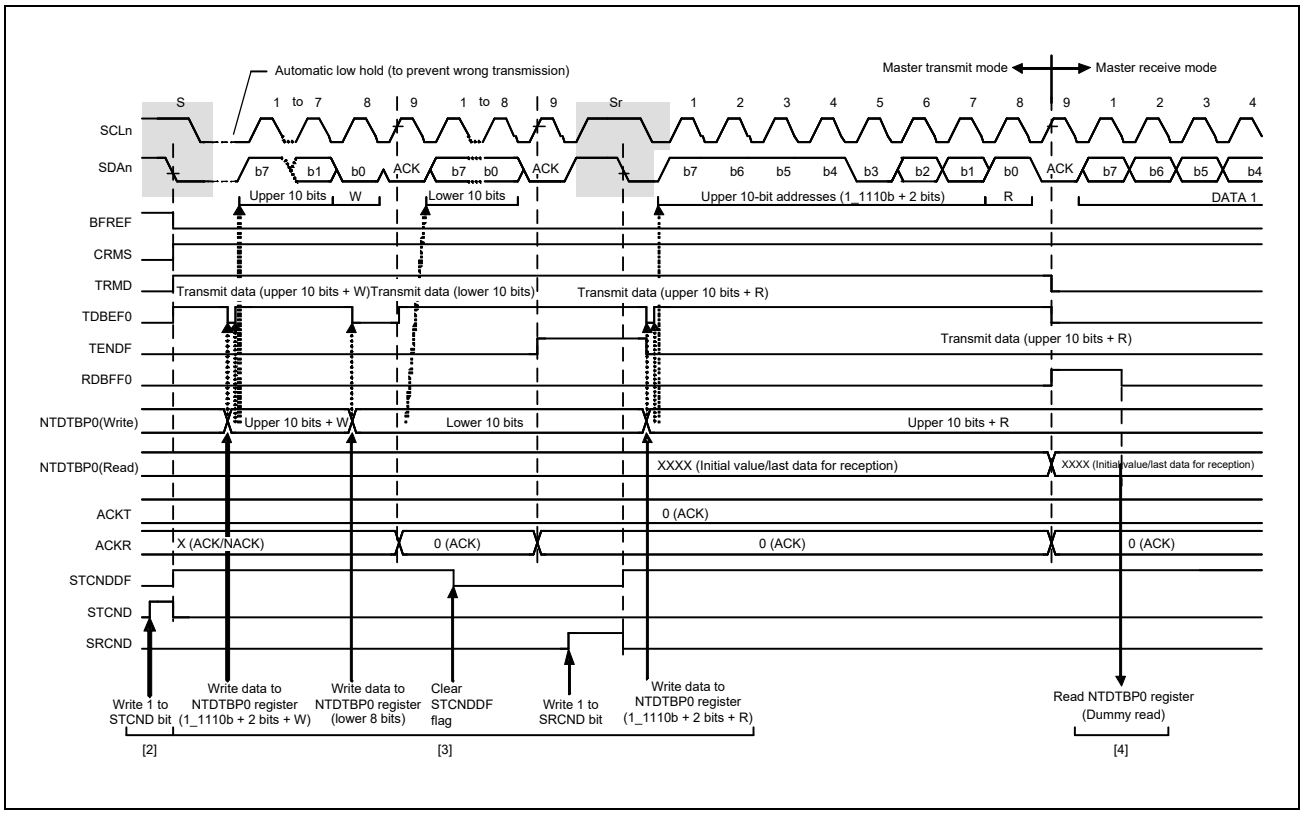

Figure 26.10 Master Receive Operation Timing (2) (10-bit Address Format, When ACKTWE = 0)

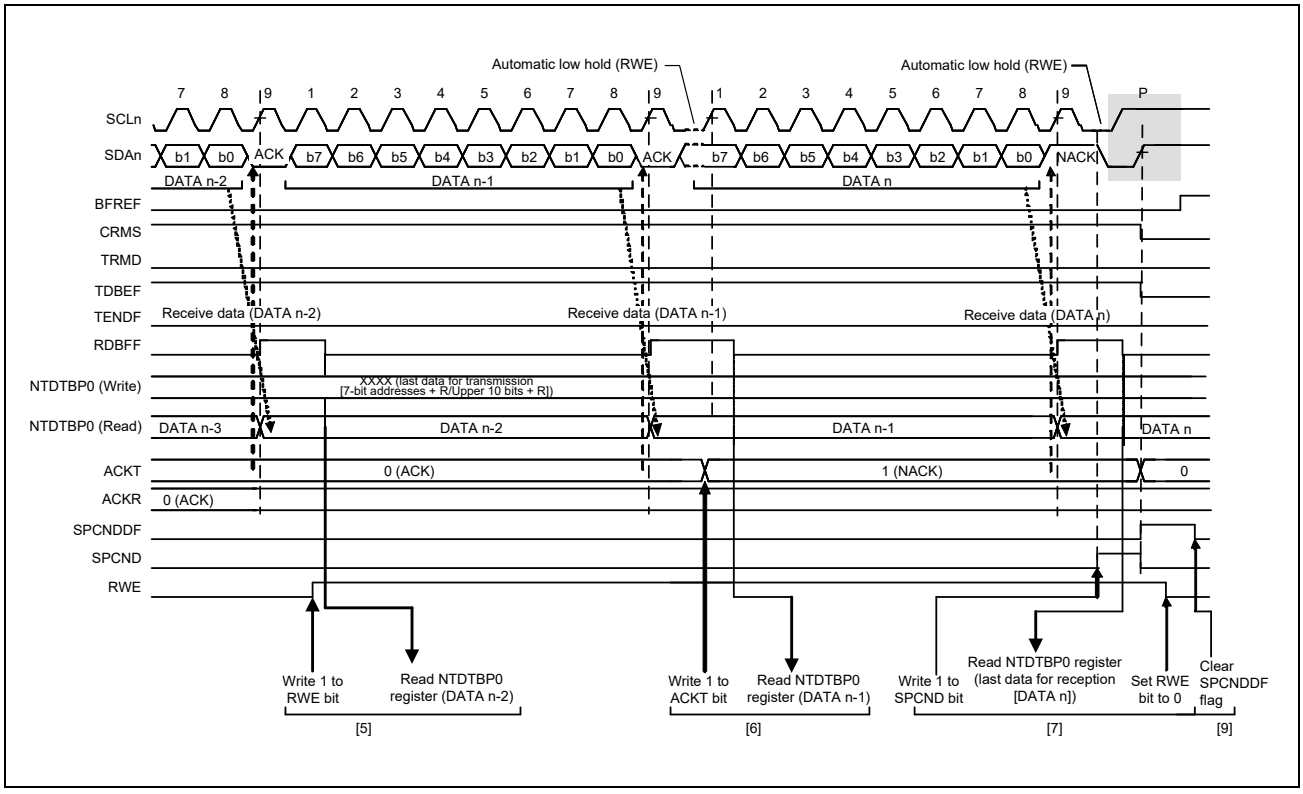

Figure 26.11 Master Receive Operation Timing (3) (When ACKTWE = 0)

(b) I3C Master Operation

1) Dynamic Address Assign Procedure

After initializing I3C, first execute Dynamic Address Assign Procedure for I3C Slave connected on the I3C Bus. The following describes the procedure.

1. Initial setting (refer to **Section 26.3.3.1(2), I3C Initial Setting Flow** for details)
2. Execute Dynamic Address Assign with ENTDAA or SETDASA Common Command Code (CCC) for I3C Slave set in DAT (DATBASm register).
   Write Command Descriptor (Address Assign Command) to Command Buffer via the NCMDQP register.
3. When Command Descriptor is written to Command Buffer, Transaction is issued on I3C Bus.
4. When ENTDAA is specified for CMD[7:0] of Address Assign Command:
   Execute Dynamic Address Assign for I3C Slave for the number of DATs specified by DEV_COUNT[3:0] starting with DAT specified by DEV_INDEX[4:0] of Address Assign Command.
   When SETDASA is specified for CMD[7:0] of Address Assign Command:
   Execute Dynamic Address Assign for I3C Slave indicated by DAT specified by DEV_INDEX[4:0] of Address Assign Command.
5. In case of ENTDAA, the Provisional ID, BCR, DCR transmitted from I3C Slave is stored in Receive Data Buffer (BCR is also automatically stored in the MSDCTm register).
   Read the Provisional ID, BCR, and DCR from the Receive Data Buffer via the NTDTBPn register with an interrupt by RDBFF0 = 1.
6. When execution of Dynamic Address Assign is completed, issue STOP condition and store the Response Descriptor into the Response Buffer.
7. Read the Response Descriptor via the NRSPQP register and check the status.
8. Check whether the value of the DATA_LENGTH[15:0] bits of the Response Descriptor match the value of DEV_COUNT[3:0] of the Address Assign Command.

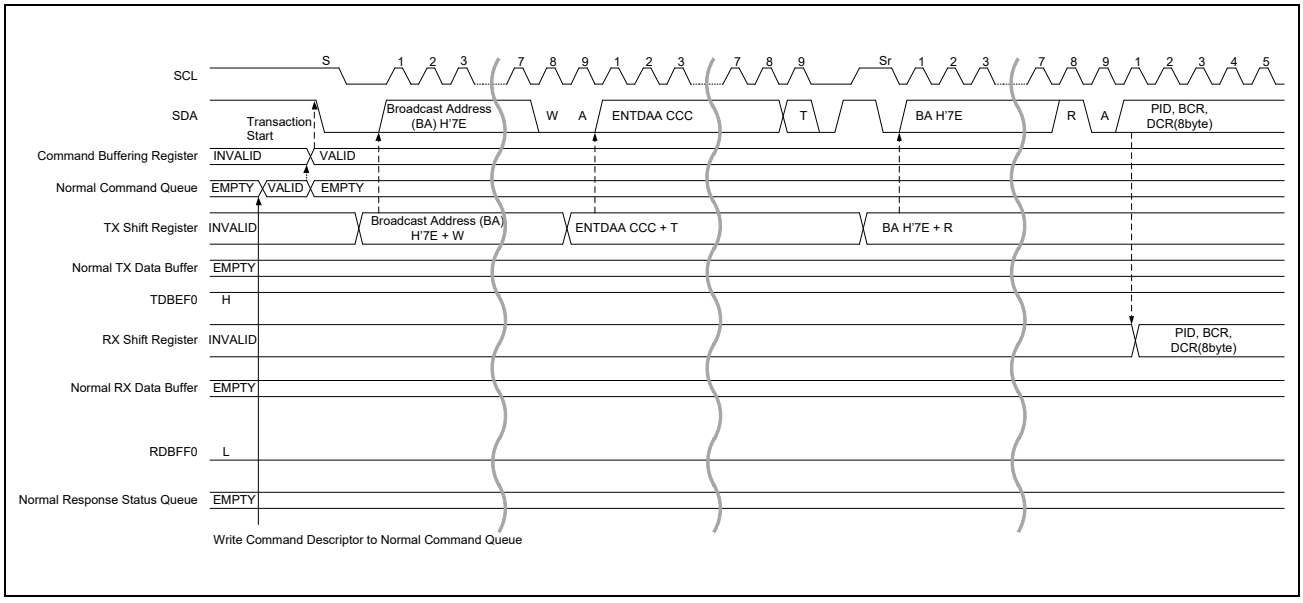

Figure 26.12 Dynamic Address Assign Procedure (ENTDAA CCC) Timing (1/3)

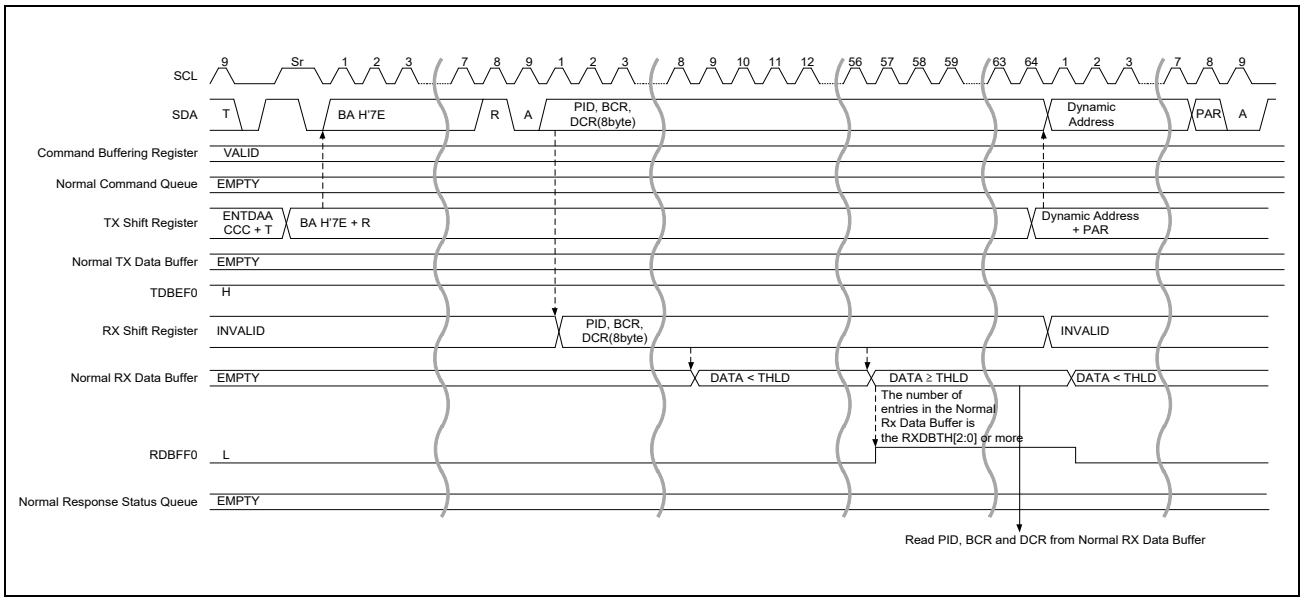

Figure 26.13 Dynamic Address Assign Procedure (ENTDAA CCC) Timing (2/3)

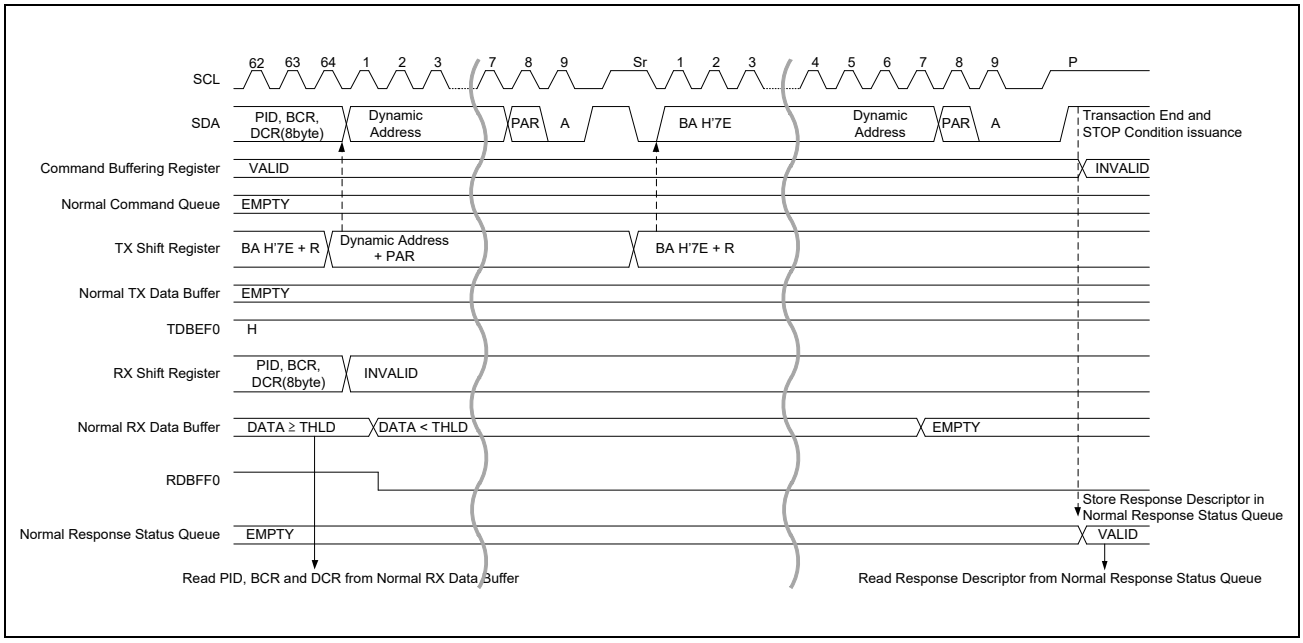

Figure 26.14 Dynamic Address Assign Procedure (ENTDAA CCC) Timing (3/3)

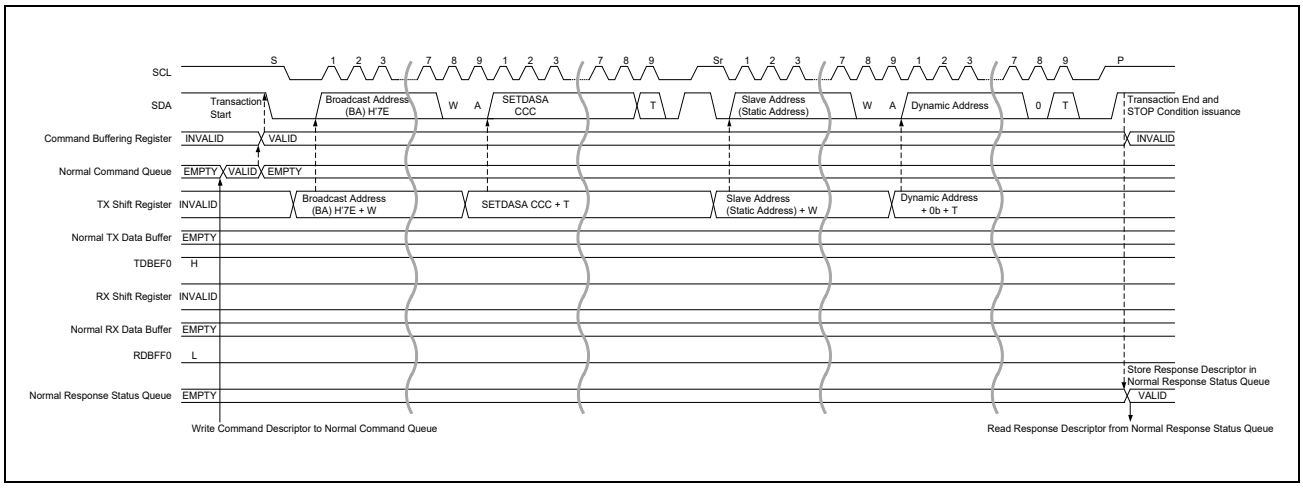

Figure 26.15 Dynamic Address Assign Procedure (SETDASA CCC) Timing

2) SDR Data Write Transfer

1. Write data for transmission to the Transmit Data Buffer via the NTDTBPn register.
2. Write a Command Descriptor (Immediate Transfer Command or Regular Transfer Command or Combo Transfer Command) for Data Transfer to the Command Buffer via the NCMDQP register.
3. When Command Descriptor is written to Command Buffer, transaction is issued on I3C Bus.
   When NACK is received with the Address Header, transaction of the same command is automatically issued according to the NACK Retry Count value (DATBASm.DVNACK) of DAT.
4. If data for transmission still remain, write data for transmission by an interrupt with TDBEF0 = 1 to the Transmit Data Buffer via the NTDTBPn register.
5. When data transmission for the number of Data Length specified by the DATA_LENGTH[15:0] bits of the Command Descriptor is completed, the Repeated START condition or STOP condition is issued and the Response Descriptor is stored in the Response Buffer.
6. Read the Response Descriptor via the NRSPQP register and check the status.
7. Check that the value of the DATA_LENGTH[15:0] bits of the Response Descriptor is 0.

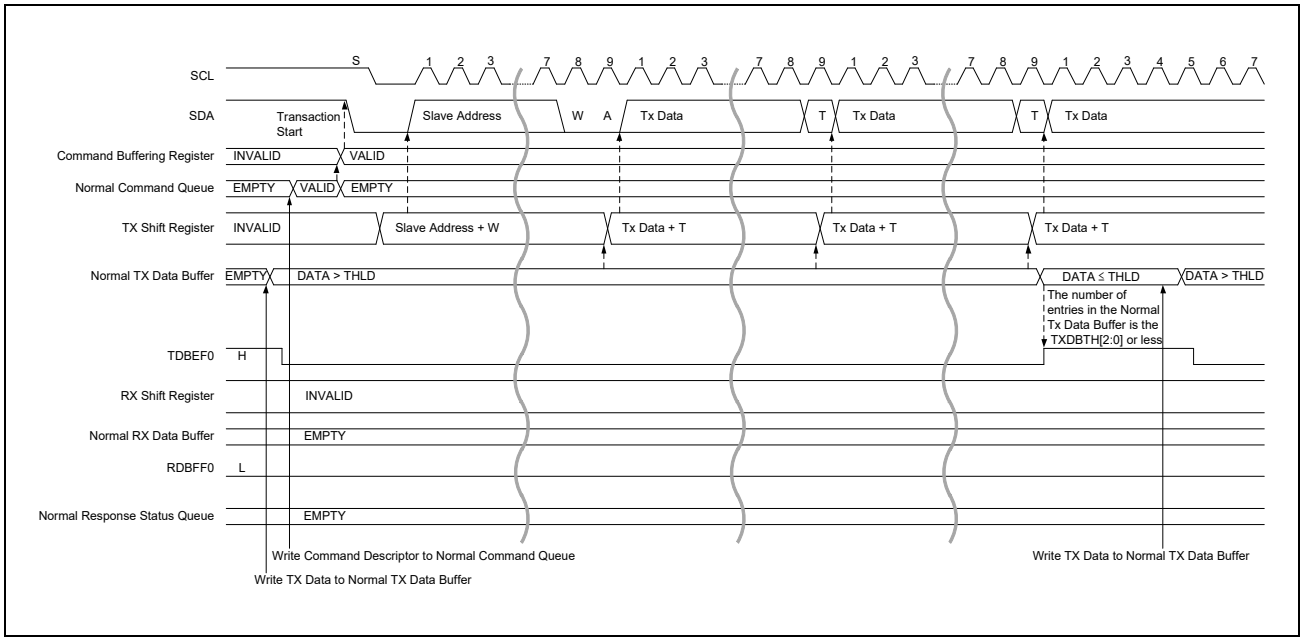

Figure 26.16 SDR Data Write Transfer Timing (1/2)

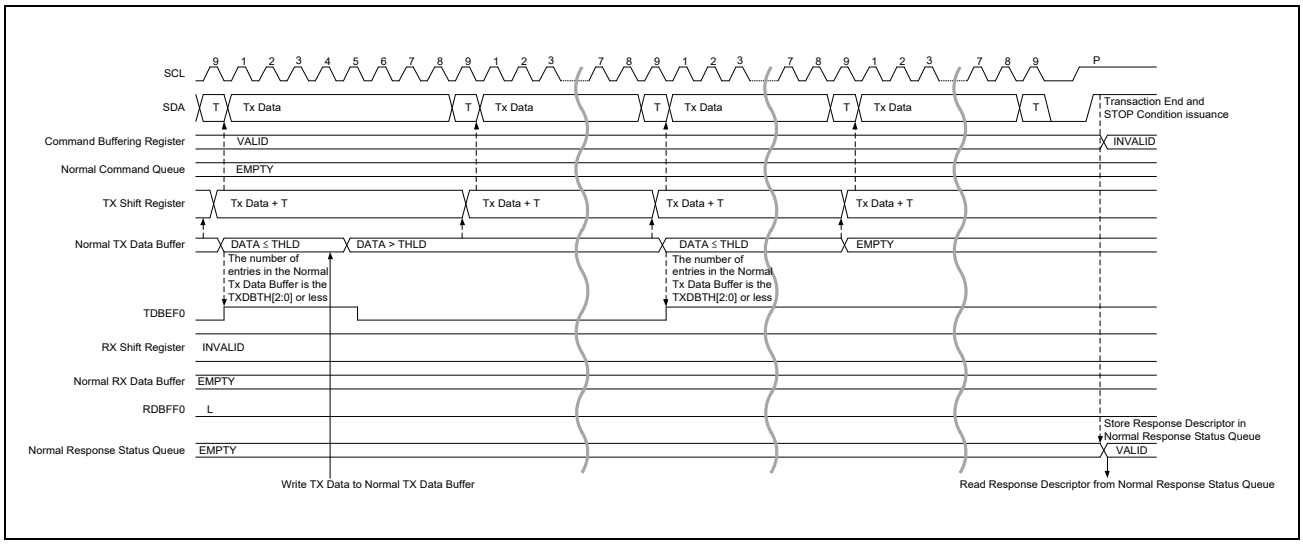

Figure 26.17 SDR Data Write Transfer Timing (2/2)

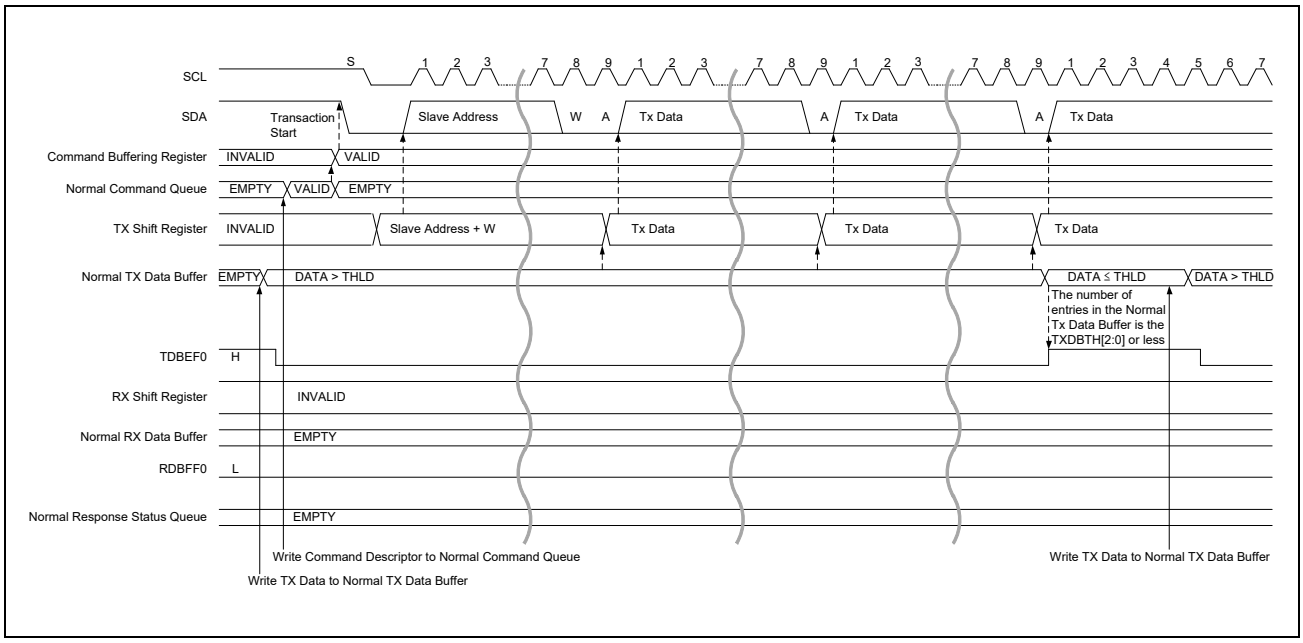

Figure 26.18 Legacy I²C Message Data Write Timing (1/2)

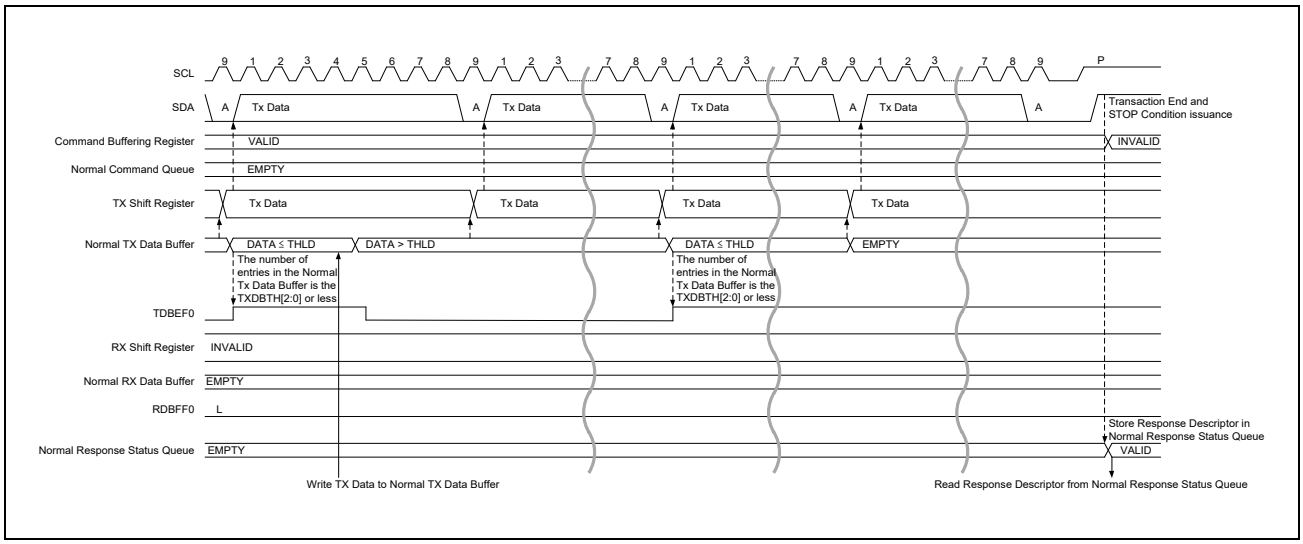

Figure 26.19 Legacy I²C Message Data Write Timing (2/2)

3) SDR Data Read Transfer

1. Write a Command Descriptor (Immediate Transfer Command or Regular Transfer Command or Combo Transfer Command) for Data Transfer to the Command Buffer via the NCMDQP register.
2. When Command Descriptor is written to Command Buffer, transaction is issued on I3C Bus.
   When NACK is received with the Address Header, transaction of the same command is automatically issued according to the NACK Retry Count value (DATBASm.DVNACK) of DAT.
3. Data received from the I3C Slave is stored in the Receive Data Buffer.
4. With the RDBFF0 = 1 interrupt, the received data is read from the Receive Data Buffer via the NTDTBPn register.
5. SDR:
   Detecting Low in T-bit or receiving Data for the number of Data Length specified by the DATA_LENGTH[15:0] bits of Command Descriptor is completed, issue Repeated START condition or STOP condition and store the Response Descriptor into the Response Buffer.
   Legacy I^2C Message:
   When data reception for the number of Data Length specified by the DATA_LENGTH[15:0] bits of Command Descriptor is completed, NACK is issued. After that, issue a Repeated START condition or STOP condition and store the Response Descriptor into the Response Buffer.
6. Read the Response Descriptor via the NRSPQP register and check the status.
7. Check whether the value of the DATA_LENGTH[15:0] bits of the Response Descriptor match the data length setting value of the Command Descriptor.

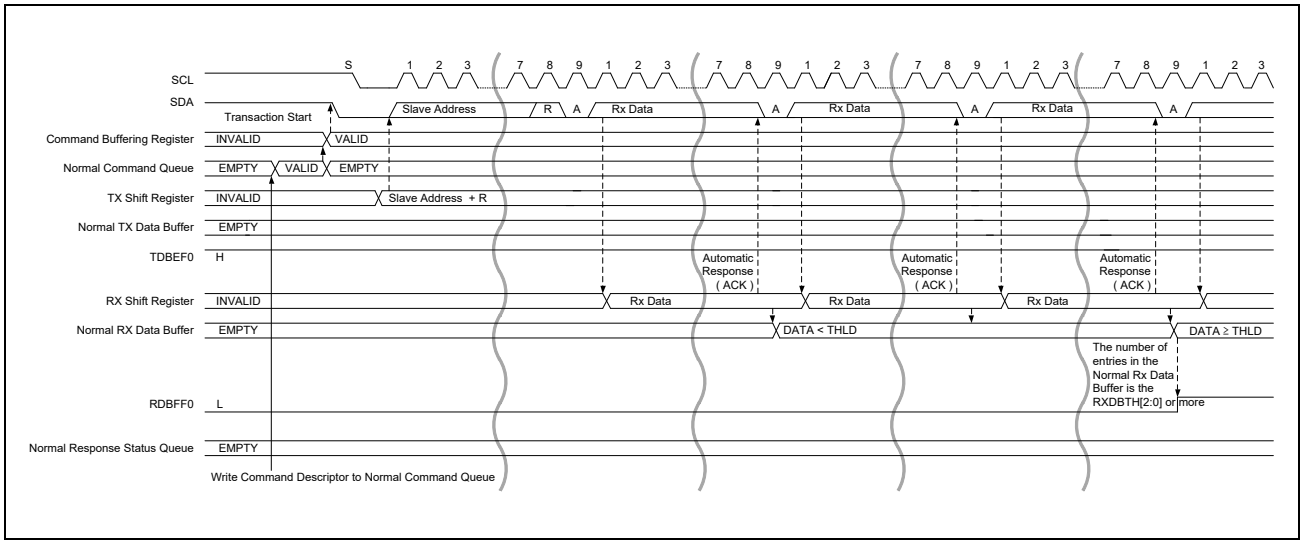

Figure 26.20 SDR Data Read Transfer Timing (1/2)

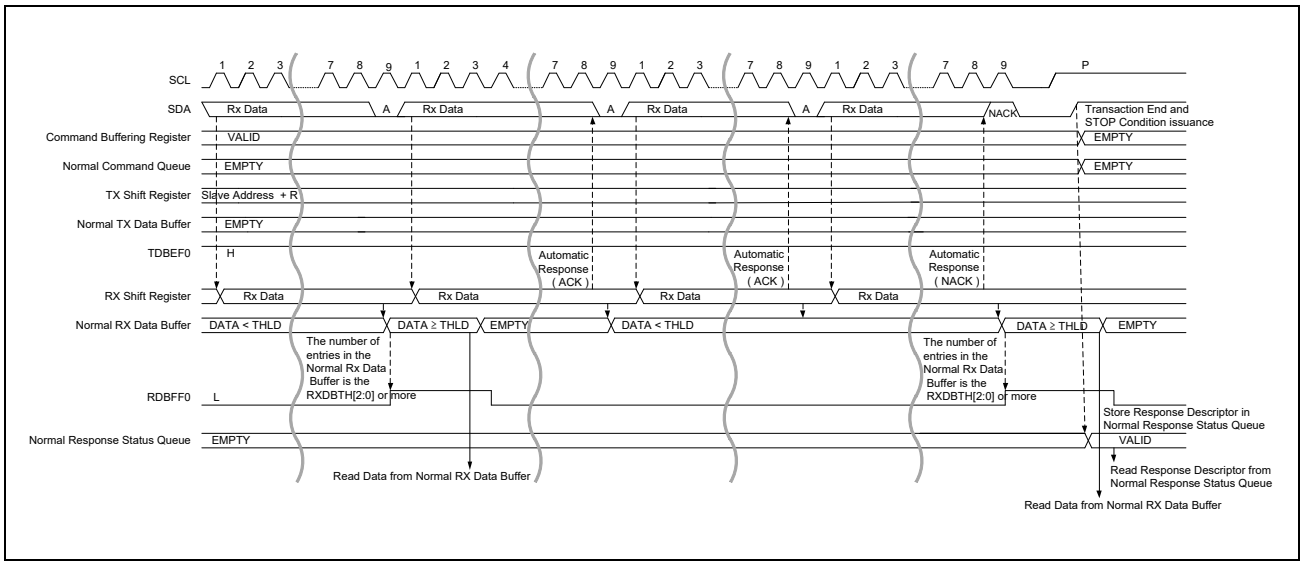

Figure 26.21 SDR Data Read Transfer Timing (2/2)

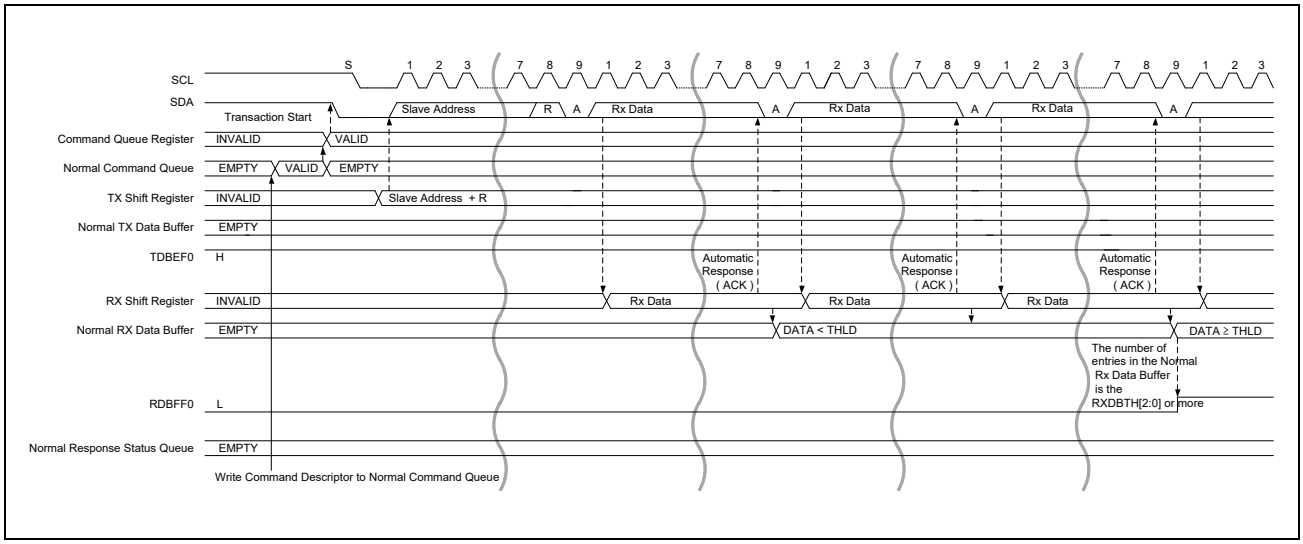

Figure 26.22 Legacy I²C Message Data Read Transfer Timing (1/2)

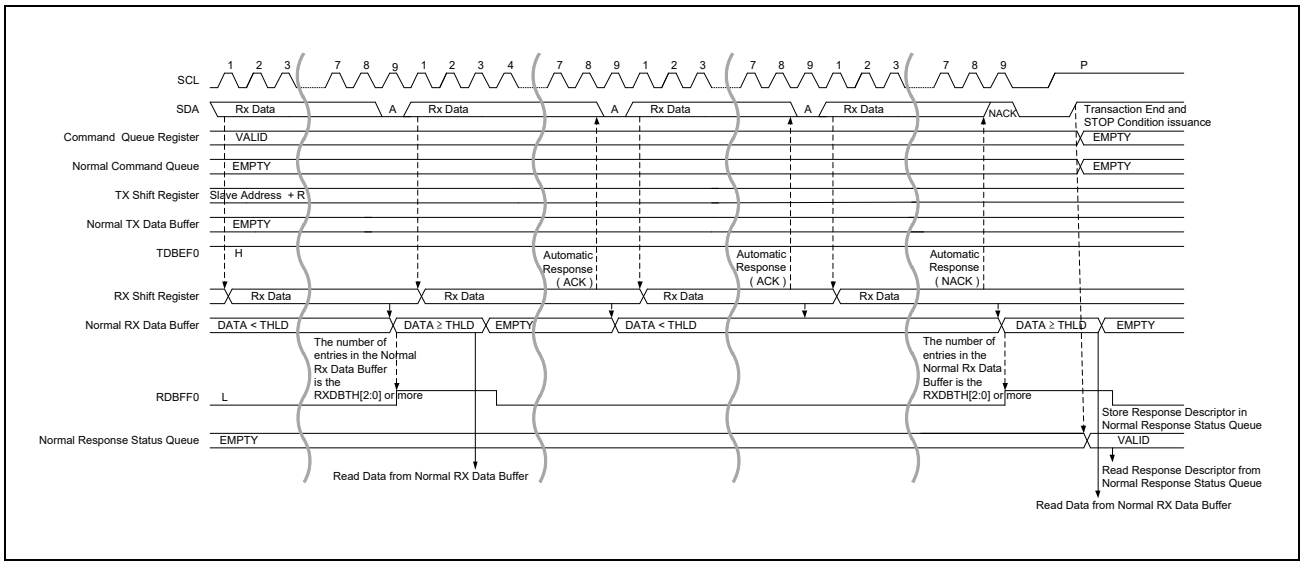

Figure 26.23 Legacy I²C Message Data Read Transfer Timing (2/2)

4) IBI Transfer

1. Write Command Descriptor to the Command Buffer and issue Transaction on I3C Bus.
   If START Request (SDA Low Drive) is issued from the slave device, I3C drives SCL to Low and completes START condition.
   Thereafter, the SCL is supplied, and In-Band Interrupt Request is received.
2. In Slave Address with RnW of the Address Header, if losing Arbitration by issuing In-Band Interrupt from I3C Slave, stop issuing Transaction.
3. According to **Section 26.3.2.3(8), In-Band Interrupt [I3C mode]**, detect In-Band Interrupt and process.
4. In the interrupt with IBIQEFF = 1, read the IBI Status Descriptor from the IBI Status Buffer via the NIBIQP register and check the status.
   When detected a Slave Interrupt Request and responded with ACK, Read the IBI Data for the Data Length indicated by the DATA_LENGTH[15:0] bits of the IBI Status Descriptor from the IBI Data Buffer via the NIBIQP register.
5. Restart issuing Transaction of Command of Step1.

An example of the processing procedure after detection of In-Band Interrupt is shown below.

Processing procedure for detecting Mastership Request and transferring master right to Secondary Master

1. If the I3C Secondary Master wins the Arbitration, issue a DEFSLVS CCC and notify Slave information to Secondary Master.
2. Issue a GETACCMST CCC and complete CCC by a STOP condition.

NOTE

- After transferring master right to Secondary Master, to get master right again, issue a Mastership Request according to (f) IBI Transfer of **Section 26.3.2.1(2)(b), I3C Slave Operation**.
- After Mastership Request is accepted by the Current Master, to get master right again at receiving the GETACCMST CCC and complete CCC by a STOP condition.

Processing procedure when Hot-Join Event is detected

1. Issue a Broadcast Command Code Enter Dynamic Address Assignment (ENTDAA) to start the Dynamic Address Assignment process.
2. Issue a DEFSLVS CCC and notify Slave information to Secondary Master.

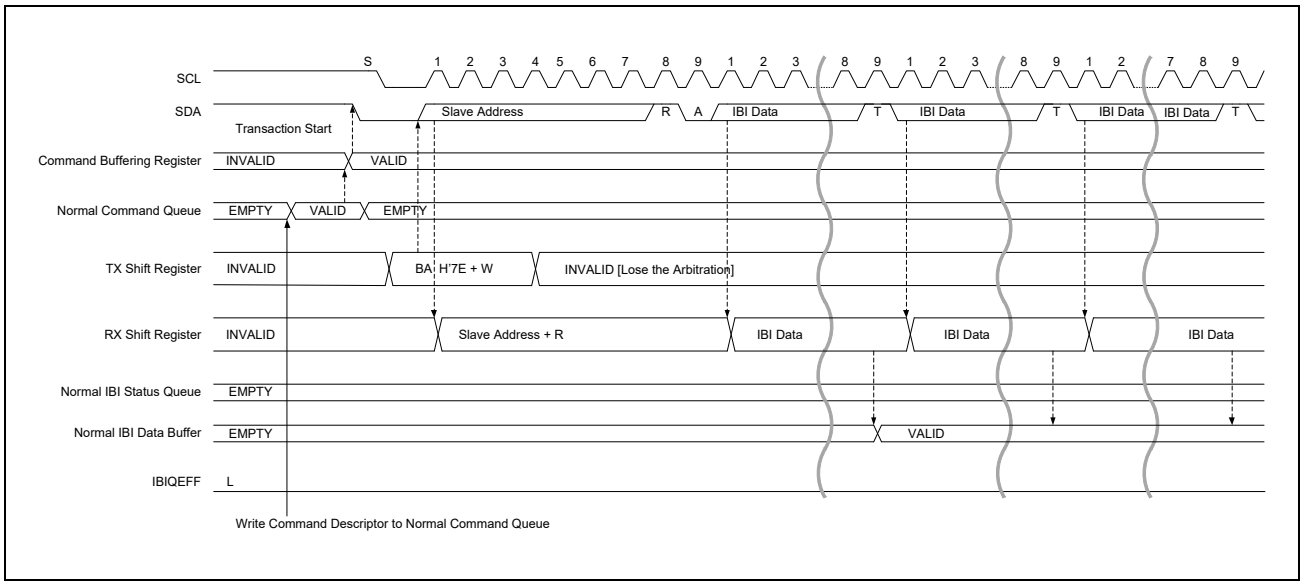

Figure 26.24 I3C Master IBI Transfer Timing (1/2)

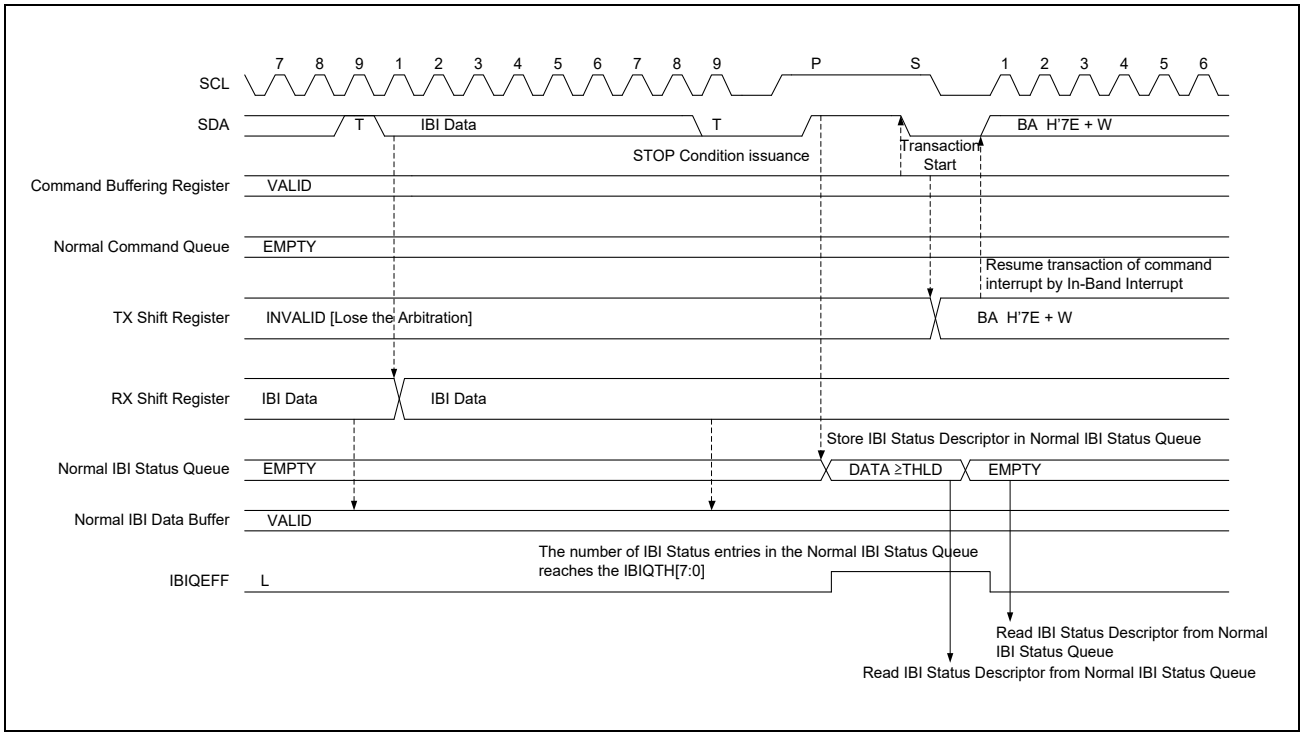

Figure 26.25 I3C Master IBI Transfer Timing (2/2)

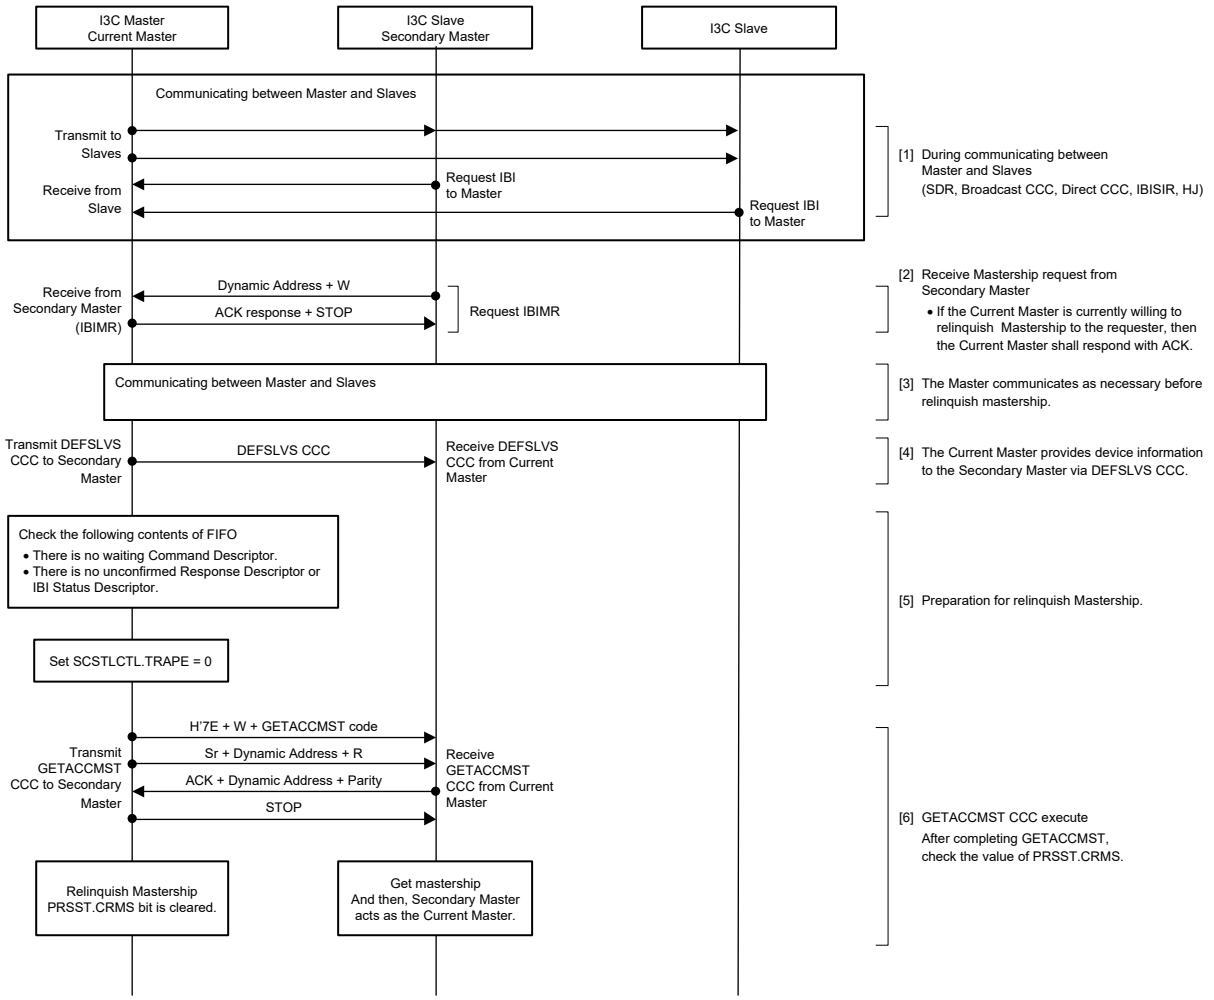

Note: The Abort request during GETACCMST by BCTL.ABT setting are prohibited due to the transfer of Mastership.

Figure 26.26 I3C Master Mastership Processing Flow

(2) Slave Mode Operation

(a) I²C Slave Operation

1) Data Write Transfer (Single Buffer Transfer)

In slave receive operation, the master device outputs the SCL clock and transmit data, and I3C returns acknowledgments as a slave device.

Figure 26.126 shows an example of usage of slave reception and **Figure 26.27** and **Figure 26.28** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

1. Initial settings. For details, refer to **Section 26.3.3.1, Initial Setting Flow**. After initial settings, I3C will stay in the standby state until it receives a slave address that it matches.
2. After receiving a matching slave address, I3C sets one of the corresponding bits SVST.HOAF, GCAF, and SVAFy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the acknowledge bit (ACK) on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, I3C continues to place itself in slave receive mode and sets the NTST.RDBFF0 flag to 1.
3. After the BST.SPCNDDF flag is confirmed to be 0 and the NTST.RDBFF0 flag to be 1, dummy read the NTDTBP0 register (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower 8 bits when the 10-bit address format is selected).
4. When the NTDTBP0 register is read, I3C automatically sets the NTST.RDBFF0 flag to 0. If reading of the NTDTBP0 register is delayed and a next byte is received while the RDBFF0 flag is still set to 1, I3C holds the SCLn line low from one SCL cycle before the timing with which RDBFF0 should be set. In this case, reading the NTDTBP0 register releases the SCLn line from being held at the low level. When the BST.SPCNDDF flag = 1 and the NTST.RDBFF0 flag is also 1, read the NTDTBP0 register until all the data is completely received.
5. Upon detecting the STOP condition, I3C automatically clears bits SVST.HOAF, GCAF, and SVAFy (y = 0 to 2) to 0.
6. After checking that the BST.SPCNDDF flag = 1, set the BST.SPCNDDF flag to 0 for the next transfer operation.

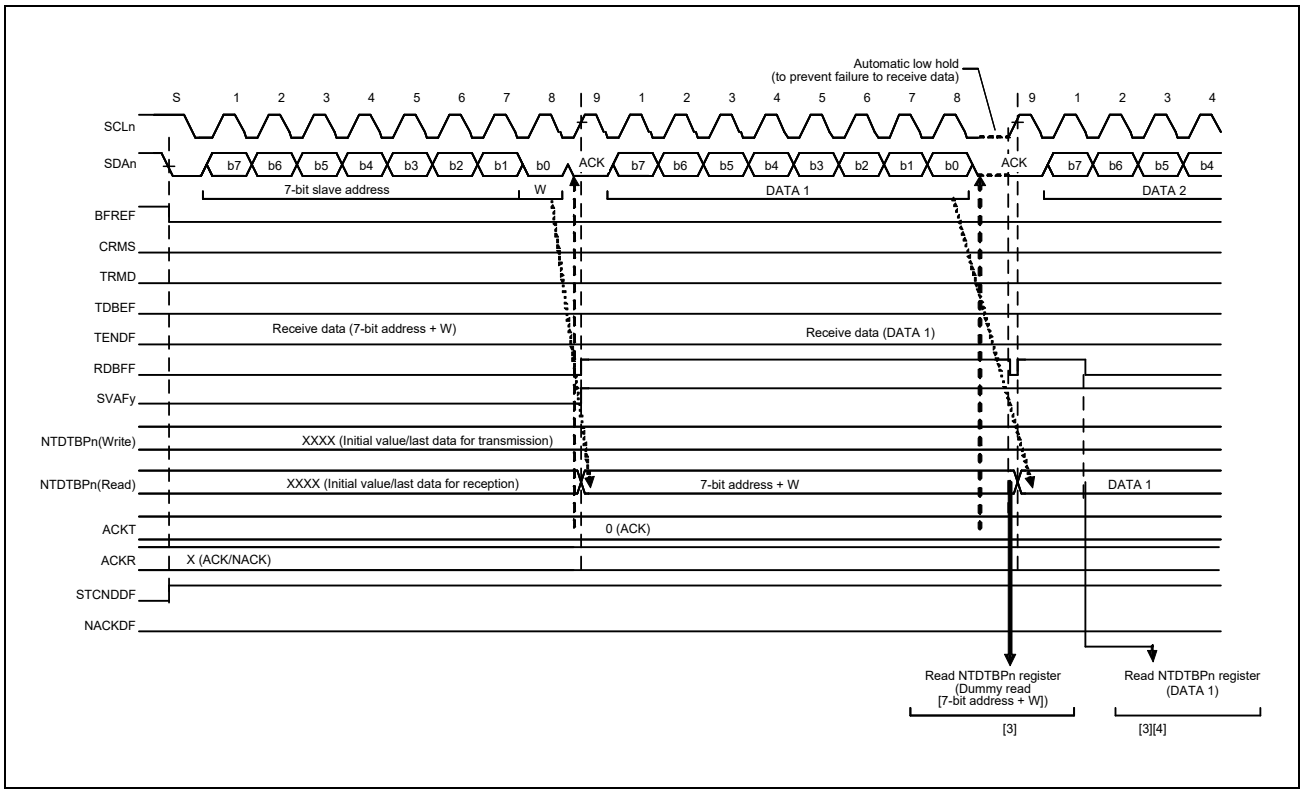

Figure 26.27 Slave Receive Operation Timing (1) (7-bit Address Format, When ACKTWE = 0)

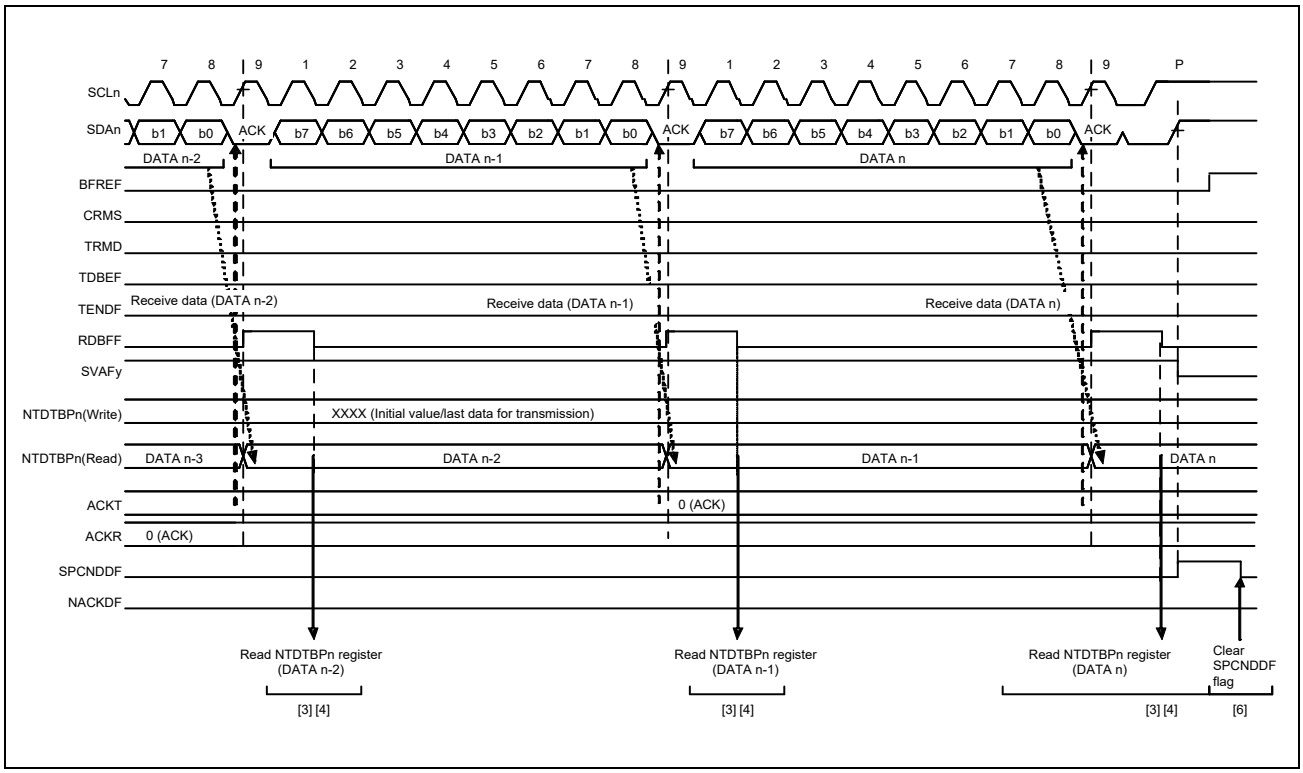

Figure 26.28 Slave Receive Operation Timing (2) (When ACKTWE = 0)

2) Data Read Transfer (Single Buffer transfer)

In slave transmit operation, the master device outputs the SCL clock, I3C transmits data as a slave device, and the master device returns acknowledgments.

Figure 26.125 shows an example of usage of slave transmission and **Figure 26.29** and **Figure 26.30** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

1. Initial settings. For details, refer to **Section 26.3.3.1, Initial Setting Flow**.
   After initial settings, I3C will stay in the standby state until it receives a slave address that it matches.
2. After receiving a matching slave address, I3C sets one of the corresponding bits SVST.HOAF, GCAF, and SVAFy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the acknowledge bit (ACK) on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, I3C automatically places itself in slave transmit mode by setting both the PRSST.TRMD bit and the NTST.TDBEF0 flag to 1.
3. After the NTST.TDBEF0 flag is confirmed to be 1, write the data for transmission to the NTDTBP0 register. At this time, if I3C does not receive acknowledge from the master device (receives an NACK signal) while the BSTE.NACKDE bit = 1, I3C aborts transfer of the next data.
4. Wait until the following (a) or (b) condition.
   (a) The BST.NACKDF flag is set to 1.
   (b) The BST.TENDF flag is set to 1 while the NTST.TDBEF0 flag = 1, after the last byte for transmission is written to the NTDTBP0 register.
   When the BST.NACKDF flag or the TENDF flag = 1, I3C drives the SCLn line low on the ninth falling edge of SCL clock.
5. When the BST.NACKDF flag or the BST.TENDF flag = 1, dummy read the NTDTBP0 register to complete the processing. This releases the SCLn line.
6. Upon detecting the STOP condition, I3C automatically sets bits SVST.HOAF, GCAF, and SVAFy (y = 0 to 2), flags NTST.TDBEF0 and BST.TENDF, and the PRSST.TRMD bit to 0, and enters slave receive mode.
7. After checking that the BST.SPCNDDF flag = 1, set the BST.NACKDF and SPCNDDF flags to 0 for the next transfer operation.

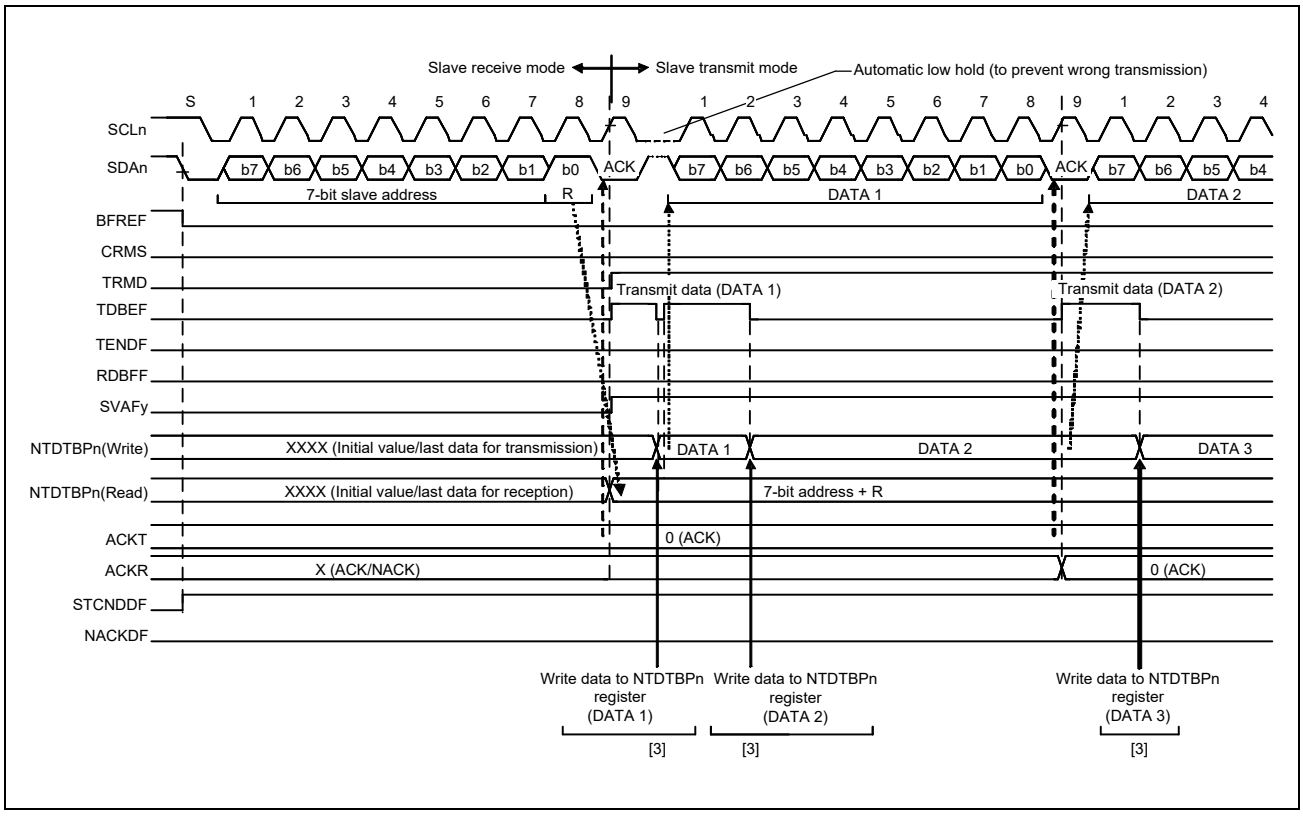

Figure 26.29 Slave Transmit Operation Timing (1) (7-bit Address Format)

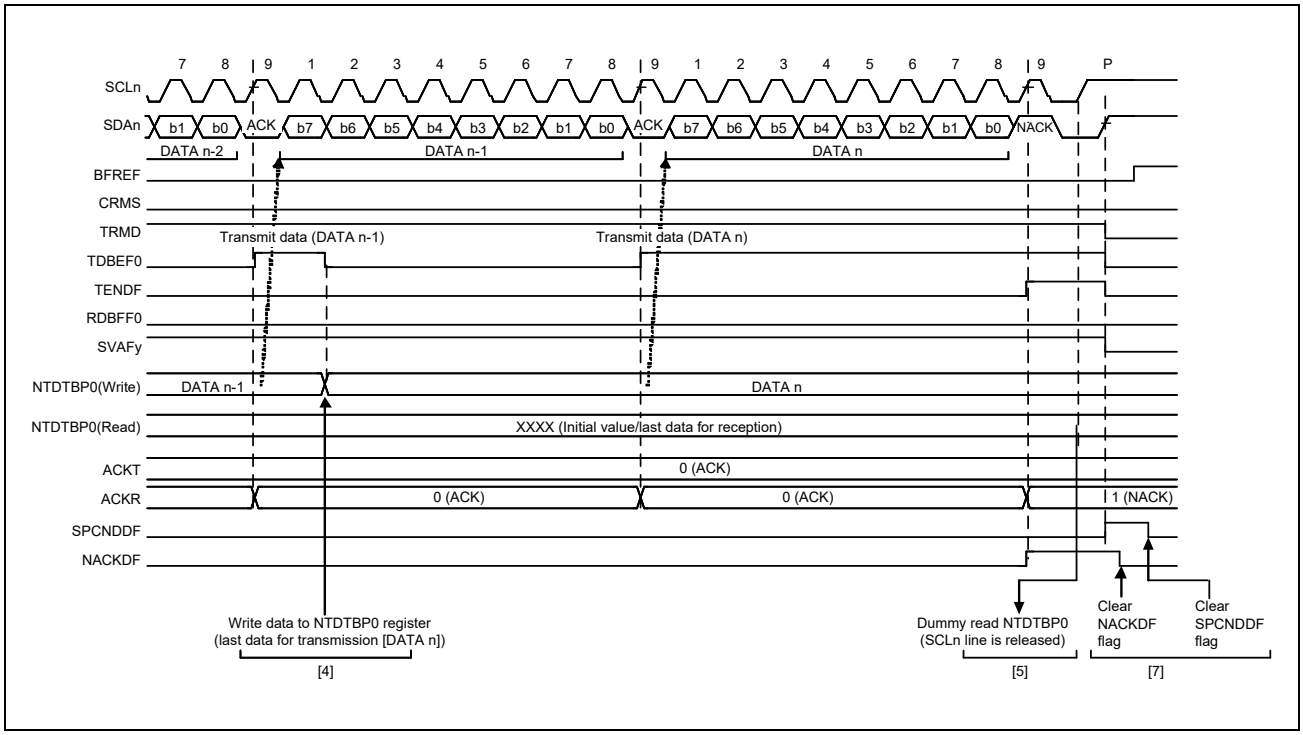

Figure 26.30 Slave Transmit Operation Timing (2)

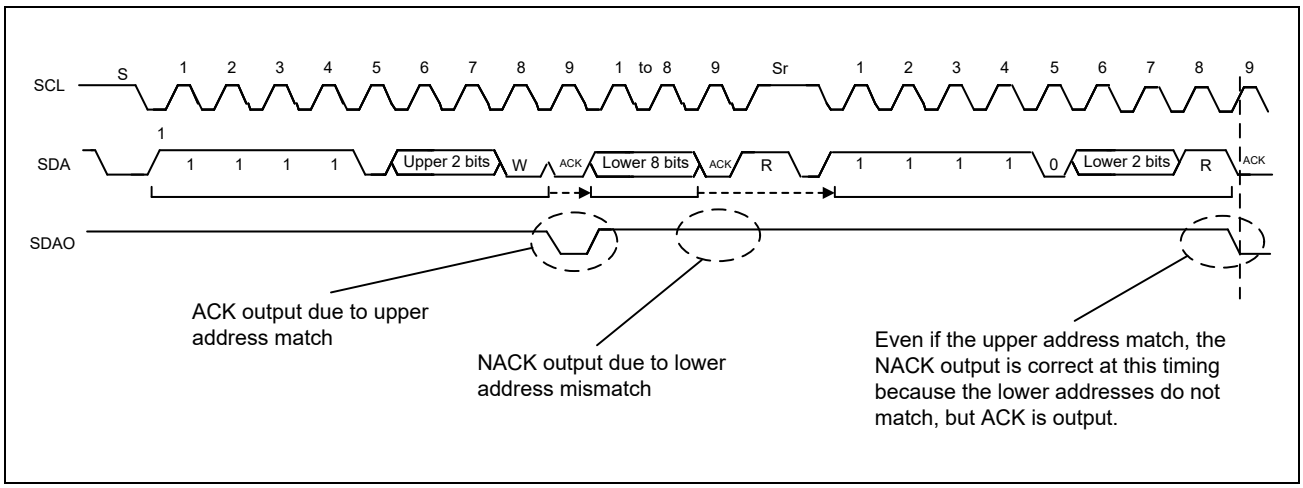
NOTE

[10-bit address format Slave transmission]



When multiple I²C slaves are connected to the I²C bus and there is a possibility that an I²C Slave other than this module will NACK for the upper address/R after Repeated START, there are the following restrictions and workarounds.

- Work around: Set the upper 2 bits of the 10-bit address assigned to this module to a value different from other Slave. If the address is exhausted and cannot be set to a different value, use restriction (1).
- Restriction (1): 10-bit address not available.
- Restriction (2): After the ACK response in the red circle in the above figure, none of the slaves respond to data, so the SDA keeps the high level, and the I²C Master receives the H'FF data. In the case of a system that can handle H'FF as abnormal data, H'FF is read and discarded on the I²C Master side. If H'FF is valid data, use restriction (1).

3) Data Write Trans

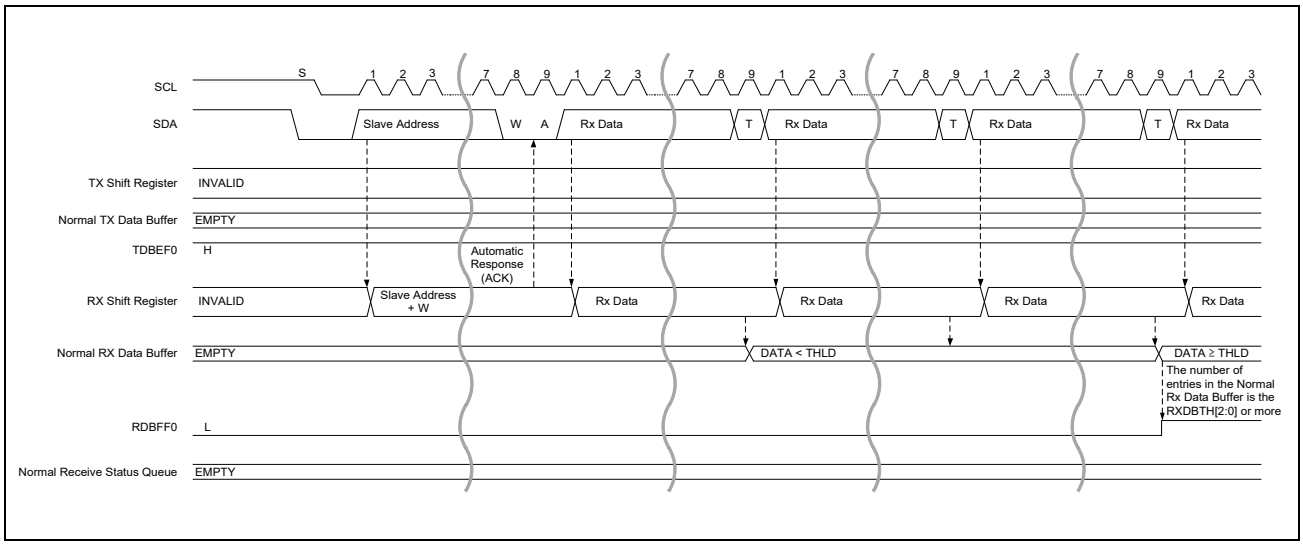


Figure 26.31 Data Write Transfer (FIFO Buffer Transfer) Timing (1)

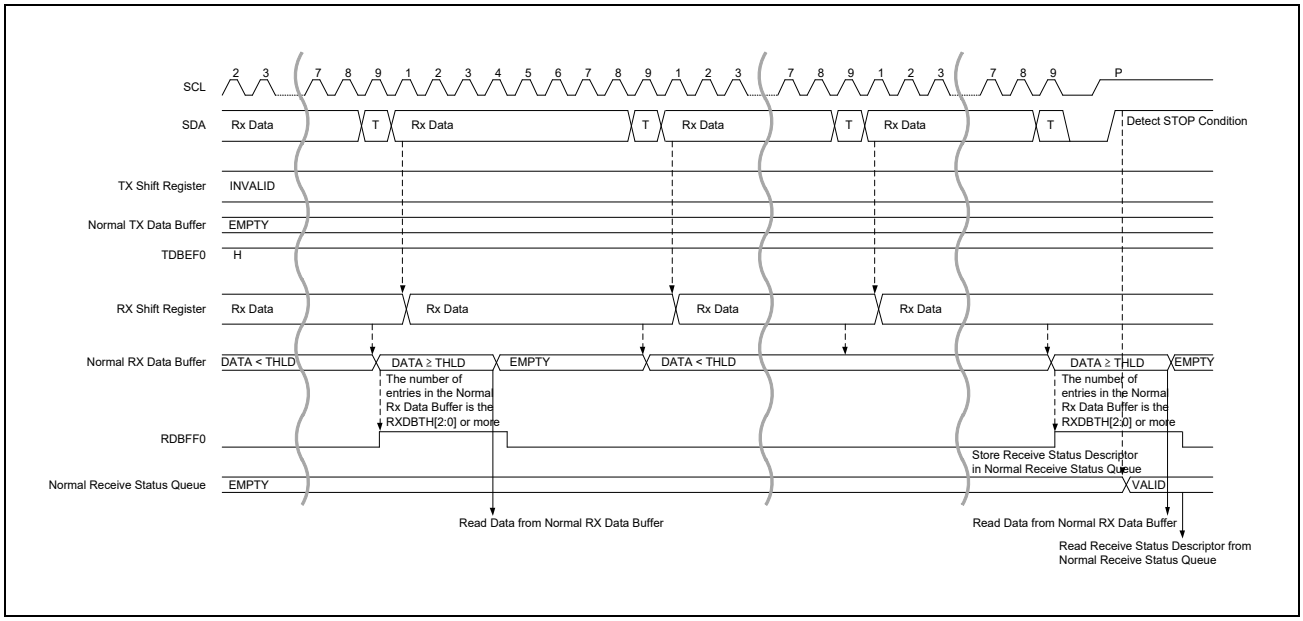

Figure 26.32 Data Write Transfer (FIFO Buffer Transfer) Timing (2)

(b) I3C Slave Operation

1) Dynamic Address Assign Procedure

After initializing I3C, the I3C master first performs Dynamic Address Assign Procedure.

The operation of R-I3 during the Dynamic Address Assign Procedure by ENTDAA CCC is described below.

1. Initial setting (For details, refer to **Section 26.3.3.1(2), I3C Initial Setting Flow**)
2. When ENTDAA CCC is received, I3C transmits Provisional ID (SDCTPIDH[31:0], SDCTPIDL[15:0]), BCR (SVDCT.TBCR[7:0]), DCR (SVDCT.TDCR[7:0]) until a dynamic address is assigned. (For details, refer to "In case of Broadcast CCC (ENTDAA)" of **Section 26.3.2.3(4)(e), CCC detection function [I3C mode]**.)
3. When ENTDAA CCC is completed and a STOP condition is detected, Receive Status Descriptor is stored in Receive Status Buffer.
4. Read Receive Status Descriptor via NRSQP register and check the status.
5. Read the data for the Data Length indicated by the DATA_LENGTH[15:0] bits of the Receive Status Descriptor from the Receive Data Buffer via the NTDTBP0 register.

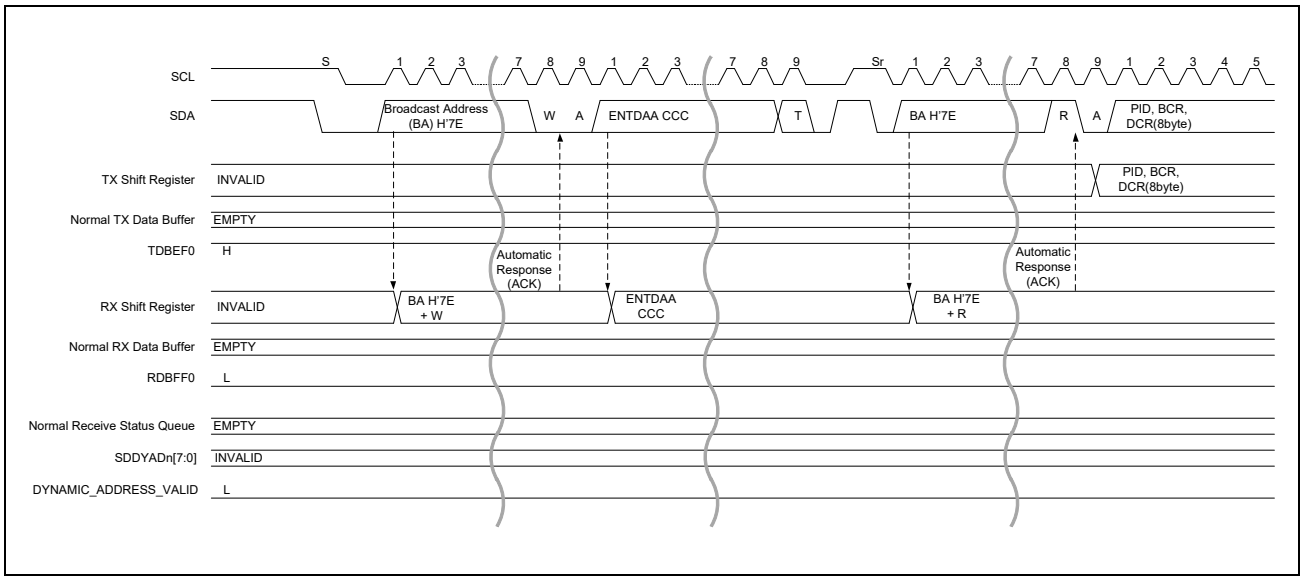

Figure 26.33 Dynamic Address Assign Procedure (ENTDAA CCC) Timing (1/3)

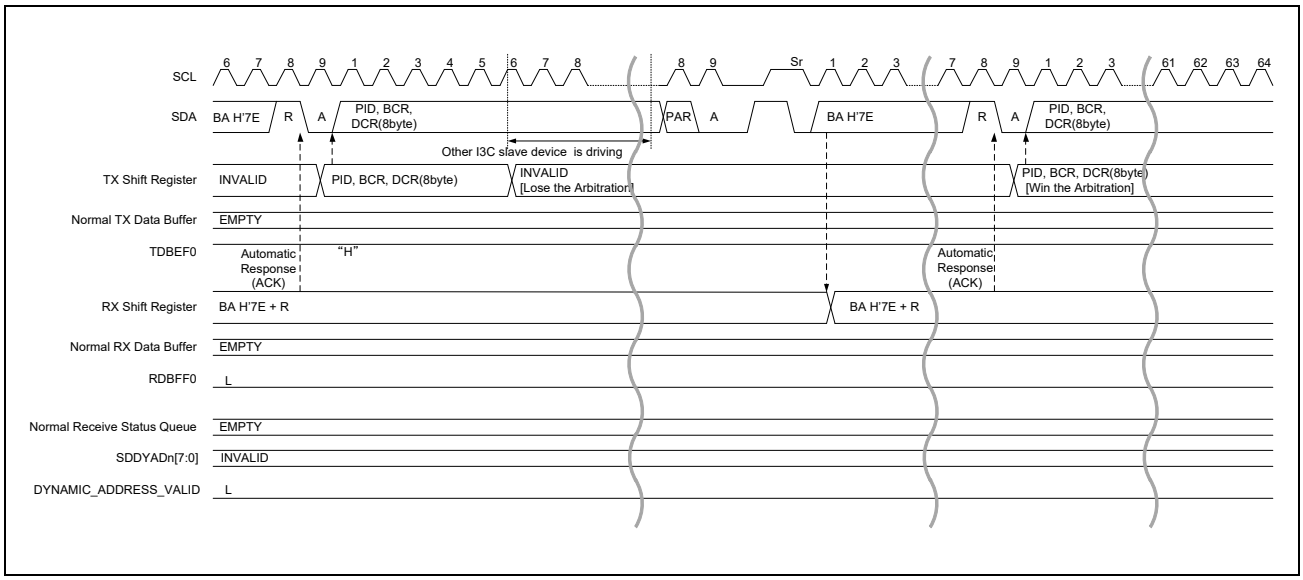

Figure 26.34 Dynamic Address Assign Procedure (ENTDAA CCC) Timing (2/3)

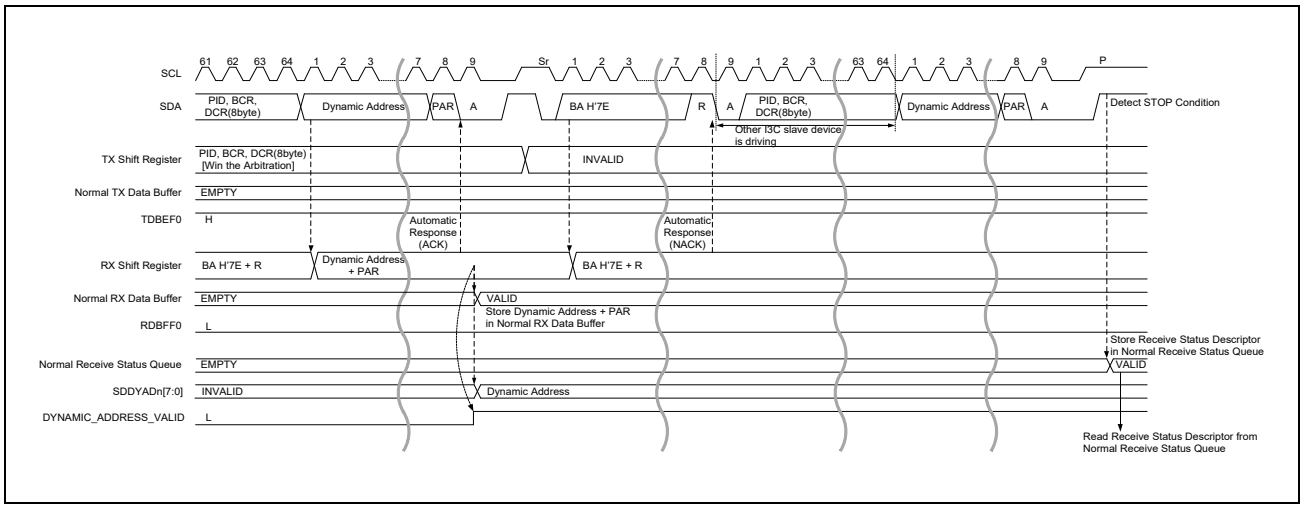

Figure 26.35 Dynamic Address Assign Procedure (ENTDAA CCC) Timing (3/3)

When communicating with a Static Address until the Dynamic Address is assigned from the I3C Master, by setting to the DVSTAD[6:0] bit of DAT (SDATBASn register), the SSTADV bit of the SVDVADn register is set to 1 and the Static Address Will be effective.

If the I3C Slave has a Static Address and the I3C Master executes the Dynamic Address Assign Procedure, it is possible to assign a Dynamic Address with SETDASA CCC.

The operation of I3C during SETDASA CCC Dynamic Address Assign Procedure is described below.

1. Initial setting (For details, refer to **Section 26.3.3.1(2), I3C Initial Setting Flow**)
2. When SETDASA CCC which agrees with its own Static Address is received, the SDDYAD[7:0] bit of DAT (SDATBAS0 register) is renewed and SDYADV bit of SVDVAD0 register is set in 1. (For details, refer to "In case of Direct Write CCC" of **Section 26.3.2.3(4)(e), CCC detection function [I3C mode]**.)
3. When SETDASA CCC is completed and a STOP condition is detected, Receive Status Descriptor is stored in Receive Status Buffer.

4. Read Receive Status Descriptor via NRSQP register and check the status.

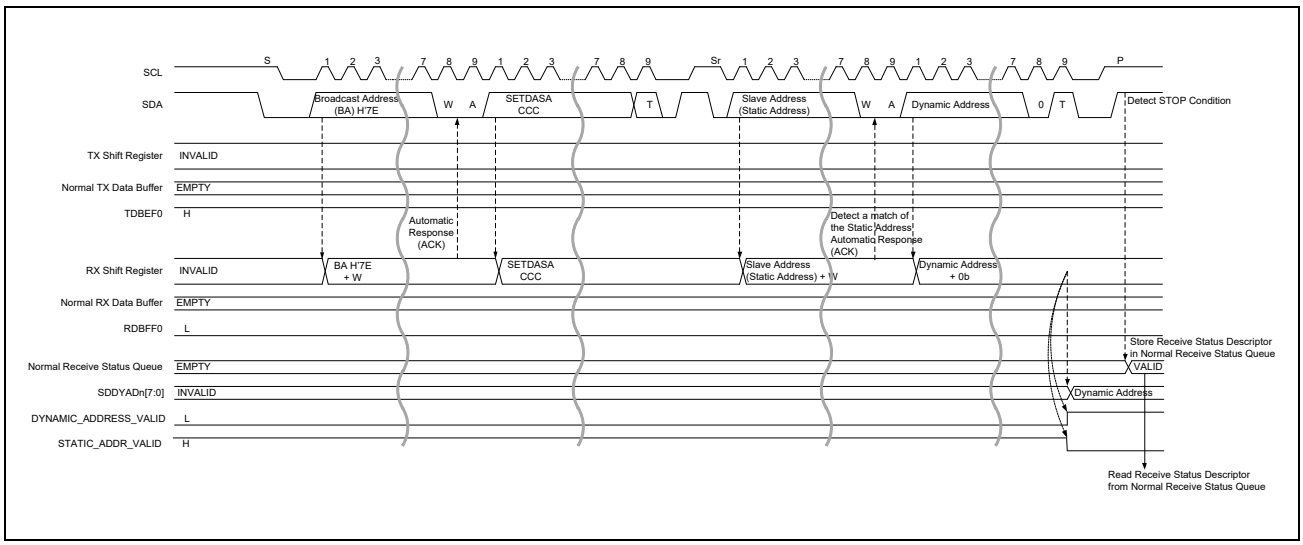

Figure 26.36 Dynamic Address Assign Procedure (SETDASA CCC) Timing

2) SDR Data Write Transfer

1. When Transaction is issued from the I3C Master, it compares the Slave Address of Address Header with its own Slave Address, and if it matches, I3C responds with ACK.
   When a Transaction is received, if the Receive Data Buffer is full, the I3C Slave will respond with NACK in the Address Header.
   In preparation for retrying the I3C Master, read the data from the Receive Data Buffer via the NTDTBPn register, and empty the Receive Data Buffer.
2. Data received from I3C Master is stored in the Receive Data Buffer.
3. With the RDBFF0 = 1 interrupt, the received data is read from the Receive Data Buffer via the NTDTBPn register.
4. When Repeated START condition or STOP condition is detected, the Receive Status Descriptor is stored in the Receive Status Buffer.
5. Read Receive Status Descriptor via NRSQP register and check the status.

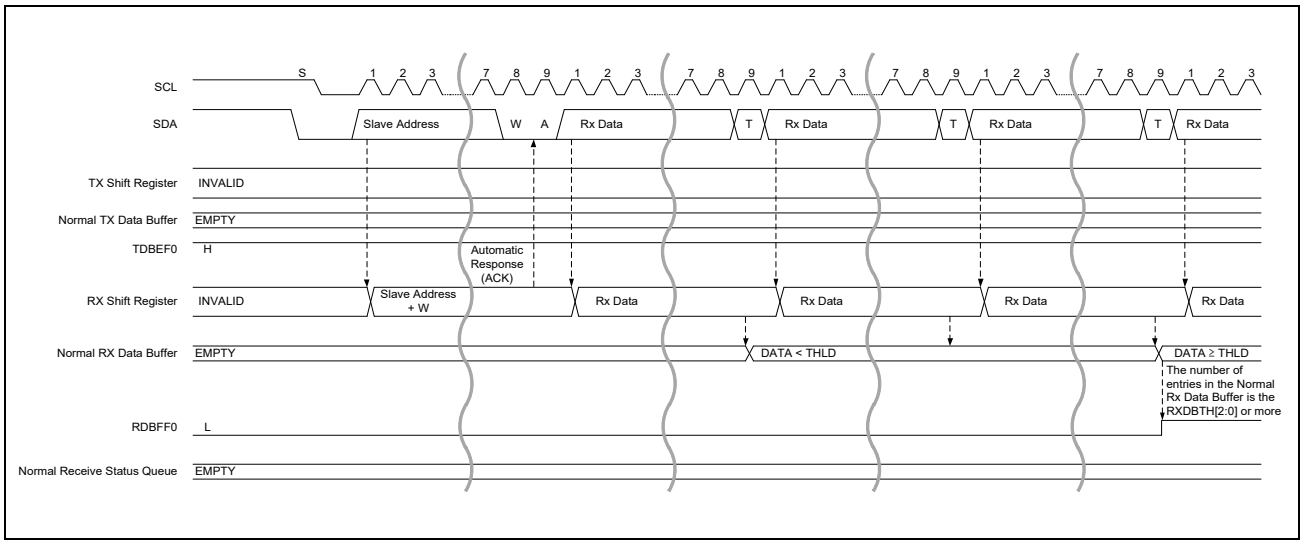

Figure 26.37 SDR Data Write Transfer Timing (1/2)

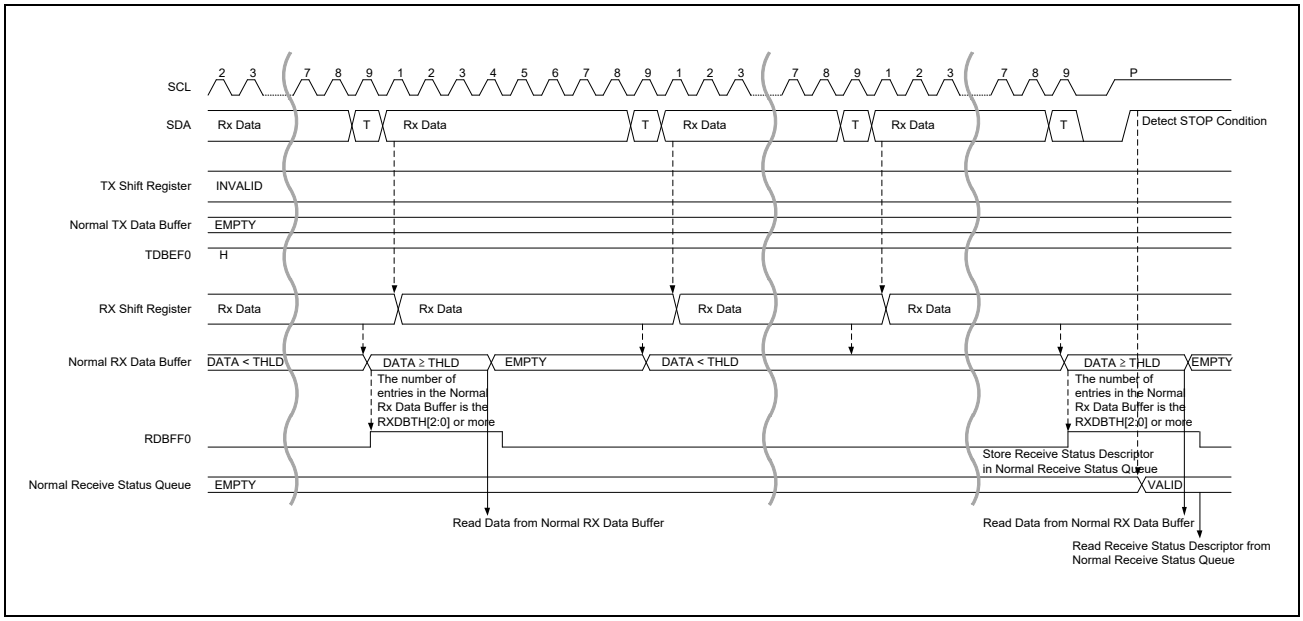

Figure 26.38 SDR Data Write Transfer Timing (2/2)

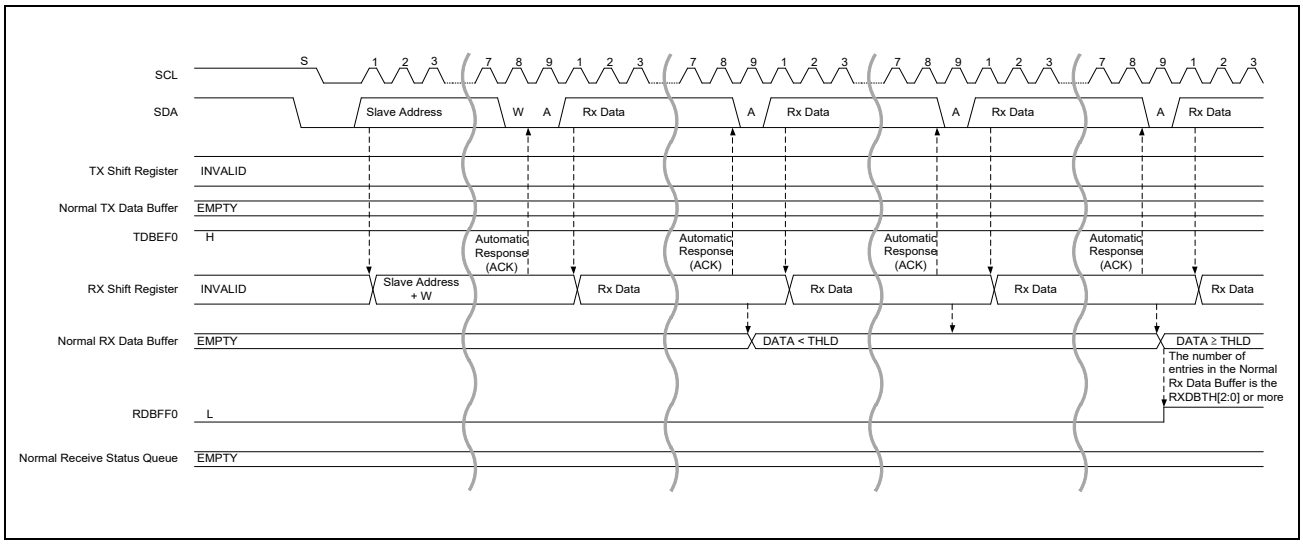

Figure 26.39 Legacy I²C Message Data Write Transfer Timing (1/2)

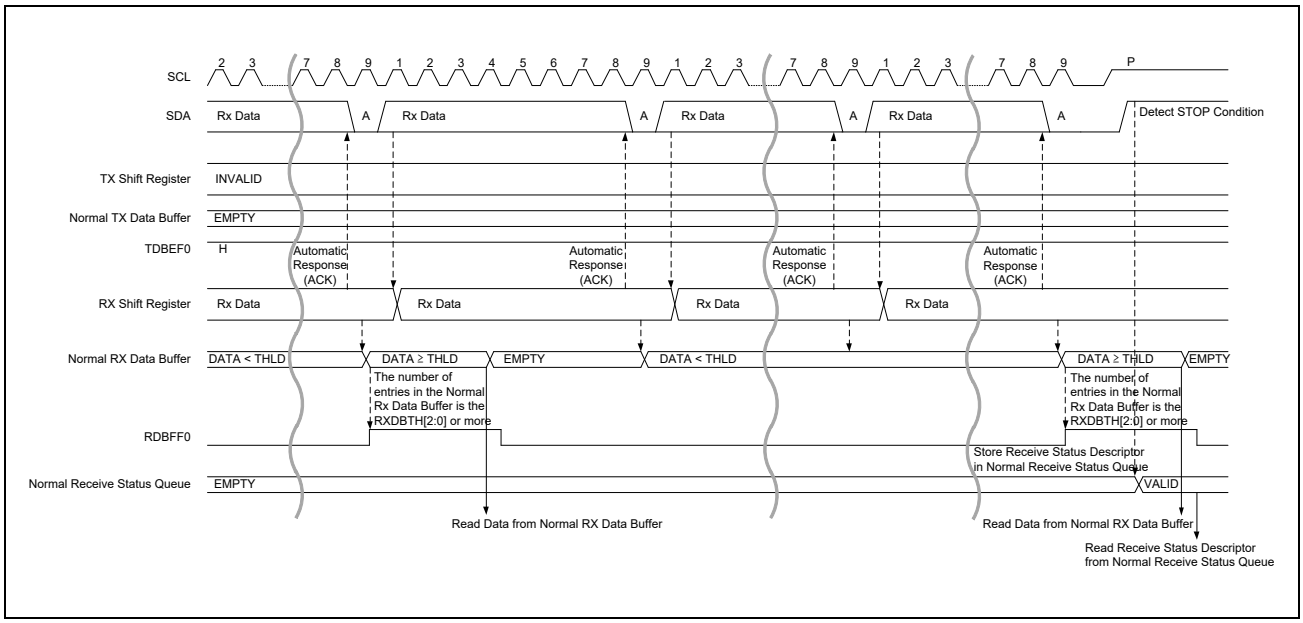

Figure 26.40 Legacy I²C Message Data Write Transfer Timing (2/2)

3) SDR Data Read Transfer

1. Write the data requested from the I3C Master to the Transmit Data Buffer via the NTDTBPn register.
2. When Transaction is issued from the I3C Master, it compares the Slave Address of Address Header with its own Slave Address, and if it matches, I3C responds with ACK.
   When a Transaction is received, if the Transmit Data Buffer is EMPTY, I3C Slave responds with NACK with the Address Header.
   In preparation for retrying the I3C Master, write data to the Transmit Data Buffer via the NTDTBPn register.
3. Transmit the data stored in the Transmit Data Buffer.
4. If data to be transmitted still remains, write the data to be transmitted with an interrupt by TDBEF0 = 1 to the Transmit Data Buffer via the NTDTBPn register.
5. SDR:
   When the transmission of the data stored in the Transmit Data Buffer is completed, Low is output to the T-bit following Data, and it is notified to the I3C Master that it is the final data.
   Legacy I^2C Message:
   When NACK is detected, data transmission is terminated.
6. When a Repeated START condition or STOP condition is detected, the Receive Status Descriptor is stored in the Receive Status Buffer.
7. Read the Receive Status Descriptor via NRSQP and check the status.
   If the data length does not match, set the RSTCTL.INTLRST bit to 1 and then reset the internal states of this module. For details, refer to **Section 26.3.2.4(6), Error Recovery Operation [I3C mode]**.

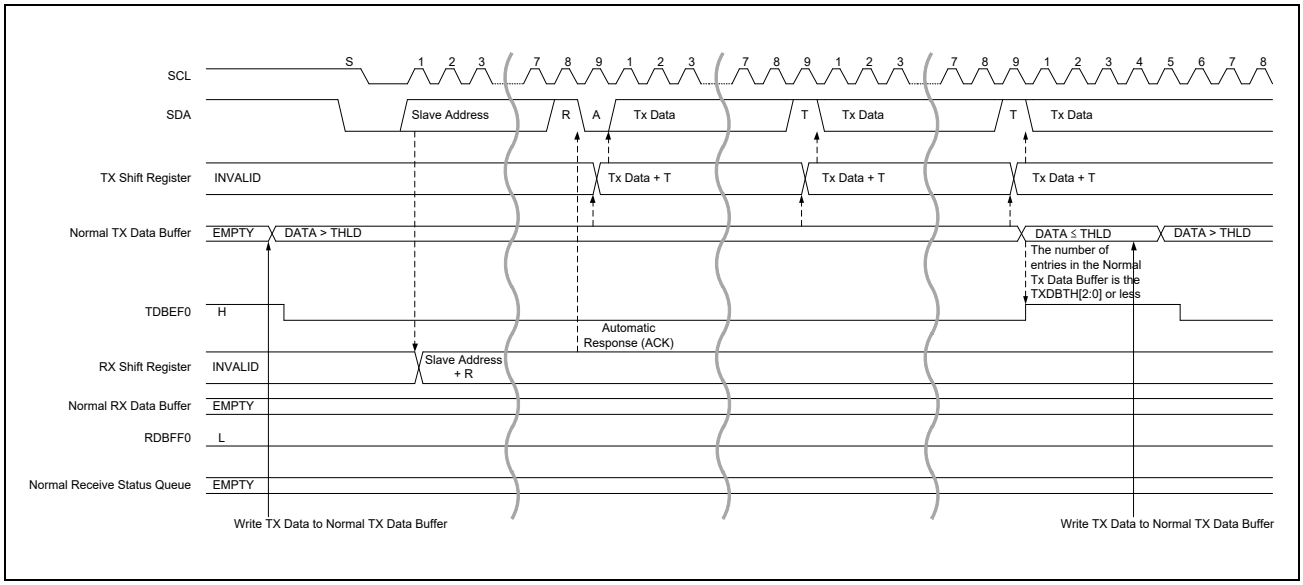

Figure 26.41 SDR Data Read Transfer Timing (1/2)

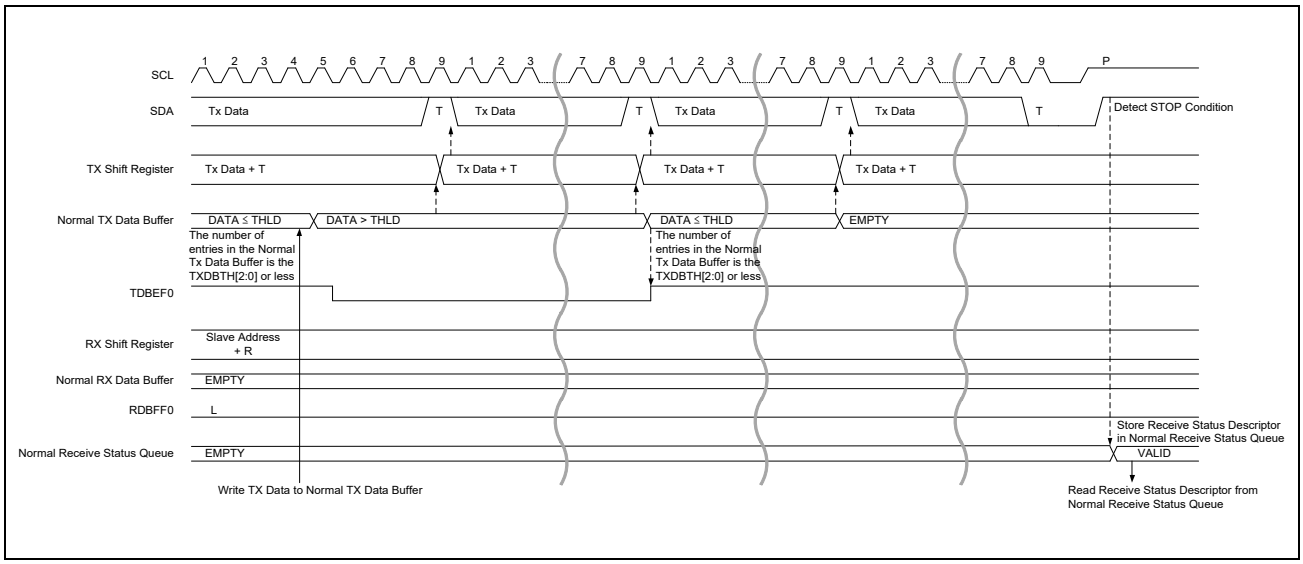

Figure 26.42 SDR Data Read Transfer Timing (2/2)

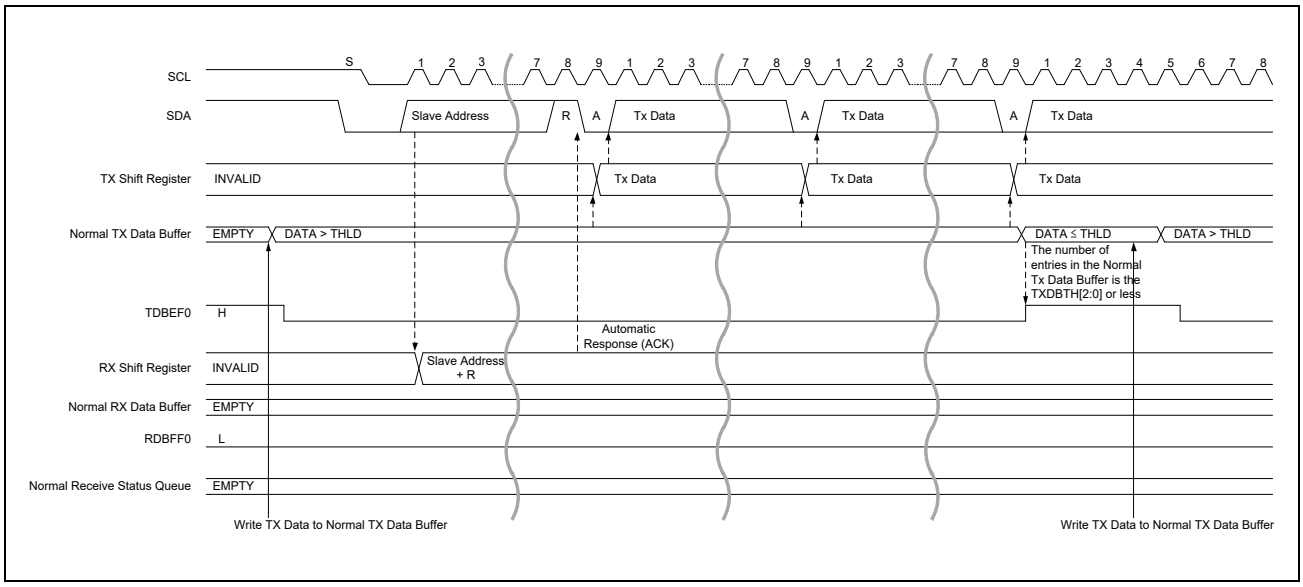

Figure 26.43 Legacy I²C Message Data Read Transfer Timing (1/2)

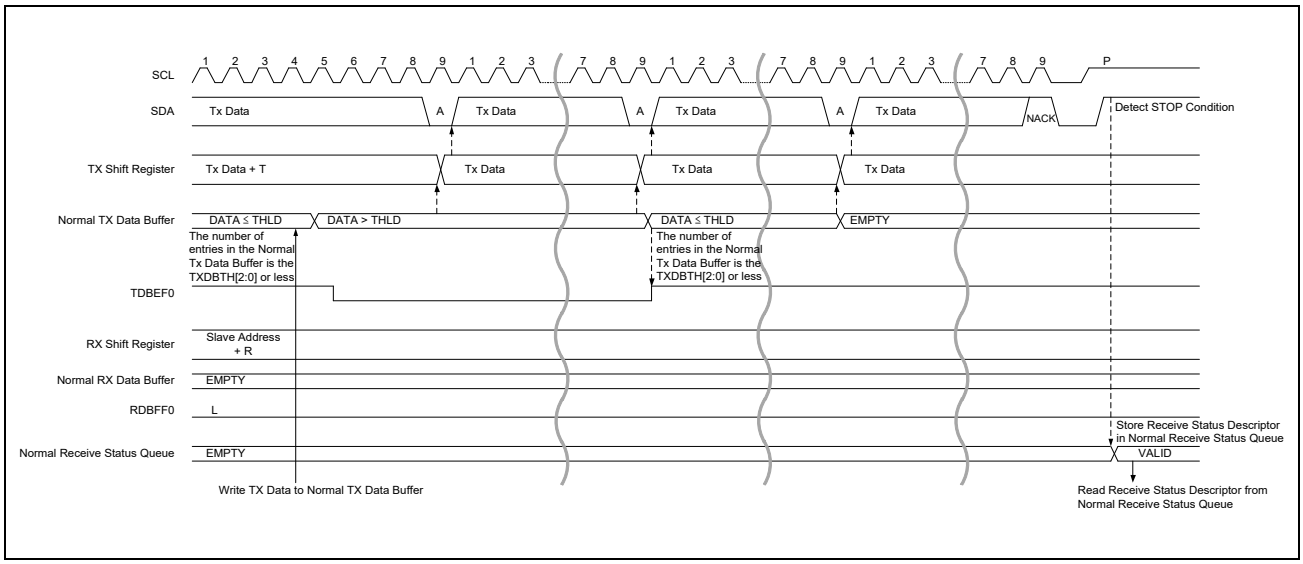

Figure 26.44 Legacy I²C Message Data Read Transfer Timing (2/2)

4) IBI Transfer

1. When sending Slave Interrupt Request.
   When transmitting IBI Data, write IBI Data to the IBI Data Buffer via the NIBIQP register.
2. Write Command Descriptor (Immediate Transfer Command or Regular Transfer Command) to the Command Buffer for IBI Transfer via the NCMDQP register.
3. When Command Descriptor is written to Command Buffer, IBI Transaction is issued under the following conditions.
   - Detect a START condition. (Does not apply a Repeated START condition)
   - If no START is forthcoming within the following Bus Condition, then this module issue a START Request by pulling the SDA line Low.
     a) Slave Interrupt Request, Mastership Request: Bus Available
     b) Hot-Join Event: Bus Idle
4. In Slave Address with RnW of the Address Header, if losing Arbitration by issuing a Transaction from I3C Master, stop issuing Transaction.
   When detecting Repeated START condition or STOP condition, store the Response Descriptor into the Response Buffer.
5. When sending Slave Interrupt Request:
   - When IBI data for transmission still remain, write IBI data with an interrupt by IBIQEFF = 1 to the IBI Data Buffer via the NIBIQP register.
   - When the transmission of IBI Data for the number of Data Length specified by the DATA_LENGTH[15:0] bits of the Command Descriptor is completed, output Low to the T-bit following IBI Data and notify the I3C Master that it is the final IBI Data.
6. When detecting Repeated START condition or STOP condition, store the Response Descriptor into the Response Buffer.
7. Read the Response Descriptor Form the Response Buffer with the NRSPQP register and check the status. If NACK is responded, repeat steps 1 to 7.
8. When sending Slave Interrupt Request:
   Check that the value of the DATA_LENGTH[15:0] bit of the Response Descriptor is 0.

The Mastership processing flow is shown in **Figure 26.47**. When joining the I3C Bus by Hot-Join after the I3C Bus has already been configured, issue the Hot-Join according to the flow shown in **Figure 26.131**.

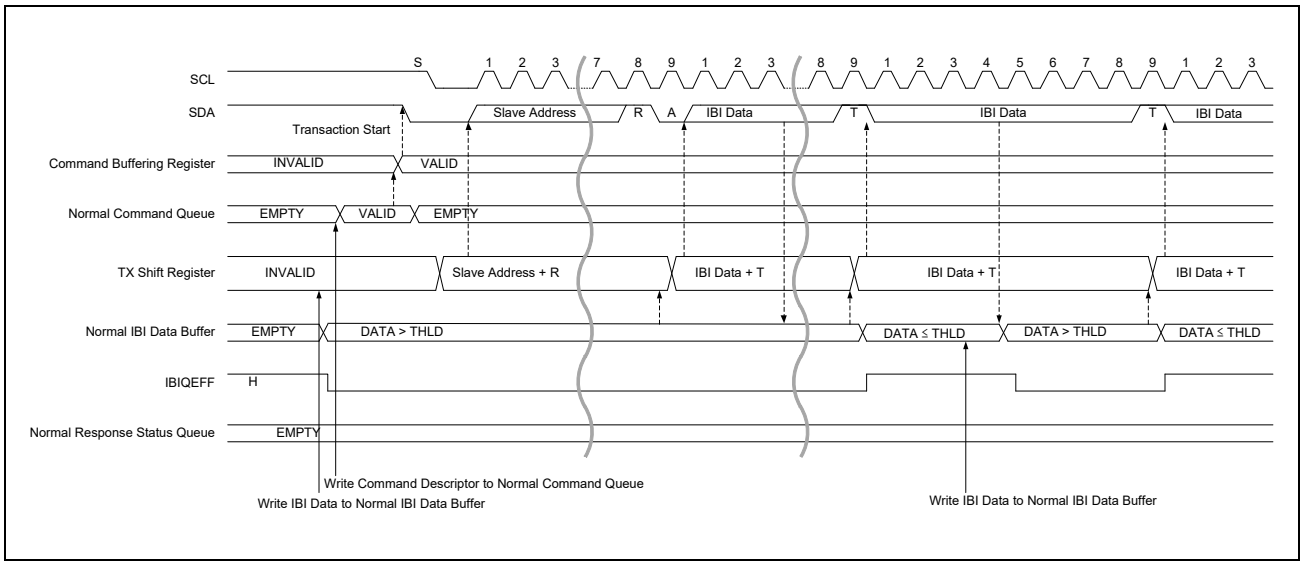

Figure 26.45 I3C Slave IBI Transfer Timing (1/2)

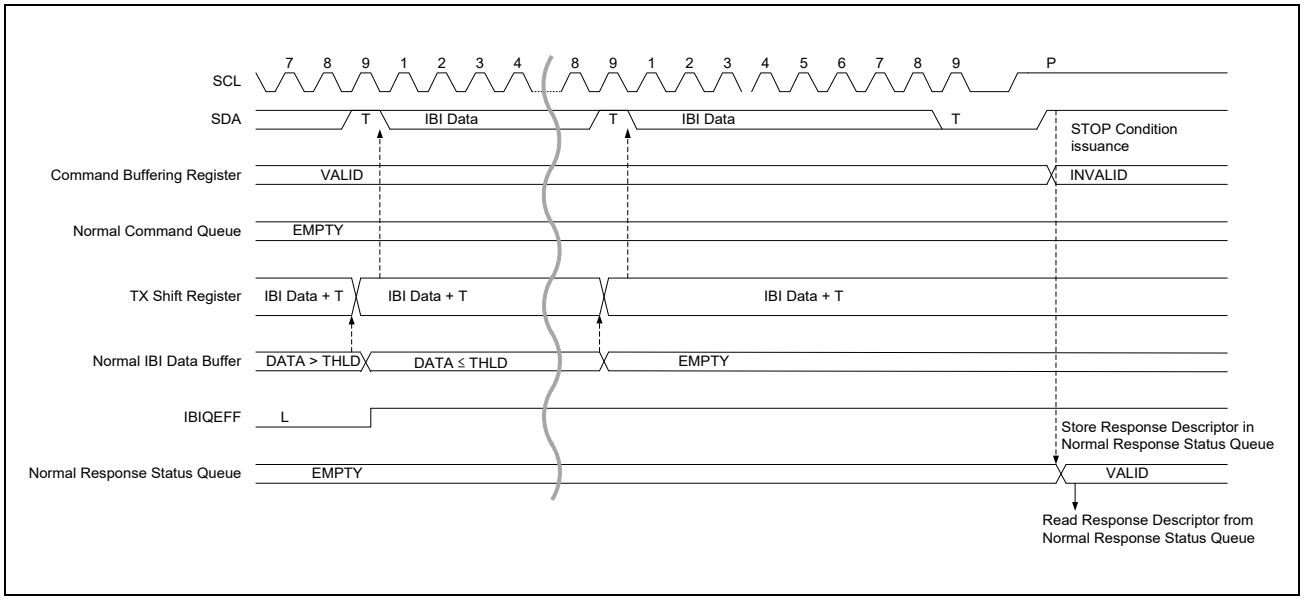

Figure 26.46 I3C Slave IBI Transfer Timing (2/2)

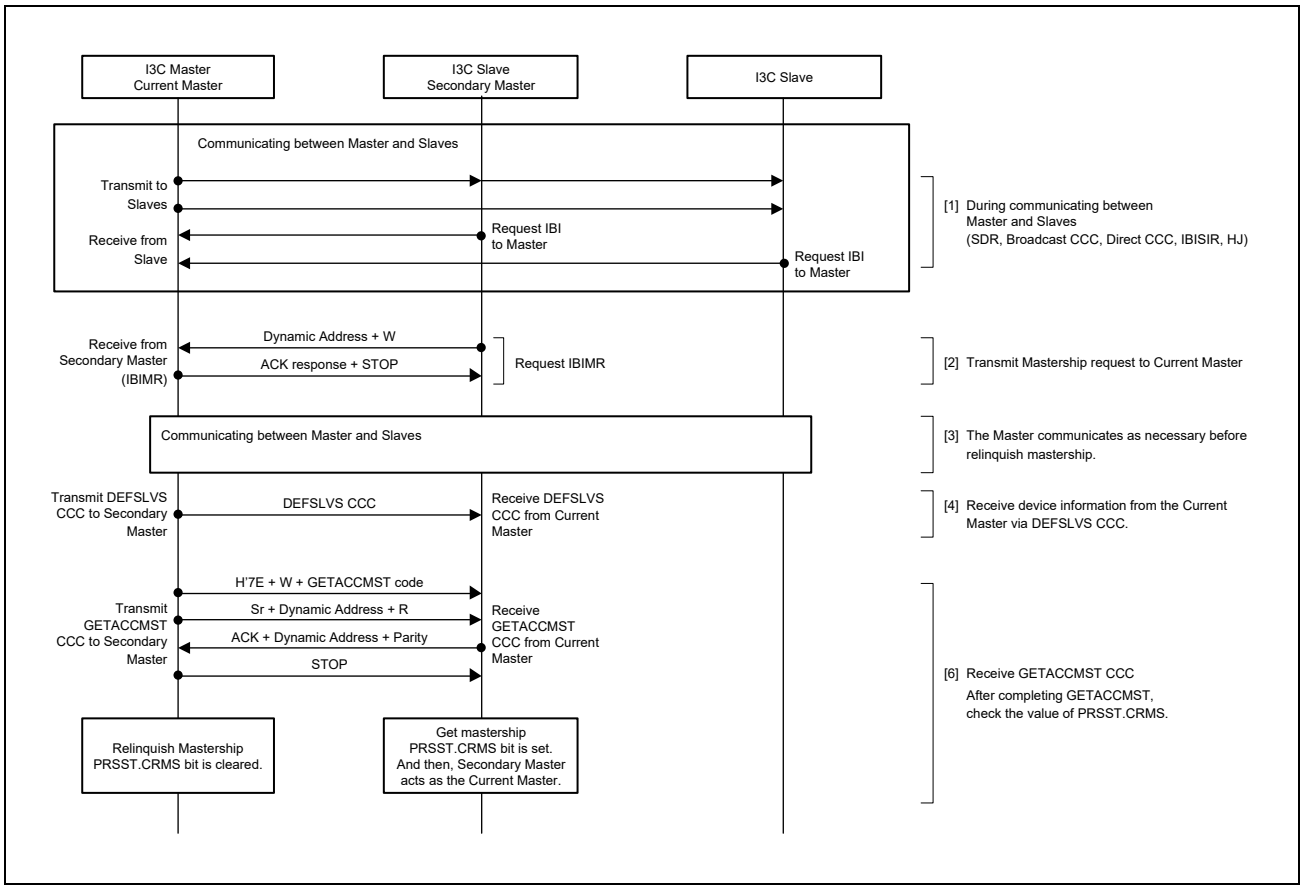

Figure 26.47 I3C Slave Mastership Processing Flow

26.3.2.2 Data Handler

The relationship between the transfer method and the queue is shown in **Table 26.11**.

Table 26.11 Transfer Method and Queue

Protocol	Transfer Method	Queue/Buffer	Size	Master	Slave	Secondary Master
I^2C Mode	Single buffer transfer	Normal Transmit Data	1 byte	✓	✓	—
		Normal Receive Data	1 byte	✓	✓	—
I3C Mode	Normal FIFO buffer transfer	Normal Command	8 QUEUEs	✓	✓	✓
		Normal Response Status	8 QUEUEs	✓	✓	✓
		Normal Transmit Data	32 DWORDs	✓	✓	✓
		Normal Receive Data	32 DWORDs	✓	✓	✓
		Normal Receive Status	8 QUEUEs	—	✓	✓
		Normal IBI Status	4 QUEUEs	✓	—	✓
		Normal IBI Data	8 DWORDs	✓	✓	✓

(1) Transfer Method in I²C Mode

(a) Single Buffer Transfer

Each process (condition issue, data transfer, ACK/NACK response) is controlled by software.

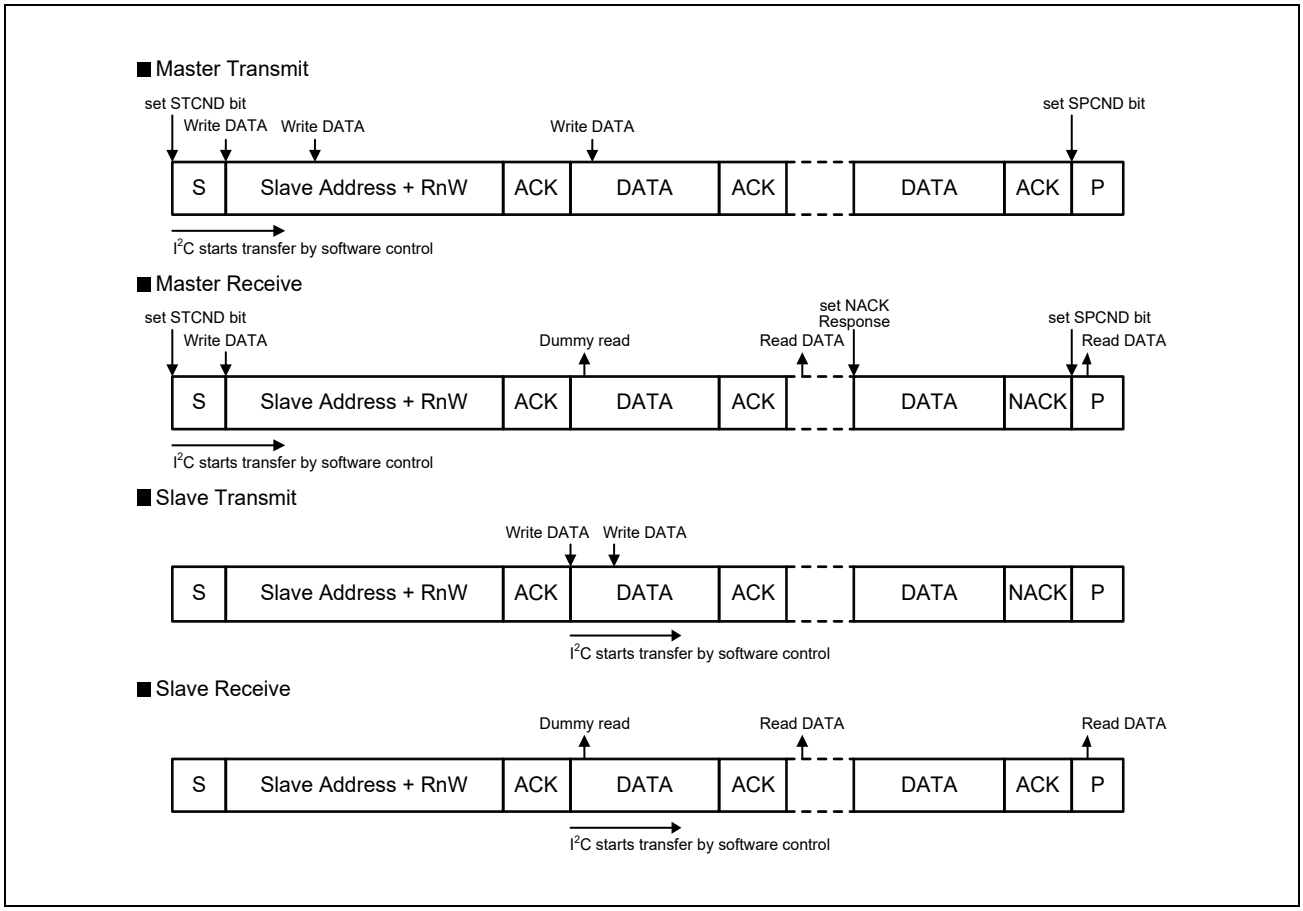

Figure 26.48 Data Handler with Single Buffer Transfer

(2) Transfer Method in I3C Mode

(a) Normal FIFO Buffer Transfer

I3C autonomously starts transfer when data and command are written.

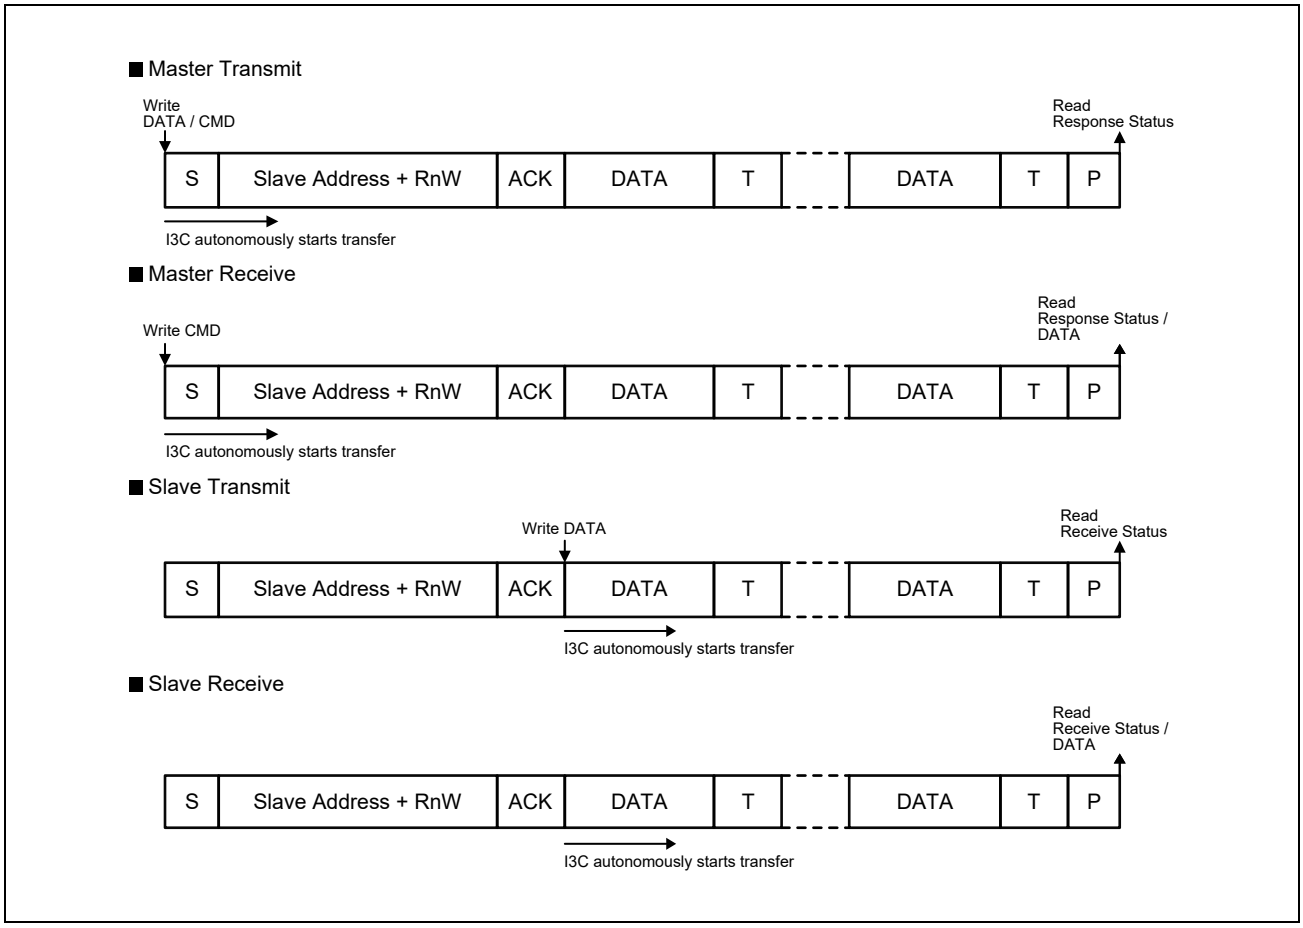

Figure 26.49 Data Handler with Normal FIFO Buffer Transfer

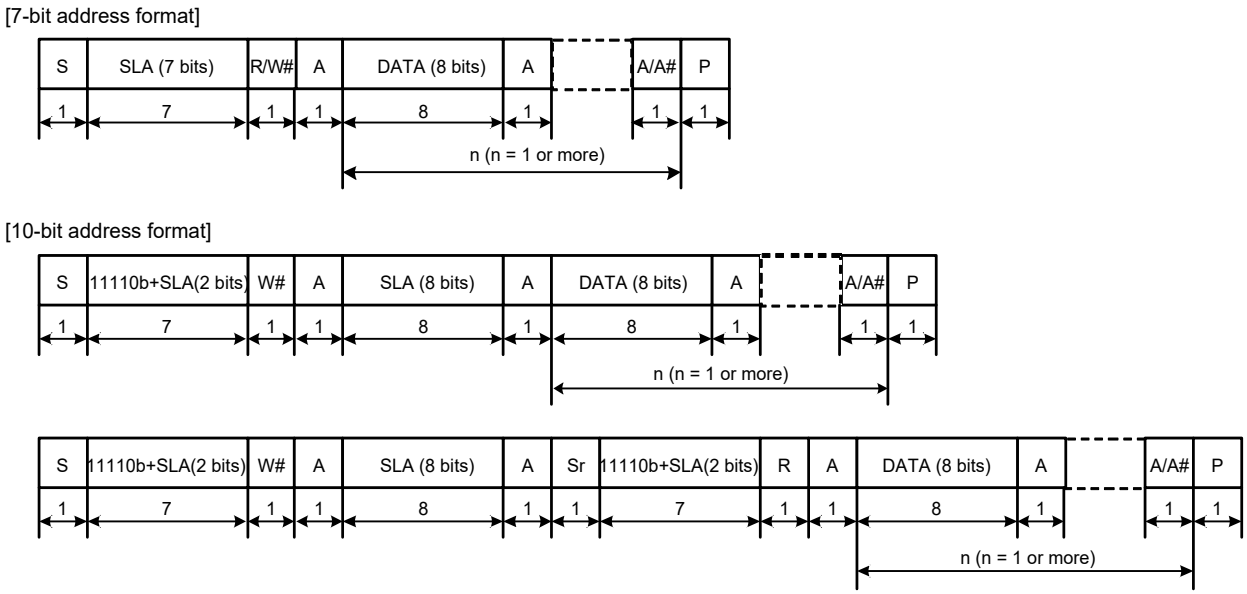
26.3.2.3 I²C/I3C Protocol

(1) Communication Protocol

(a) I²C Communication Data Format

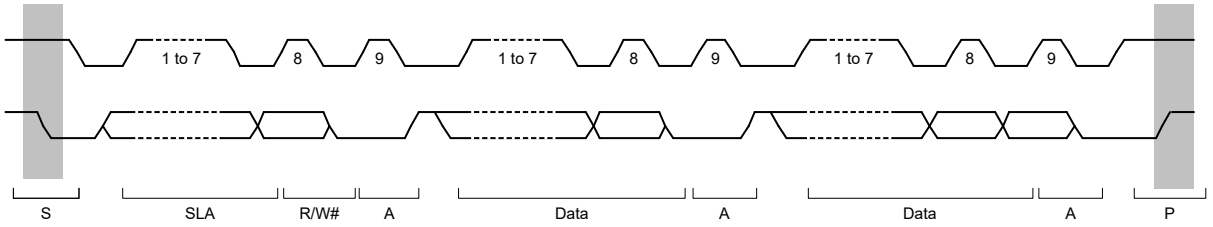
The I²C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a START condition or Repeated START condition is an address frame used to specify a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a STOP condition is issued.

Figure 26.50 shows the I²C bus format, and **Figure 26.51** shows the I²C bus timing.



Note: n: Number of transmit DATA bytes

Figure 26.50 I²C Bus Format



S: START condition. The master device drives the SDAn line low from high level while the SCLn line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W = 1, or from the master device to the slave device when R/W = 0.

A: Acknowledge. The receive device drives the SDAn line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not Acknowledge. The receive device drives the SDAn line high.

Sr: Repeated START condition. The master device drives the SDAn line low from the high level after the setup time has elapsed with the SCLn line at the high level.

DATA: Transmitted or received data

P: STOP condition. The master device drives the SDAn line high from low level while the SCLn line is at a high level.

Figure 26.51 I^2C Bus Timing (SLA = 7 bits)

(b) I3C Communication Data Format

Figure 26.52 through illustrate a typical communication for each of the six I3C Protocols. While these diagrams do not exhaustively illustrate all possible I3C communications, they do serve as useful introductions to the signaling and transmission formatting used in each I3C Protocol.

Figure 26.52illustrates example communication using I3C Single Data Rate (SDR) coding with Broadcast (H'7E). It shows the Master reading a byte of data from the Slave at Address H'2B in SDR Mode. From the Bus Free Condition, the Master issues a START by driving the SDA line Low while keeping the SCL line High. It then issues the Broadcast Address (H'7E) followed by RnW (0 for Write). Then the Master turns on a pull-up resistor and goes to Open Drain.

All Slaves ACK by pulling the SDA line Low (in the Figure, pink fill means the Slave is in control of the SDA line at this time). The Master then issues a Repeated START, then the Address of the Slave (H'2B) it wants to read followed by RnW (1 for Read). The Master then turns on a pull-up resistor and goes to Open Drain, allowing the Slave to acknowledge by pulling the SDA line Low. At this point, the Master continues to toggle the SCL line and release the SDA line, allowing the Slave to drive SDA to send one byte of data (H'4A) followed by T. T = 1 informs the Master that there is additional data, whereas T = 0 signals the end. Here there is additional data, so the Slave drives SDA High until SCL goes High, at which time it releases SDA. The Master has the option of holding SDA High with a weak pullup, which signals to the Slave that the Master allows another byte to be transmitted, or to pull SDA Low (while SCL is High – hence a Repeated START), which would signal to the Slave that the Master has terminated the Read and is taking over. SDR Mode is backwards compatible with Legacy I^2C Devices, because the High time of an SCL pulse is always less than 50ns and therefore SCL will always appear to be Low because of the I^2C 50ns Spike Filter.

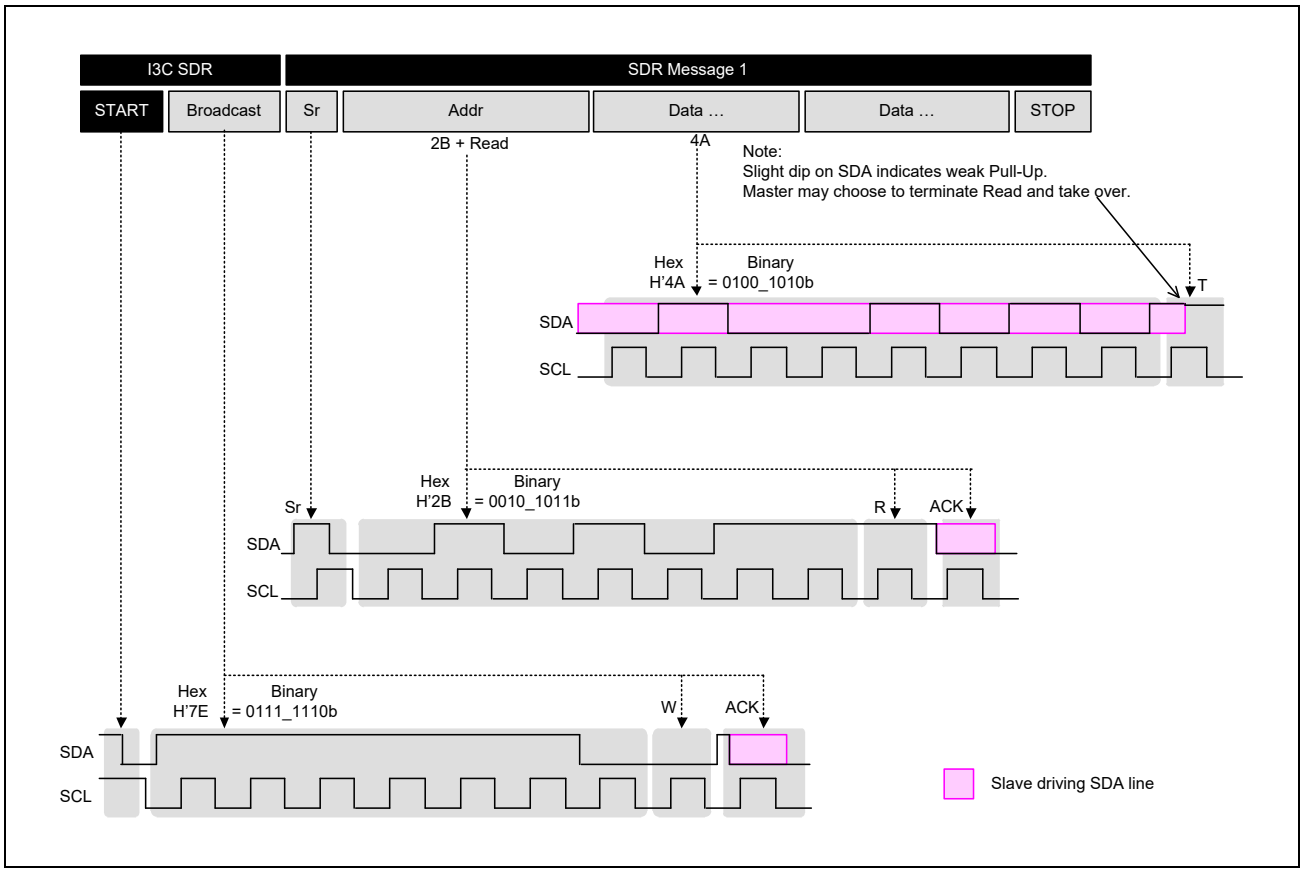


Figure 26.52 Example Communication Using I3C Coding SDR with Broadcast (H'7E)

Figure 26.53 illustrates example communication using I3C Single Data Rate (SDR) coding without Broadcast (H'7E). It shows the Master reading a byte of data from the Slave at Address H'2B in SDR Mode. From the Bus Free Condition, The Master then issues a START, then the Address of the Slave (H'2B) it wants to read followed by RnW (1 for Read).

The Master then turns on a pull-up resistor and goes to Open Drain, allowing the Slave to acknowledge by pulling the SDA line Low. At this point, the Master continues to toggle the SCL line and release the SDA line, allowing the Slave to drive SDA to send one byte of data (H'4A) followed by T. T = 1 informs the Master that there is additional data, whereas T = 0 signals the end. Here there is additional data, so the Slave drives SDA High until SCL goes High, at which time it releases SDA. The Master has the option of holding SDA High with a weak pull-up, which signals to the Slave that the Master allows another byte to be transmitted, or to pull SDA Low (while SCL is High – hence a Repeated START), which would signal to the Slave that the Master has terminated the Read and is taking over. SDR Mode is backwards compatible with Legacy I^2C Devices, because the High time of an SCL pulse is always less than 50ns and therefore SCL will always appear to be Low because of the I^2C 50ns Spike Filter.

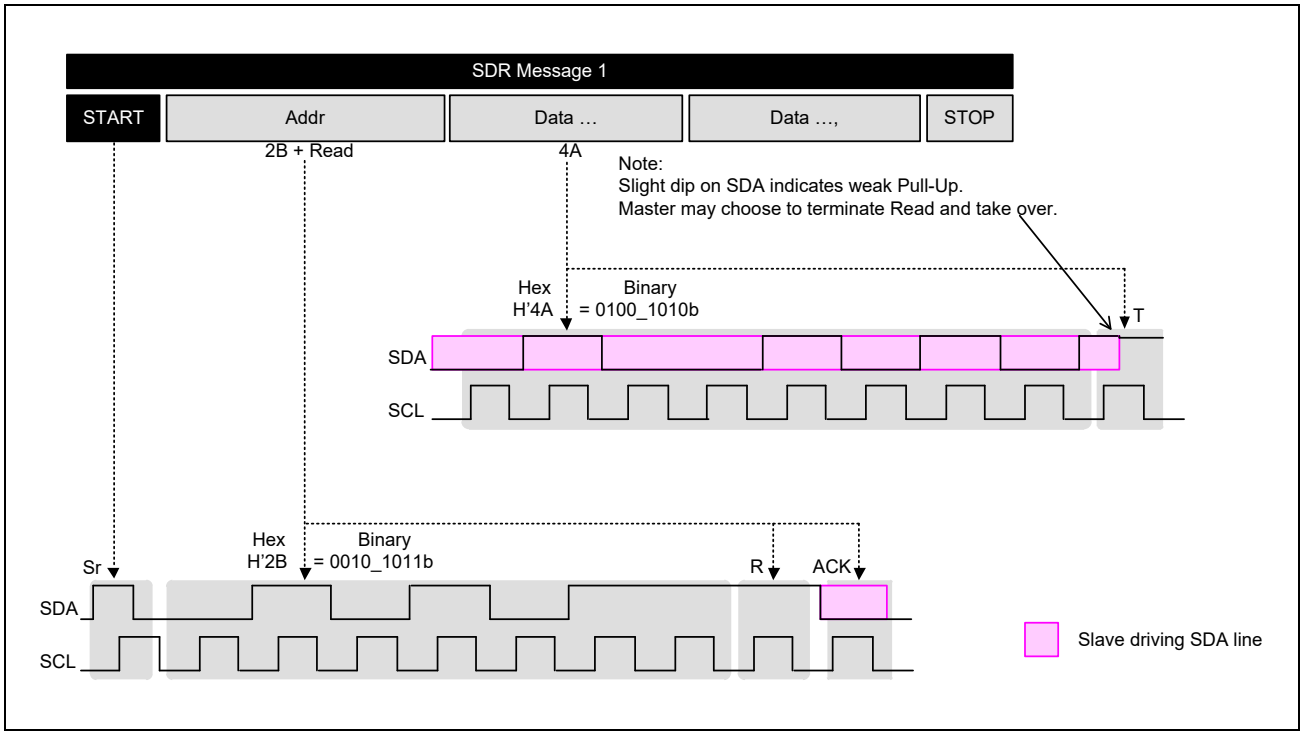

Figure 26.53 Example communication using I3C coding SDR without broadcast (H'7E)

Figure 26.54 shows the Master issuing a CCC Direct Command to a single Slave. This particular command (GETPID) reads the Provisional ID of a Slave.

From the Bus Free Condition, the Master issues a START by driving the SDA line Low while keeping the SCL line High. It then issues the Broadcast Address (H'7E) followed by RnW (0 for Write). Then the Master turns on a pull-up resistor and goes to Open Drain. All Slaves ACK by pulling SDA Low (in the Figure, pink fill means the Slaves are in control of SDA at this time). The Master then issues the Direct Common Command Code for GETPID (H'8C) followed by parity bit T (odd parity = 0 for H'8C) then the 7-bit Dynamic Address of the Slave (chosen arbitrarily here to be H'2B) followed by a RnW bit (1 for Read). Then the Master turns on a pull-up resistor and goes to Open Drain, allowing the Slave at Address H'2B to ACK by pulling SDA Low, which tells the Master that the Slave Acknowledges the command and will comply. (Alternatively, the Slave may NACK by not pulling SDA Low, which would inform the Master that the Slave will not comply – in this case, that an error occurred.) Following the ACK, the Slave outputs its 48-bit PID one byte at a time, and then the Master issues a Repeated START (this part of the waveform sequence is not shown in the Figure).

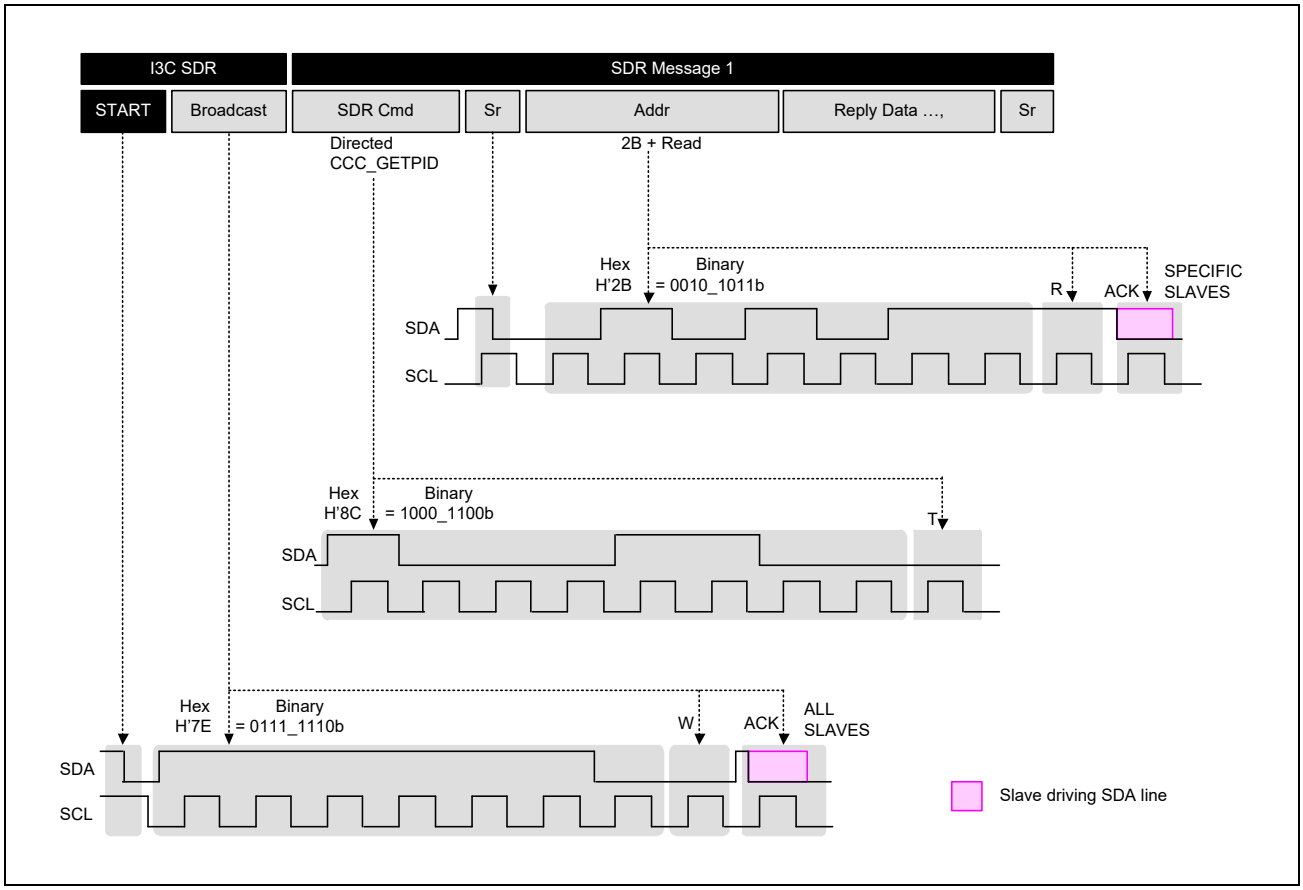

Figure 26.54 Example Communication Using I3C Coding SDR with CCC Direct Addressing

Figure 26.55 illustrates example SDR communication with a CCC Broadcast command. The command used in this example sets the Maximum Read Length of all Slaves to 43 bytes (H'2B).

From the Bus Free Condition, the Master issues a START by driving the SDA line Low while keeping the SCL line High. It then issues the Broadcast Address (H'7E) followed by RnW (0 for Write). Then the Master turns on a pull-up resistor and goes to Open Drain. All Slaves ACK by pulling SDA Low (in the Figure, pink fill means the Slaves are in control of SDA at this time). The Master then issues the Broadcast Common Command Code for SETMRL (H'09) followed by parity bit T (odd parity = 1 for H'09), and then 2 data bytes (MSB first) to define the maximum number of bytes which can be read from a Slave in a single read operation. Each data byte is followed by a T bit (parity bit – odd parity). After this the Master issues a Repeated START.

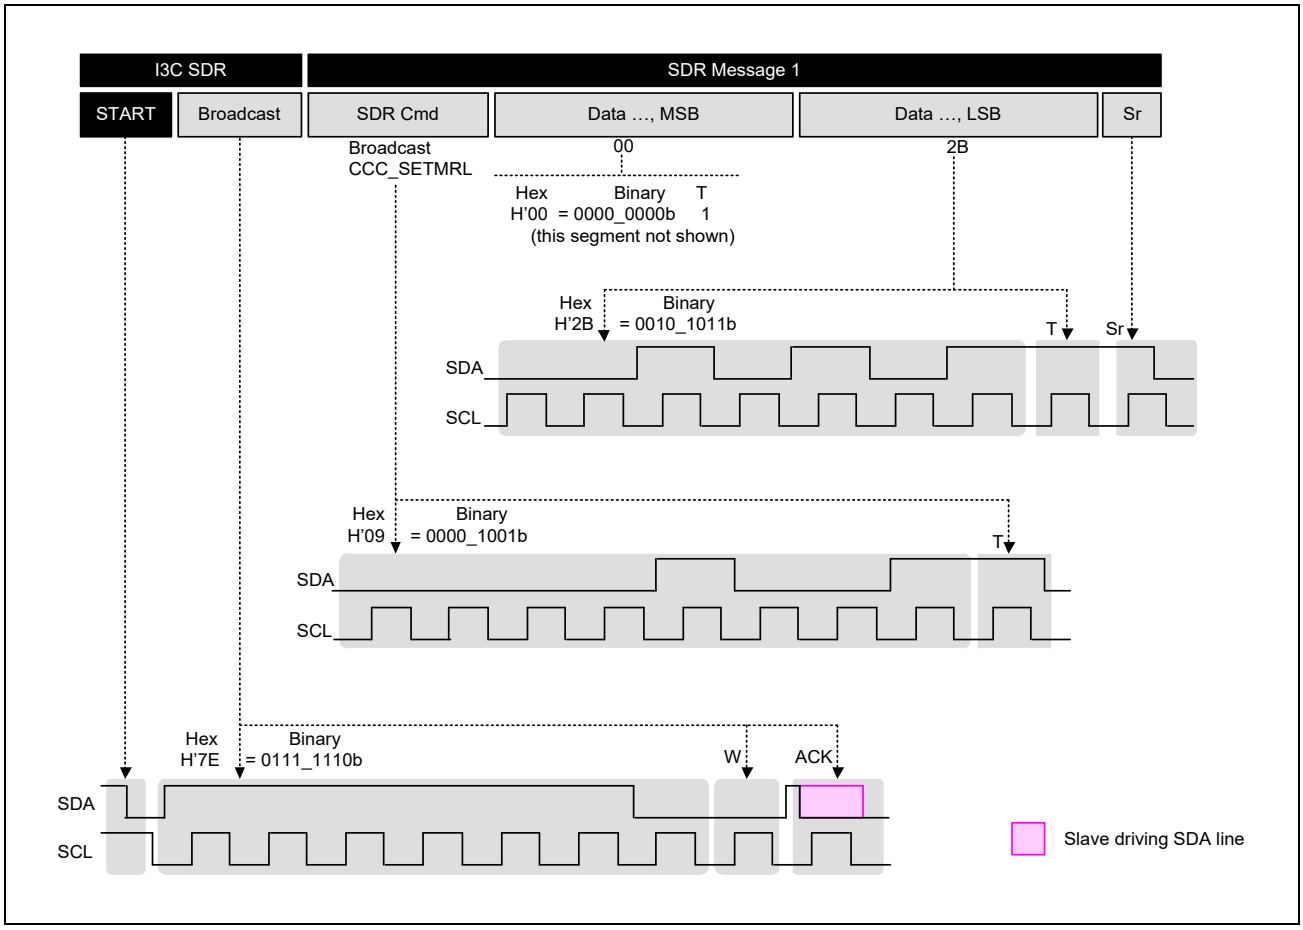

Figure 26.55 Example Communication Using I3C Coding SDR with CCC Broadcast

(2) Bus Conditions

I3C defines three distinct conditions in which the I3C Bus shall be considered inactive: Bus Free, Bus Available, and Bus Idle (refer to **Figure 26.56**).

(a) Bus Free Condition

State on the I3C Bus where both the SCL line and the SDA line are High for at least the period set by BFRECDT.FRECYC[8:0] bit.

(b) Bus Available Condition [I3C mode]

State on the I3C Bus where both the SCL line and the SDA line are High for at least the period set by BAVLCDT.AVLCYC[8:0] bit.

A Slave may only issue a START Request (For example, for an In-Band Interrupt, or for a Master Handoff Request) after a Bus Available Condition.

(c) Bus Idle Condition [I3C mode]

State on the I3C Bus where both the SCL line and the SDA line are High for at least the period set by BIDLCDT.IDLCYC[17:0] bit.

A Slave may only issue a START Request (For example, for a Hot-Join) after a Bus Idle Condition. Specifications are as follows. IDLE needs to be the largest.

BFRECDT.FRECYC[8:0] < BAVLCDT.AVLCYC[8:0] < BIDLCDT.IDLCYC[17:0]

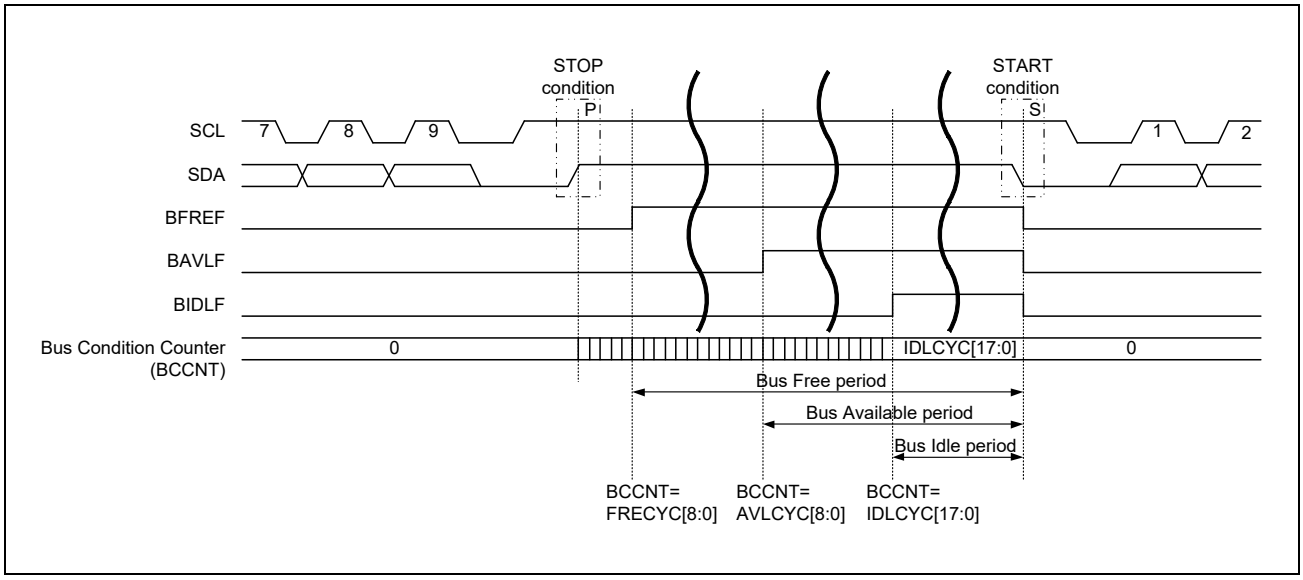

Figure 26.56 Bus Conditions

(3) START Condition / Repeated START Condition / STOP Condition Issuing Function

(a) Issuing a START Condition

I3C issues a START condition when the CNDCTL.STCND bit is set to 1.

Set the STCND bit to 1 (START condition issuance request) when the BCST.BFREF flag is set to 1 (bus free state).

I3C issues a START condition.

When a START condition is issued normally, I3C automatically shifts to the master transmit mode. A START condition is issued in the following sequence.

[START condition issuance]

- Drive the SDAn line low (high level to low level).
- Ensure the time set in STDBR.SBRHO[7:0] and the START condition hold time.
- Drive the SCLn line low (high level to low level).
- Detect low level of the SCLn line and ensure the low-level period of SCLn line set in STDBR.SBRLO[7:0].

(b) Issuing a Repeated START Condition

I3C issues a Repeated START condition when the CNDCTL.SRCND bit is set to 1.

When the SRCND bit is set to 1, a Repeated START condition issuance request is made and I3C issues a Repeated START condition when the BCST.BFREF flag = 0 (bus busy state) and the PRSST.CRMS bit = 1 (master mode).

A Repeated START condition is issued in the following sequence. [Repeated START condition issuance]

- Release the SDAn line.
- Ensure the low-level period of SCLn line set in STDBR.SBRLO[7:0].
- Release the SCLn line (low level to high level).
- Detect a high level of the SCLn line and ensure the time set in STDBR.SBRLO[7:0] and the Repeated START condition setup time.
- Drive the SDAn line low (high level to low level).
- Ensure the time set in STDBR.SBRHO[7:0] and the Repeated START condition hold time.
- Drive the SCLn line low (high level to low level).
- Detect a low level of the SCLn line and ensure the low-level period of SCLn line set in STDBR.SBRLO[7:0].

NOTE

When issuing Repeated START conditions request, please write the slave address to NTDTBP0 after confirming CNDCTL.SRCND = 0. Data written in the period of CNDCTL.SRCND = 1 is not forwarded because retransmission condition before the occurrence.

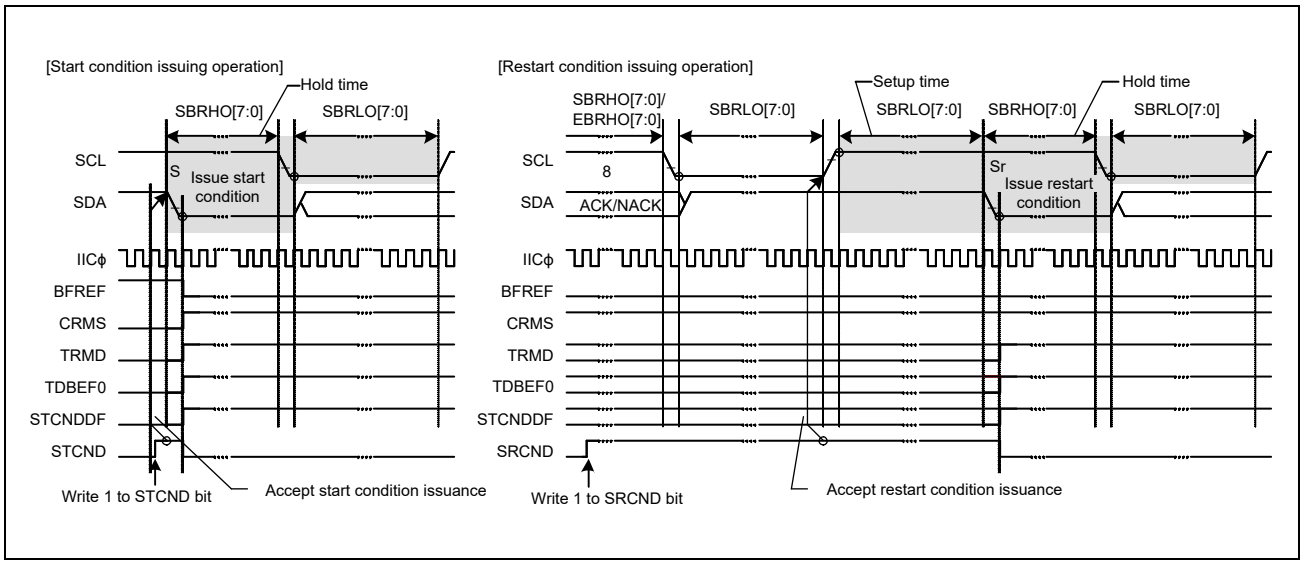

Figure 26.57 START Condition / Repeated START Condition Issue Timing (STCND and SRCND bits)

Figure 26.58 shows the operation to issue a Repeated START condition after the master transmission. [Repeated START condition issuance after the master transmission]

- Initial setting. For details, refer to **Section 26.3.3.1, Initial Setting Flow**.
- Read the BFREF flag in BCST to check that the bus is open, and then set the STCND bit in CNDCTL to 1 (START condition issuance request). Upon receiving the request, I3C issues a START condition. At the same time, the BFREF flag is automatically set to 0 and the STCNDDF flag in BST is automatically set to 1 and the STCND bit is automatically set to 0. At this time, if the START condition is detected and the internal levels for the SDA output state and the levels on the SDAn line have matched while the STCND bit = 1, I3C recognizes that issuing of the START condition as requested by the STCND bit has been successfully completed, and CRMS and TRMD bits in PRSST is automatically set to 1, placing I3C in master transmit mode. The NTST.TDBEF0 flag is also automatically set to 1 in response to setting of the TRMD bit to 1.
- Check that the NTST.TDBEF0 flag = 1, and then write the value for transmission (the slave address and the R/W# bit) to NTDTBP0. Once the data for transmission are written to NTDTBP0, the TDBEF0 flag is automatically set to 0, the data are transferred from NTDTBP0, and the TDBEF0 flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRMD bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, I3C continues in master transmit mode. Since the BST.NACKDF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to CNDCTL.SPCND bit to issue a STOP condition. For data transmission with an address in the 10-bit format, start by writing 1_1110, the 2 higher-order bits of the slave address, and W to NTDTBP0 as the first address transmission. Then, as the second address transmission, write the 8 lower-order bits of the slave address to NTDTBP0.
- After confirming that the NTST.TDBEF0 flag = 1, write the data for transmission to the NTDTBP0 register. I3C automatically holds the SCLn line low until the data for transmission are ready, a Repeated START condition is issued or a STOP condition is issued.
- After all bytes of data for transmission have been written to the NTDTBP0 register, wait until the value of the BST.TENDF flag returns to 1, and then, after check that the BST.STCNDDF flag = 1, set the BST.STCNDDF flag to 0.
- Set the SRCND bit in CNDCTL to 1 (Repeated START condition issuance request). Upon receiving the request, I3C issues a Repeated START condition.

- After check that the BST.STCNDDF flag = 1, write the value for transmission (the slave address and the R/W# bit) to NTDTBP0.

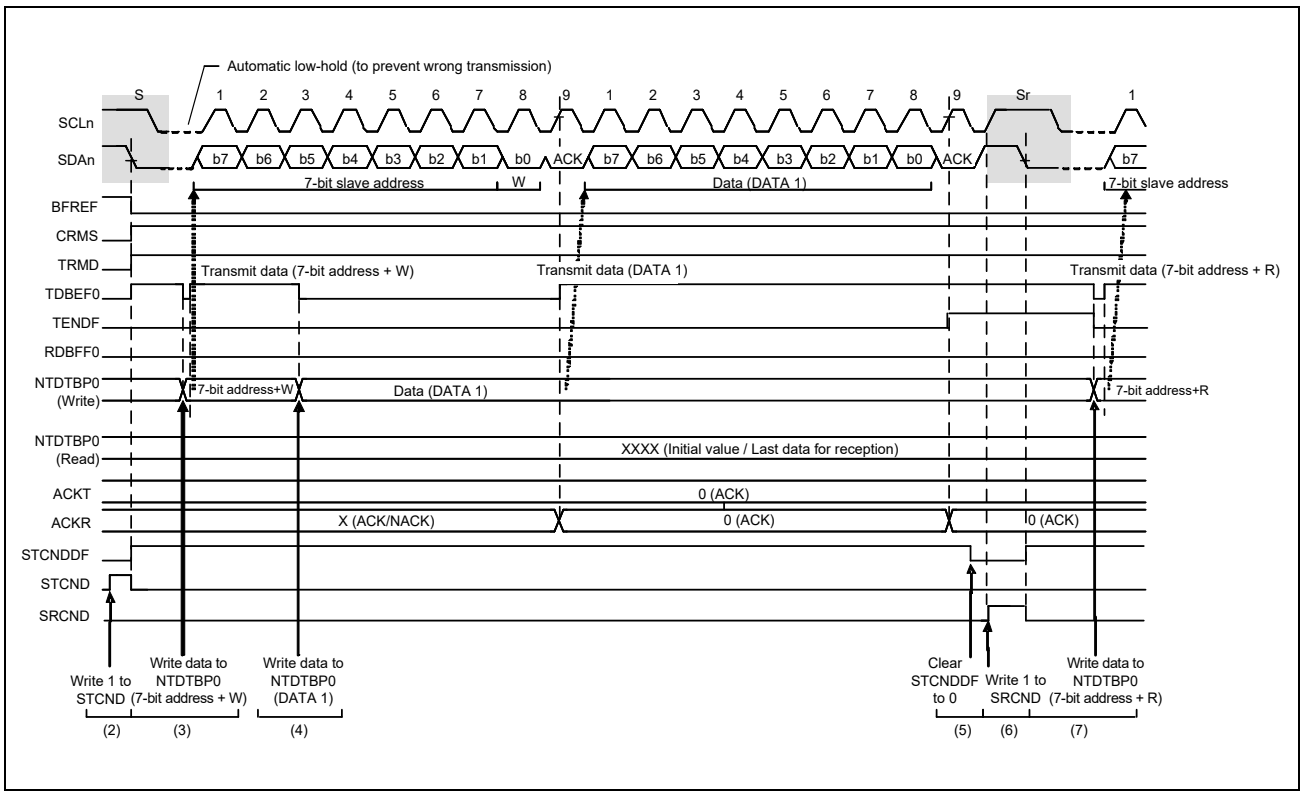

Figure 26.58 Repeated START Condition Issuance after the Master Transmission Timing

(c) Issuing a STOP Condition

I3C issues a STOP condition when the SPCND bit in CNDCTL is set to 1.

When the SPCND bit is set to 1, a STOP condition issuance request is made and I3C issues a STOP condition when the BCST.BFREF flag = 0 (bus busy state) and the PRSST.MST bit = 1 (master mode).

A STOP condition is issued in the following sequence.

[STOP condition issuance]

- Drive the SDAn line low (high level to low level).
- Ensure the low-level period of SCLn line set in STDBR.SBRLO[7:0].
- Release the SCLn line (low level to high level).
- Detect a high level of the SCLn line and ensure the time set in STDBR.SBRHO[7:0] and the STOP condition setup time.
- Release the SDAn line (low level to high level).
- Ensure the time set in STDBR.SBRLO[7:0] and the bus free time.
- Set the BFREF flag to 1 (to release the bus mastership).

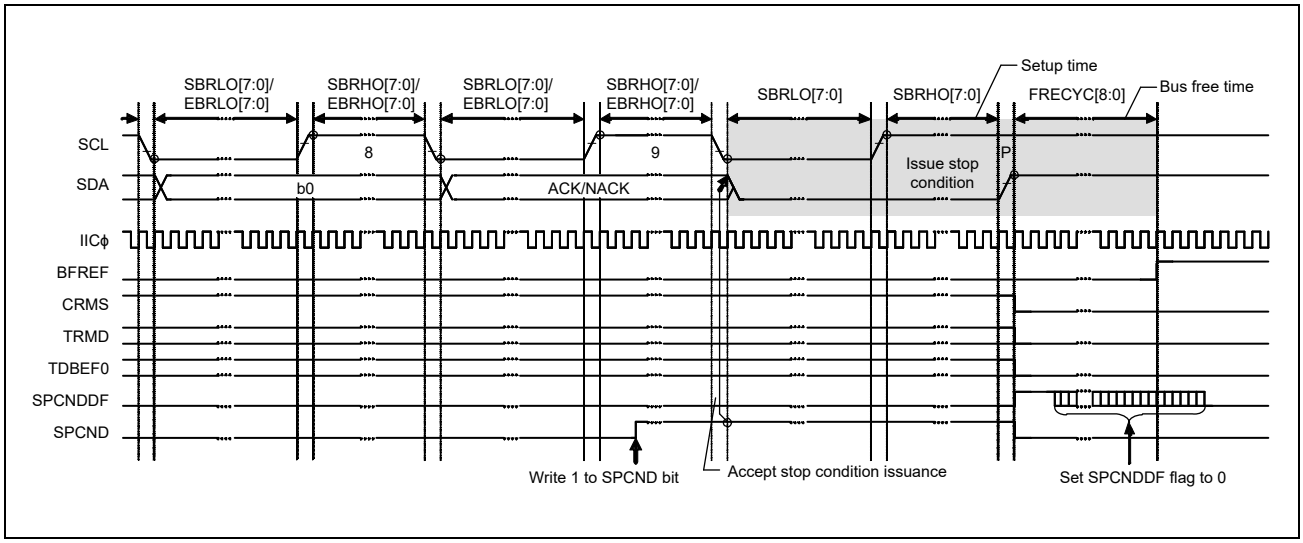

Figure 26.59 STOP Condition Issue Timing (SPCND bit)

(4) Address Match Detection

I3C can set three unique slave addresses in addition to the general call address and host address, and also can set 7- bit or 10- bit slave addresses.

(a) Slave-Address Match Detection [I²C mode]

I3C can set three unique slave addresses and has a slave address detection function for each unique slave address.

When the SVCTL.SVAEy bit (y = 0 to 2) is set to 1, the slave addresses set in the SVDVADy register (y = 0) can be detected.

When I3C detects a match of the set slave address, the corresponding SVST.SVAFy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle, and the NTST.RDBFF0 flag or the NTST.TDBEF0 flag is set to 1 by the following R/W# bit. This causes a receive data full interrupt (I3Cn_RX) or transmit data empty interrupt (I3Cn_TX) to be generated. The SVAFy flag is used to identify which slave address has been specified.

Figure 26.60 to **Figure 26.62** show the SVAFy flag set timing in three cases.

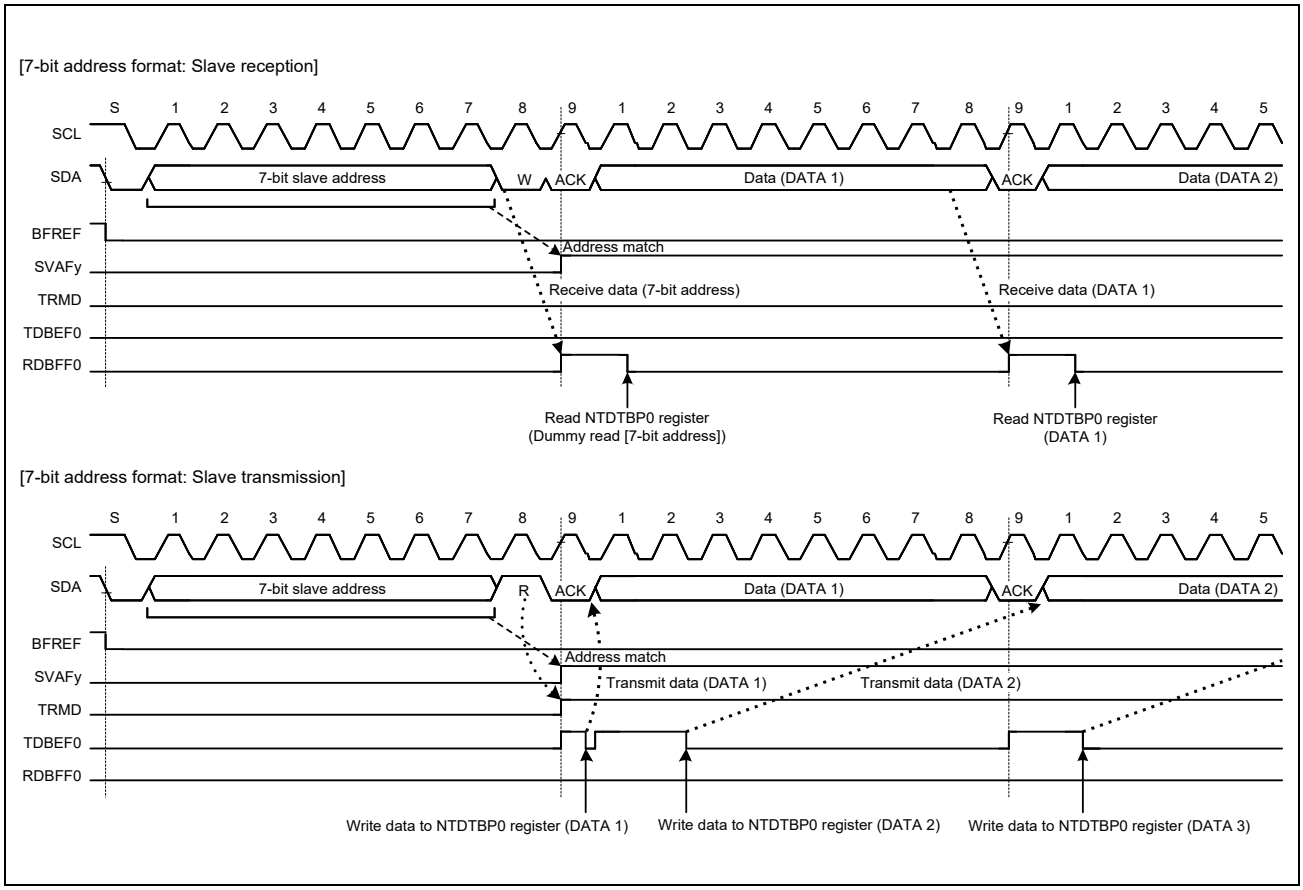

Figure 26.60 SVAFy Flag Set Timing with 7-bit Address Format Selected

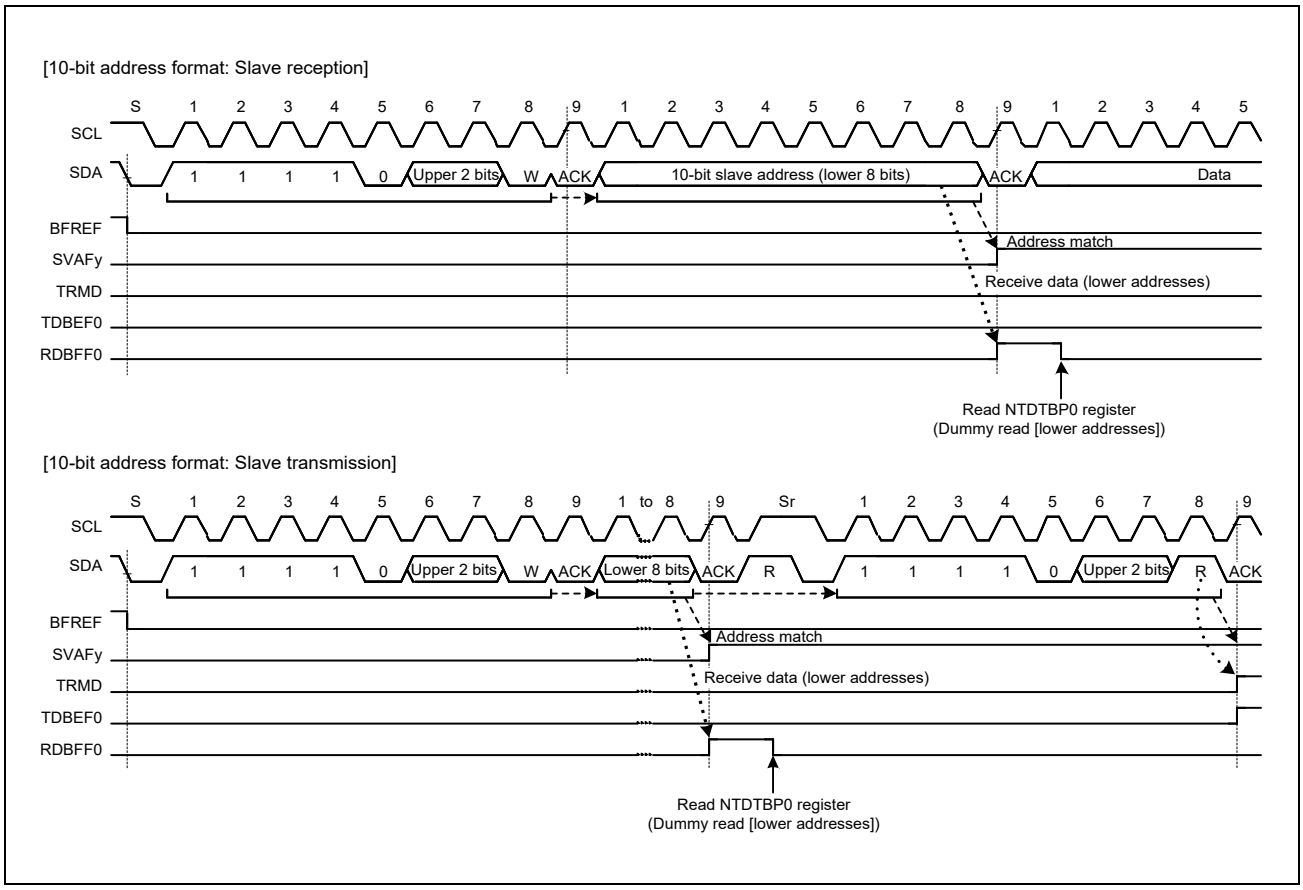

Figure 26.61 SVAFy Flag Set Timing with 10-bit Address Format Selected

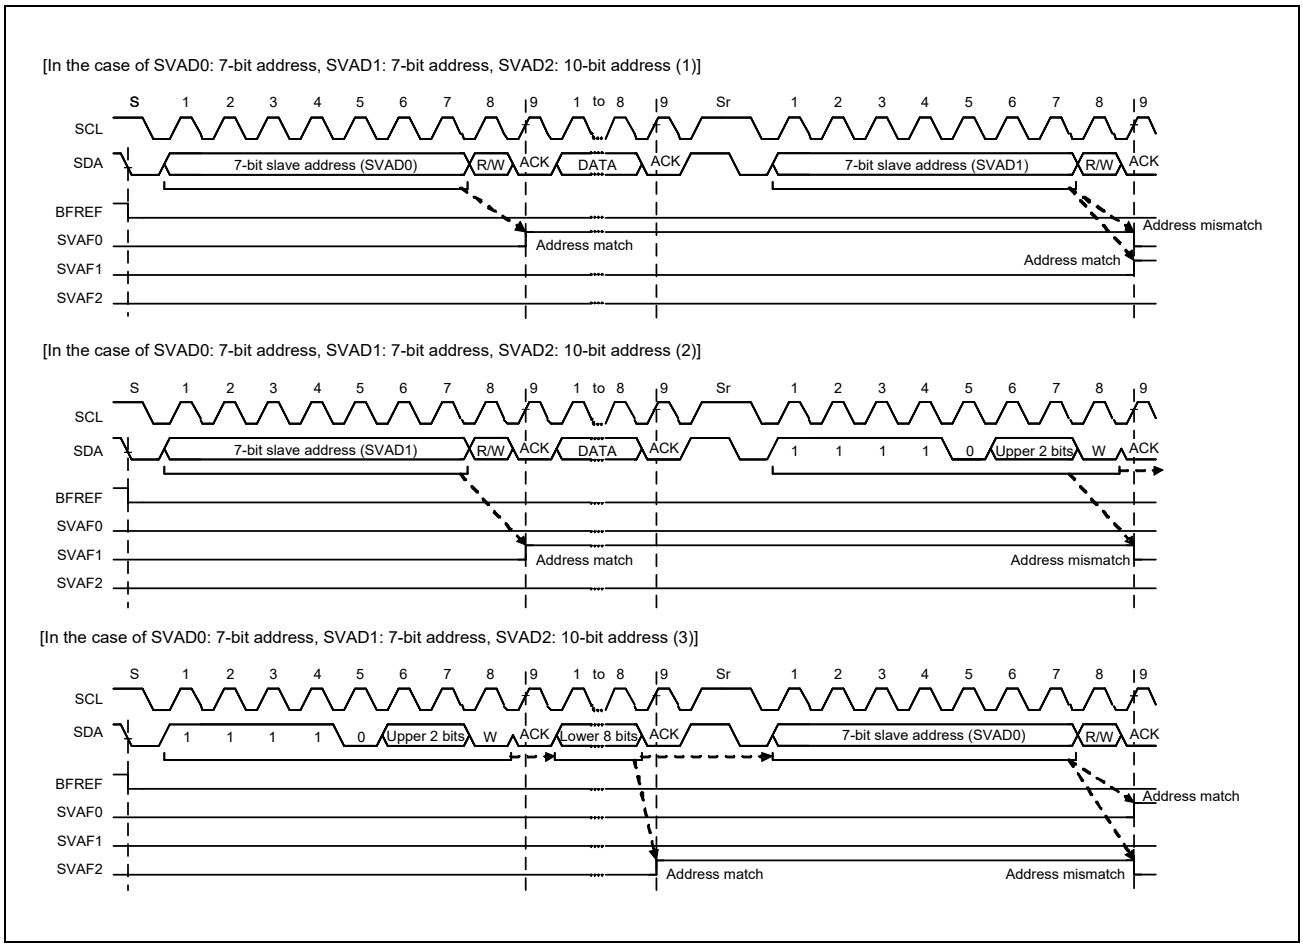

Figure 26.62 SVAFy Flag Set / Clear Timing with 7-bit/10-bit Address Formats Mixed

(b) Detection of the General Call Address [I^2C mode]

I3C has a facility for detecting the general call address (000_0000 + 0 (write)). This is enabled by setting the SVCTL.GCAE bit to 1.

If the address received after a START or Repeated START condition is issued is 000_0000 + 1 (read) (start byte), I3C recognizes this as the address of a slave device with an all-zero address but not as the general call address.

When I3C detects the general call address, both the SVST.GCAF flag and the NTST.RDBFF0 flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive data full interrupt (I3Cn_RX). The value of the GCAF flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

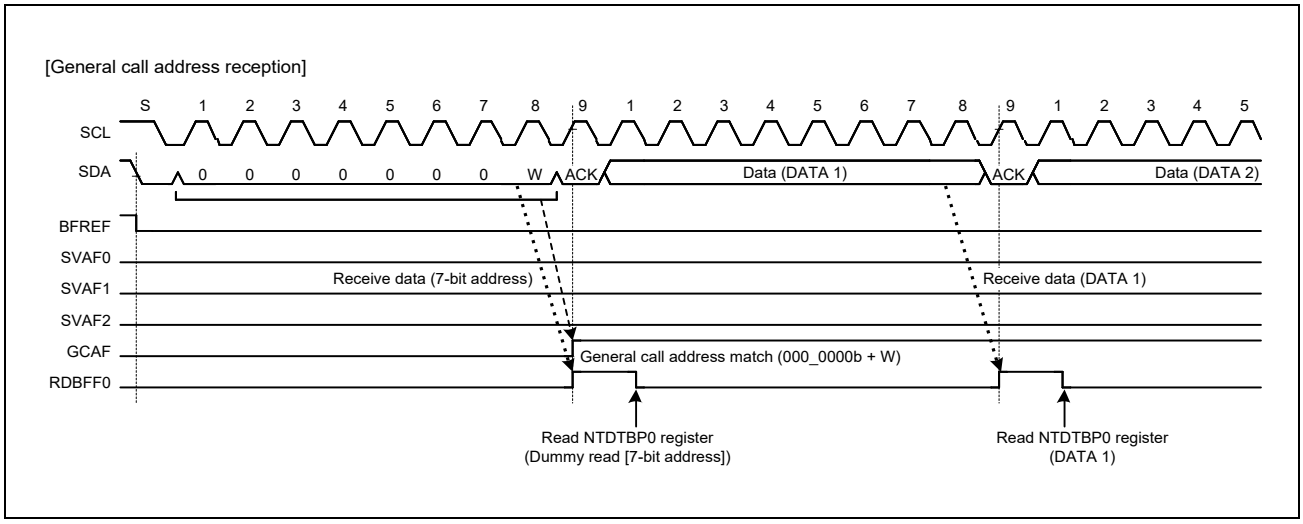

Figure 26.63 Timing of GCAF Flag Setting during Reception of General Call Address

(c) Device-ID Address Detection [I²C mode]

I3C module has a facility for detecting device-ID addresses conformant with the I²C-bus specification (Rev.03). When I3C receives 111_1100 as the first byte after a START condition or Repeated START condition was issued with the SVCTL.DVIDE bit set to 1, I3C recognizes the address as a device ID, sets the SVST.DVIDF flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit = 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, I3C sets the corresponding SVST.SVAFy flag (y = 0 to 2) to 1.

After that, when the first byte received after a START or Repeated START condition is issued matches the device ID address (111_1100) again and the following R/W# bit = 1, I3C does not compare the second and subsequent bytes and sets the NTST.TDBEF0 flag to 1.

In the device-ID address detection function, I3C sets the DVIDF flag to 0 if a match with I3C's own slave address is not obtained or a match with the device ID address is not obtained after a match with I3C's own slave address and the detection of a Repeated START condition. If the first byte after detection of a START or Repeated START condition matches the device ID address (111_1100) and the R/W# bit = 0, I3C sets the DVIDF flag to 1 and compares the second and subsequent bytes with I3C's slave address. If the R/W# bit = 1, the DVIDF flag holds the previous value and I3C does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DVIDF flag after confirming that TDBEF0 flag = 1.

Furthermore, prepare the device-ID fields (3 bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details of the information that must be included in device-ID fields, contact NXP Semiconductors.

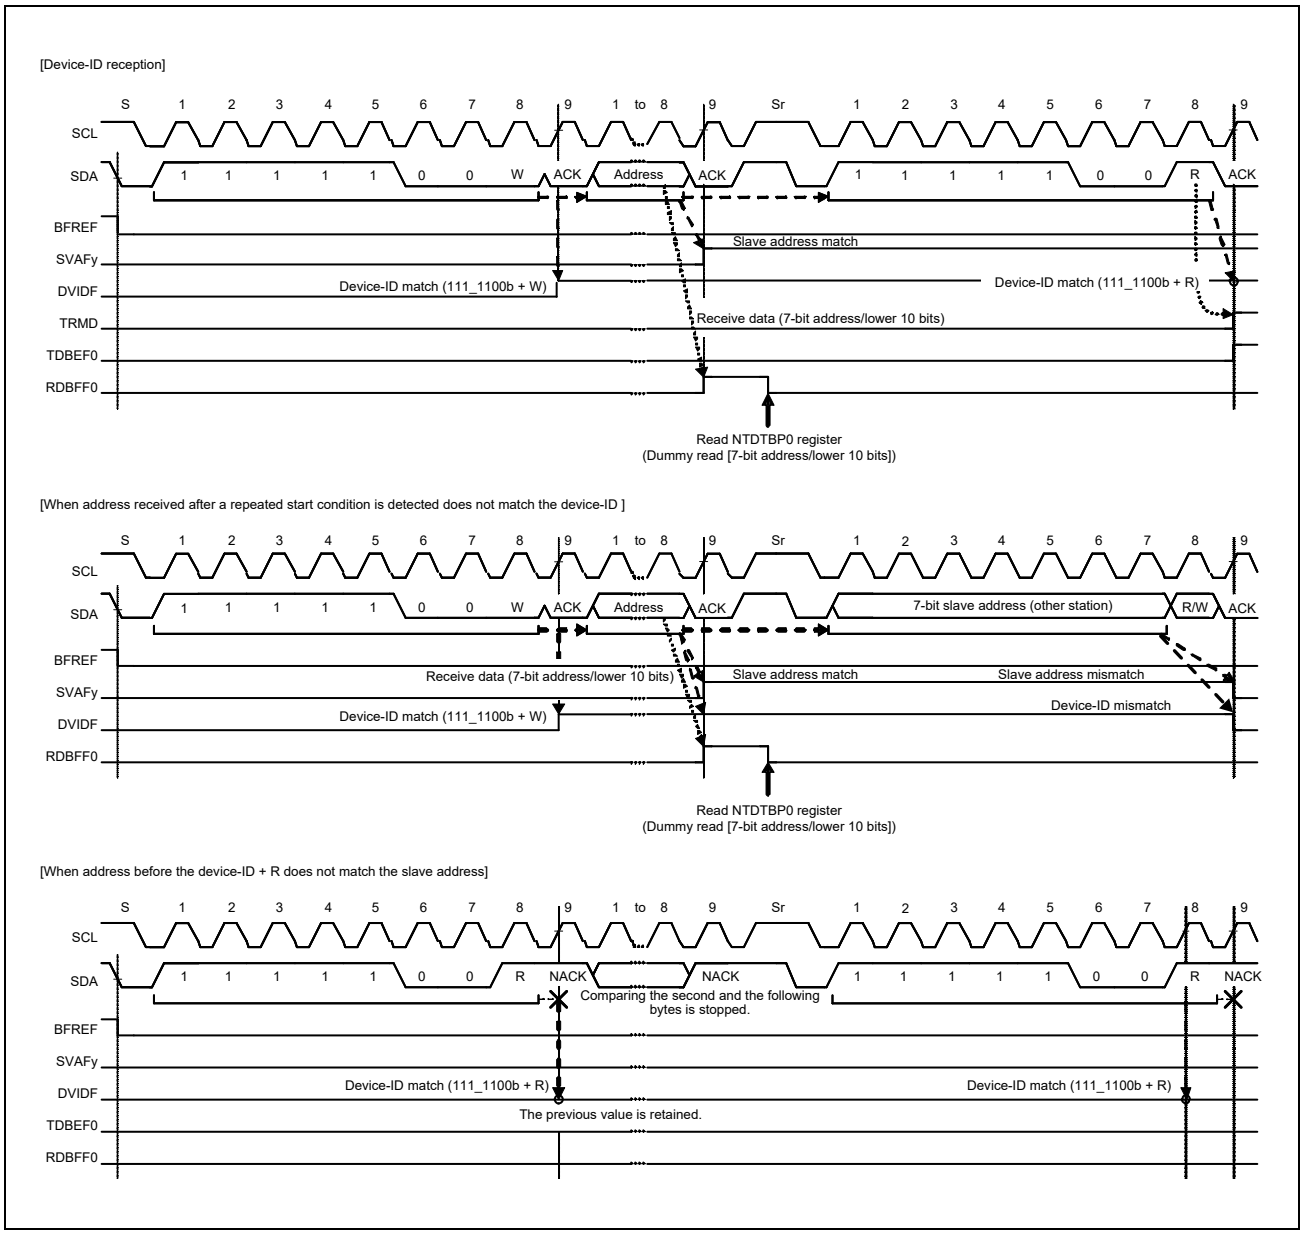

Figure 26.64 SVAFy/DVIDF Flag Set / Clear Timing during Reception of Device-ID

(d) Hs-Mode Master Code Detection [I²C mode]

IIC has a facility for detecting the Hs-mode master code (0000_1XXXb). When IIC receives the Hs-mode master code (0000_1XXXb) as the first byte after a START condition was issued with the SVCTL.HSMCE bit set to 1, this module recognizes the address as the Hs-mode master code, sets the SVST.HSMCF flag to 1 on the rising edge of the ninth SCL clock cycle. The first byte after Repeated START after NACK response to Hs-mode master code is recognized as a slave address and compared with the slave address set by SVDVADy.SVAD[9:0] (y = 0 to 2). When IIC detects a match of the set slave address, the corresponding SVST.SVAFy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle, and the NTST.RDBFF0 flag or the NTST.TDBEF0 flag is set to 1 by the following R/W# bit. This causes a receive data full interrupt (IICn_RX) or transmit data empty interrupt (IICn_TX) to be generated. The SVAFy flag is used to identify which slave address has been specified. The SVST.HSMCF flag is cleared to 0 when the STOP condition is detected.

NOTE

If the Hs-mode master code (0000_1XXXb) is received with the SVCTL.HSMCE bit set to 0, other patterns are ignored until the STOP condition is detected.

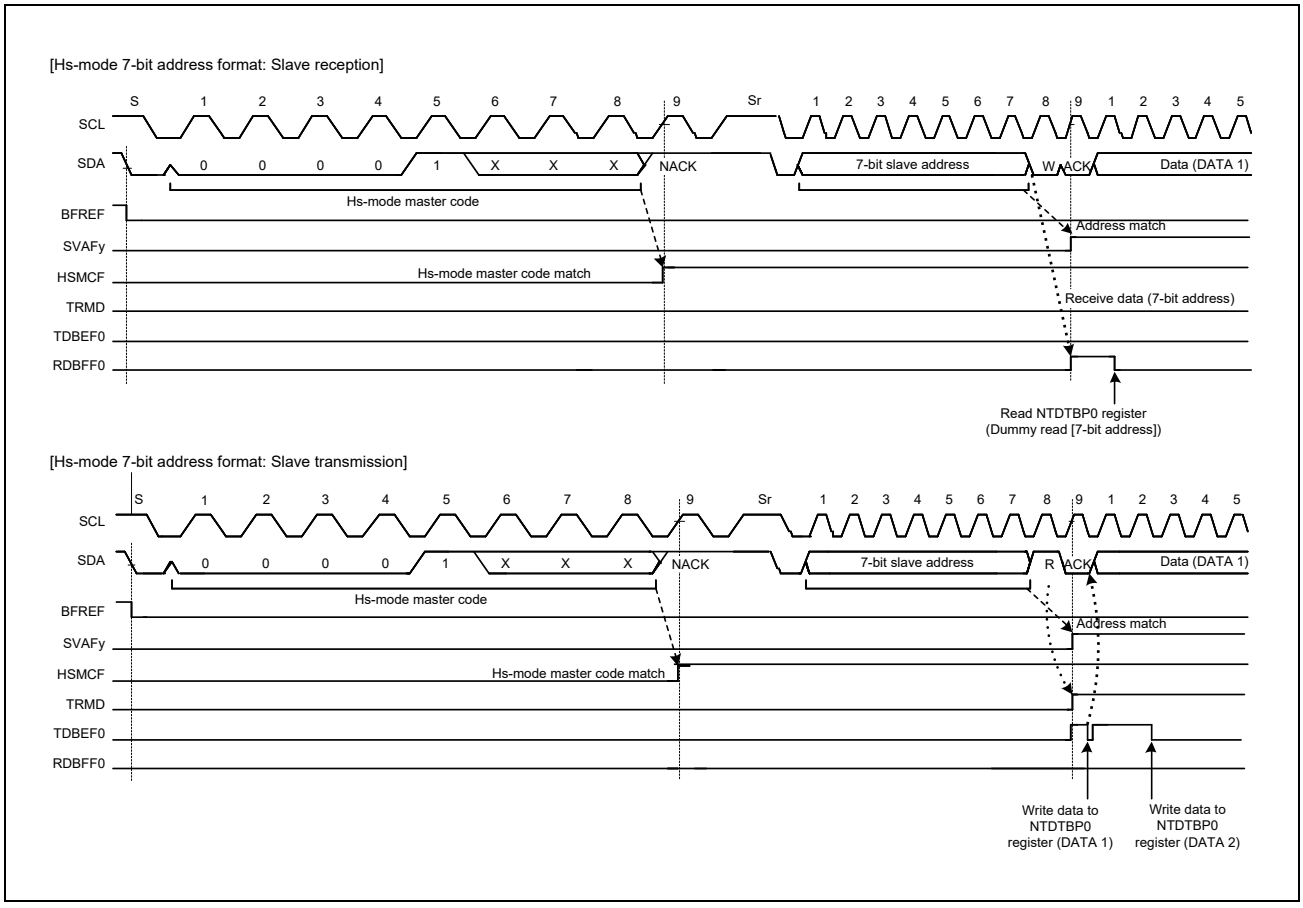

Figure 26.65 SVAFy/HSMCF Flag Set Timing during Reception of Hs-Mode Master Code

(e) CCC Detection Function [I3C mode]

- In case of Broadcast CCC

1. It receives Broadcast Address (H'7E) and R/W# = 0 after START condition or Repeated START.
2. Respond to ACK.
3. Receive Common Command Code (CCC).
4. In accordance with the CCC, the following data is stored. (Storage destination: refer to **Table 26.12**)
5. Store the Receive Status Descriptor into the Receive Status Queue.

- In case of Broadcast CCC (ENTDAA)

1. It receives Broadcast Address (H'7E) and R/W# = 0 after START condition.
2. Respond to ACK.
3. Receive ENTDAA.
4. If receives Broadcast Address (H'7E) and R/W# = 1 after Repeated START.
5. When the Dynamic Address is not assigned, ACK response is done.
6. This Provisional ID (SDCTPIDH[31:0], SDCTPIDL[15:0]), BCR (SVDCT.TBCR[7:0]) and DCR (SVDCT.TDCR[7:0]) are transmitted.
7. When winning the arbitration in a transmission of the above Step 6, the dynamic address following that is received. When losing arbitration in a transmission of the above Step 6, processing of Step 6 is repeated from Step 4.
8. When parity of the Dynamic Address is valid, ACK response is done.
9. When parity of the Dynamic Address is invalid, NACK replies, and repeat the process from Steps 4 to 7.
10. SDATBAS0.SDDYAD[7:0] is renewed and the SVDVAD0.SDYADV bit is set to 1.
11. Upon detecting the STOP condition, Store the Receive Status Descriptor into the Receive Status Queue.

- In case of Direct Write CCC

1. It receives Broadcast Address (H'7E) and R/W# = 0 after START condition or Repeated START.
2. Respond to ACK.
3. Receive Common Command Code (CCC).
4. Receive Dynamic Address and R/W# = 0 after Repeated START.
5. Compare the received Dynamic Address with the assigned Dynamic Address, and if it matches, I3C responds with ACK.
   If they do not match, it responds with NACK and waits for Repeated START or STOP.
6. In accordance with the CCC, the following data is stored. (Storage destination: refer to **Table 26.12**)
7. Store the Receive Status Descriptor into the Receive Status Queue.

- In case of Direct Read CCC

1. It receives Broadcast Address (H'7E) and R/W# = 1 after START condition or Repeated START.
2. Respond to ACK.
3. Receive Common Command Code (CCC).
4. Receive Dynamic Address and R/W# = 1 after Repeated START.

5. Compare the received Dynamic Address with the assigned Dynamic Address, and if it matches, I3C responds with ACK.
   If they do not match, it responds with NACK and waits for Repeated START or STOP.
6. Respond from SFR according to CCC. (Responding CCC: refer to **Table 26.12**)
7. Store the Receive Status Descriptor into the Receive Status Queue.

Table 26.12 Common Command Code Operation

Command Code	CCC Type	Command Name	With Data	Auto Response	Storage

(5) Arbitration-Lost Detection [I²C mode]

In addition to the normal arbitration-lost detection function defined by the I²C-bus specification, the I3C has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration- lost in slave transmit mode.

(a) Master Arbitration-Lost Detection (MALE Bit)

The I3C drives the SDAn line low to issue a start condition. However, if the SDAn line has already been driven low by another master device issuing a start condition, this module causes arbitration to be lost, so priority is given to transfer by the other master device. Similarly, if the CNDCTL.STCND bit is set to 1 while the BCST.BFREF flag is 0 (bus busy state), arbitration is lost, so priority is given to transfer by the other master device. No start condition is issued in this case.

When a start condition is issued successfully, if the data for transmission including the address bits (the internal SDA output level) and the level on the SDAn line do not match (the high output as the internal SDA output, that is, the SDA0 pin is in the high-impedance state) and the low level is detected on the SDAn line, the I3C loses in arbitration.

I3C detects master arbitration-lost when the following conditions are met while the BSTE.ALE bit = 1 and the BFCTL.MALE bit = 1 (master arbitration-lost detection enabled).

If arbitration of mastership is lost, I3C immediately enters slave receive mode.

If a slave address (including the general call address) matches its own address at this time, I3C continues in slave operation.

[Conditions for master arbitration-lost]

- Non-matching of the internal level for output on SDA and the level on the SDAn line after a START condition was issued by setting the CNDCTL.STCND bit to 1 while the BCST.BFREF flag was set to 1 (erroneous issuing of a START condition)
- Setting of the CNDCTL.STCND bit to 1 (START condition double-issue error) while the BFREF flag is set to 0

NOTE

I3C does not issue a START condition.

- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDAn line in master transmit mode (bits CRMS and TRMD in the PRSST register = 11)

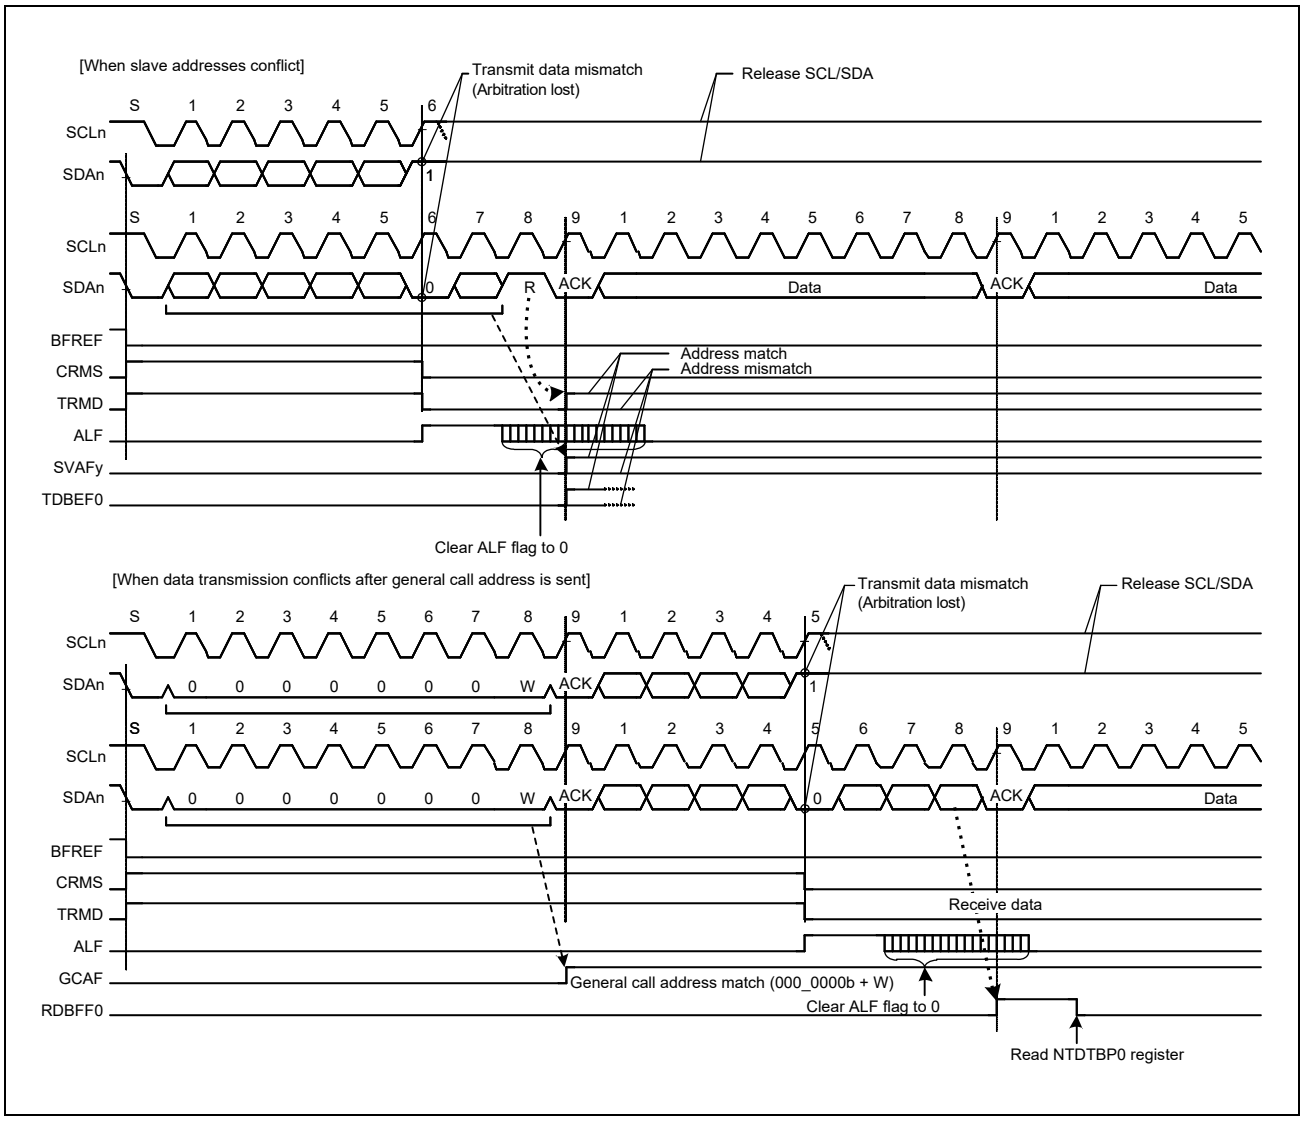

Figure 26.66 Examples of Master Arbitration-Lost Detection (MALE = 1)

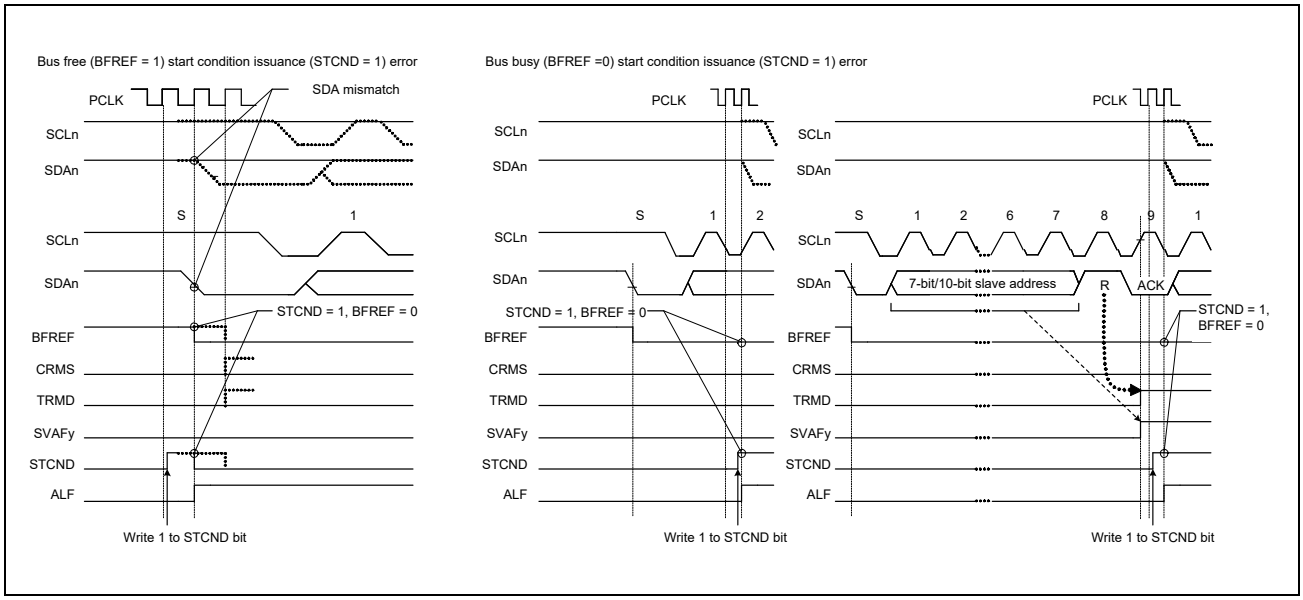

Figure 26.67 Arbitration-Lost Detection when a START Condition is Issued (MALE = 1)

(b) Arbitration-Lost Detection during NACK Transmission (NALE Bit)

The I3C has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDAn line (the high output as the internal SDA output, i.e., the SDAn pin is in the high-impedance state) and the low level is detected on the SDAn line during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device.

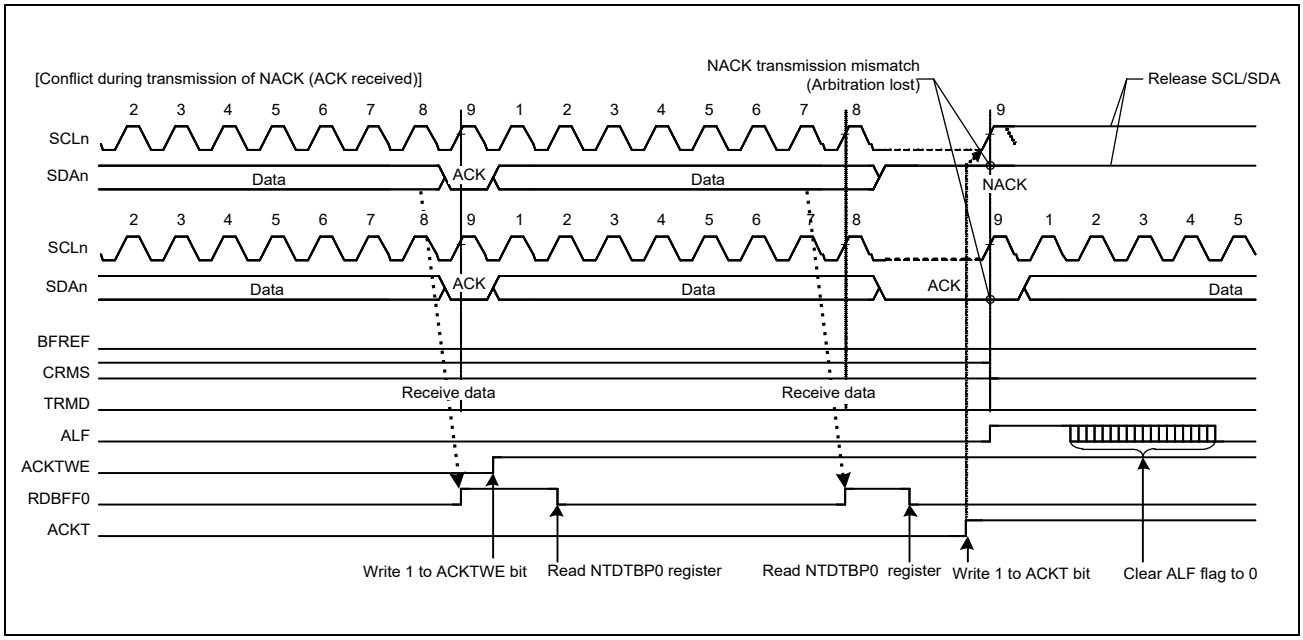

Figure 26.68 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following section explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives 2 bytes of data from the slave device, and master B receives 4 bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. In this example, master A sends NACK when it has received 2 final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received the necessary 4 bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition. Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When this module receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, this module is immediately released from the slave-matched state and enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

The I3C detects arbitration-lost during transmission of NACK when the following condition is met while the BSTE.ALE bit = 1 and the BFCTL.NALE bit = 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

- When the internal SDA output level does not match the SDAn line (ACK is received) during transmission of NACK (ACKCTL.ACKT bit = 1)

(c) Slave Arbitration-Lost Detection (SALE Bit)

The I3C has a function to cause arbitration to be lost if the data for transmission (the internal SDA output level) and the level on the SDAn line do not match (the high output as the internal SDA output, that is, the SDAn pin is in the high impedance state) and the low level is detected on the SDAn line in slave transmit mode.

If arbitration is lost during transmission of DATA, this module is immediately released from the slave-matched state and enters slave receive mode.

The I3C detects slave arbitration-lost when the following condition is met while the BSTE.ALE bit = 1 and the BFCTL.SALE bit = 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDAn line in slave transmit mode (bits CRMS and TRMD in the PRSST register = 01).

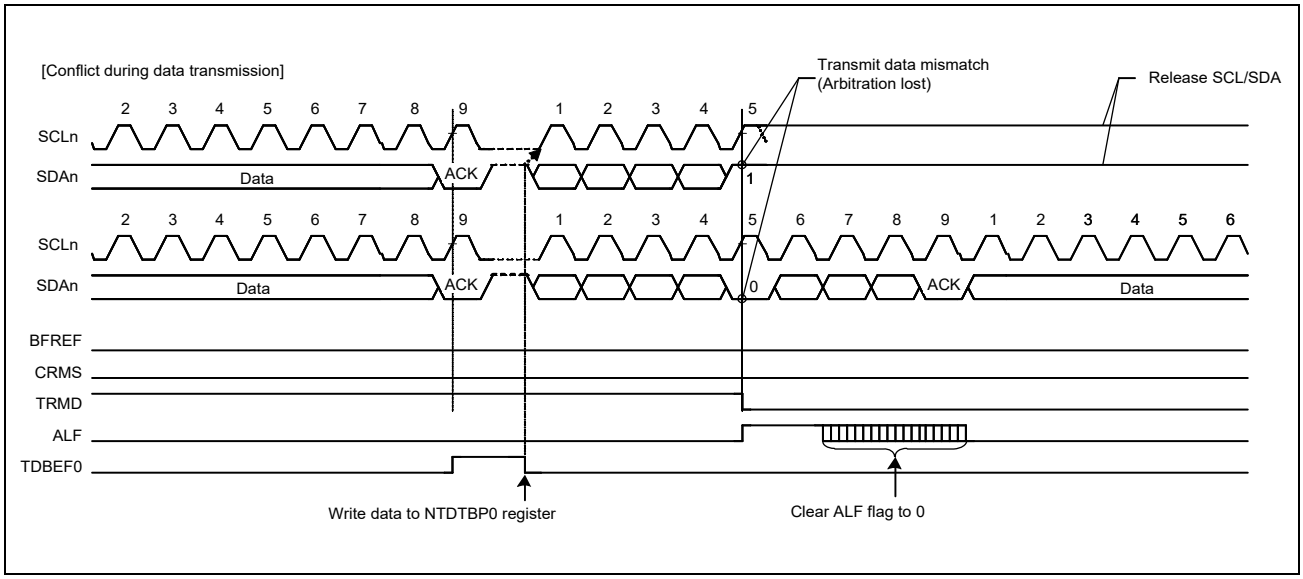

Figure 26.69 Example of Slave Arbitration-Lost Detection (SALE = 1)

(6) Clock Stretching [I²C mode]

(a) Function to Prevent Wrong Transmission of Transmit Data

When data have not been written to the I²C bus transmit data register (NTDTBP0) with I3C in transmission mode (PRSST.TRMD = 1), the SCLn line is automatically held at the low level over the intervals shown below. This low-hold period is extended until data for transmission have been written, which prevents the unintended transmission of erroneous data.

Master transmit mode

- Low-level interval after a START condition or Repeated START condition is issued
- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

Slave transmit mode

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

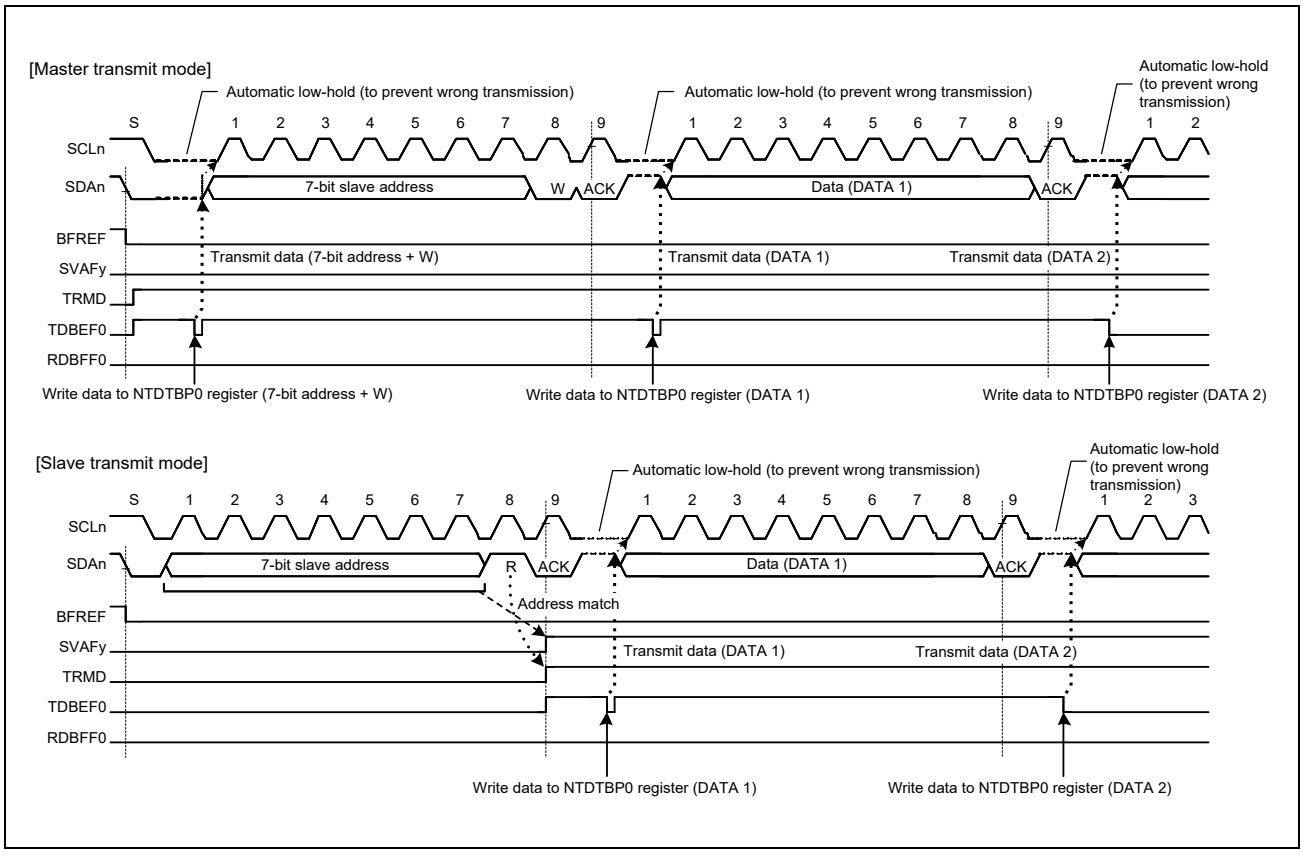

Figure 26.70 Automatic Low-Hold Operation in Transmit Mode

(b) NACK Reception Transfer Abort Function

I3C has a function to abort transfer operation when NACK is received in transmit mode (PRSST.TRMD = 1). This function is enabled when the BSTE.NACKDE bit is set to 1 (transfer abort enabled). If the next transmit data has already been written (NTST.TDBEF0 = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically aborted. This prevents the SDAn line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is aborted by this function (BST.NACKDF = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to set the NACKDF flag to 0. In master transmit mode, restore operation using either of the methods below:

- After issuing a Repeated START condition, set the NACKDF flag to 0
- After issuing a STOP condition, set the NACKDF flag to 0 and then issue a START condition

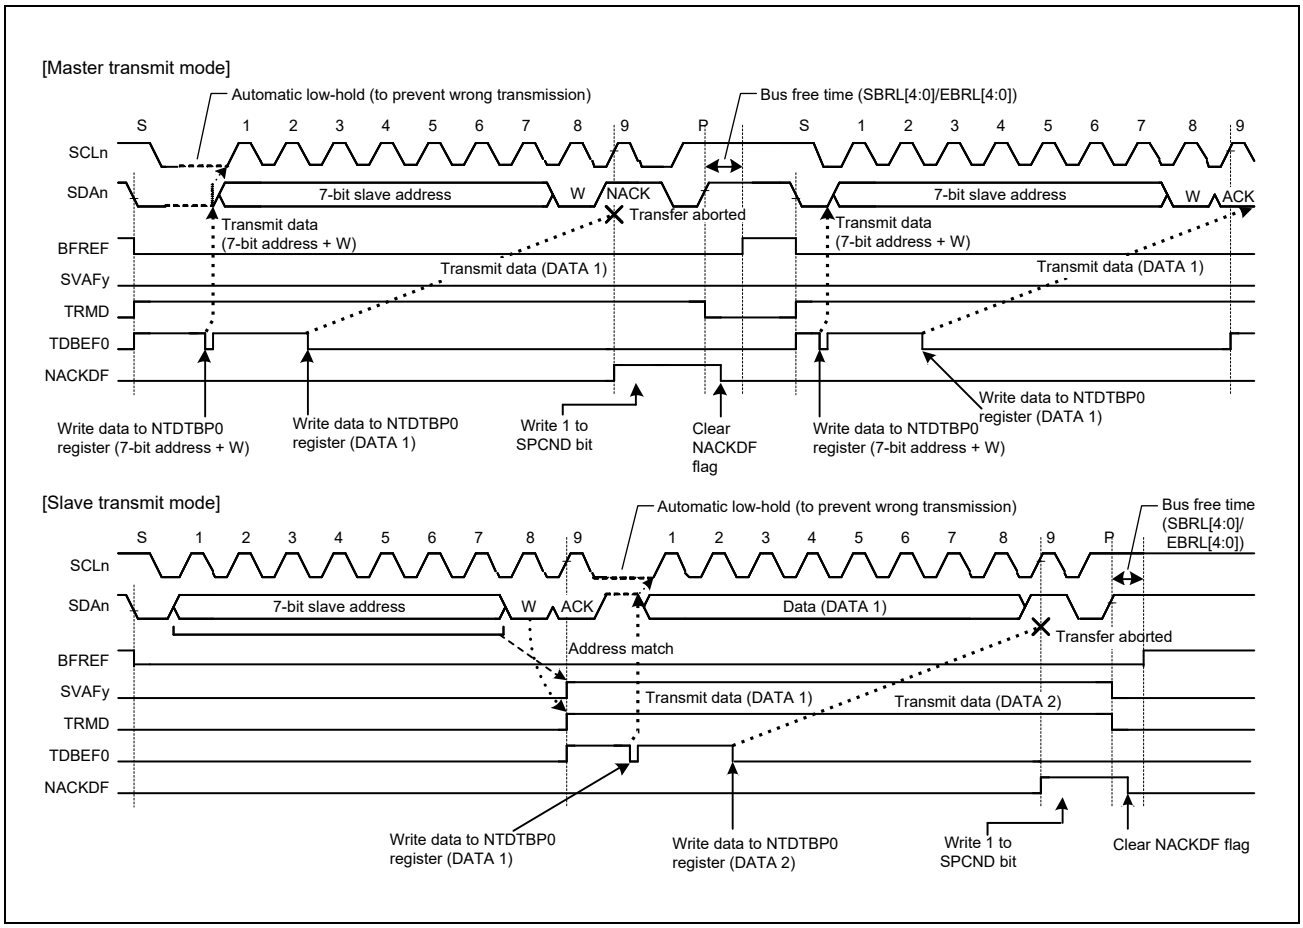

Figure 26.71 Abort of Data Transfer When NACK is Received (NACKE = 1)

(c) Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (NTDTBP0) read is delayed for a period of one transfer frame or more with receive data full (NTST.RDBFF0 = 1) in receive mode (PRSST.TRMD = 0), I3C holds the SCLn line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, I3C's own slave address or another slave address is received after a STOP condition is issued.

Sections in which the SCLn line is held low can be selected with a combination of the RWE and ACKTWE bits in SCSTRCTL.

1) 1-Byte Receive Operation and Automatic Low-Hold Function Using the RWE Bit

When the SCSTRCTL.RWE bit is set to 1, I3C performs 1-byte receive operation using the RWE bit function.

Furthermore, when the SCSTRCTL.ACKTWE bit = 0, I3C automatically sends the ACKCTL.ACKT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCLn line low at the falling edge of the ninth SCL clock cycle using the RWE bit function. This low hold is released by reading data from NTDTBP0, which enables bytewise receive operation.

The RWE bit function is enabled for receive frames after a match with I3C's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

2) 1-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the ACKTWE Bit

When the SCSTRCTL.ACKTWE bit is set to 1, I3C performs 1-byte receive operation using the ACKTWE bit function.

When the ACKTWE bit is set to 1, the NTST.RDBFF0 flag (receive data full) is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCLn line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the ACKCTL.ACKT bit, but cannot be released by reading data from NTDTBP0, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The ACKTWE bit function is enabled for receive frames after a match with I3C's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

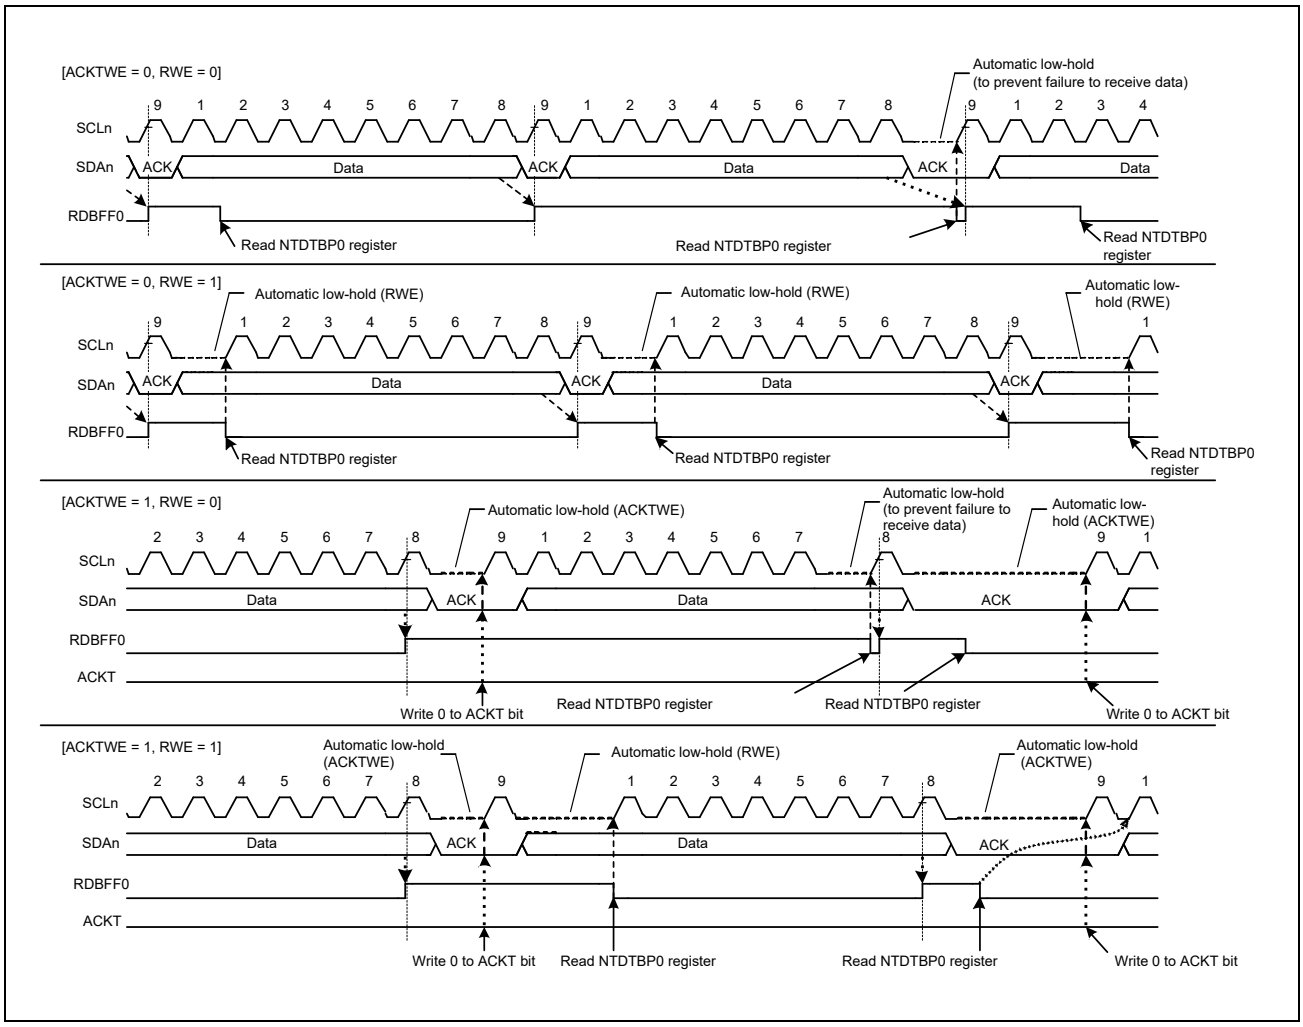

Figure 26.72 Automatic Low-Hold Operation in Receive Mode (using ACKTWE and RWE bits)

(7) Clock Stalling [I3C mode]

I3C has the function of stalling the SCL during the SCL Low period.

The SCL stall control is described in the table below.

Table 26.13 I3C clock stalling

Clock Stalling Condition	Clock Stalling Control	Clock Stalling Period
I3C Transfer, ACK/NACK Phase	SCSTLCTL.ACKPE bit setting	During the count period of SCSTLCTL.STLCYC[15: 0] value
	Transmit Data FIFO Empty	Until data is written to the TX FIFO
	Receive Data FIFO Full	Until data is read from the RX FIFO
I3C Write Data Transfer, Parity Bit	SCSTLCTL.PARPE bit setting	During the count period of SCSTLCTL.STLCYC[15: 0] value
	Transmit Data FIFO Empty	Until data is written to the TX FIFO
I3C Read Transfer, Transition Bit	Receive Data FIFO Full	Until data is read from the RX FIFO
Assigned Address Phase	SCSTLCTL.AAPE bit setting	During the count period of SCSTLCTL.STLCYC[15: 0] value
I3C Transfer, ACK/NACK Phase	SCSTLCTL.ACKPE bit setting	During the count period of SCSTLCTL.STLCYC[15: 0] value
	Transmit Data FIFO Empty	Until data is written to the TX FIFO
	Receive Data FIFO Full	Until data is read from the RX FIFO
I3C Write Data Transfer, Parity Bit	SCSTLCTL.PARPE bit setting	During the count period of SCSTLCTL.STLCYC[15: 0] value
	Transmit Data FIFO Empty	Until data is written to the TX FIFO
I3C Read Transfer, Transition Bit	Receive Data FIFO Full	Until data is read from the RX FIFO
Assigned Address Phase	SCSTLCTL.AAPE bit setting	During the count period of SCSTLCTL.STLCYC[15: 0] value

The following figure shows the stalling timing of each Condition.

(a) I3C Transfer, ACK/NACK Phase

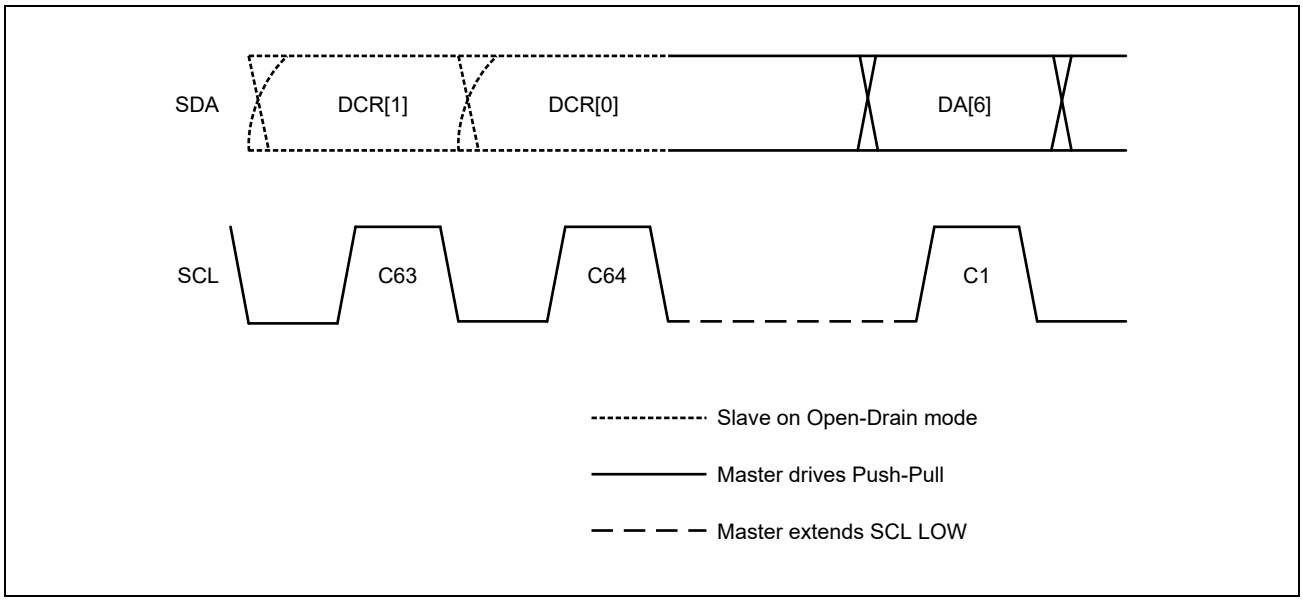

Figure 26.78 Master Clock Stalling in Dynamic Address First Bit

(8) In-Band Interrupt [I3C mode]

I3C detects In-Band Interrupt in the arbitrated Address Header following a START condition (but not following a Repeated START). If START Request (SDA Low Drive) is issued from Slave Device, I3C drives SCL low and completes START condition. After that, it supplies SCL and receives In-Band Interrupt Request.

The In-Band Interrupt to be detected is classified into the following three types.

- Slave Interrupt Request
- Mastership Request
- Hot-Join Event

The operation when detecting each In-Band Interrupt is described below.

(a) Slave Interrupt Request

1. Detect Slave Address with RnW bit High in Address Header.
2. Compare the detected Slave Address with the DVDYAD[7:0] in each DAT (DATBASm register).
3. When it does not match DAT.DVDYAD[7:0]:
   Responds NACK, then issues the STOP condition.
   When it matches the DAT.DVDYAD[7:0] bits and the DAT.DVSIRRJ bit = 1:
   It operates in the following order:
   (a) Responds NACK.
   (b) Issues Repeated START condition, then automatically issues Direct DISEC CCC to the detected Slave.
   (c) Issues the STOP condition.
   When it matches the DAT.DVDYAD[7:0] bits and the DAT.DVSIRRJ bit = 0:
   Responds ACK.
4. When DAT.DVIBIPL = 0:
   Issues the STOP condition.
   When DAT.DVIBIPL = 1:
   Drives the SCL to receive the IBI Data from the Slave following the ACK response and receives IBI Data.
   It stores the received IBI Data into the IBI Data Queue.
   Each time IBI Data of the size set by the NQTHCTL.IBIDSSZ[7:0] bits is received, the IBI Status Descriptor is stored in the IBI Status Queue.
5. After detection of Low of T-bit following IBI Data, issues STOP condition.
6. After issues of STOP condition NACK response:
   – If IBINCTL.NRSIRCTL = 0, the IBI Status Descriptor is not stored into the IBI Status Queue.
   – If IBINCTL.NRSIRCTL = 1, the IBI Status Descriptor is stored into the IBI Status Queue.
   ACK response:
   Stores the IBI Status Descriptor into the IBI Status Queue.

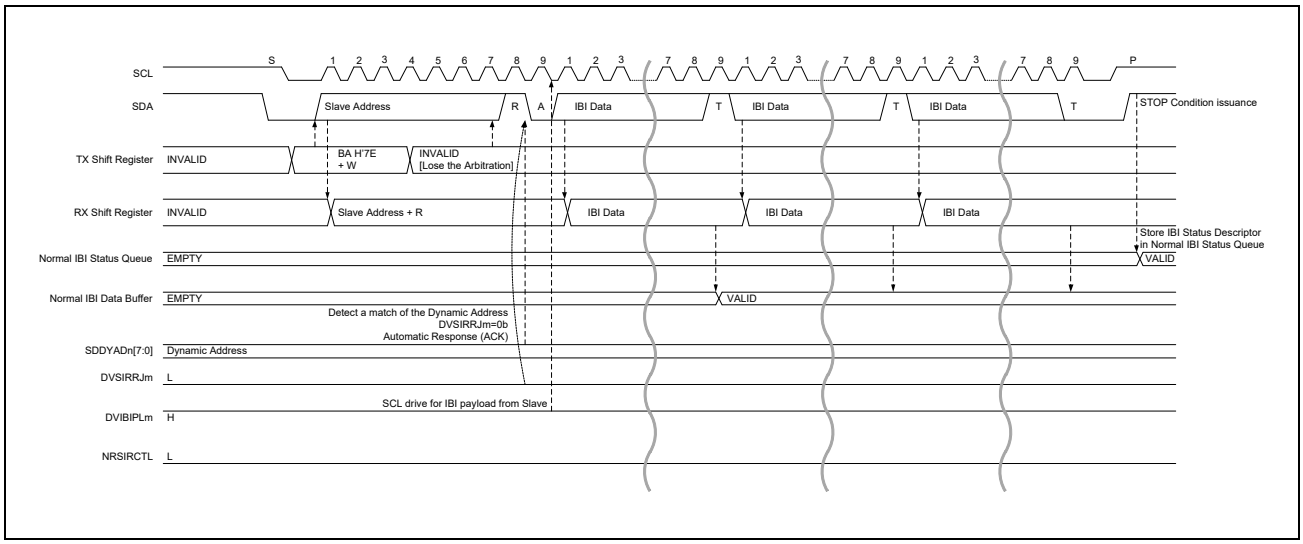

Figure 26.79 Slave Interrupt Request: ACK and DVIBIPL = 1

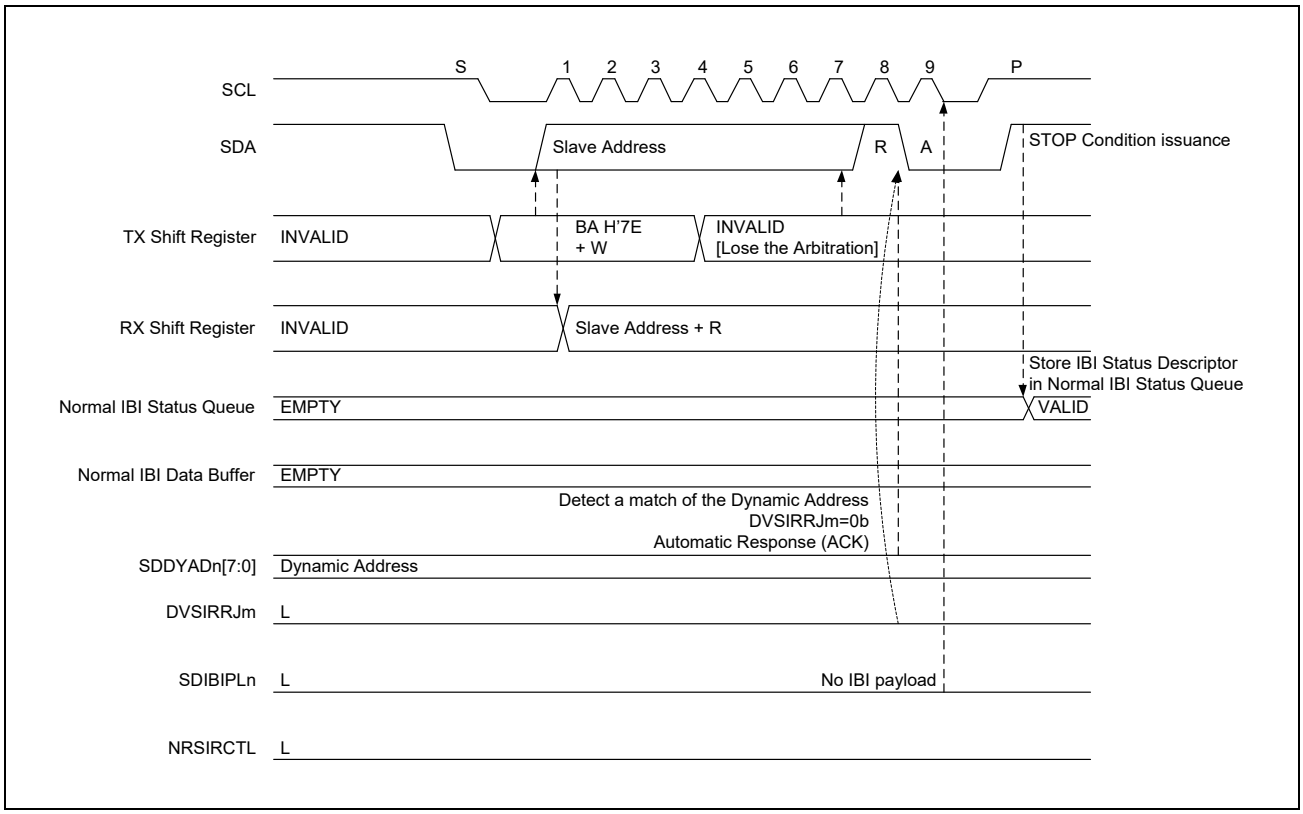

Figure 26.80 Slave Interrupt Request: ACK and DVIBIPL = 0

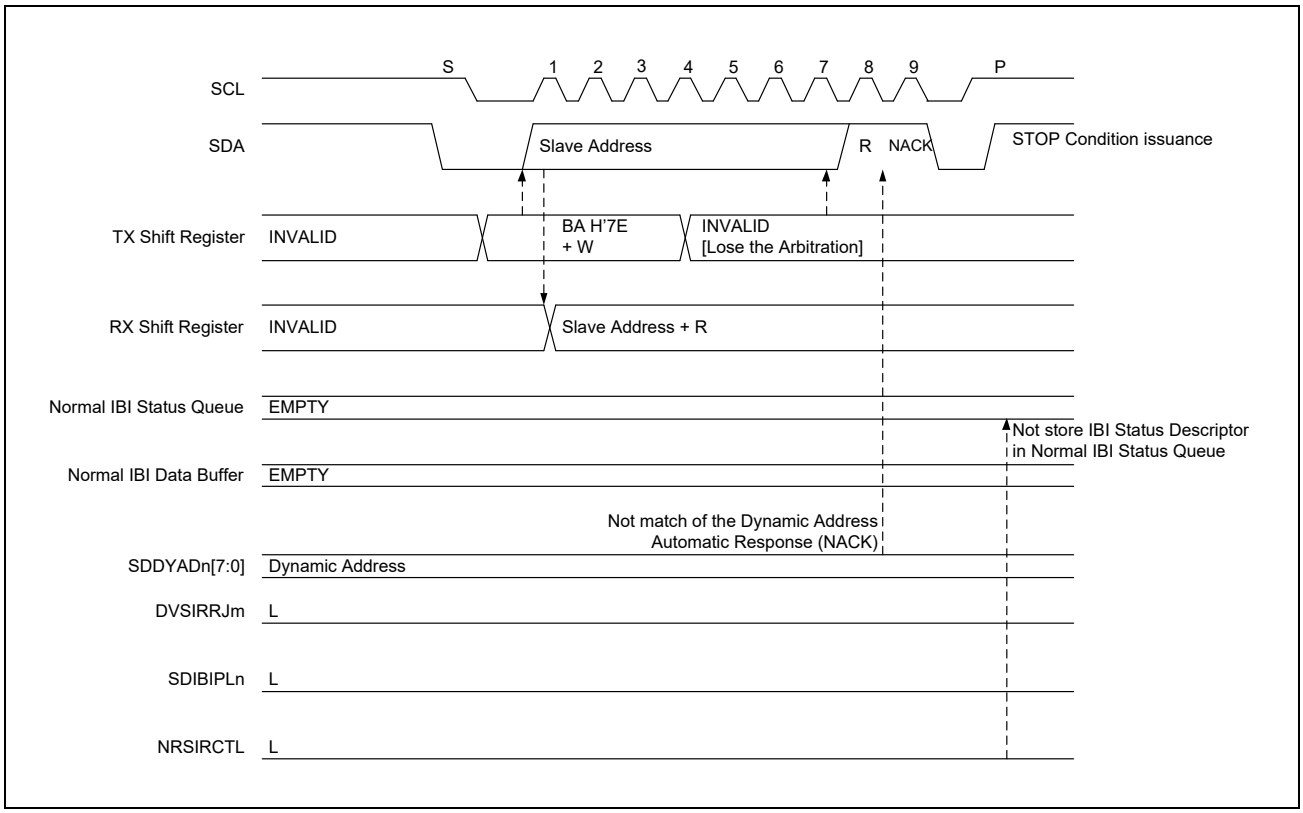

Figure 26.81 Slave Interrupt Request: NACK (not match the SDDYAD[7:0] of DAT) and NRSIRCTL = 0

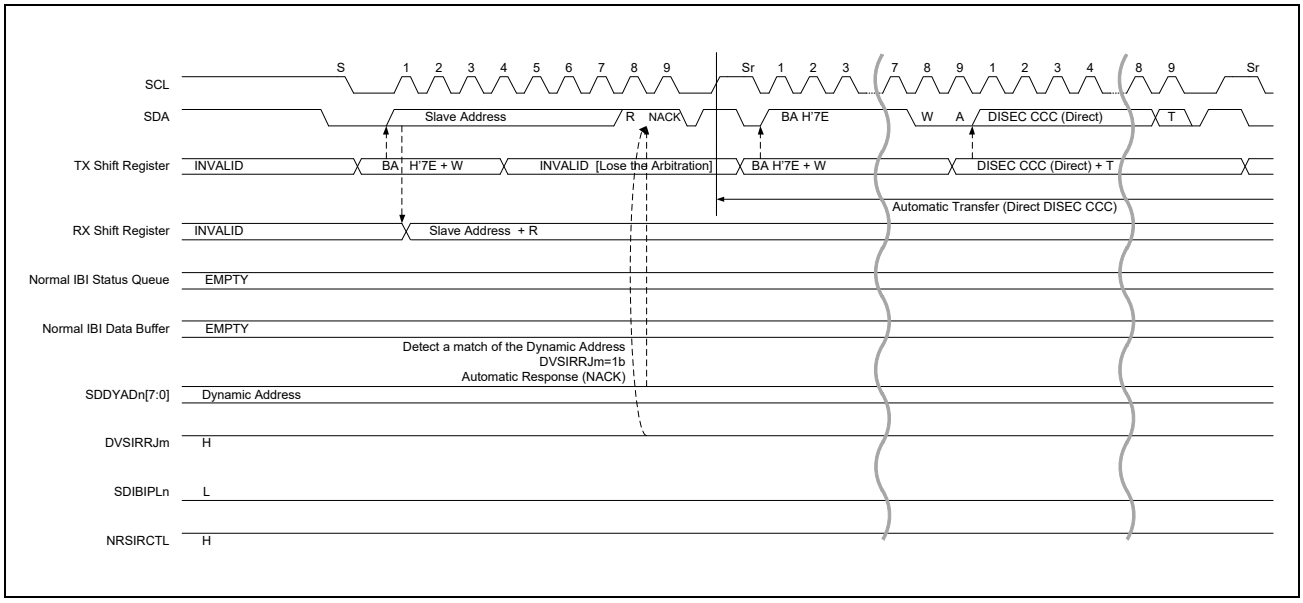

Figure 26.82 Slave Interrupt Request: NACK (DVSIRRJ = 1) and NRSIRCTL = 1 (1/2)

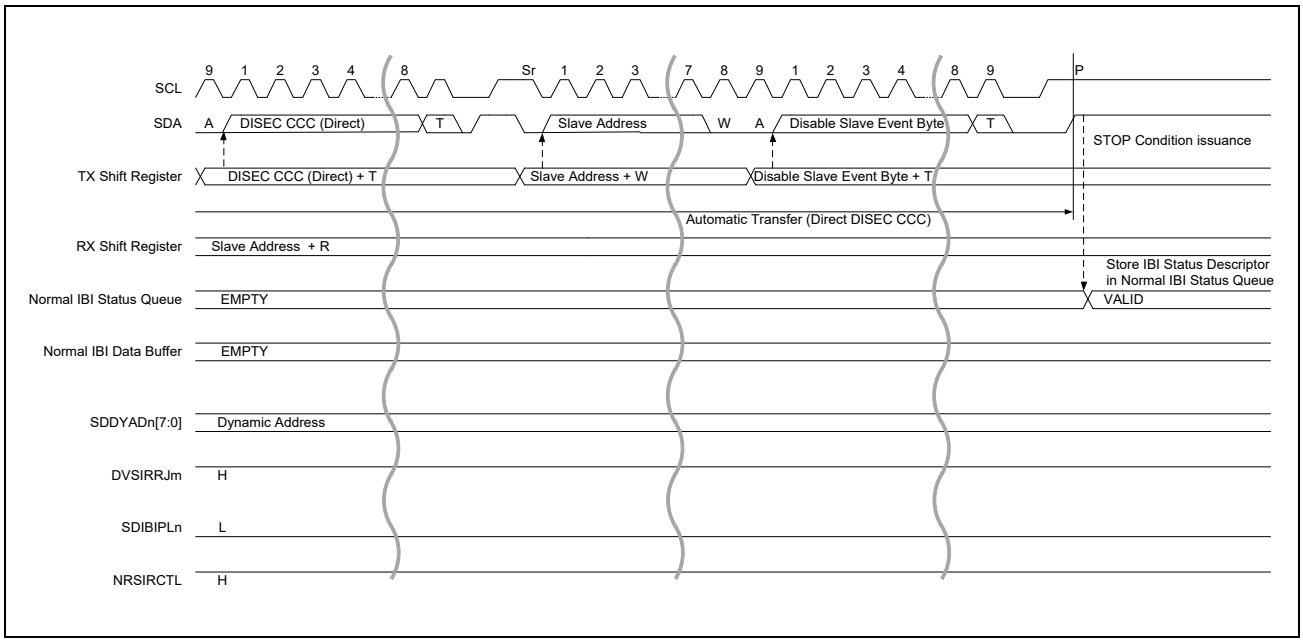

Figure 26.83 Slave Interrupt Request: NACK (DVSIRRJ = 1) and NRSIRCTL = 1 (2/2)

(b) Mastership Request

1. Detect Slave Address with RnW bit Low in Address Header.
2. Compare the detected Slave Address with the DVDYAD[7:0] in each DAT (DATBAS register).
3. When it does not match DAT.DVDYAD[7:0]:
   Rresponds NACK, then issues the STOP condition.
   When it matches the DAT.DVDYAD[7:0] bits and Device Role[1:0] in RBCR (MSDCTm) is other than I3C Master (01):
   Responds NACK, then issues the STOP condition.
   When it matches the DAT.DVDYAD[7:0] bits and Device Role[1:0] in RBCR (MSDCTm) is I3C Master (01):
   - When DAT.DVMRRJ = 1
     It operates in the following order.
     (a) Responds NACK.
     (b) Issued Repeated START condition and automatically issues Direct DISEC CCC to the detected Slave.
     (c) Issues the STOP condition.
   - When DAT.DVMRRJ = 0
     Responds ACK, then issues STOP condition.
4. After issues of STOP condition,
   NACK response:
   – If IBINCTL.NRMRCTL = 0, the IBI Status Descriptor is not stored into the IBI Status Queue.
   – If IBINCTL.NRMRCTL = 1, the IBI Status Descriptor is stored into the IBI Status Queue.
   ACK response:
   Stores the IBI Status Descriptor into the IBI Status Queue.

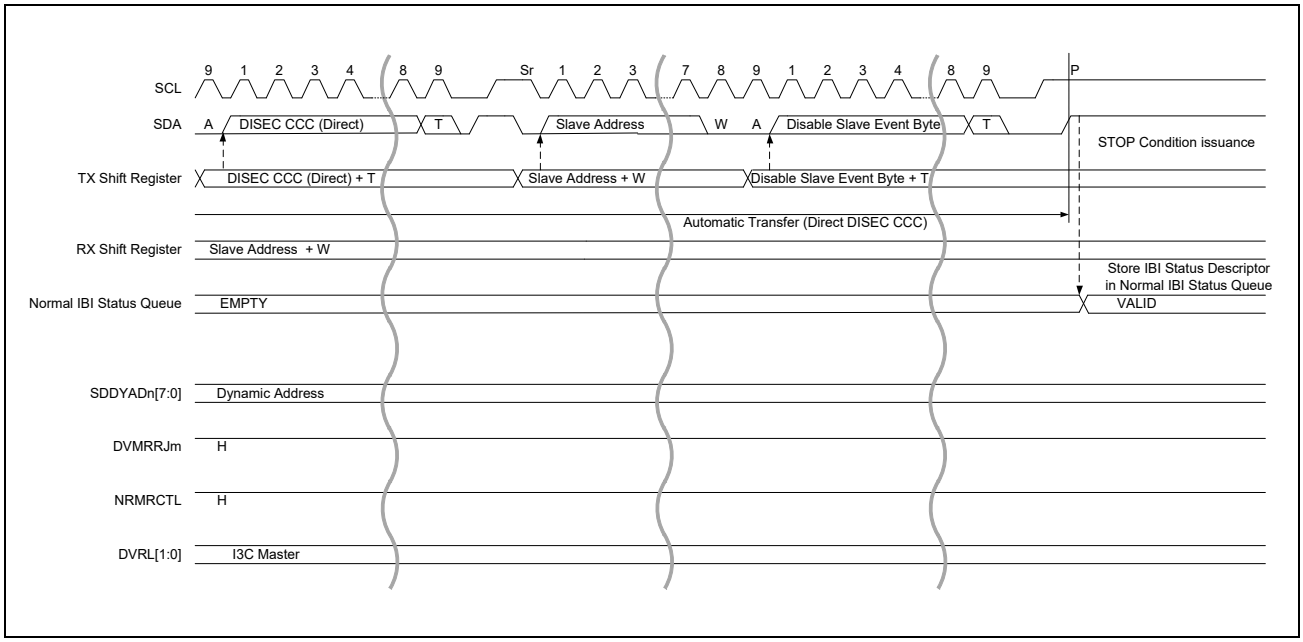

Figure 26.88 Mastership Request: NACK (DVMRRJ = 1) and NRMRCTL = 1 (2/2)

(c) Hot-Join Event

1. Detect the Hot-Join Address (H'02) with RnW bit Low in the Address Header.
2. When BCTL.HJACKCTL = 1,
   It operates in the following order.
   (a) Responds NACK.
   (b) Issues Repeated START condition and automatically issues Broadcast DISEC CCC.
   (c) Issues the STOP condition.
   When BCTL.HJACKCTL = 0,
   Responds ACK, then issues STOP condition.
3. After issues of STOP condition, NACK response:
   – If IBINCTL.NRHJCTL = 0, the IBI Status Descriptor is not stored into the IBI Status Queue.
   – If IBINCTL.NRHJCTL = 1, store the IBI Status Descriptor into the IBI Status Queue.
   ACK response:
   Stores the IBI Status Descriptor into the IBI Status Queue.

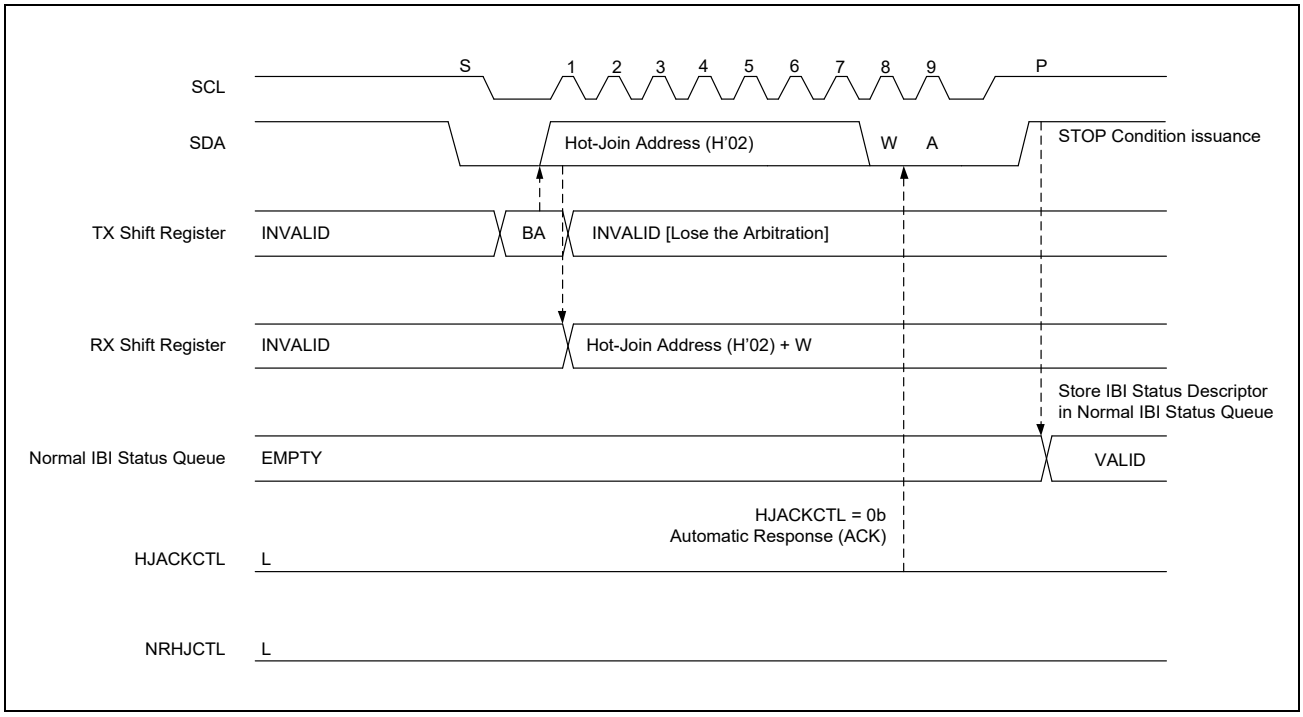

Figure 26.89 Hot-join Event: ACK

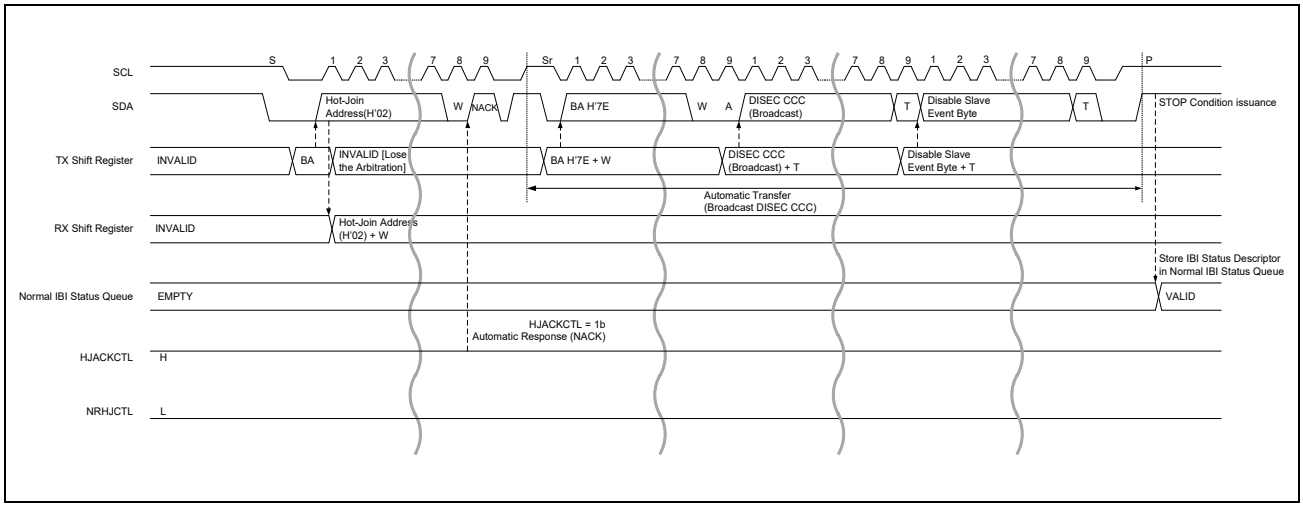

Figure 26.91 Hot-join Event: NACK (HJACKCTL = 1) and NRHJCTL = 1

(9) Timing Control [I3C mode]

I Timing Control is a function that enables Master to efficiently read data from Slave by controlling and grasping the timing at which the Slave Device samples the sensor value.

For details, refer to *5.1.8, Timing Control of MIPI I3C Specificaton v1.0*.

In this IP, timing Control supports the following three modes.

- Sync Mode
- Async Mode 0 (Asynchronous Basic Mode)
- Async Mode 1 (Asynchronous Advanced Mode)

The resources for realizing Timing Control in each mode are described below.

(a) Sync Mode

1) I3C Master

The measured value of Delay Time is sent as a DT message (SETXTIME CCC with DT subcommand) following the ST message.

2) I3C Slave

The sampling timing is recalculated by the corrected T_ph.

(b) Async Mode 0 (Asynchronous Basic Mode)

For timing control in Async Mode 0, set the ATCTL register if necessary.

1) I3C Master

This IP has counters of MREF (32bit) and MC2(16bit) for Async Mode 0.

- MREF Counter

  When ATCCNTE.ATCE is enabled, it starts counting.
  It captures as MREF on the SCL rise edge next to ACK for the IBI transmitted from the I3C Slave.

- MC2 Counter

  After enabling ATCCNTE.ATCE, it counts up from the SCL rise edge next to ACK for the IBI transmitted from the I3C Slave to the SCL rise edge next to the Tbit after Mandatory Byte and capture it as MC2.

The MREF and MC2 capture values are stored next to the IBI Status Descriptor when IBI is received from the I3C Slave with the DATBASm.DVIBITS bit set to 1.
The MREF counter implemented in this IP is 32-bit counter.

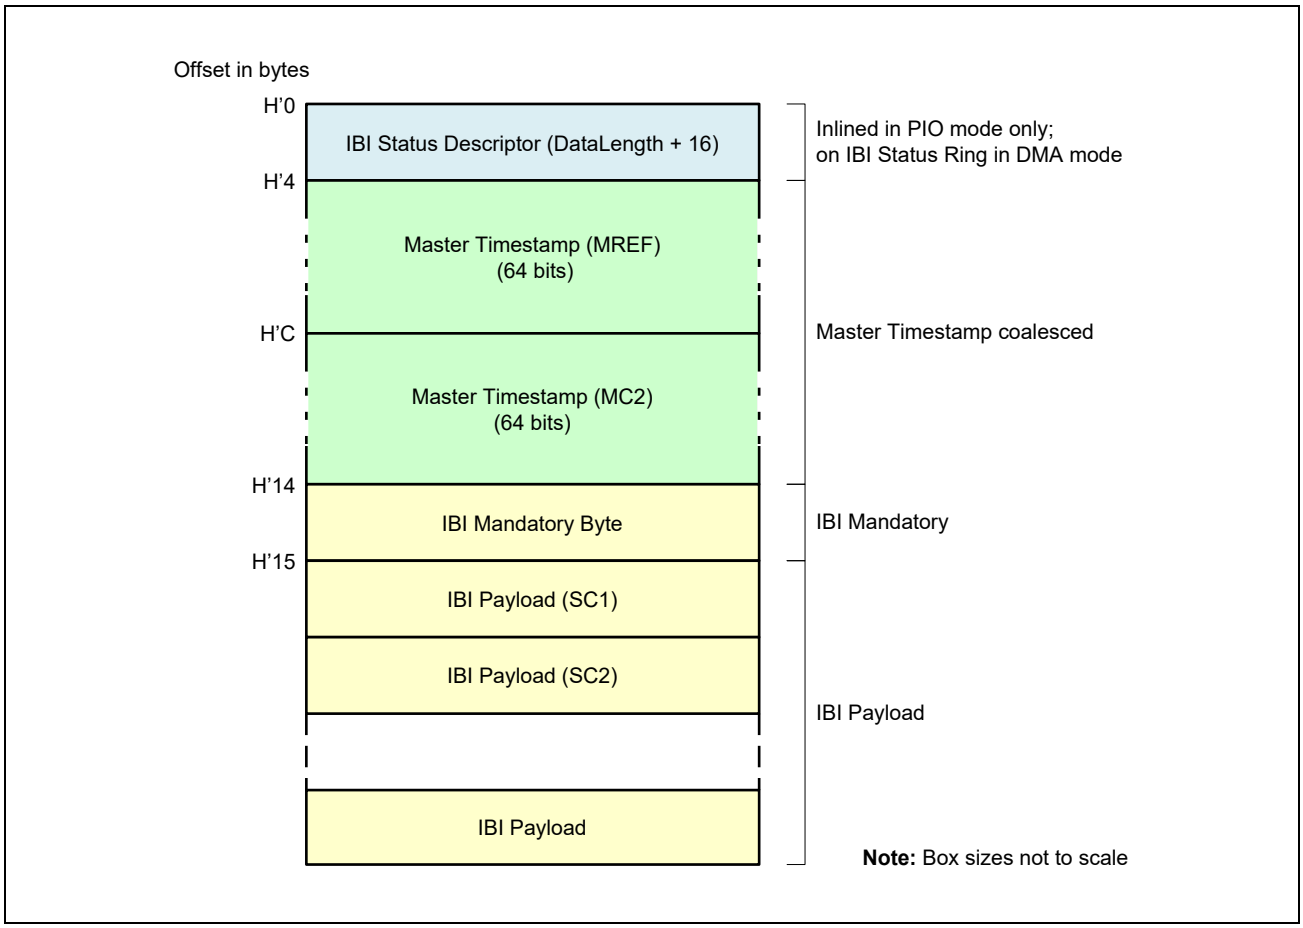

Figure 26.92 Master Timestamp Counters for IBI Event

2) I3C Slave

This IP has counters of SC1 (16 bits) and SC2 (8 bits) for Async Mode 0.

- SC1 Counter
  After enabling ATCCNTE.ATCE, it counts up from SC1 count trigger to SCL rise edge next to ACK for the IBI and capture it as SC1.
- SC2 Counter
  After enabling ATCCNTE.ATCE, it counts up from SCL rise edge next to ACK for the IBI transmitted from I3C Slave to SCL rise edge next to Tbit after Mandatory Byte and capture it as SC2.

When the CETSS.ASYNE[0] bit = 1 and the ITS bit in Command Descriptor for issuing IBI is 1, the SC1 and SC2 capture values are transmitted following the IBI Mandatory Byte as shown in the following figure.

If the SC1 and SC2 counters overflow, H'FFFF and H'FF are captured and CETSS.ICOVF is set 1.

The DATA_LENGTH[15:0] bits value of the Command Descriptor sets a value obtained by adding the number of data of SC1 and SC2 to the number of transmission data.

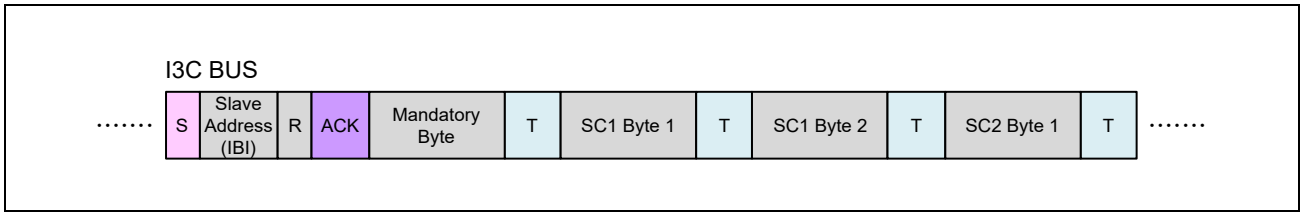

Figure 26.93 Example of Asynchronous Mode 0 Timestamp Data Transfer

(10) Async Mode 1 (Asynchronous Advanced Mode)

For timing control in Async Mode 1, set the ATCTL register if necessary.

(a) I3C Master

This IP has counters of MREF (32 bits), MSyncCNT (32 bits) and MC2 (16 bits) for Async Mode 1.

- MREF Counter

  When ATCCNTE.ATCE is enabled, it starts counting.
  It captures as MREF at the SCL rise edge next to ACK for the IBI transmitted from the I3C Slave.
  The MREF extension method described in "1) I3C Master" of **Section 26.3.2.3(9)(b), Async Mode 0 (Asynchronous Basic Mode)** is also possible in Async Mode 1.
- MSyncCNT Counter

  When ATCCNTE.ATCE is enabled, it starts counting.
  It captures as MSyncCNT for each aME (SDA falling edge of START condition) and store it in the capture register.
- MC2 Counter

  After enabling ATCCNTE.ATCE, it counts up from the SCL rise edge next to ACK for the IBI transmitted from the I3C Slave to the SCL rise edge next to the Tbit after Mandatory Byte and capture it as MC2.

The MREF and MC2 capture values are stored next to the IBI Status Descriptor when the IBI is received from the I3C Slave with the DATBASm.DVIBITS bit set to 1. (Same as Async Mode 0)

(b) I3C Slave

This IP has counters of SC1 (16 bits), SC2 (8 bits) and aME_TICK (8 bits) for Async Mode 1.

- SC1 Counter

  After enabling ATCCNTE.ATCE, it counts up from SC1 count trigger*1 to the first aME and capture it as SC1.

Note 1. SW or external trigger can be selected by selection bits.
The SC1 count trigger select method described in “2) I3C Slave” of **Section 26.3.2.3(9)(b), Async Mode 0 (Asynchronous Basic Mode)** is also possible in Async Mode 1.

- SC2 Counter

  After enabling ATCCNTE.ATCE, it counts up from SCL rise edge next to ACK for the IBI transmitted from I3C Slave to SCL rise edge next to Tbit after Mandatory Byte and capture it as SC2.

- aME_TICK Counter

  After enabling ATCCNTE.ATCE, it counts every aME, and capture it as aME_TICK at the SCL rise edge next to ACK for the IBI.
  The aME_TICK counter is cleared on the first aME after the SC1 count trigger.

When the CETSS.ASYNE[1] bit = 1 and the ITS bit in Command Descriptor for issuing IBI is 1, the SC1, SC2 and aME_TICK capture values are transmitted following the IBI Mandatory Byte as shown in the following figure.

If the SC1 and SC2 counters overflow, H’FFFF and H’FF are captured and CETSS.ICOVF is set 1.

The DATA_LENGTH[15:0] bits value of the Command Descriptor sets a value obtained by adding the number of data of SC1, SC2 and aME_TICK to the number of transmission data.

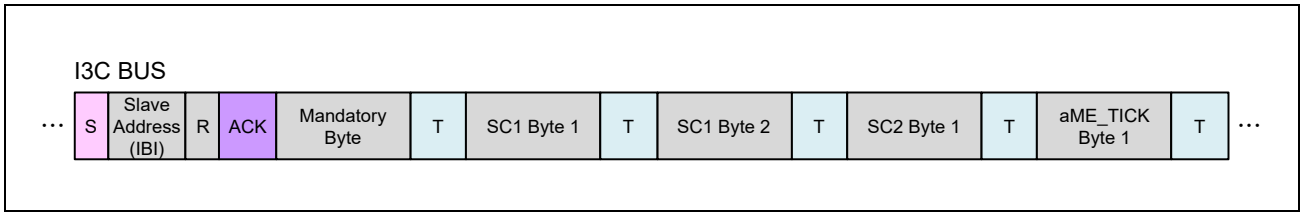

Figure 26.94 Example of Asynchronous Mode 1 Timestamp Data Transfer

(11) Port Control

(a) Extra SCL Clock Cycle Output Function

In master mode, I3C module has a facility for the output of extra SCL clock cycles to release the SDAn line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDAn line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from I3C with single cycles of the SCL clock as the unit in the case of a bus error where I3C cannot issue a Repeated START condition or a STOP condition because the slave device is holding the SDAn line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the OUTCTL.EXCYC bit is set to 1, an additional clock pulse at the frequency set by the REFCKCTL.IREFCKS[2:0] bits and the STDBR.SBRHO[7:0] and STDBR.SBRLO[7:0] registers is output from the SCLn pin. After output of this clock pulse, the EXCYC bit automatically becomes 0. After confirming that the EXCYC bit is 0, wait for the setup time of the Repeated START condition or STOP condition, and then confirm the detection of the Repeated START condition or STOP condition. If the Repeated START condition or STOP condition is not detected, consecutive additional clock pulses can be output by writing 1 to the EXCYC bit again.

When I3C module is in master mode and the slave device is holding the SDAn line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a Repeated START condition or a STOP condition is not possible. The facility for output of an extra cycle of the SCL clock can be used to output extra cycles of SCL one by one to make the slave device release the SDAn line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDAn line by the slave device can be monitored by reading the SDILV bit in PRSTDBG. After the SDAn line has been released by the slave device, the preset of a Repeated START condition or a STOP condition is issued.

Use this function with the BFCTL.MALE bit set to 0 (master arbitration-lost detection is disabled).

[Output conditions for using the EXCYC bit in OUTCTL]

- When the bus is free (BFREF flag in BCST = 1) or in master mode (CRMS bit = 1 in PRSST and BFREF flag = 0 in BCST)
- When the communication device does not hold the SCLn line low

Figure 26.95 shows the operation timing of the extra SCL clock cycle output function (EXCYC bit).

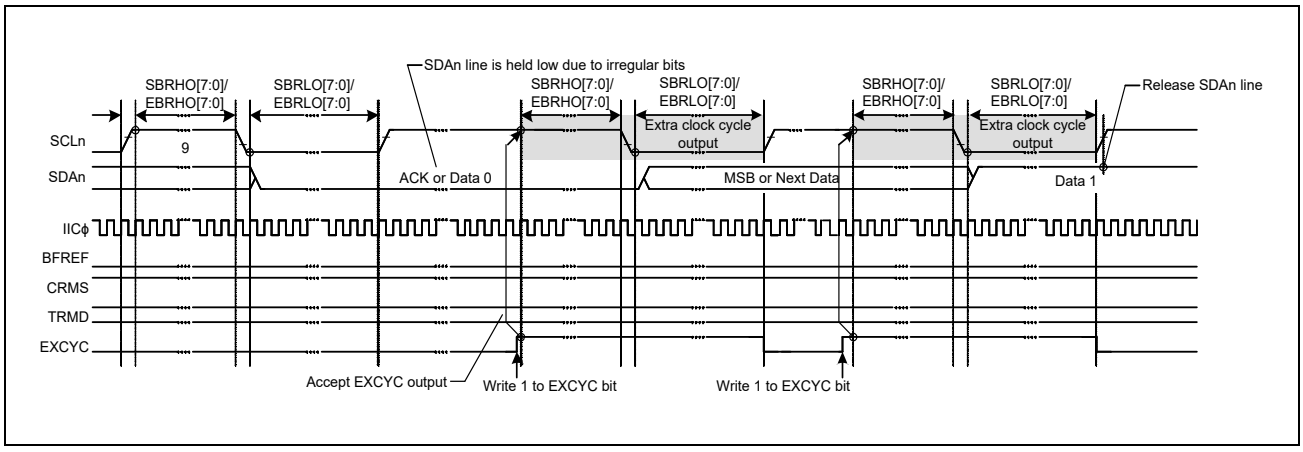

Figure 26.95 Extra SCL Clock Cycle Output Function (EXCYC Bit)

(12) Common Command Codes (CCC) [I3C mode]

Command Code H'E0 to H'FE Vendor Extension-Direct CCCs defined are not supported. The MIPI reserved area and Vendor Extension area of Command Code are not supported. Do not use an unsupported CCC when using this module with I3C Slave.

If the I3C Master must use an unsupported CCC, use the added CCC after using ENTASx CCC to put this module to Sleep mode.

26.3.2.4 Error Detection

(1) SDR Error Detection and Recovery Methods for I3C Slave Devices [I3C mode]

The seven error types summarized in **Table 26.14** are supported for all I3C slave devices. Each error type is further explained below the table.

Table 26.14 SDR Slave Error Types

Error Type	Description	Error Detection Method	Error Recovery Method
S0	Broadcast address/W (= H'7E/W) or Dynamic address/RW	Detect any of the following: H'3E/W H'5E/W H'6E/W H'76/W H'7A/W H'7C/W H'7F/W H'7E/R	Enable HDR EXIT Detector and ignore all other patterns
S1	CCC code	Parity check, using T-Bit	Enable HDR EXIT detector and neglect other patterns
S2	Write data	Parity check, using T-Bit	Enable STOP detector and neglect other patterns
S3	Assigned address during Dynamic address arbitration	Parity check, using PAR Bit	Generate NACK (after PAR), then wait for another Repeated START and 7E/R to re-transmit the Provisional ID
S4	H'7E/R after Sr during Dynamic address arbitration	Detect any value other than H'7E/R after Sr during Dynamic Address Arbitration	Generate NACK (after H'7E/R), then enable STOP Detector and ignore all other patterns
S5	Transaction after detecting CCC	Detect illegally formatted CCC	Generate NACK (after Slave Address), then enable STOP Detector and ignore all other patterns
S6 (optional)	Monitoring error	Slave detects (through monitoring) that transmitted Data differs from what it intended to transmit (Does not apply during Dynamic address arbitration)	Stop the transmission, then enable STOP Detector and ignore all other patterns

(2) SDR Error Detection and Recovery Methods for I3C Master Devices [I3C mode]

The two error types summarized in **Table 26.15** are supported for all I3C master devices. Each error type is further explained below the table.

Table 26.15 SDR Master Error Types

Error Type	Description	Error Detection Method	Error Recovery Method
M0	Transaction after sending CCC	Detect illegally formatted CCC	Stop the transmission, then send STOP and retry the transmission.
M1 (optional)	Monitoring error	Master detects (through monitoring) transmitted data different from what it intended to transmit (Does not apply during Dynamic address arbitration)	Stop the transmission, then send STOP and retry the transmission.
M2	No response to Broadcast address (H'7E)	Master detects NACK after Broadcast address (H'7E) transmission	Upon detection of NACK, master transmits HDR exit pattern followed by STOP

(3) Timeout Error Detection

I3C includes a timeout function for detecting when the SCLn line has been stuck longer than the predetermined time. I3C can detect an abnormal bus state by monitoring that the SCLn line is stuck low or high for a predetermined time.

The timeout function monitors the SCLn line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCLn line changes (rising or falling), but continues to count unless the SCLn line changes. If the internal counter overflows due to no SCLn line change, I3C can detect the timeout and report the bus hung state.

This timeout function is enabled when BSTE.TODE = 1. It detects a hung state that the SCLn line is stuck low or high during the following conditions: (When TMOCTL.TOMDS[1:0] = 00b)

- The bus is busy (BCST.BFREF = 0) in master mode (PRSST.CRMS = 1).
- I3C's own slave address is detected (SVST register is not H'0000) and the bus is busy (BCST.BFREF = 0) in slave mode (PRSST.CRMS = 0).
- The bus is free (BCST.BFREF = 1) while generation of a START condition is requested (CNDCTL.STCND = 1).

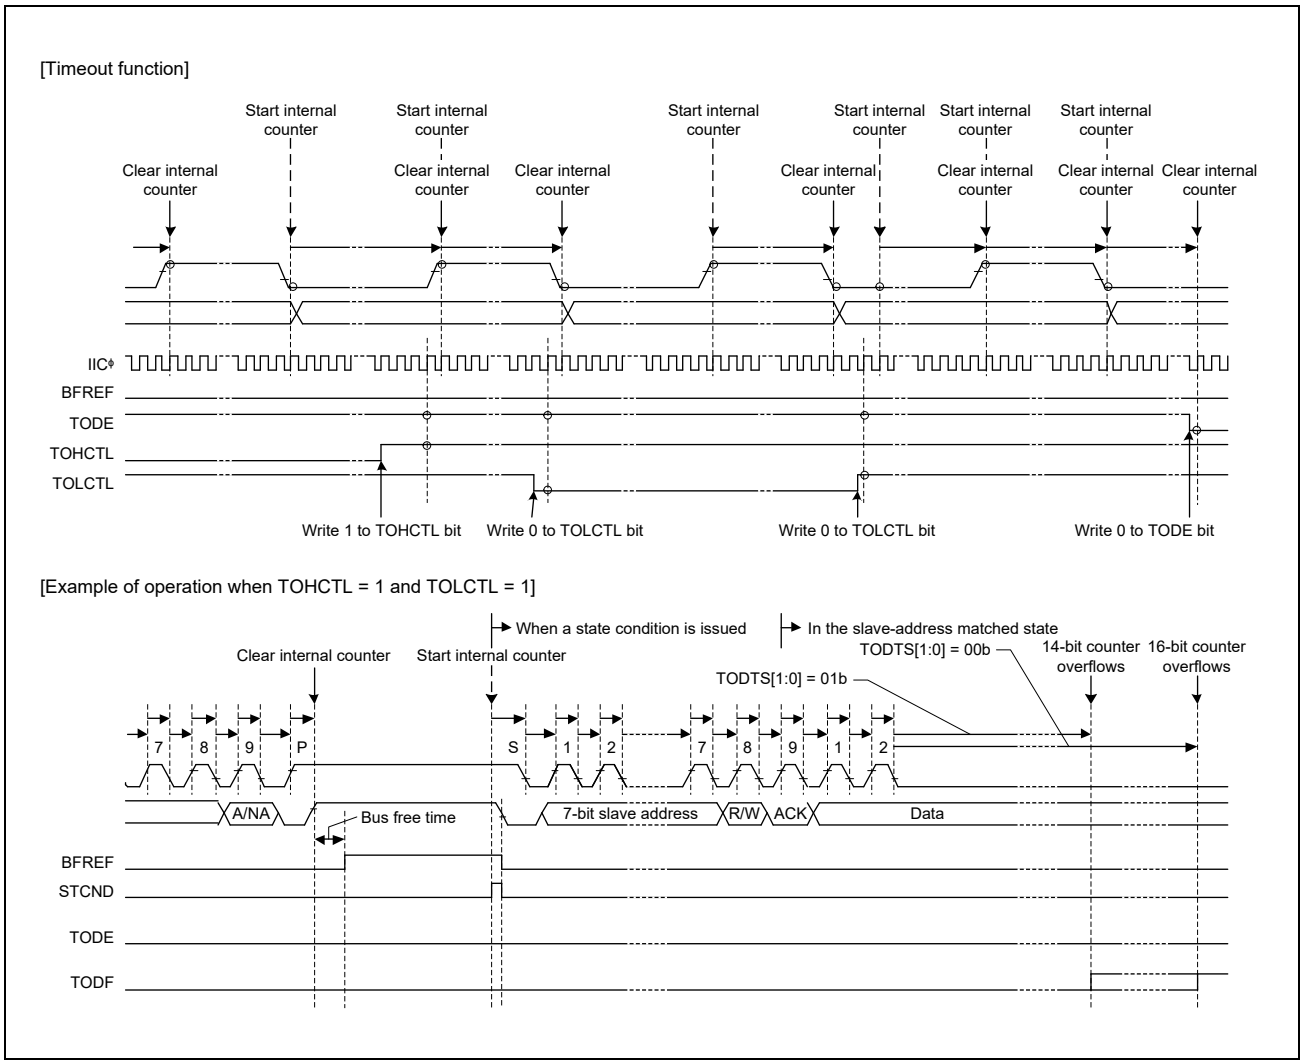

Figure 26.96 Timeout Error Detection (TODE, TODTS[1:0], TOHCTL, and TOLCTL bits)

(4) Resume Operation [I3C mode]

I3C enters the Halt state as a result of any type of error occurring in a transfer.

The error type is indicated by the field ERR_STATUS in Response Descriptor or Receive Status Descriptor. After I3C has entered the Halt state, the user must write the value 1 to the RSM bit to resume operation. I3C shall auto clear the RSM bit once it has initiated the next Command transfer or detected the START condition.

(5) Abort Operation [I3C mode]

When the BCTL.ABT bit is set to 1, I3C relinquish control of the bus before completing the currently issued transfer. In response to an abort request, I3C issues the STOP condition on the bus after the complete data byte is transferred or received. After I3C has aborted, the user shall clear the BCTL.ABT bit to allow operation on the bus.

NOTE

For Read transaction, when BCTL.ABT is set to 1, that receive data is stored in Receive data buffer.

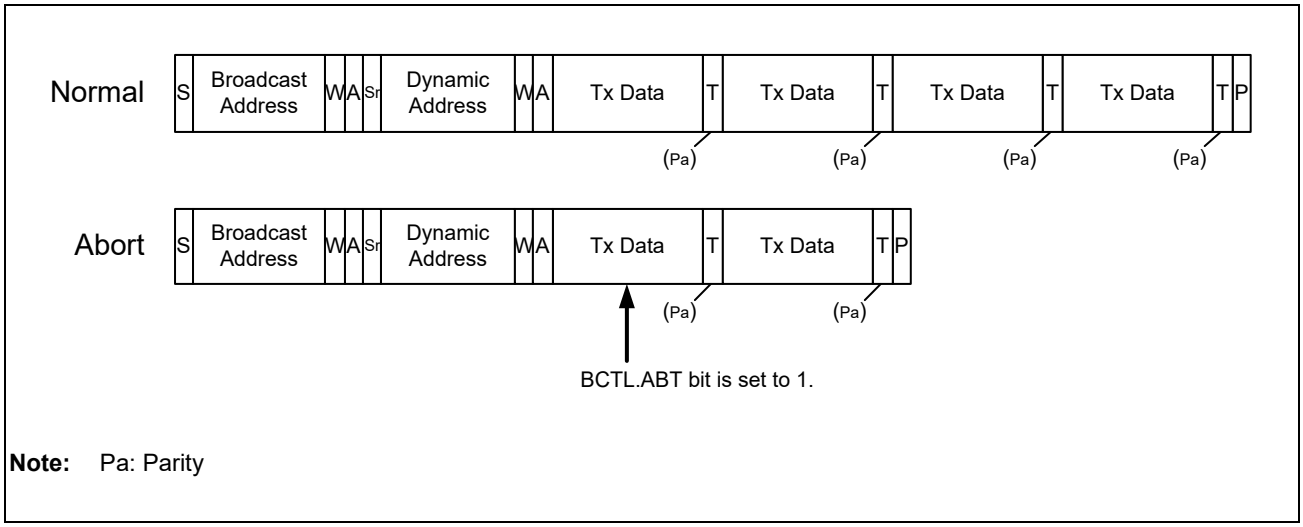

Figure 26.97 Abort Operation of SDR Write Transfer

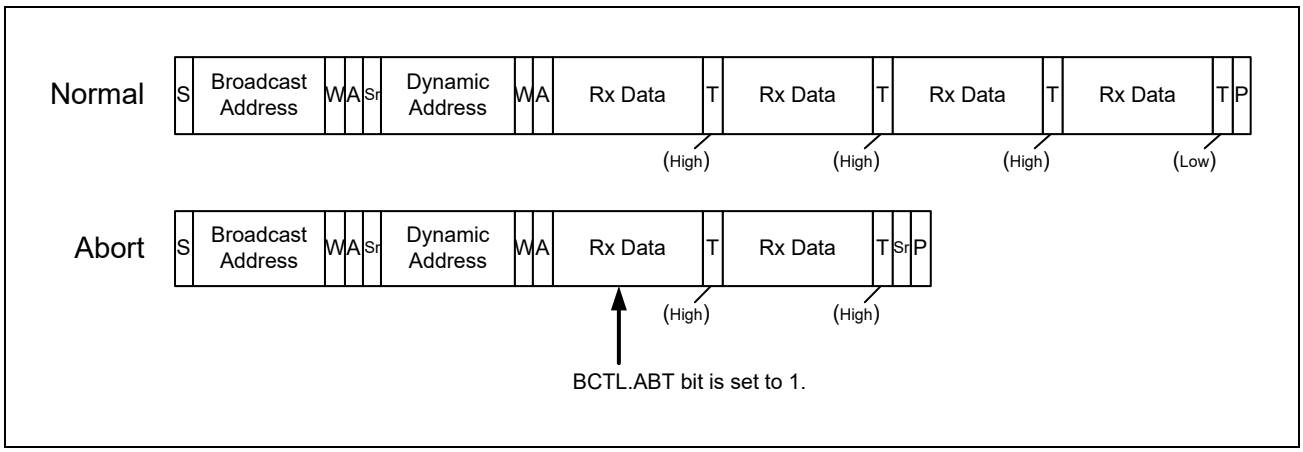

Figure 26.98 Abort Operation of SDR Read Transfer

(6) Error Recovery Operation [I3C mode]

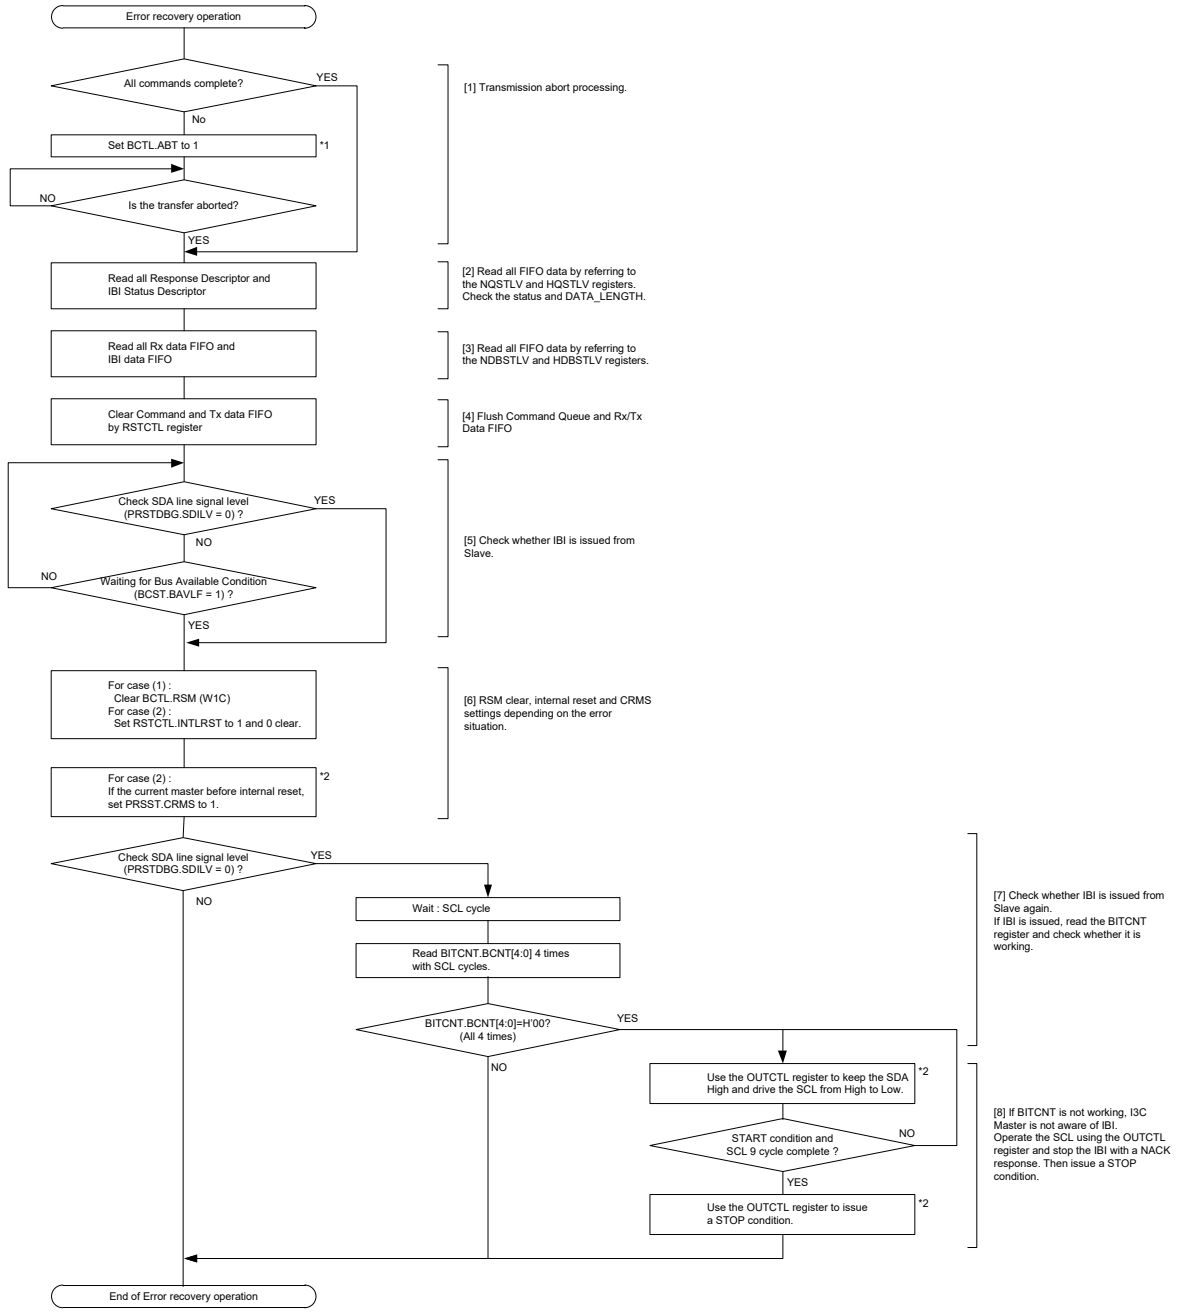
When an error occurs, the INST.INEF, NTST.TEF and NTST.TABTF flags are set to 1 according to the cause of the error, or the interrupts associated with each flag are asserted (when detection and interrupts are enabled.)

There is a possibility of communication error or internal module error.

The I3C master must perform an error recovery flow according to the following case:

- When TEF is detected.

Figure 26.99 and **Figure 26.100** show the error recovery flow.



Note 1. If the transfer is not aborted due to an error, set the BCTL.ABT bit to 1 and then abort the transfer.

Note 2. When writing to the CRMS bit, set PRSST.PRSSTWP bit to 1 at the same time.

Note 3. When writing to the SDOC and SCOC bit, set OUTCTL.SOCWP bit to 1 at the same time.

Figure 26.99 Example of Error Recovery Operation Flowchart for I3C Master

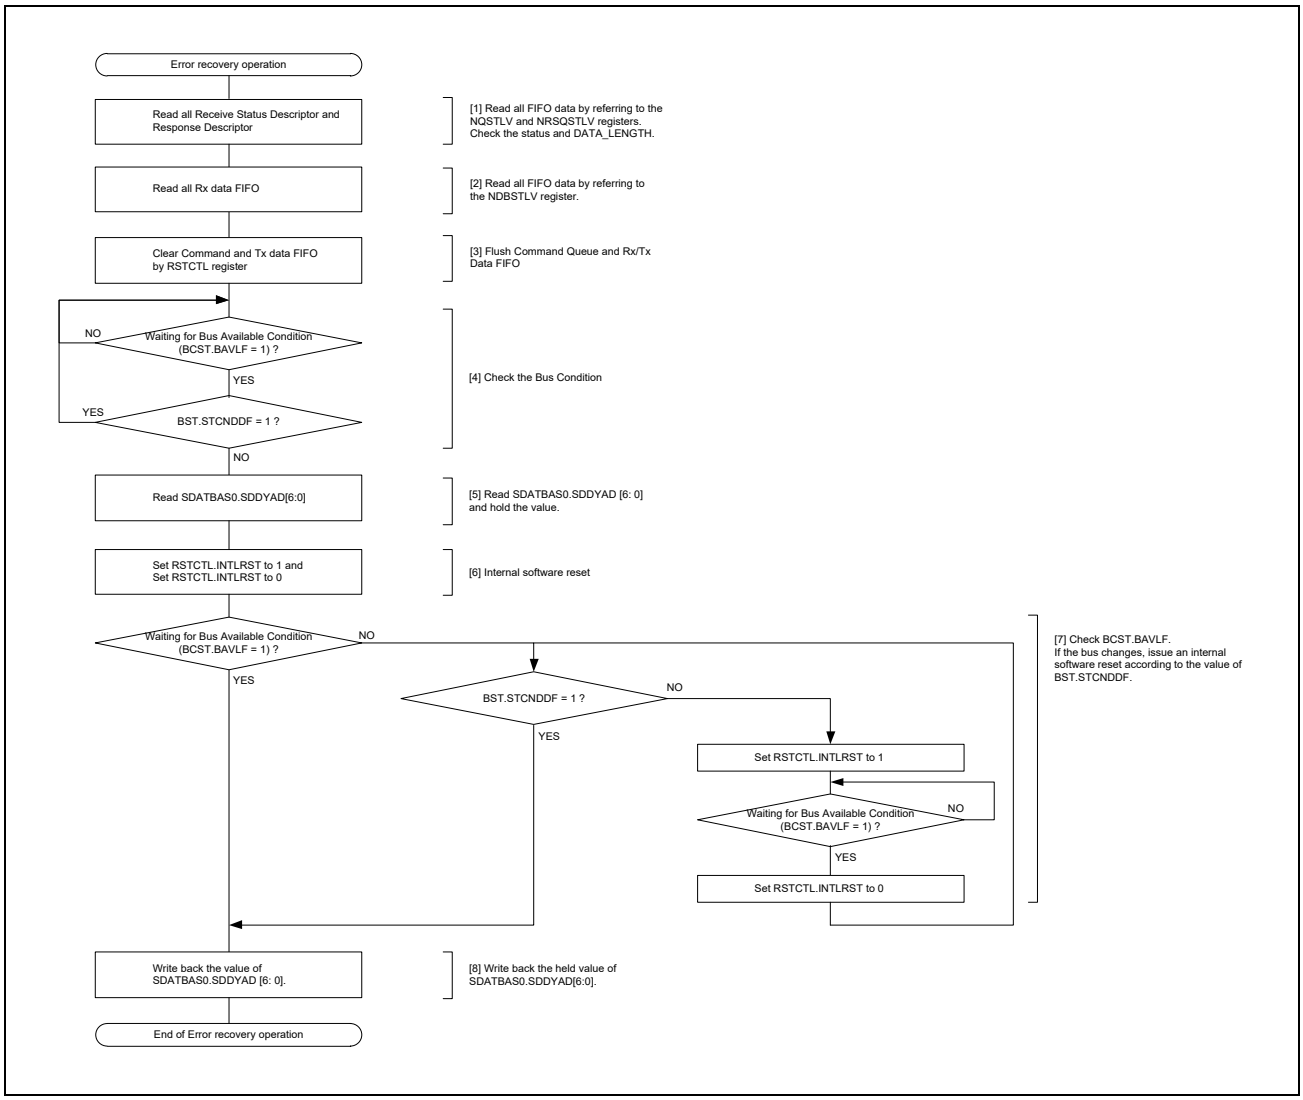


Figure 26.100 Example of Error Recovery Operation Flowchart for I3C Slave

26.3.2.5 Low Power Function [I²C/I3C common]

(1) Wake Up function [I²C mode]

This IP is equipped with the Wake-up function that causes the microcomputer to transition from low power consumption mode with system clock is stopped (software standby mode, snooze, etc.) to the normal operation. The Wake-up function is used to generate a Wake-Up interrupt signal when the received data matches the address set to Wake-Up interrupt factor also receives data in a state where the operating clock (PCLK/TCLK) is stopped (PCLK/TCLK asynchronous operation). This wake-up interrupt signal causes the microcomputer to transition to the normal operation. After Wake-Up interrupt occurs, switch this IP to PCLK/TCLK synchronous operation, it will be able to continue the communication operation.

The Wake-up function has four wake-up operation modes (normal WU mode 1, normal WU mode 2, command recovery mode, and EEP response mode). The table below describes the behavior in these four wake-up operation modes.

Table 26.16 Wake-Up Operation Mode

	ACK Response Timing	ACK Type Responded before Recovery to PCLK/TCLK Synchronous Operation	SCL State before Recovery to PCLK/TCLK Synchronous Operation
Normal WU mode 1	Before recovery to PCLK/TCLK synchronous operation*1	ACK	Fixed to “L”
Normal WU mode 2	After recovery to PCLK/TCLK synchronous operation*2	Before recovery: no response (NACK level retained) After recovery: ACK response	Fixed to “L”
Command recovery mode	Before recovery to PCLK/TCLK synchronous operation*1	ACK	Open
EEP response mode	Before recovery to PCLK/TCLK synchronous operation*1	NACK	Open

Note 1. Switching timing from PCLK/TCLK asynchronous operation to PCLK/TCLK Synchronous operation is the fall of the 9th clock of SCL.

Note 2. Switching timing from PCLK/TCLK asynchronous operation to PCLK/TCLK Synchronous operation is the fall of the 8th clock of SCL.

The following is able to select as Wake-Up interrupt factor.

- Host address detection (valid when SVCTL.HOAE = 1)
- General call address detection (valid when SVCTL.GCAE = 1)
- Slave address 0*1 detection (valid when SVCTL.SVAE0 = 1)
- Slave address 1*1 detection (valid when SVCTL.SVAE1 = 1)
- Slave address 2*1 detection (valid when SVCTL.SVAE2 = 1)

Note 1. 7-bit address only can be set. Please set SDADLS bit to “0” in SDATBASn.

(a) Normal Wake-Up mode 1

This section describes the behavior, the timing, and a use case of normal WU mode 1.

1. A wake-up interrupt triggered by the match of the slave address makes the transition to the normal operation in the manner described below. Also, the detailed timing is provided in **Figure 26.103**.

   Before Wake-Up recovery: ACK is sent in response to the data received with its own slave address.

   During Wake-Up recovery: ACK response is made at the 9th clock cycle of SCL, and the SCL is held low afterwards.*1

   After Wake-Up recovery: Normal operation continues.

   If the slave address does not match, the SCL line is not held low after the fall of the 9th clock cycle of SCL, and the slave operation continues.

Note 1. Between ninth clock cycle and first clock cycle during Wake-Up recovery, SCSTRCTL.RWE = 1 does not work.

Refer to **Figure 26.101** “Use Case of Normal WU Mode 1” below for a use case.

2. A wake-up interrupt is not generated at the transition to the normal operation if the transition is triggered by a cause (other recovery causes (IRQ)) other than a wake-up interrupt signal generated by a slave address match. BST.WUCNDDF is not set in this case. Carry out the following processing according to **Figure 26.102**.

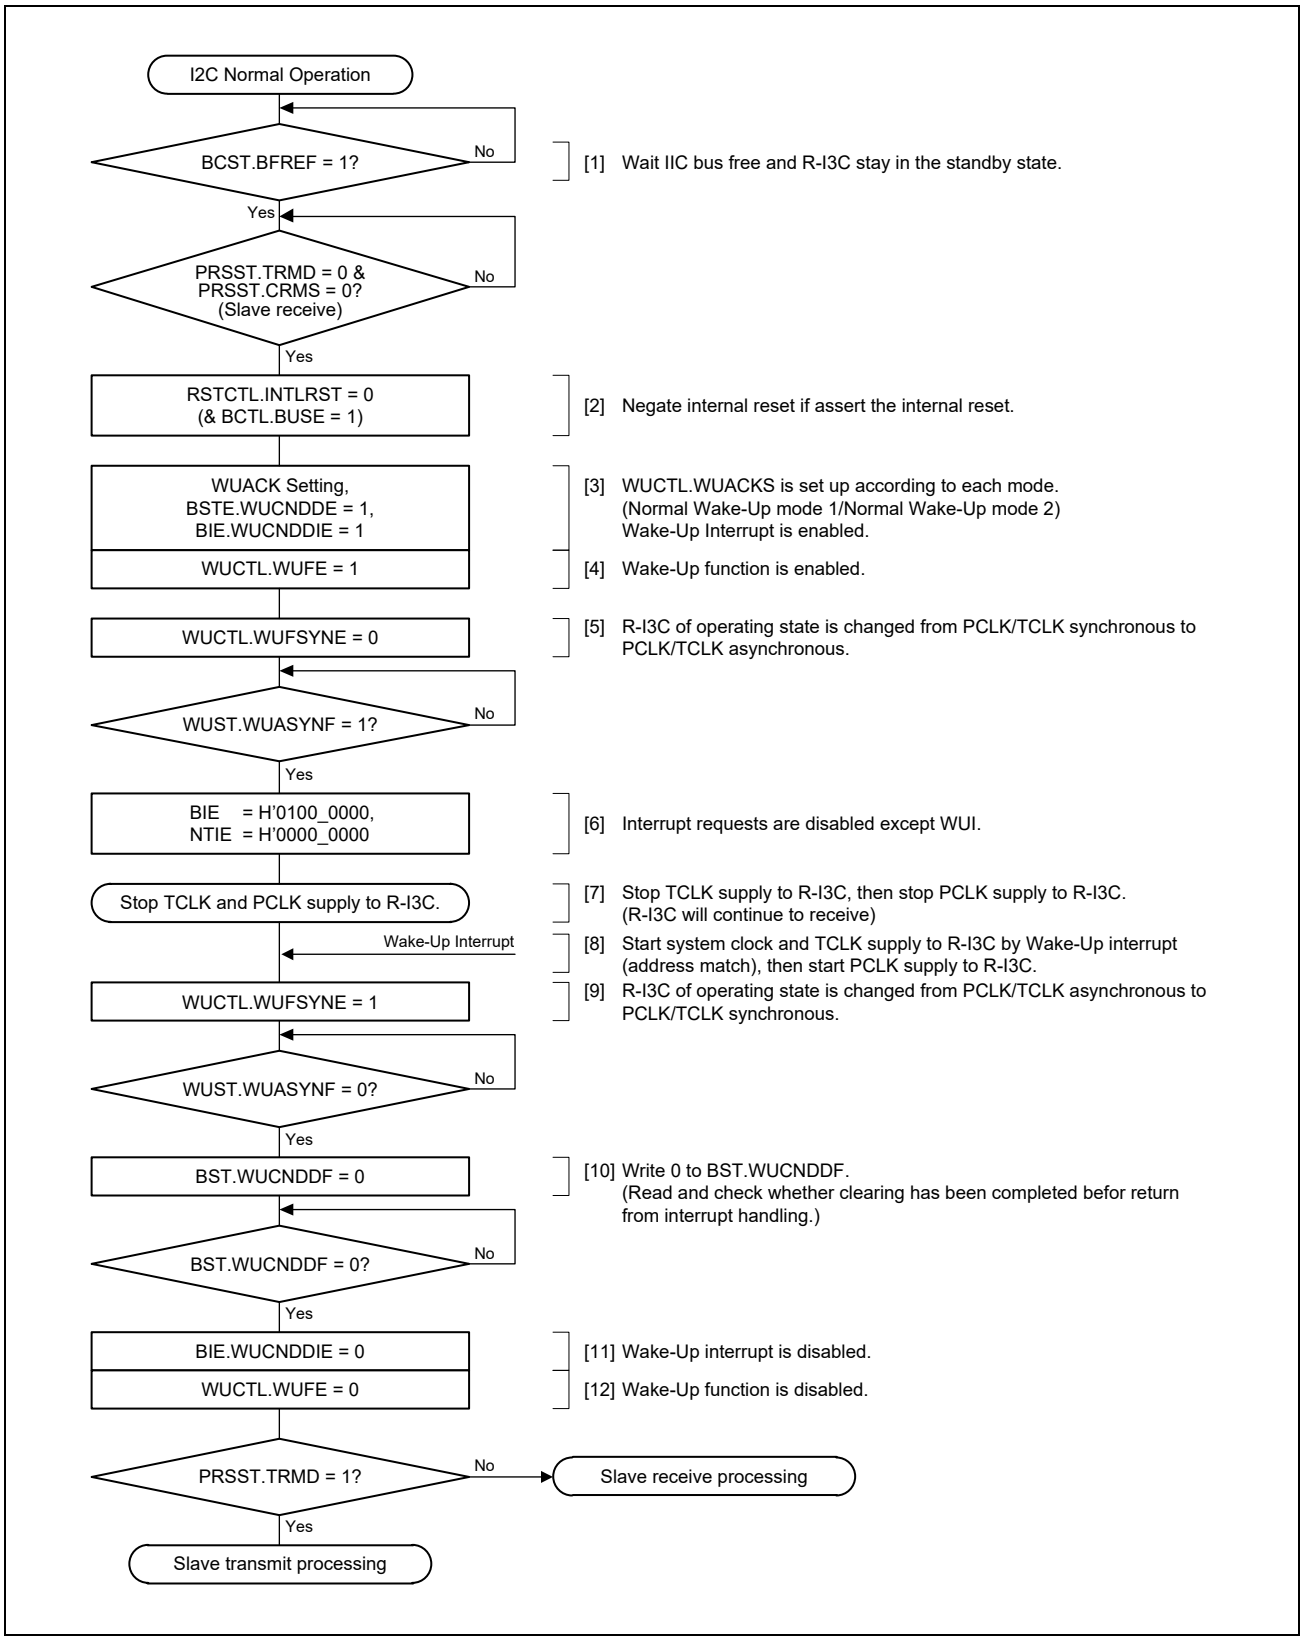

Figure 26.101 Use Case of Normal WU Mode 1
(Wake-Up Recovery by a Wake-Up Interrupt Triggered by the Match of the Slave Address)

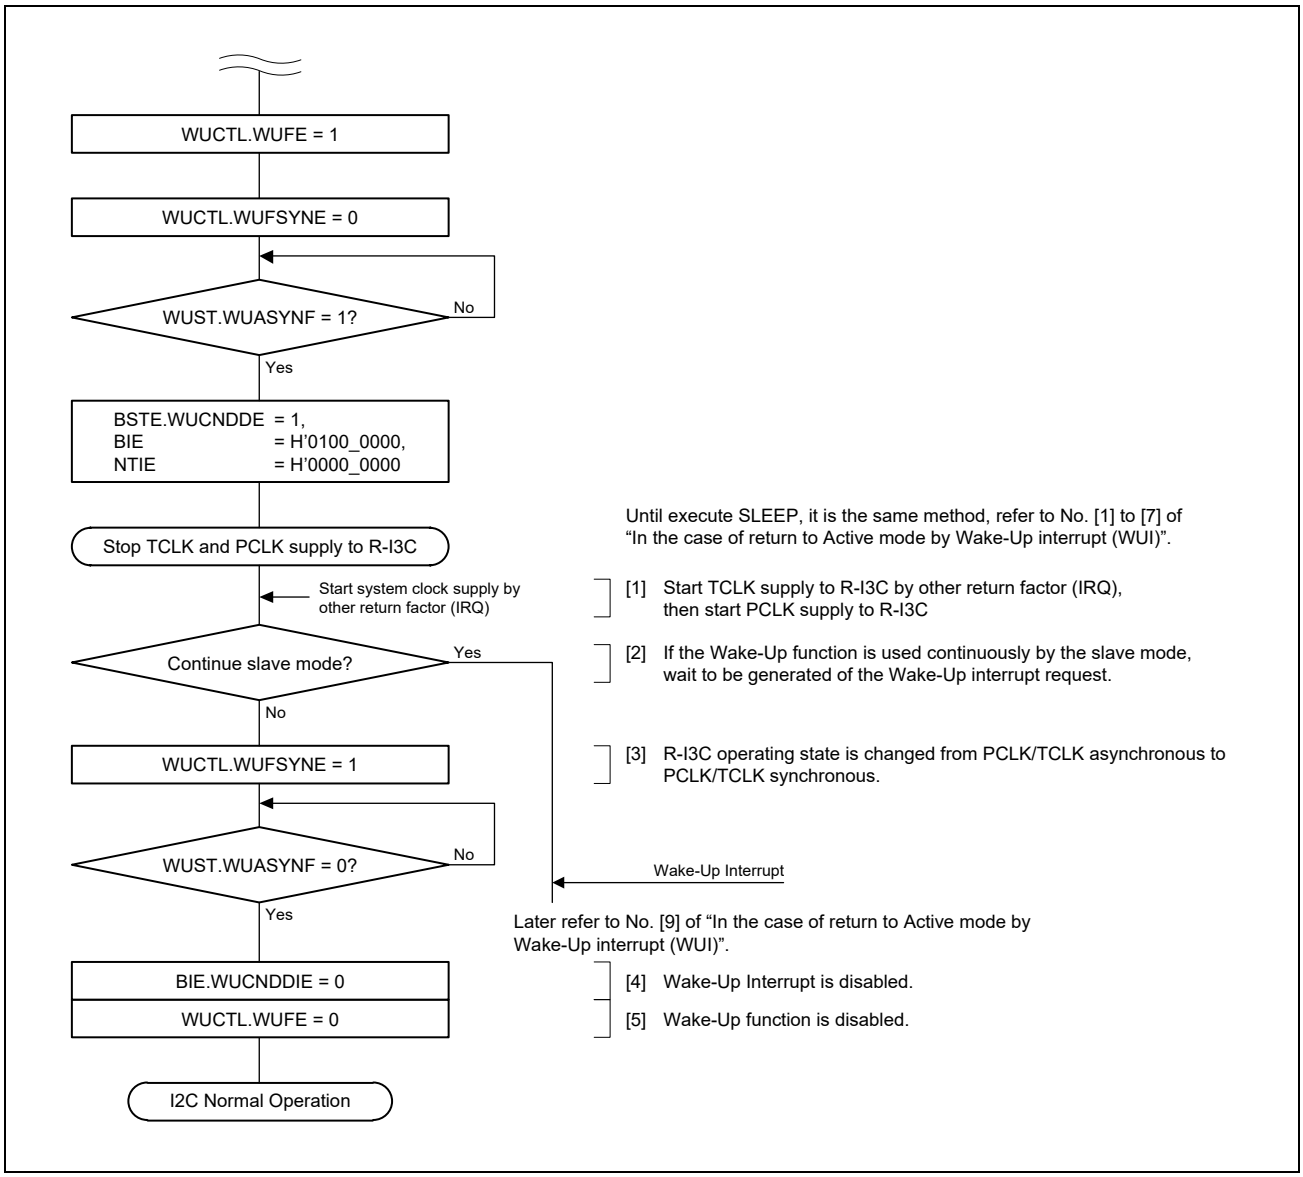

Figure 26.102 Use Case of Normal WU Modes 1 and 2
(Wake-Up Recovery by Other Recovery Causes (IRQ))

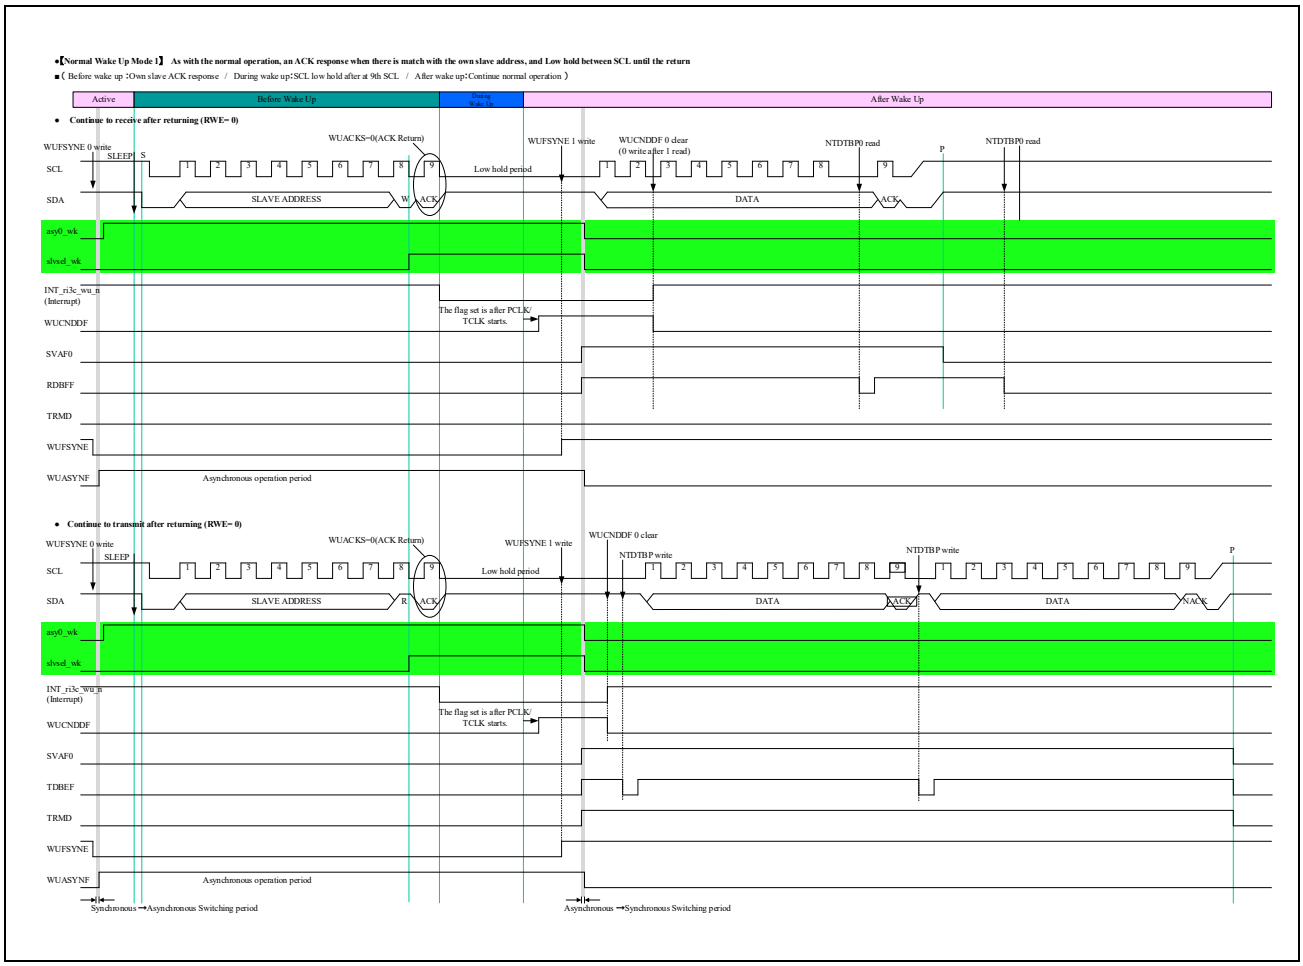

Figure 26.103 Timing of Normal Wake Up Mode 1

(b) Normal Wake Up mode 2

This section describes the behavior, the timing, and a use case of normal WU mode 2.

1. A wake-up interrupt triggered by the match of the slave address makes the transition to the normal operation in the manner described below. Also, the detailed timing is provided in **Figure 26.105**.

   Before Wake-Up recovery: No response to the data received with its own slave address (until 8th SCL cycle end)

   During Wake-Up recovery: Holding the SCL line low during the 8th and 9th clock cycles

   After Wake-Up recovery: Returning ACK at the 9th clock cycle of SCL, and continuing the normal operation

If the slave address does not match, the SCL line is not held low after the fall of the 8th SCL v clock cycle. The slave operation continues.

Refer to **Figure 26.104** “Use Case of Normal WU Mode 2” below for a use case.

2. A wake-up interrupt is not generated at the transition to the normal operation if the transition is triggered by a cause (other recovery causes (IRQ)) other than a wake-up interrupt signal generated by a slave address match. BST.WUCNDDF is not set in this case. Carry out the following processing according to **Figure 26.102**.

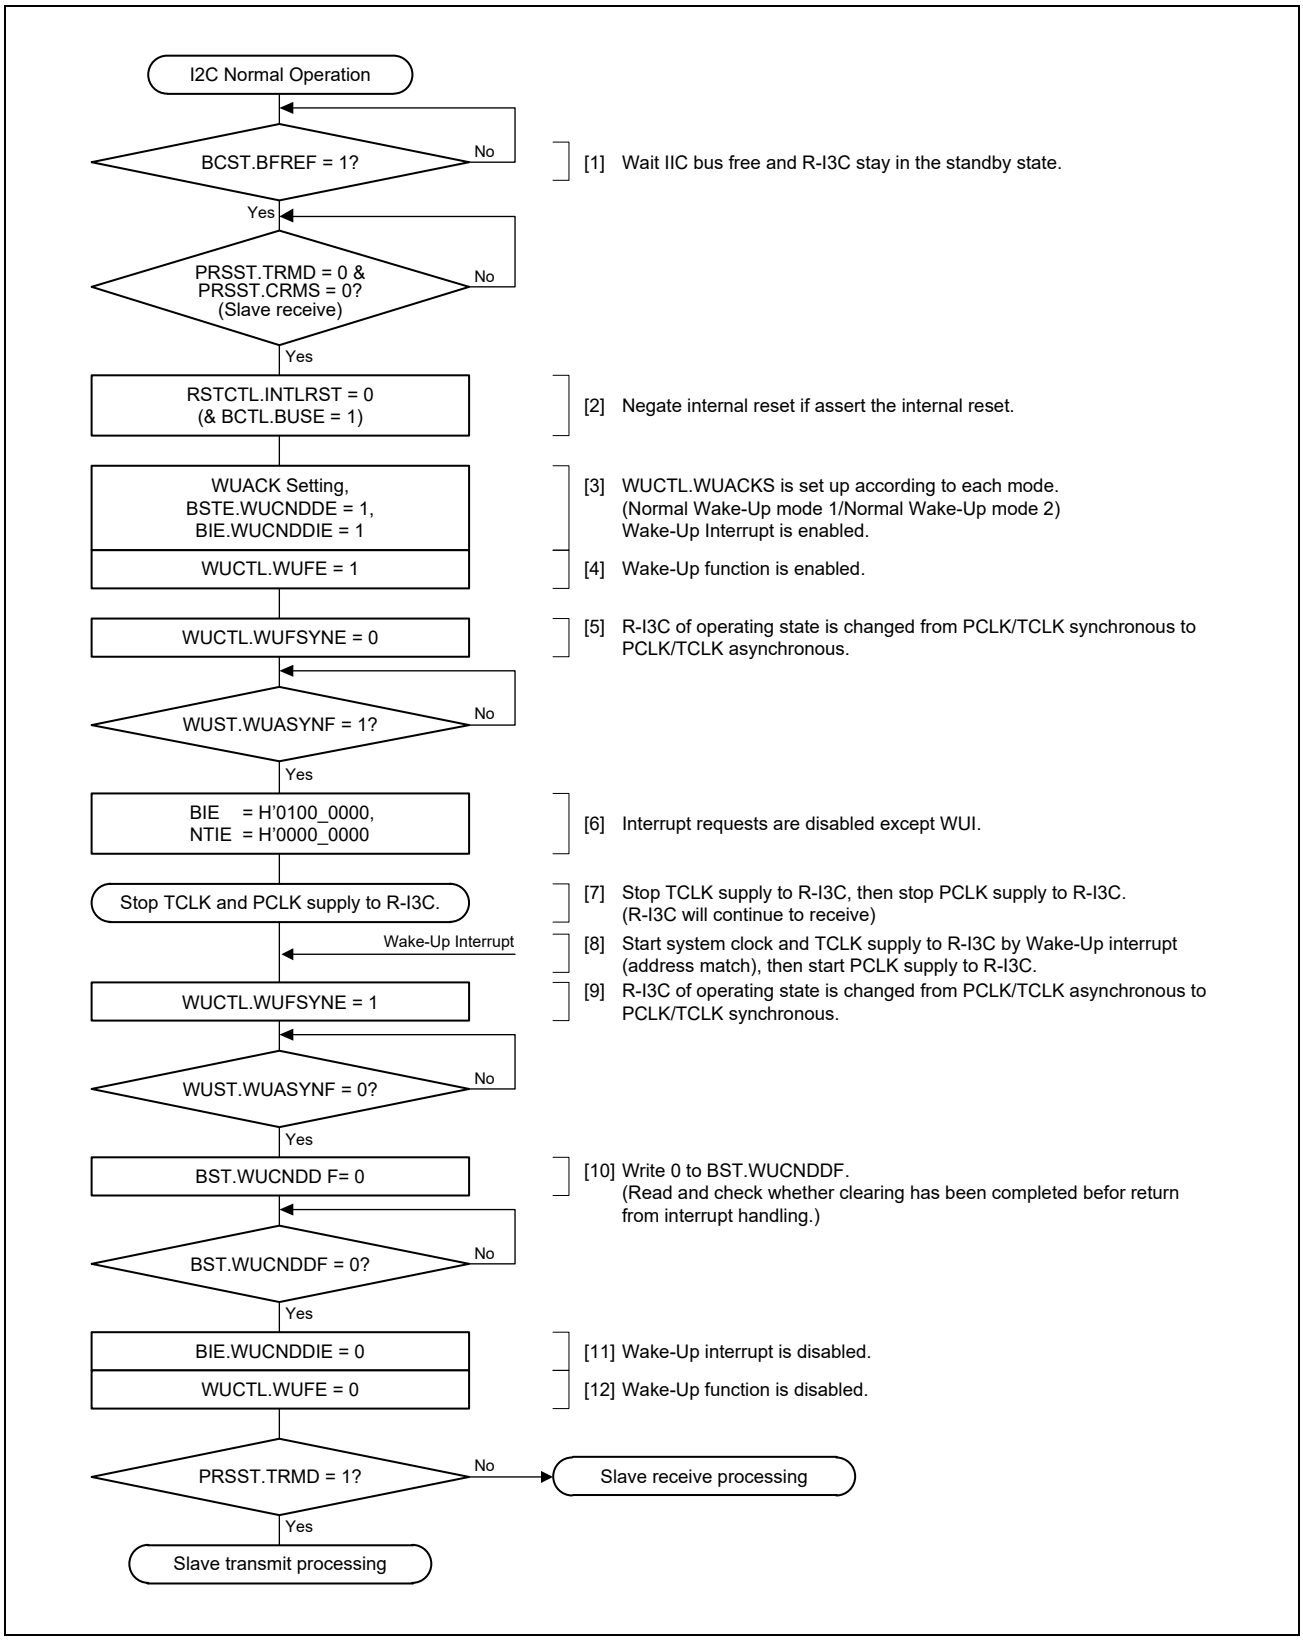

Figure 26.104 Use Case of Normal WU Mode 2
(Wake-Up Recovery by a Wake-Up Interrupt Triggered by the Match of the Slave Address)

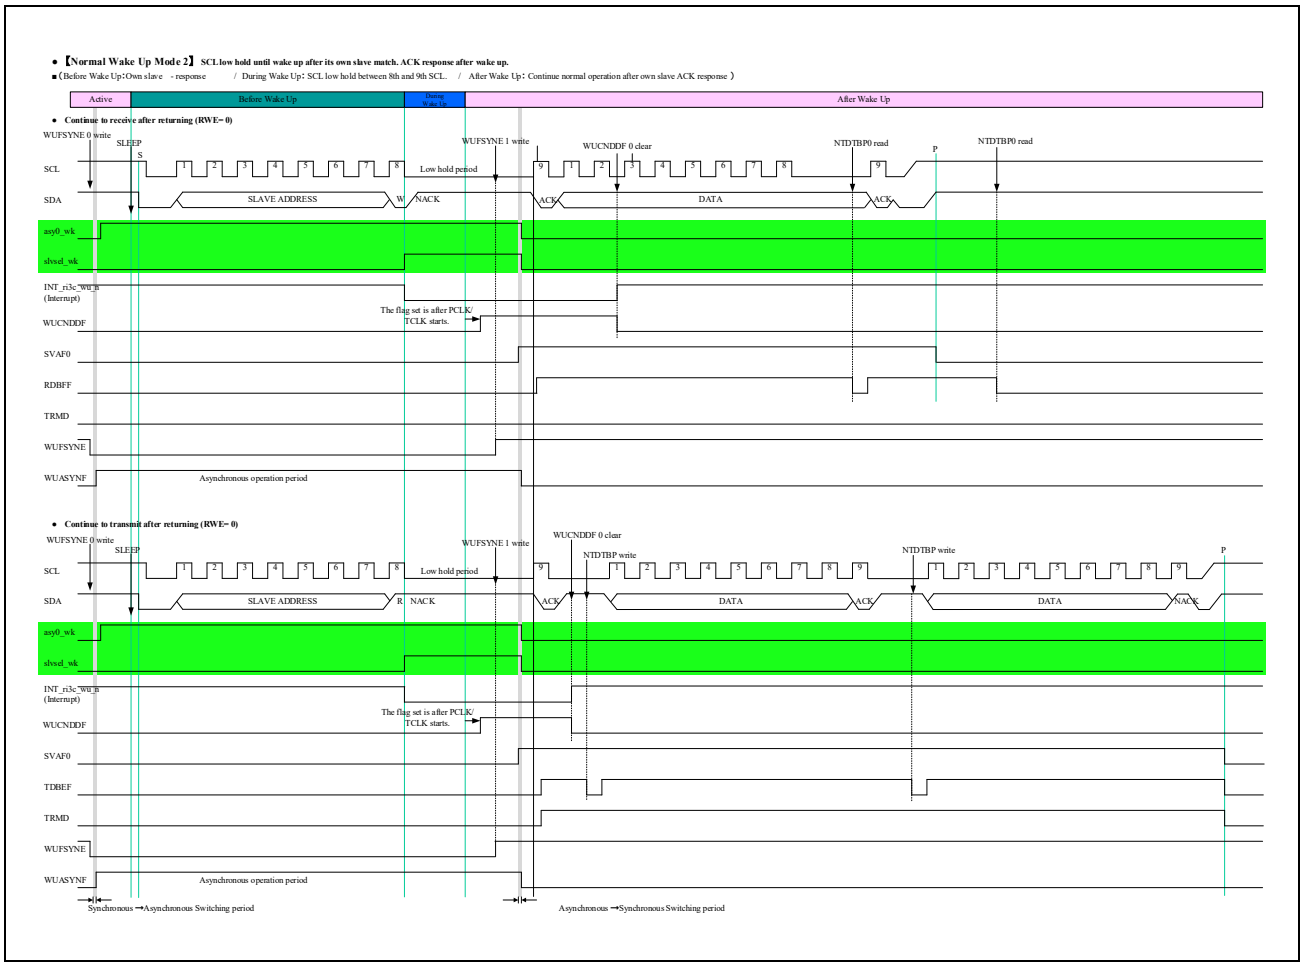

Figure 26.105 Timing of Normal Wake Up Mode2

(c) Command Recovery mode/EEP Response mode (Special Wake Up mode)

In the command recovery mode and EEP response mode, the SCL line is not held low during the wake-up recovery period (after the rise of the 9th clock cycle of SCL), so other I^2C/I3C devices can use the I^2C bus during this period.

This section describes the behavior, the timing, and use cases of the command recovery mode and the EEP response mode.

1. A wake-up interrupt triggered by the match of the slave address makes the transition to the normal operation in the manner described below. Also, the detailed timing is provided in **Figure 26.108**.

   Before Wake-Up recovery: In response to the data received with its own slave address, ACK (command recovery mode) or NACK (EEP response mode) is returned.

   During Wake-Up recovery: The SCL line is not held low.

   After Wake-Up recovery: Normal operation continues after this IP initial setting.

If the slave address does not match, the slave operation continues.

NOTES

1. Because the SCL line is not held low during wake-up recovery, the transmission/reception of the data that follows the slave address is not possible.
2. The command recovery mode and the EEP response mode are internal reset (RSTCTL.INTLRST= 1) states. Therefore, the match of the slave address does not set the SVST flags (HOAF, GCAF, and SVAF2, SVAF1, SVAF0).

Refer to **Figure 26.106** “Use Case of Command Recovery Mode and EEP Response Mode” below for a use case.

2. A wake-up interrupt is not generated at the transition to the normal operation if the transition is triggered by a cause (other recovery causes (IRQ)) other than a wake-up interrupt signal generated by a slave address match. BST.WUCNDDF is not set in this case. Carry out the following processing according to **Figure 26.107**.

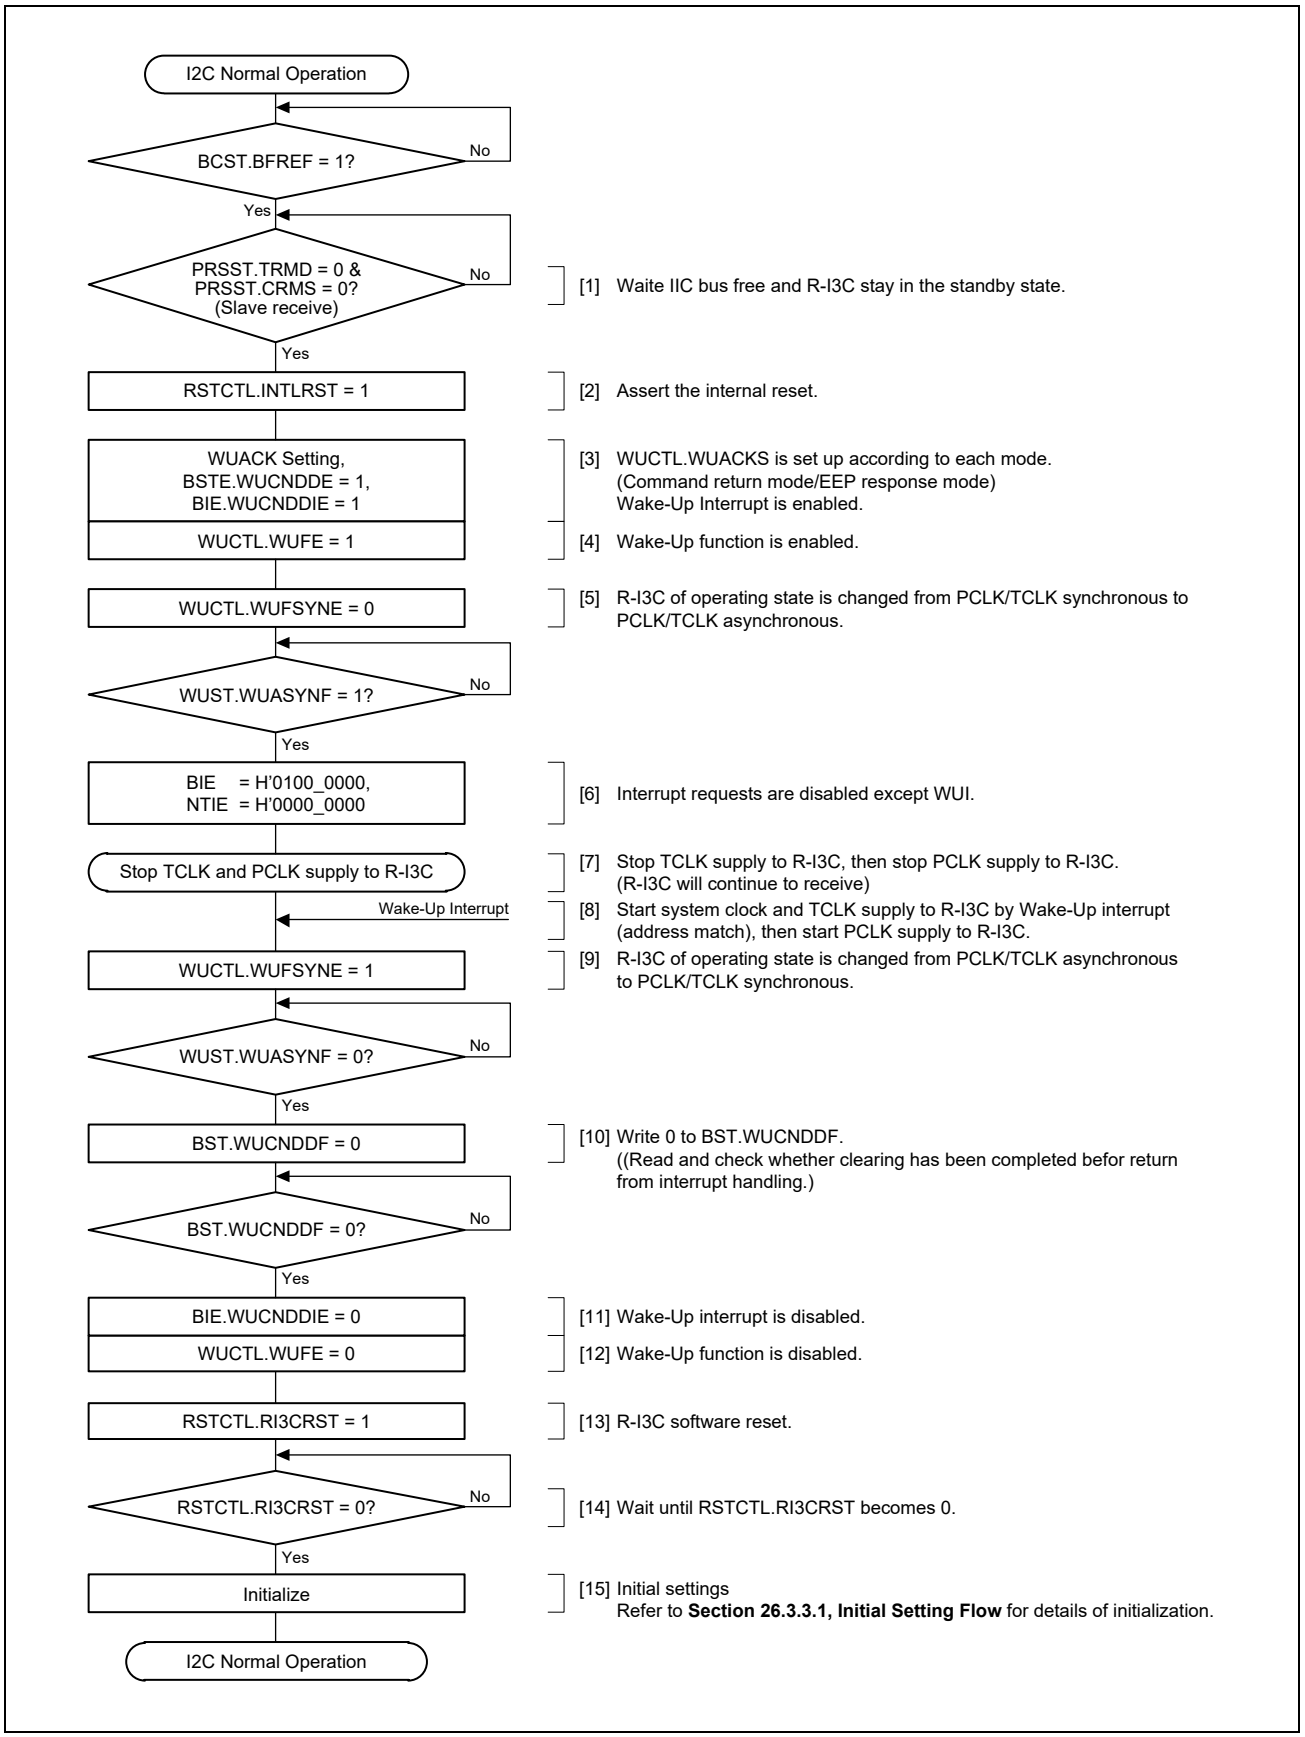

Figure 26.106 Use Case of Command Recover Mode and EEP Response Mode
(Wake-Up Recovery by a Wake-Up Interrupt Triggered by the Match of the Slave Address)

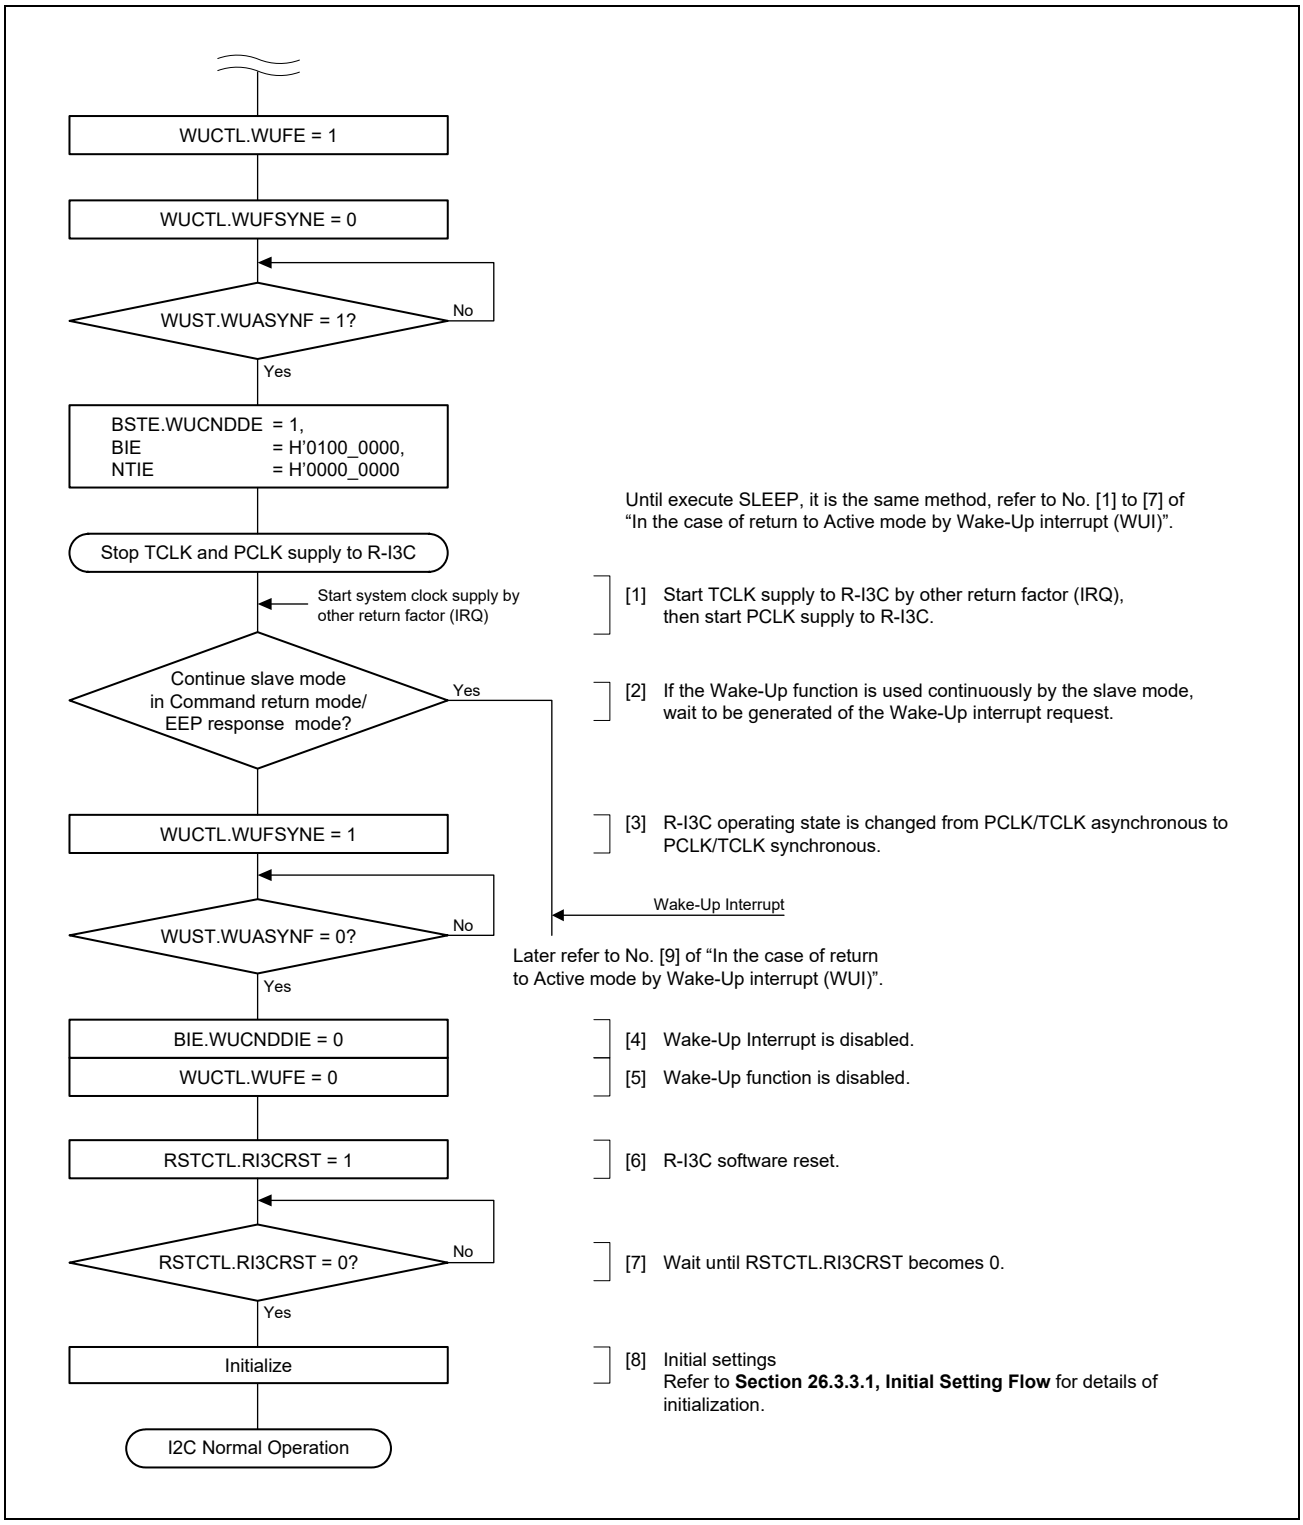

Figure 26.107 Use Case of Command Recover Mode and EEP Response Mode
(Wake-Up Recovery by Other Recovery Causes (IRQ))

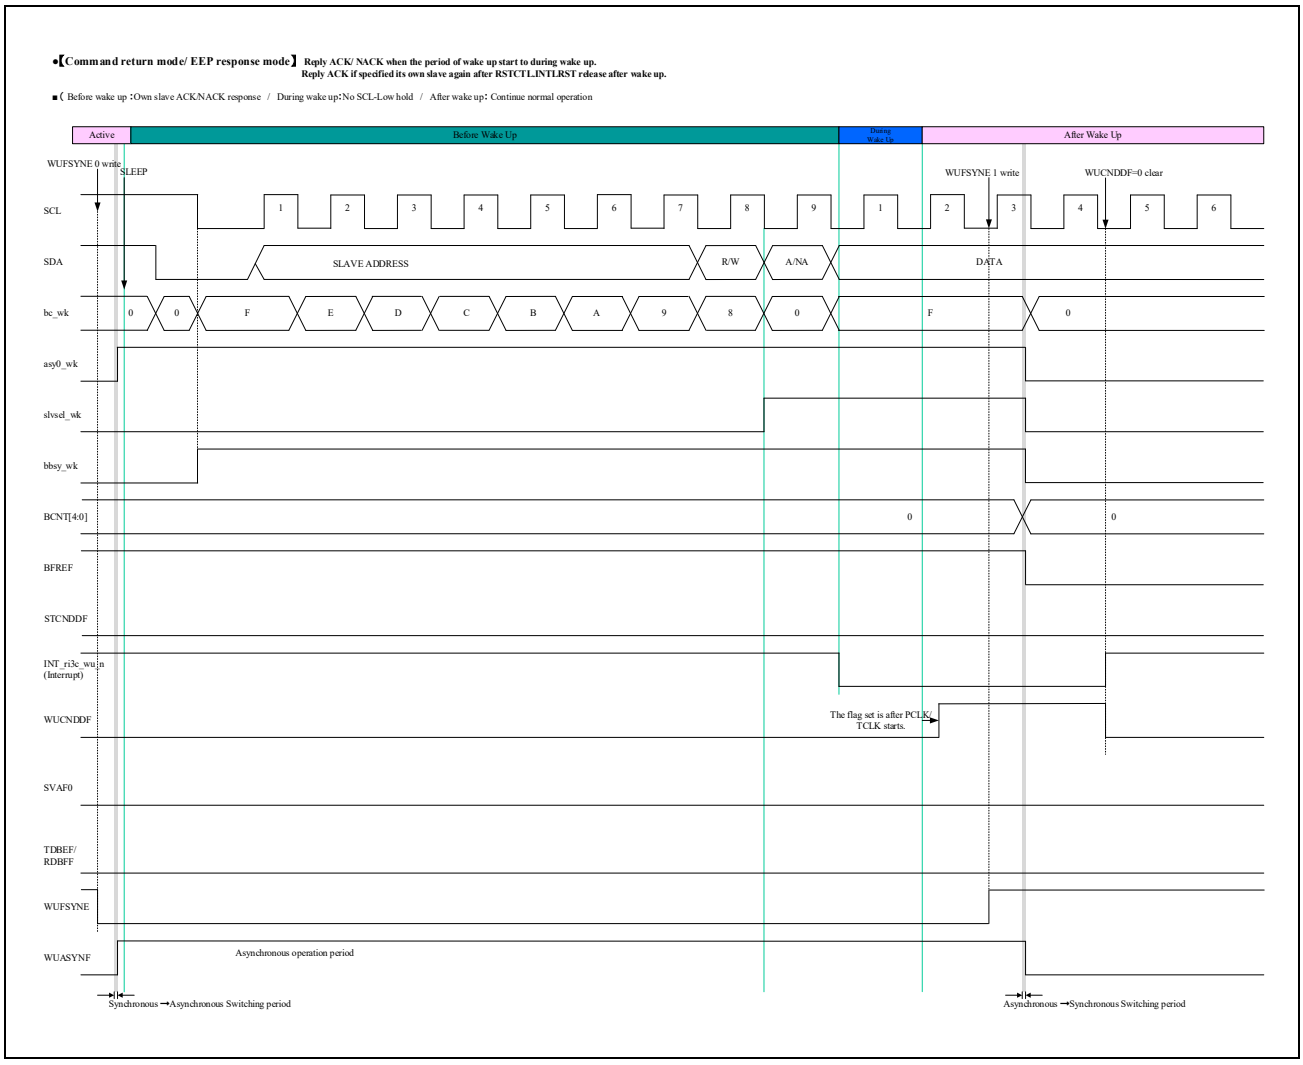

Figure 26.108 Timing of Command Recovery Mode/EEP Response Mode

(d) Precautions on the Use of the Wake-Up Function

Precautions on the use of the Wake-Up function is shown below.

1. Do not change the registers in this IP except the WUCTL.WUFSYNE bit while the WUST.WUASYNF flag = 1 (while PCLK/TCLK asynchronous operation).
2. Set WUCTL.WUFE = BSTE.WUCNDDE = BIE.WUCNDDIE = 1 and PRSST.CRMS = PRSST.TRMD = 0 (slave reception mode) before switching PCLK/TCLK asynchronous mode.
3. Can not select the device ID and the 10-bit slave address for Wake-Up interrupt factor. Set the DVIDE bit in SVCTL and SDADLS bit in SDATBAS2 to 0.
4. Sets all bits in BIE (TENDIE, NACKDIE, SPCNDDIE, STCNDDIE, ALIE, TODIE) to 0 (Interrupt disabled) before switching the asynchronous operation.
5. Do not use the timeout function while the Wake-up function is enabled (WUCTL.WUFE = 1).
6. Wake-up interrupt is generated while PCLK/TCLK asynchronous operation (when WUST.WUASYNF = 1). In case of detecting slave address matching, the case of detect slave address match in PCLK/TCLK synchronous mode (WUST.WUASYNF = 0), does not occur Wake-Up interrupt, and BST.WUCNDDF flag will be not set also.
7. If WUCTL.WUFSYNE bit to “0” write timing and START condition of detecting a conflict, this IP might start the next reception in PCLK/TCLK synchronous operation mode. In this case, WUST.WUASYNF flag becomes 1 (switch to PCLK/TCLK asynchronous mode) when data communication is finished and detected STOP condition and starts the Wake-Up event detection.
8. If you want to switch from PCLK/TCLK asynchronous operation to PCLK/TCLK synchronous operation without address match detection, it will switch in the STOP condition detection. When the WUCTL.WUFSYNE bit was set to 1 in a bus free state, it is continued PCLK/TCLK asynchronous operation (Reception operation: waiting communication frame). WUST.WUASYNF flag becomes to 0 when this IP detect the STOP condition of the next communication frame, and this IP switches to PCLK/TCLK synchronous operation.
9. After writing 0 to WUFSYNE bit in WUCTL, do not change this IP operation mode setting register (BFCTL, SCSTRCTL, ACKCTL, INCTL, SVCTL, SDATBASn) until switched to the PCLK/TCLK asynchronous operation from PCLK/TCLK synchronous operation (while WUST.WUASYNF flag = 1). If register value changes by the interrupt processing etc. in this period, this IP might malfunction without succeeding to the setting to the asynchronous operation.
10. During PCLK/TCLK asynchronous operation (WUST.WUASYNF = 1), do not refer to each flag of SVST, BST register and BCST.BFREF flag.
11. Do not set ACKCTL.ACKT = 1 in order to make an ACK response in the synchronization unit when Wake-Up is performed by slave address match in Normal Wake-Up Mode 2.

(2) Wake Up function [I3C mode]

(a) I3C Master Wake-Up

Wake-Up interrupt causes of I3C Master are shown below.

1. SDA Low detection (IBI request from I3C Slave)

   The operation when transitioning to active mode (normal operation) by Wake-Up interrupt of SDA Low detection is shown below.

   Before Wake-Up recovery: SDA Low Drive is detected and the INTWU interrupt is asserted.

   During Wake-Up recovery: Keep SCL Line High.

   After Wake-Up recovery: Drive SCL Low and complete START condition. SCL is supplied on the I3C Bus and IBI from I3C Slave is received.

If transition to active mode (normal operation) due to other factors, disable the Wake-Up function as necessary.

After confirming PRSTDBG.SDILV = 1, set WUCTL.WUFE = 0.

Do not use the timeout function while the Wake-up function is enabled (WUCTL.WUFE = 1).

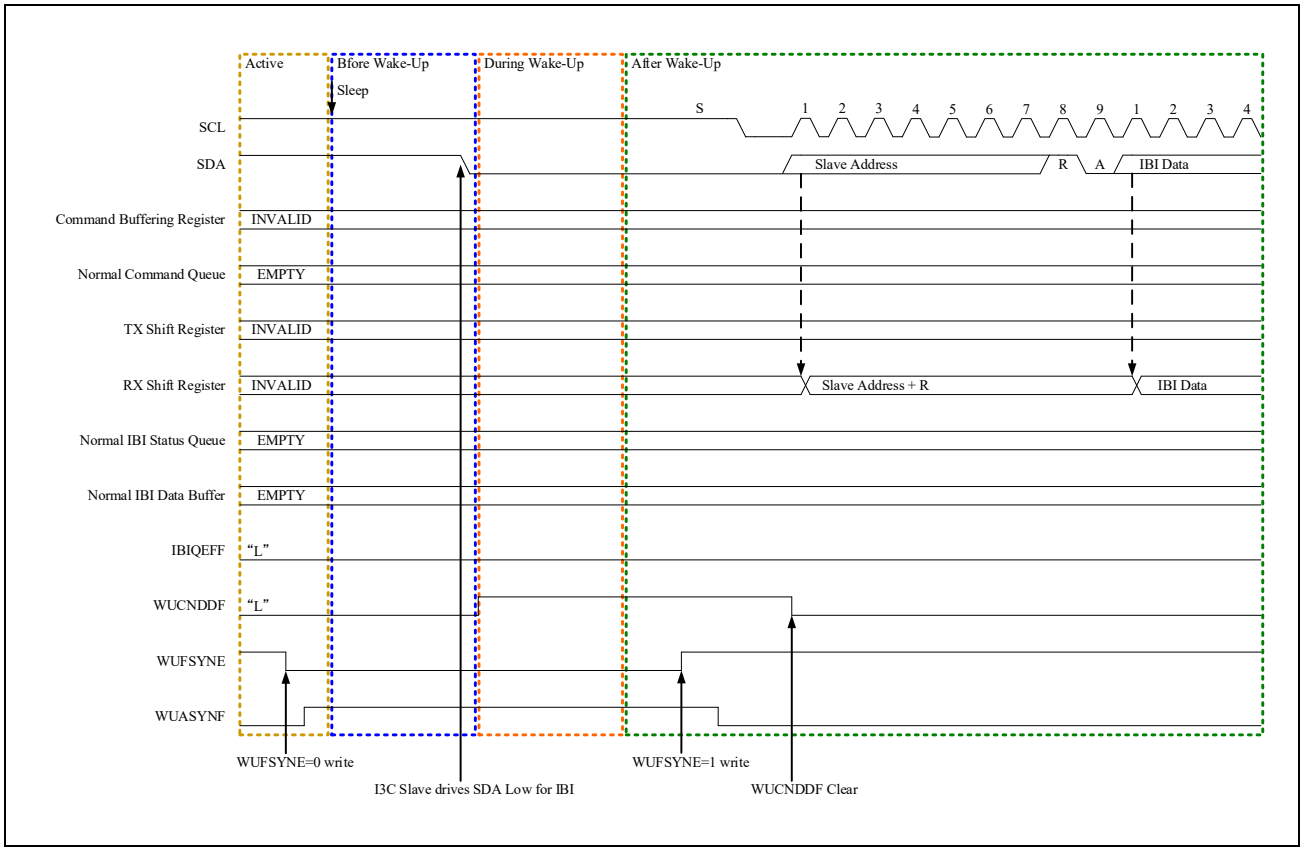

Figure 26.109 I3C Master Wake-Up Operation

(b) I3C Slave Wake-Up

Wake-Up interrupt causes of I3C Slave are shown below.

1. Broadcast Address (H'7E) and detects its own Slave Address match

   The operation when the Broadcast Address (H'7E) and transition to active mode (normal operation) by Wake-Up interrupt by detecting its own Slave Address match is shown.

   Before Wake-Up recovery:

   [Step 1]
   If this IP detects BA (H'7E/W) following a START (or Repeated START) Condition, then this IP shall generate ACK (after H'7E/W).

   [Step 2]

   If this IP detects its own Dynamic Address after a Repeated START condition following Step1, then this IP shall generate NACK (after its own Dynamic Address) and then issues a INTWU interrupt.

   During Wake-Up recovery: This IP always generates NACK.

   After Wake-Up recovery: Normal operation continues.

If transition to active mode (normal operation) due to other factors, disable the Wake-Up function as necessary.

Do not use the timeout function while the Wake-up function is enabled (WUCTL.WUFE = 1).

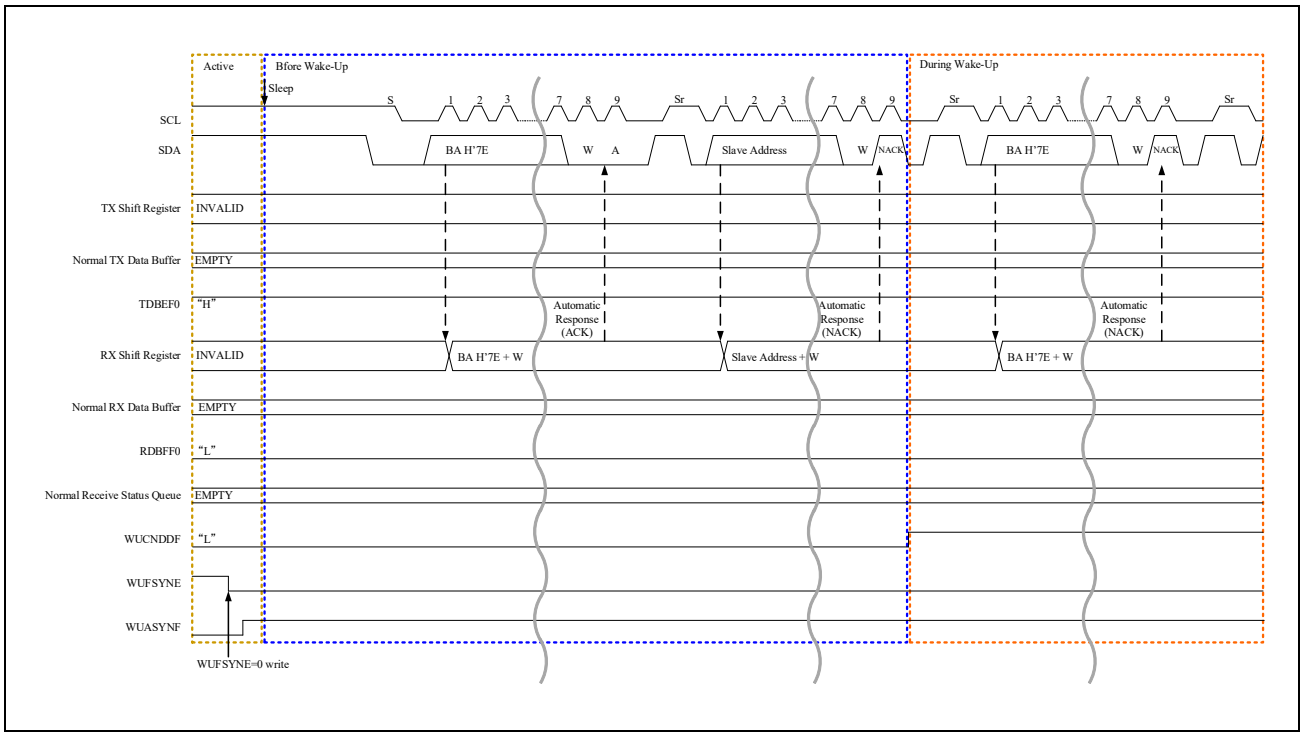

Figure 26.110 I3C Slave Wake-Up Operation (1/2)

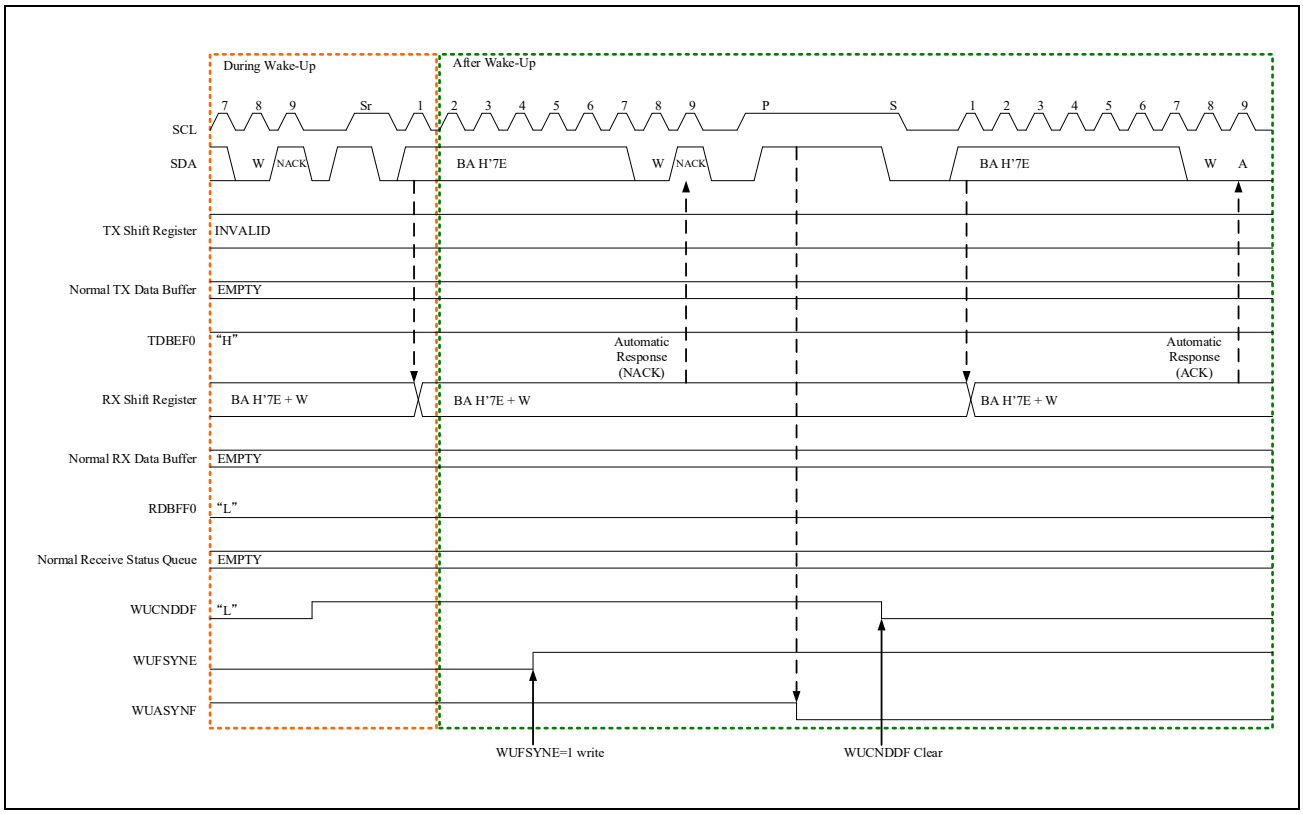

Figure 26.111 I3C Slave Wake-Up Operation (2/2)

26.3.2.6 Other

(1) SCL Synchronization Circuit [I²C mode]

This function is enabled while the PRTS.PRTMD bit is set to 1.

In generation of the SCL clock, I3C starts counting out the value for width at high level specified in STDBR.SBRHO[7:0] when it detects a rising edge on the SCLn line and drives the SCLn line low once counting of the width at high level is complete.

When I3C detects the falling edge of the SCLn line, it starts counting out the width at low level period specified in STDBR.SBRLO[7:0], and then stops driving the SCLn line (releases the line) once counting of the width at low level is complete. The SCL clock is thus generated.

If multiple master devices are connected to the I²C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, I3C is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCLn line while in master mode.

When I3C has detected a rising edge on the SCLn line and thus started counting out the width at high level specified in STDBR.SBRHO[7:0], and the level on the SCLn line falls because an SCL signal is being generated by another master device, I3C stops counting when it detects the falling edge, drives the level on the SCLn line low, and starts counting out the width at low level specified in STDBR.SBRLO[7:0]. When I3C finishes counting out the width at low level, it stops driving the SCLn line to the low level (releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in this module, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCLn line has been released. When I3C finishes outputting the low-level period of the SCL clock, the SCLn line is released and the SCL clock rises. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the SCSYNE bit in BFCTL is set to 1.

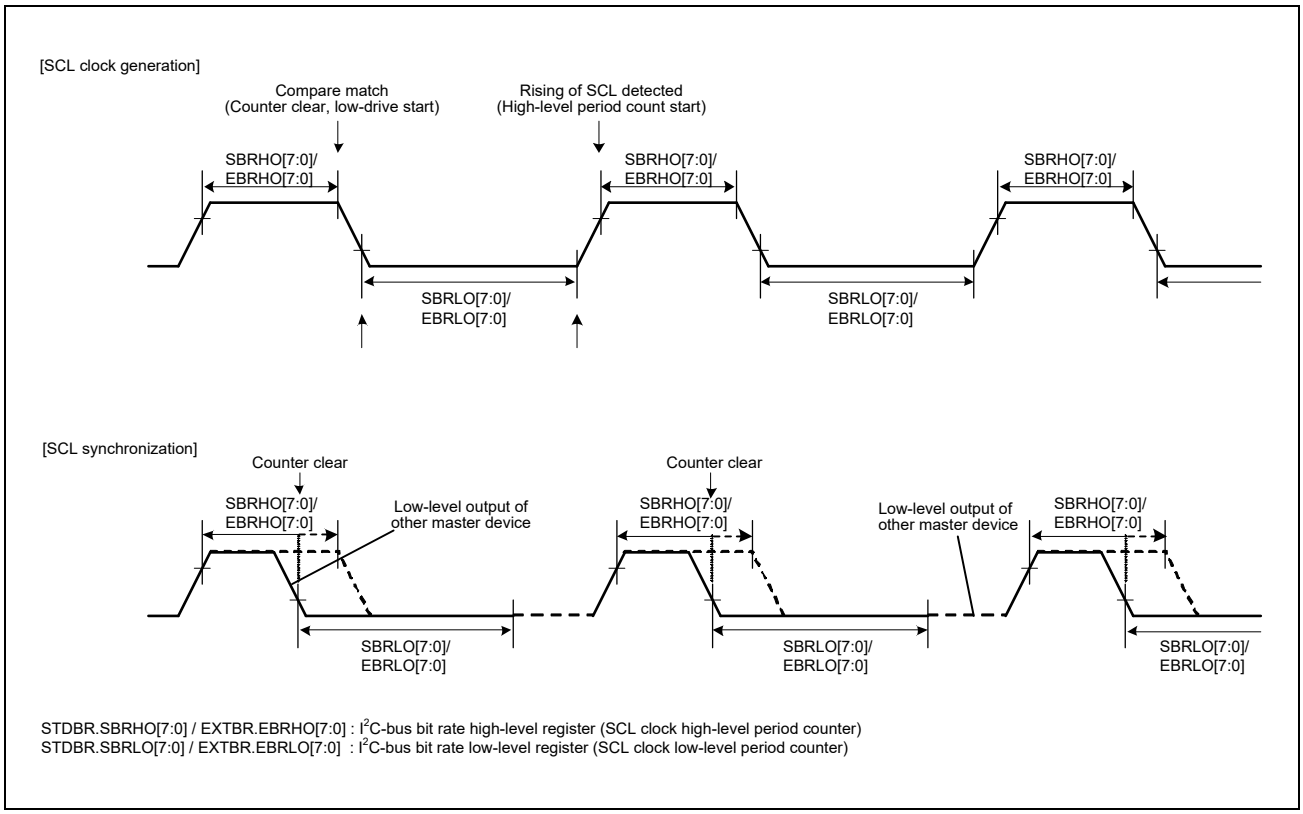

Figure 26.112 Generation and Synchronization of the SCL Signal

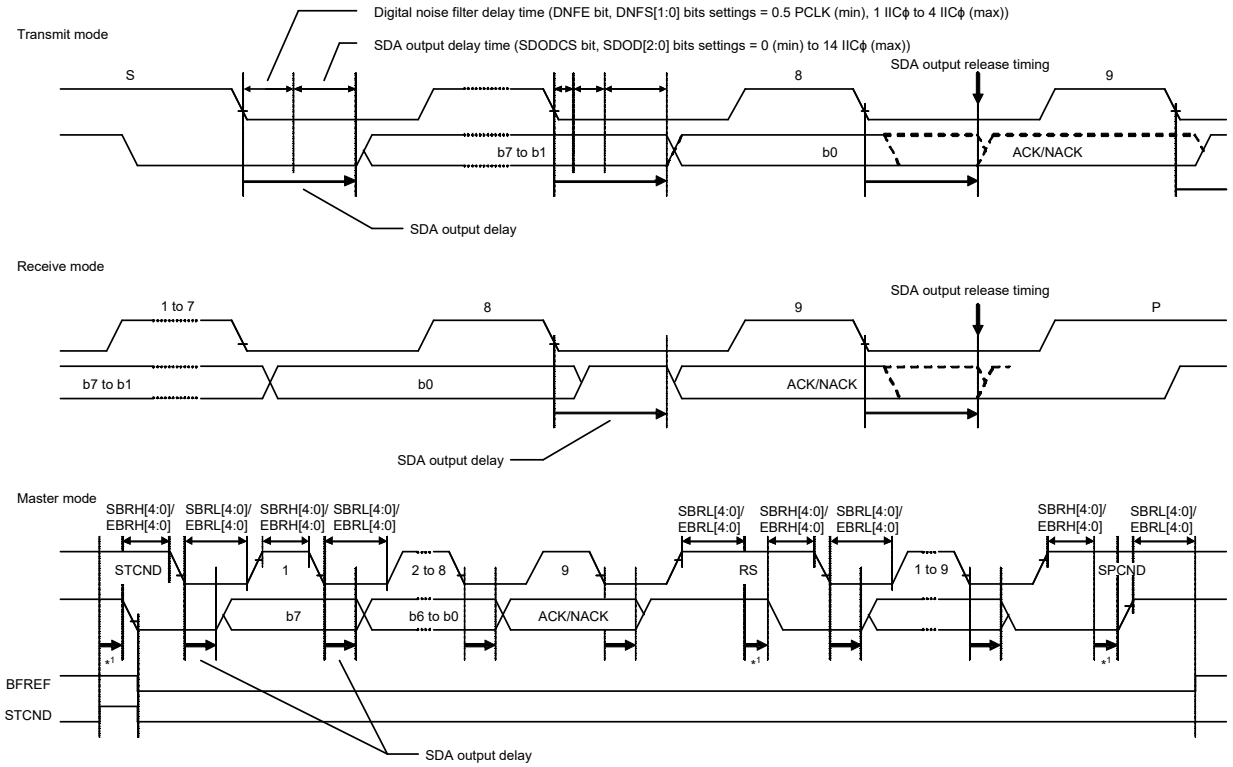
(2) Facility for Delaying SDA Output [I²C mode]

I3C module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the START, Repeated START, and STOP conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL clock is at the low level.

The output delay facility is enabled by setting the SDOD[2:0] bits in OUTCTL to any value other than 000b, and disabled by setting the same bits to 000b.

While the SDA output delay facility is enabled (while the SDOD[2:0] bits in OUTCTL are set to any value other than 000b), the SDODCS bit in OUTCTL selects the clock source for counting by the SDA output delay counter as the internal base clock (I3Cϕ) for I3C module or as a clock signal derived by dividing the frequency of the internal base clock by two (I3Cϕ/2). The counter counts the number of cycles set in the SDOD[2:0] bits in OUTCTL. After counting of the set number of cycles of delay is completed, I3C module places the required output (START, Repeated START, or STOP condition, data, or an ACK or NACK signal) on the SDA line.



Note: PCLK = PCLKB

Note 1. The output delay function is set by the SDODCS and SDOD[2:0] bits when a start (STCND), repeated start (SRCND), or stop (SPCND) condition is issued.

Figure 26.113 SDA Output Delay Facility

(3) Digital Noise-Filter Circuits [I²C mode]

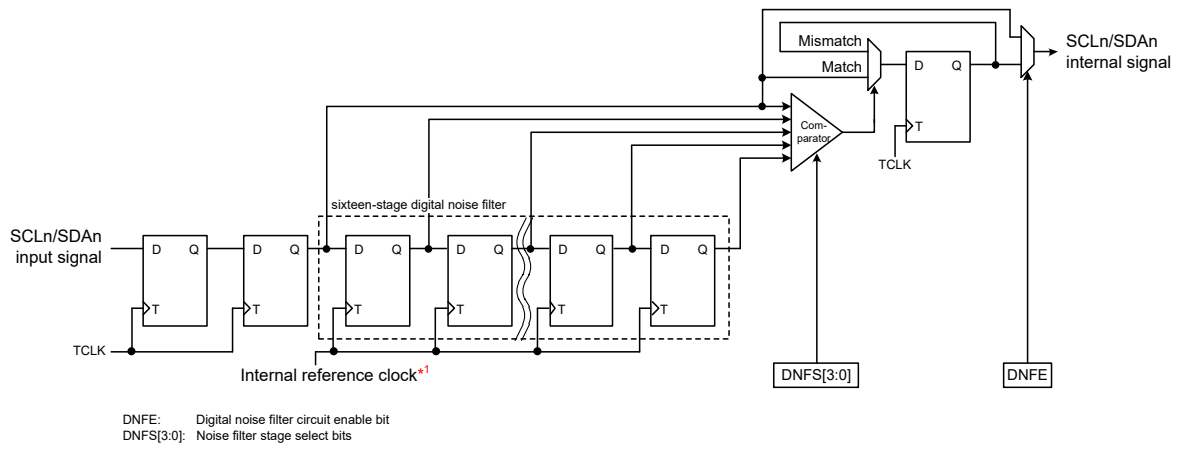
The states of the SCLn and SDAn pins are conveyed to the internal circuitry through digital noise-filter circuits. **Figure 26.114** is a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of I3C consists of 16 flip-flop circuit stages connected in series and a match detection circuit. When HS mode is selected, only the first four flip-flop circuits stages are enabled.

The number of effective stages in the digital noise filter is selected by the INCTL.DNFS[3:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to sixteen I3Cϕ cycles.

The input signal to the SCLn pin (or SDAn pin) is sampled on rising edges of the I3Cϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the INCTL.DNFS[3:0] bits, the signal level is conveyed to the subsequent stage. If the signal levels do not match, the previous value is retained.

If the ratio between the frequency of the internal operating clock (PCLKD) and the transfer rate is small (For example, data transfer at 400 kbps with PCLKD = 4 MHz), the characteristics of the digital noise filter may lead to the elimination of needed signals as noise.



Note: TCLK = PCLKD

Note 1. Internal reference clock = I3Cϕ

Figure 26.114 Block Diagram of Digital Noise Filter Circuit

26.3.3 Operation

26.3.3.1 Initial Setting Flow

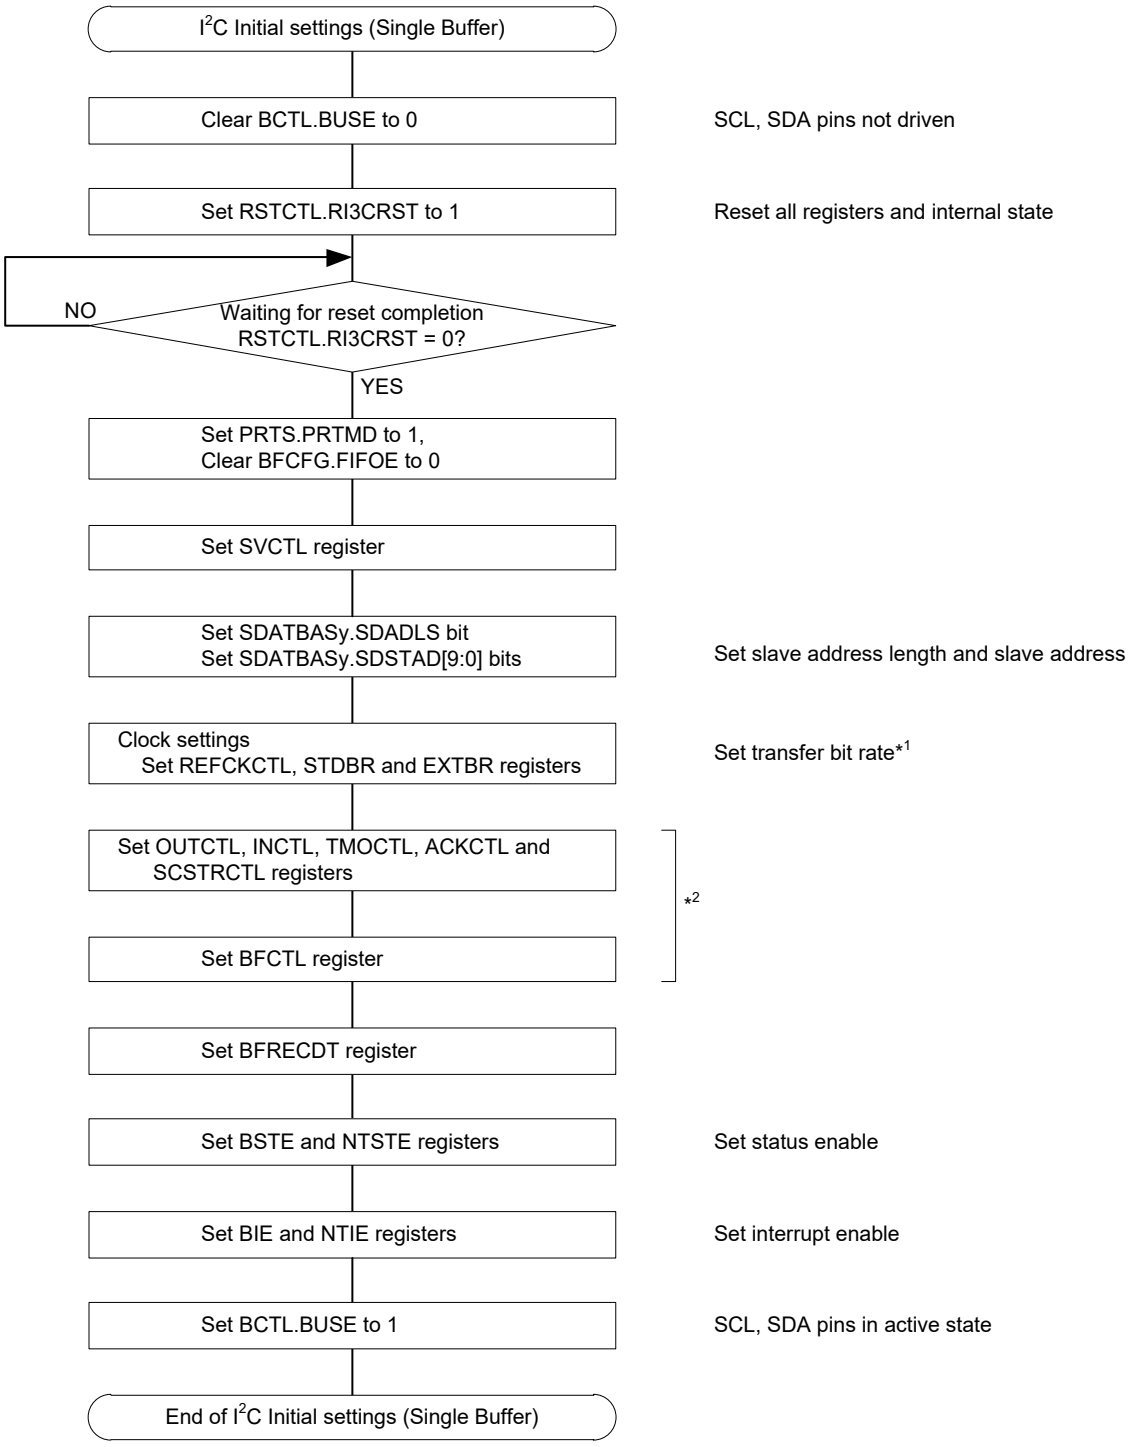
(1) I²C Initial Setting Flow (Single Buffer Transfer)

Before starting data transmission and reception, initialize I3C according to the procedure in **Figure 26.115**. First, set the BCTL.BUSE bit to 0 (SCLn, SDAn pins not driven).

Next, set the RSTCTL.RI3CRST bit to 1 (I3C reset). This initializes all registers and internal state. Then, waits for RI3CRST to become 0.

This initializes the various flags and some registers. Refer to **Section 26.5, Reset Descriptions**.

After that, set registers SDATBAS.SDADLS, SDATBAS.SDATAD[9:0], STDBR, INCTL, OUTCTL, TMOCTL, TMOCNT, SCSTRCTL, ACKCTL, and BFCTL, then set the other registers as necessary (for initial settings of I3C, refer to **Figure 26.115**).



Note: n = 0

Note 1. When the I3C is used only in slave mode, set the STDBR register to a value longer than the data setup time.

Note 2. Set these registers as necessary.

Figure 26.115 Block Diagram of Digital Noise Filter Circuit

(2) I3C Initial Setting Flow

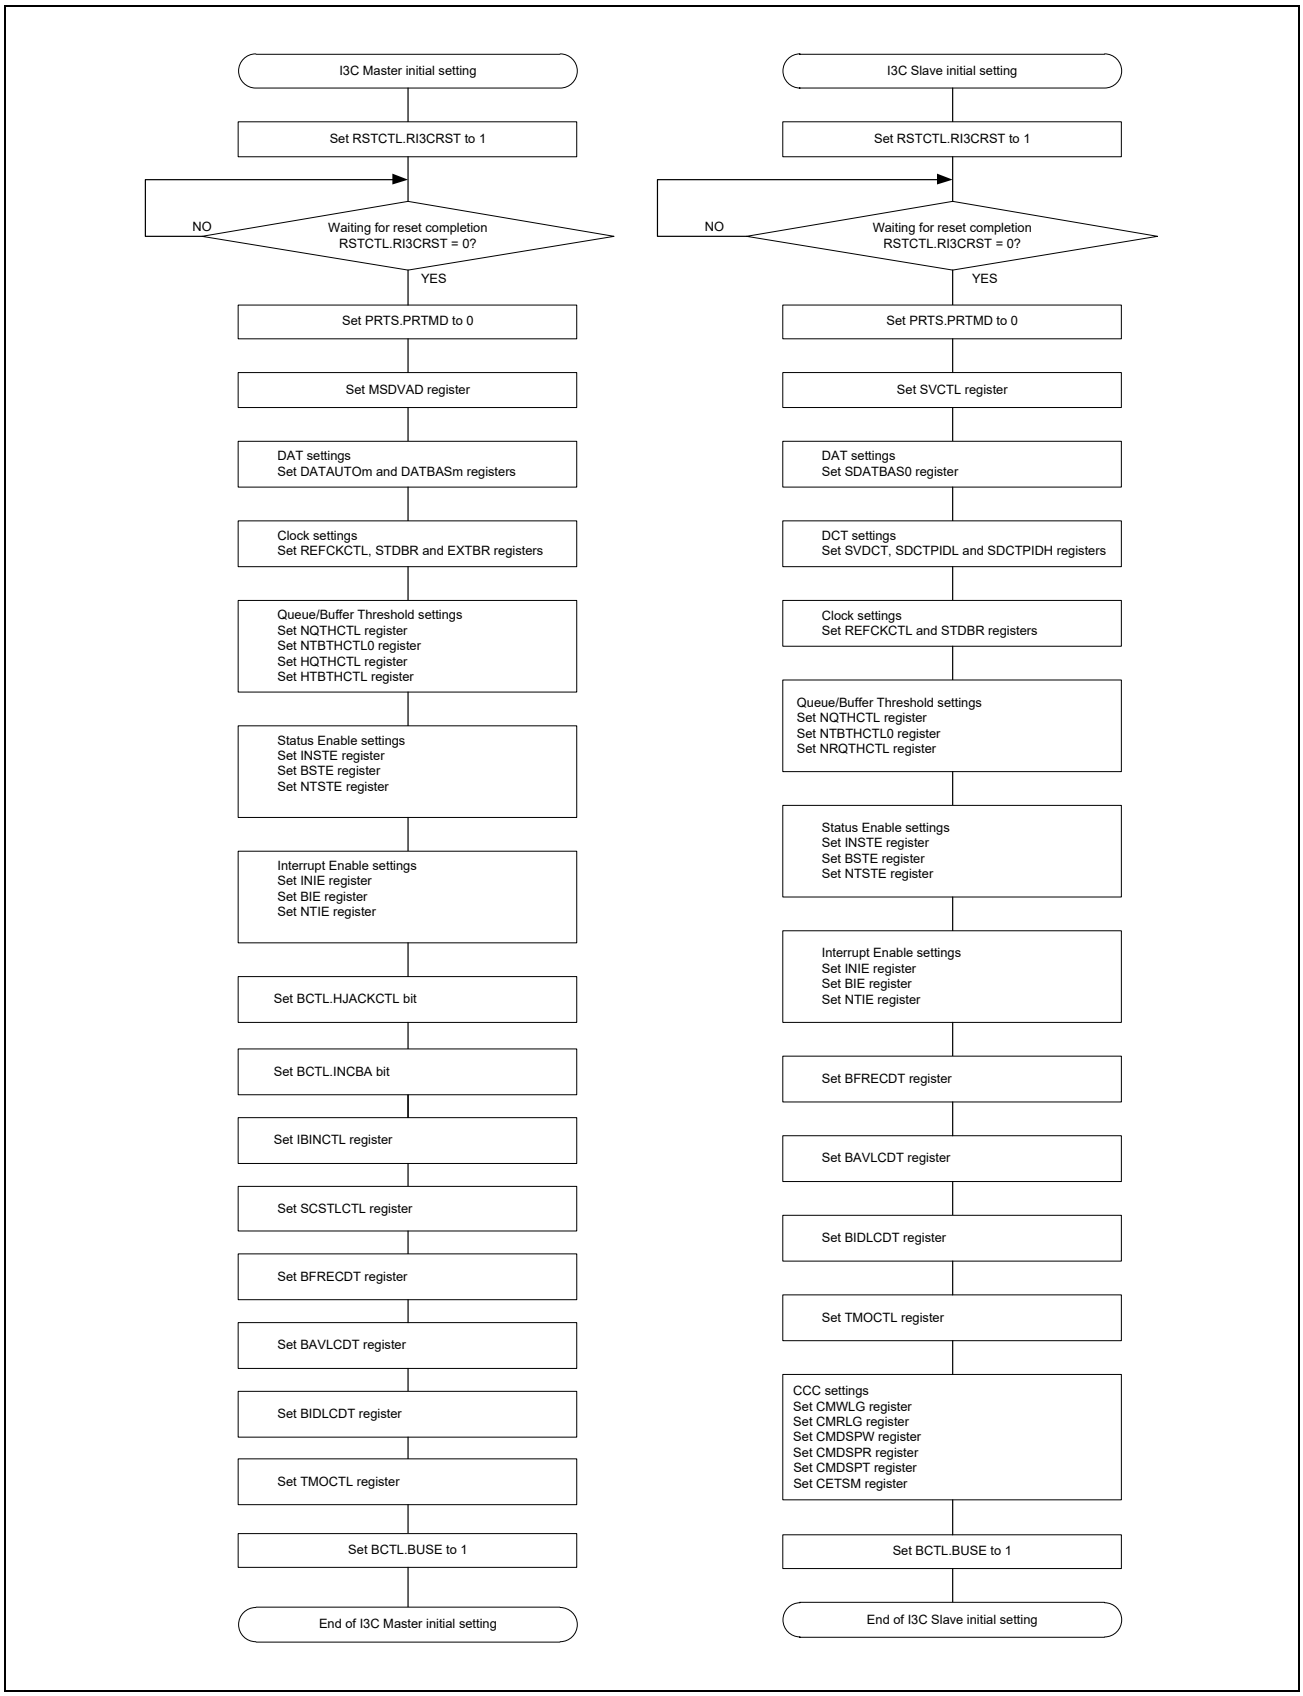


Figure 26.116 Example of I3C Initialization Flowchart

26.3.3.2 I3C Communication Flow

Figure 26.117 illustrates how I3C communication is initiated:

- All I3C communication occurs within a frame. The frame begins with a START, followed by one or more transfers, and a STOP.

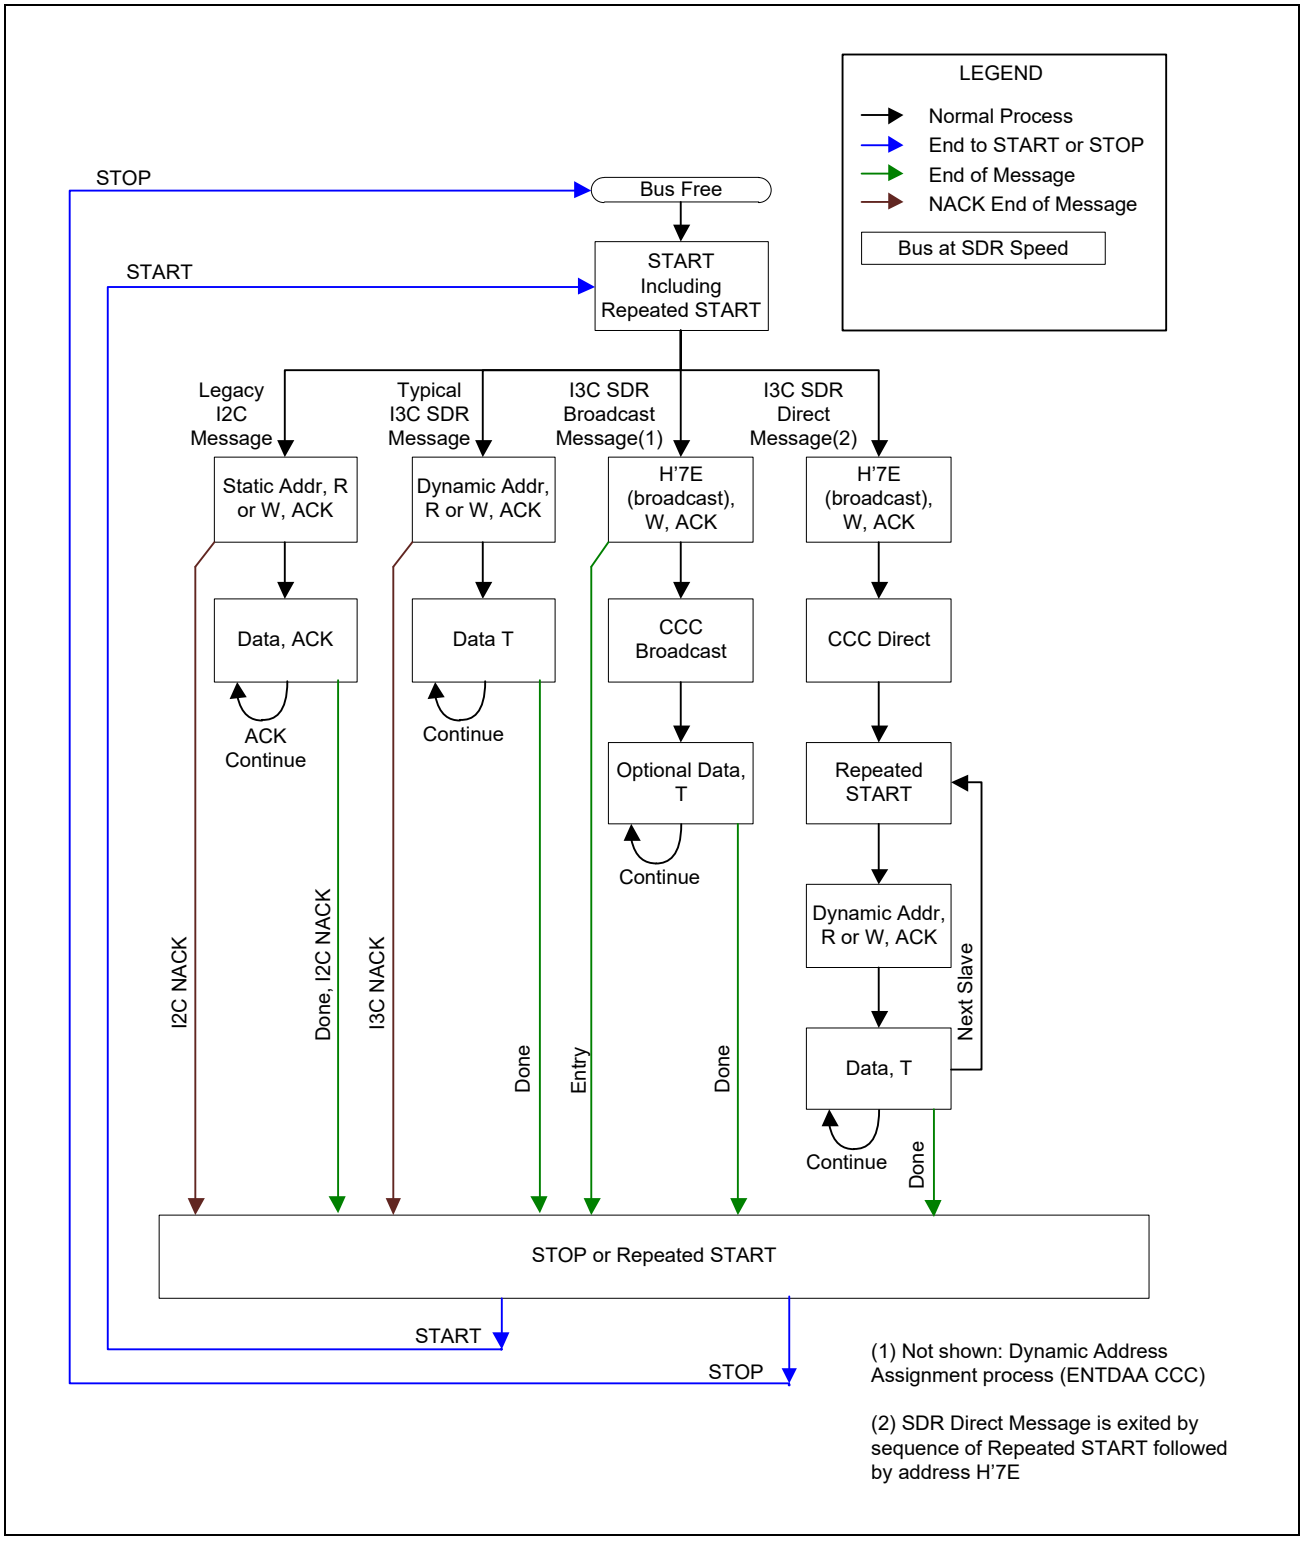

Figure 26.117 I3C Communication Flow

I3C is based on a frame encapsulation approach. A frame includes a data payload. The transfer protocol for the data payload is either SDR. Frames are bordered by I^2C-like bus management.

The I3C frame always includes at least the START, the Header, the Data, and the STOP. The Header following a START allows for Bus Arbitration. The Master uses the Header to address Slave device (s). Slave devices (s) may use the Header Arbitration for multiple purposes: for In-Band Interrupt, for Hot-Join, and for Secondary Master functionality.

I3C allows only one Master to have control of the I3C bus at a time. Mechanisms for handoff of the Master role from one device to another device are provided.

26.3.3.3 Master Mode Communication Flow

(1) I²C Master Transmission Flow (Single Buffer Transfer)

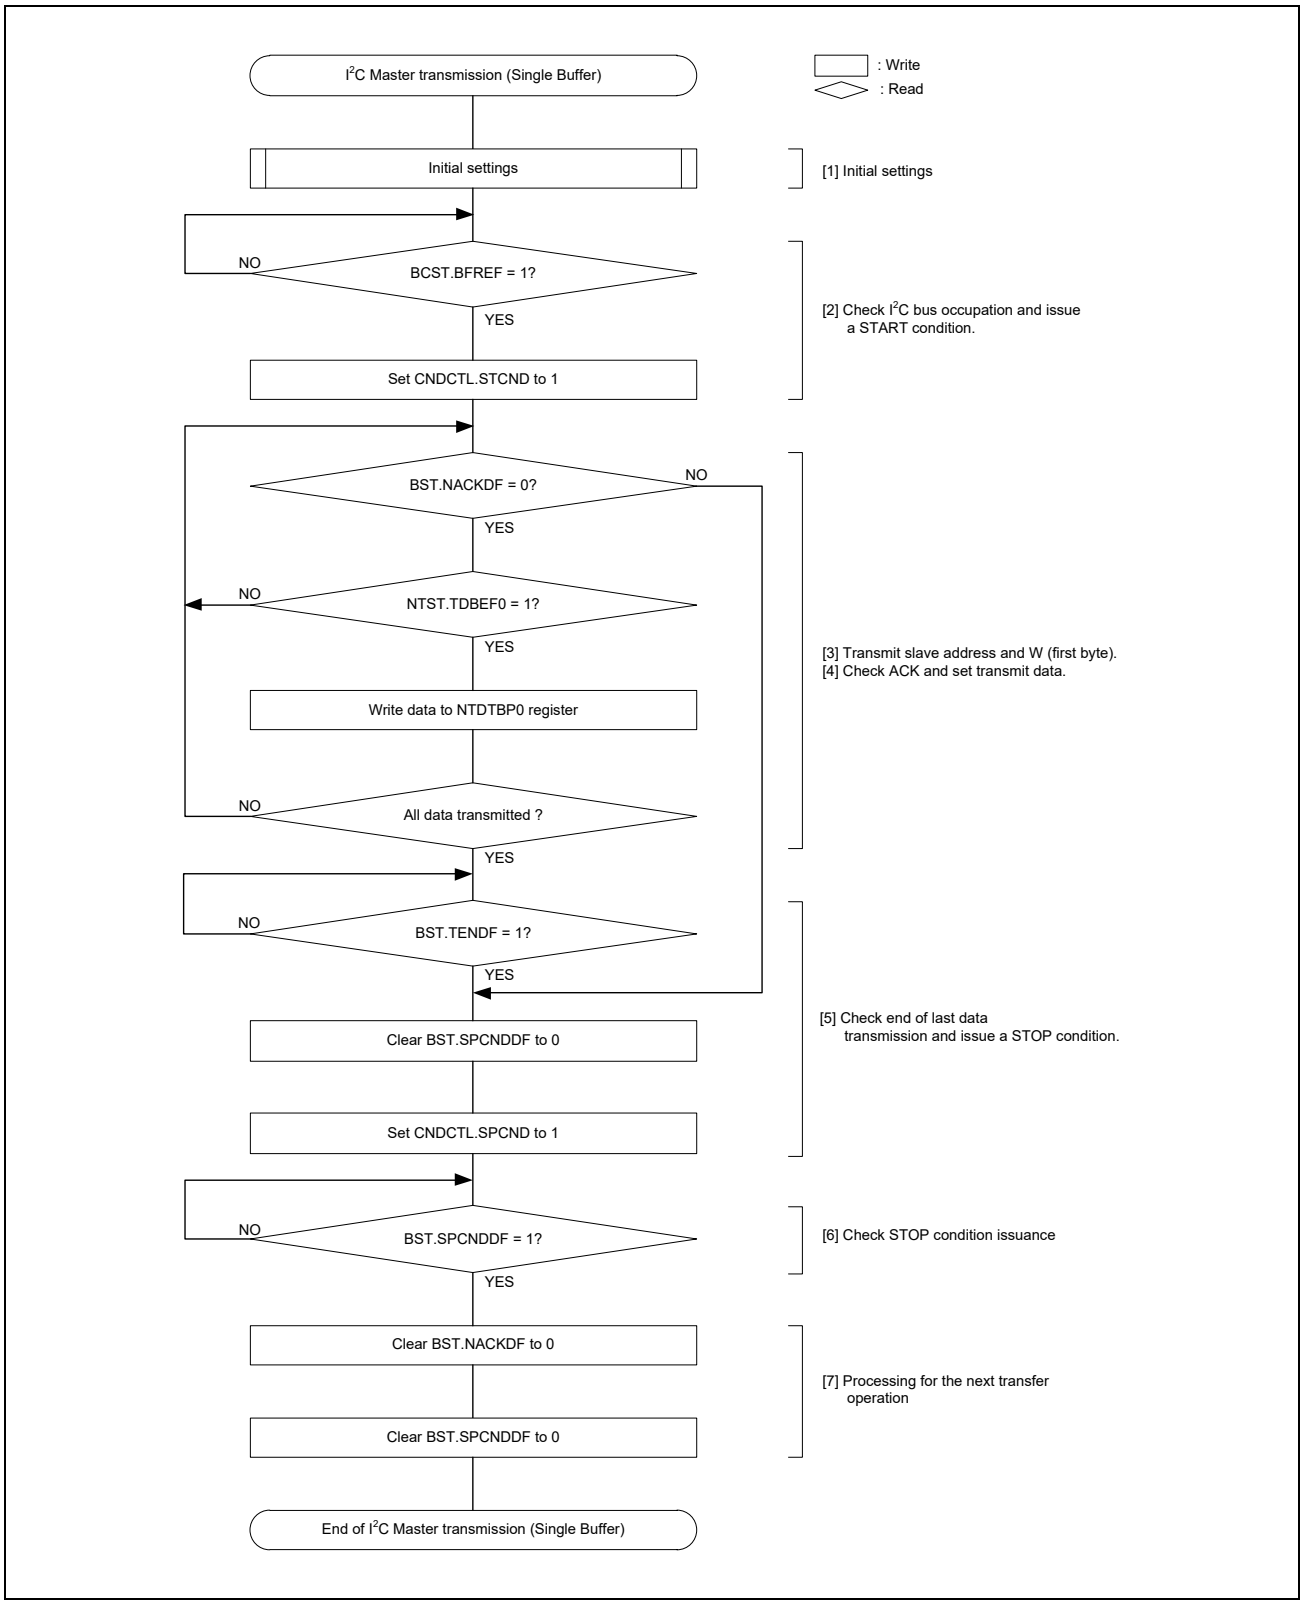

Figure 26.118 Example of I²C Master Transmission Flowchart (Single Buffer Transfer)

NOTE

The following processing is required when checking NTST.TDBEF0 = 1 in Steps [3] and [4] of the I^2C master transmission flowchart as shown in **Figure 26.118**.

- When sending a slave address:
  After confirming NTST.TDBEF0 = 1, confirm that PRSTDBG.SCILV = 0 (check the status of SCL) before writing the transmission data.
- When sending data:
  - If BITCNT.BCNT = other than 0 after confirming NTST.TDBEF0 = 1, write the transmission data immediately
  - If BITCNT.BCNT = 0 after confirming NTST.TDBEF0 = 1, check that BST.TENDF = 1 and PRSTDBG.SCILV = 0 (check the status of SCL) before writing the transmission data.

(2) I²C Master Reception Flow (Single Buffer Transfer)

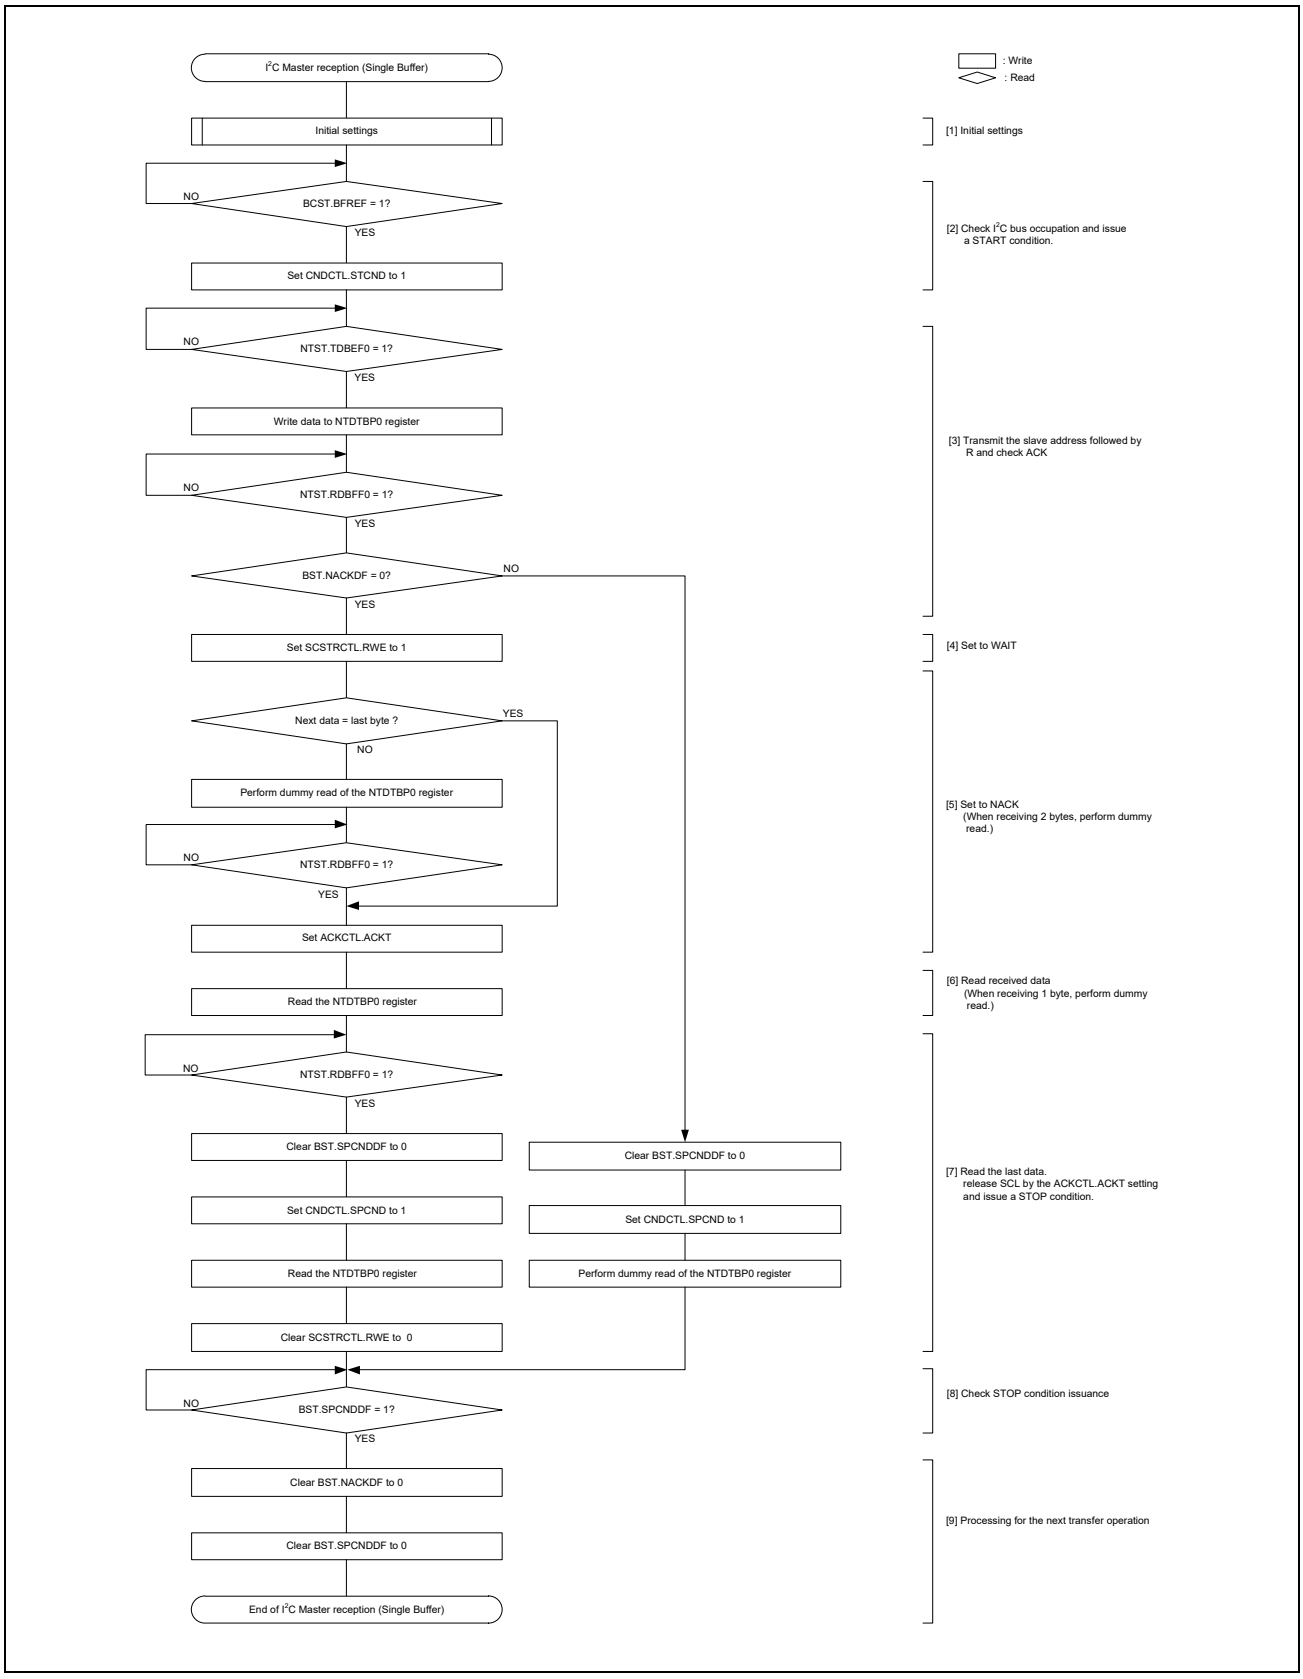

Figure 26.119 Example of I²C Master Reception Flowchart (7-bit Address Format, 1 or 2 bytes)

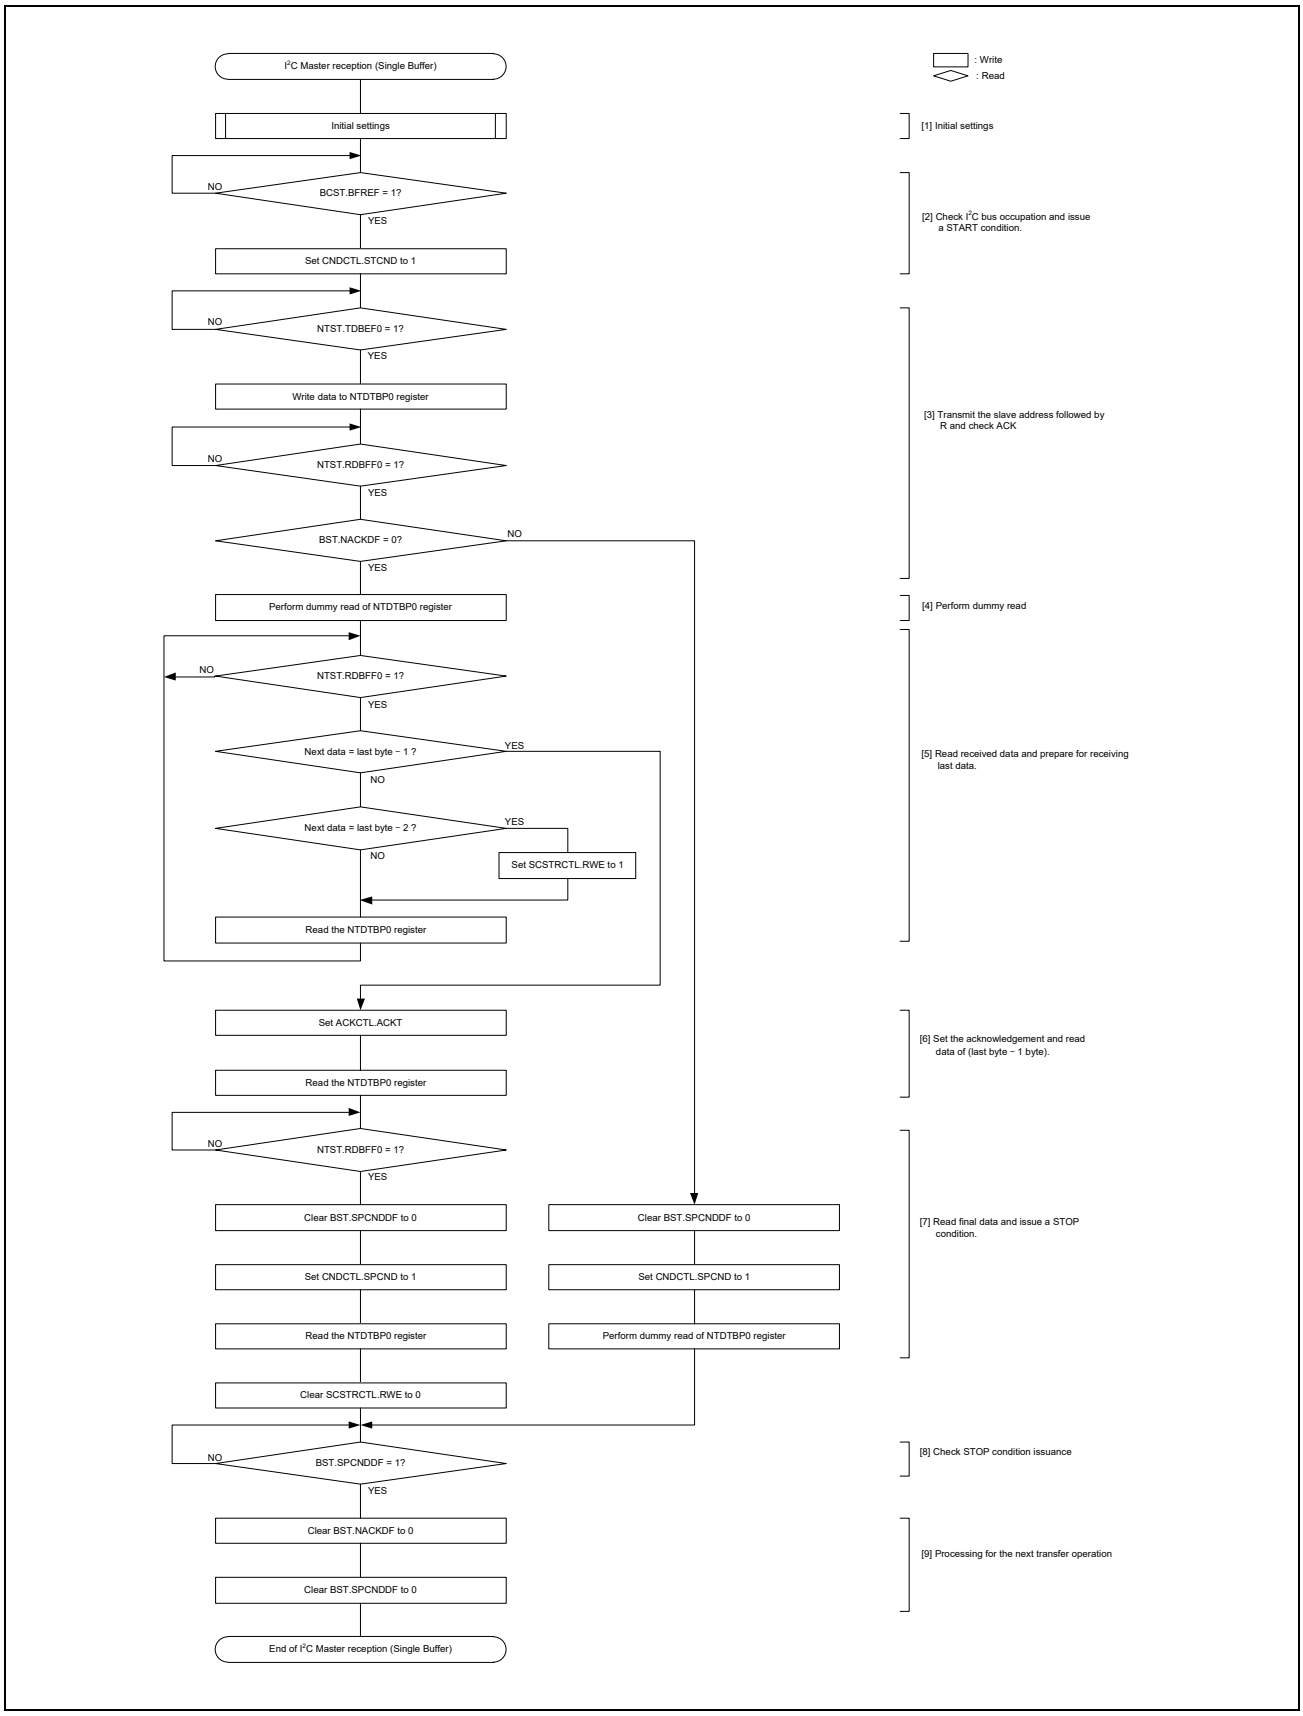

Figure 26.120 Example of I²C Master Reception Flowchart (7-bit Address Format, 3 bytes or more)

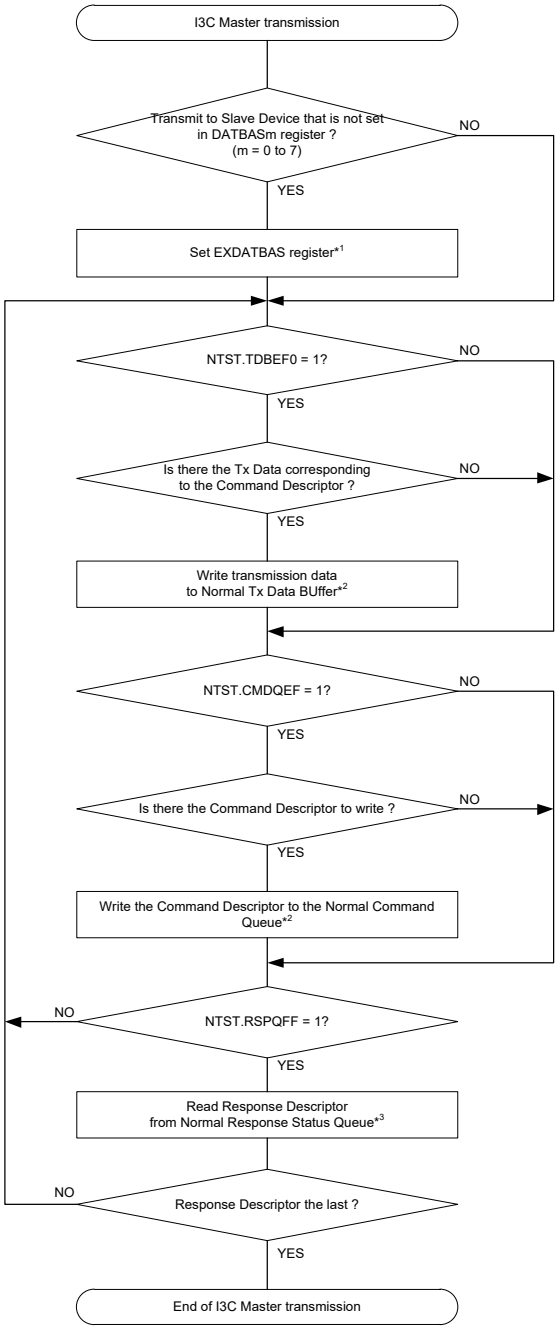
(3) I3C Master Transmission Flow (Normal FIFO Buffer Transfer)

Master transmission flow in I3C normal FIFO buffer transfer is common to Legacy I^2C, SDR (Private Transfer, Broadcast CCC, Direct CCC).



Note 1. Changing the EXDATBAS register is prohibited until all response descriptors of command for the Slave device set in the EXDATBAS register are stored.

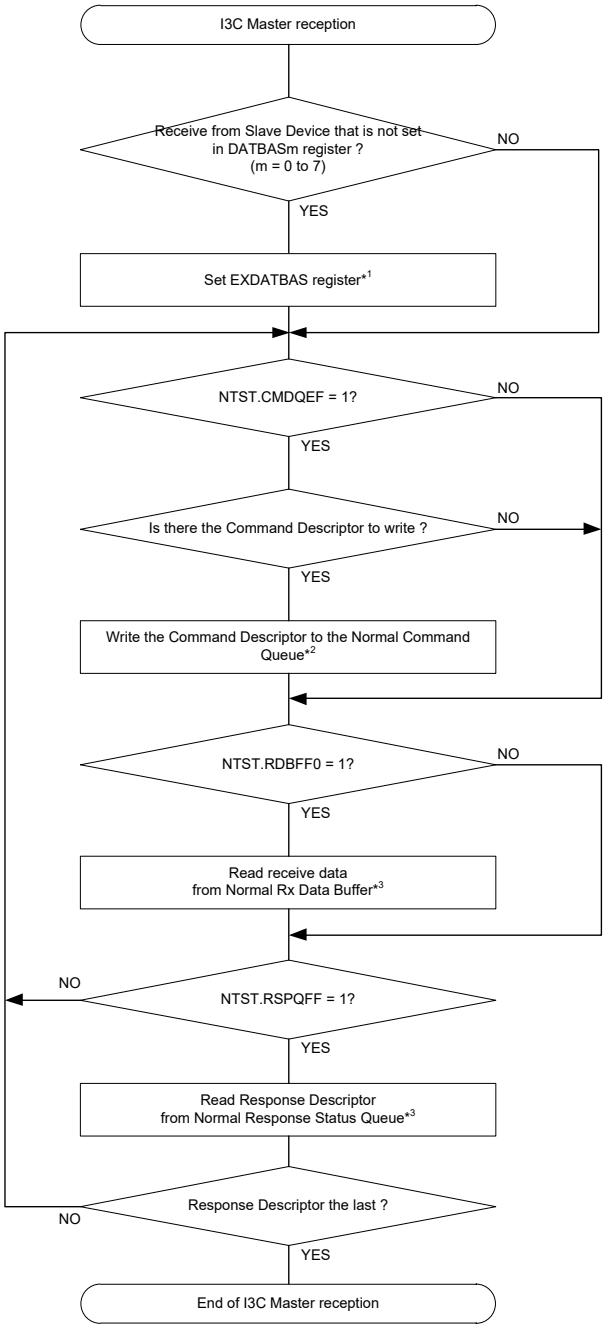
Note 2. In the case the register is write by away other than DTC, clear corresponding flags after write access.

Note 3. In the case the register is read by away other than DTC, clear corresponding flags after read access.

Figure 26.121 Example of I3C Master Transmission Flowchart (Normal FIFO Buffer Transfer)

(4) I3C Master Reception Flow (Normal FIFO Buffer Transfer)

Master reception flow in I3C normal FIFO buffer transfer is common to Legacy I^2C, SDR (Private Transfer, Broadcast CCC, Direct CCC).



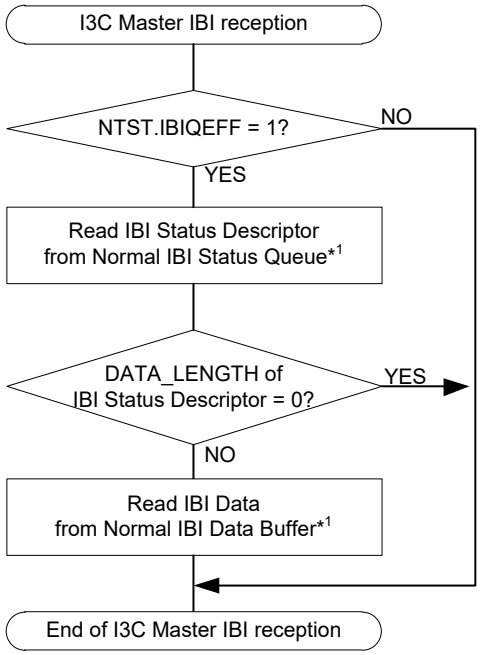
Note 1. Changing the EXDATBAS register is prohibited until all response descriptors of command for the Slave device set in the EXDATBAS register are stored.

Note 2. In the case the register is write by away other than DTC, clear corresponding flags after write access.

Note 3. In the case the register is read by away other than DTC, clear corresponding flags after read access.

Figure 26.122 Example of I3C Master Reception Flowchart (Normal FIFO Buffer Transfer)

(5) I3C Master IBI Reception Flow



Note 1. In the case the register is read by a way other than DTC, clear corresponding flags after read access.

Figure 26.123 Example of I3C Master IBI Reception Flowchart

(6) I3C Master Wake-Up Flow

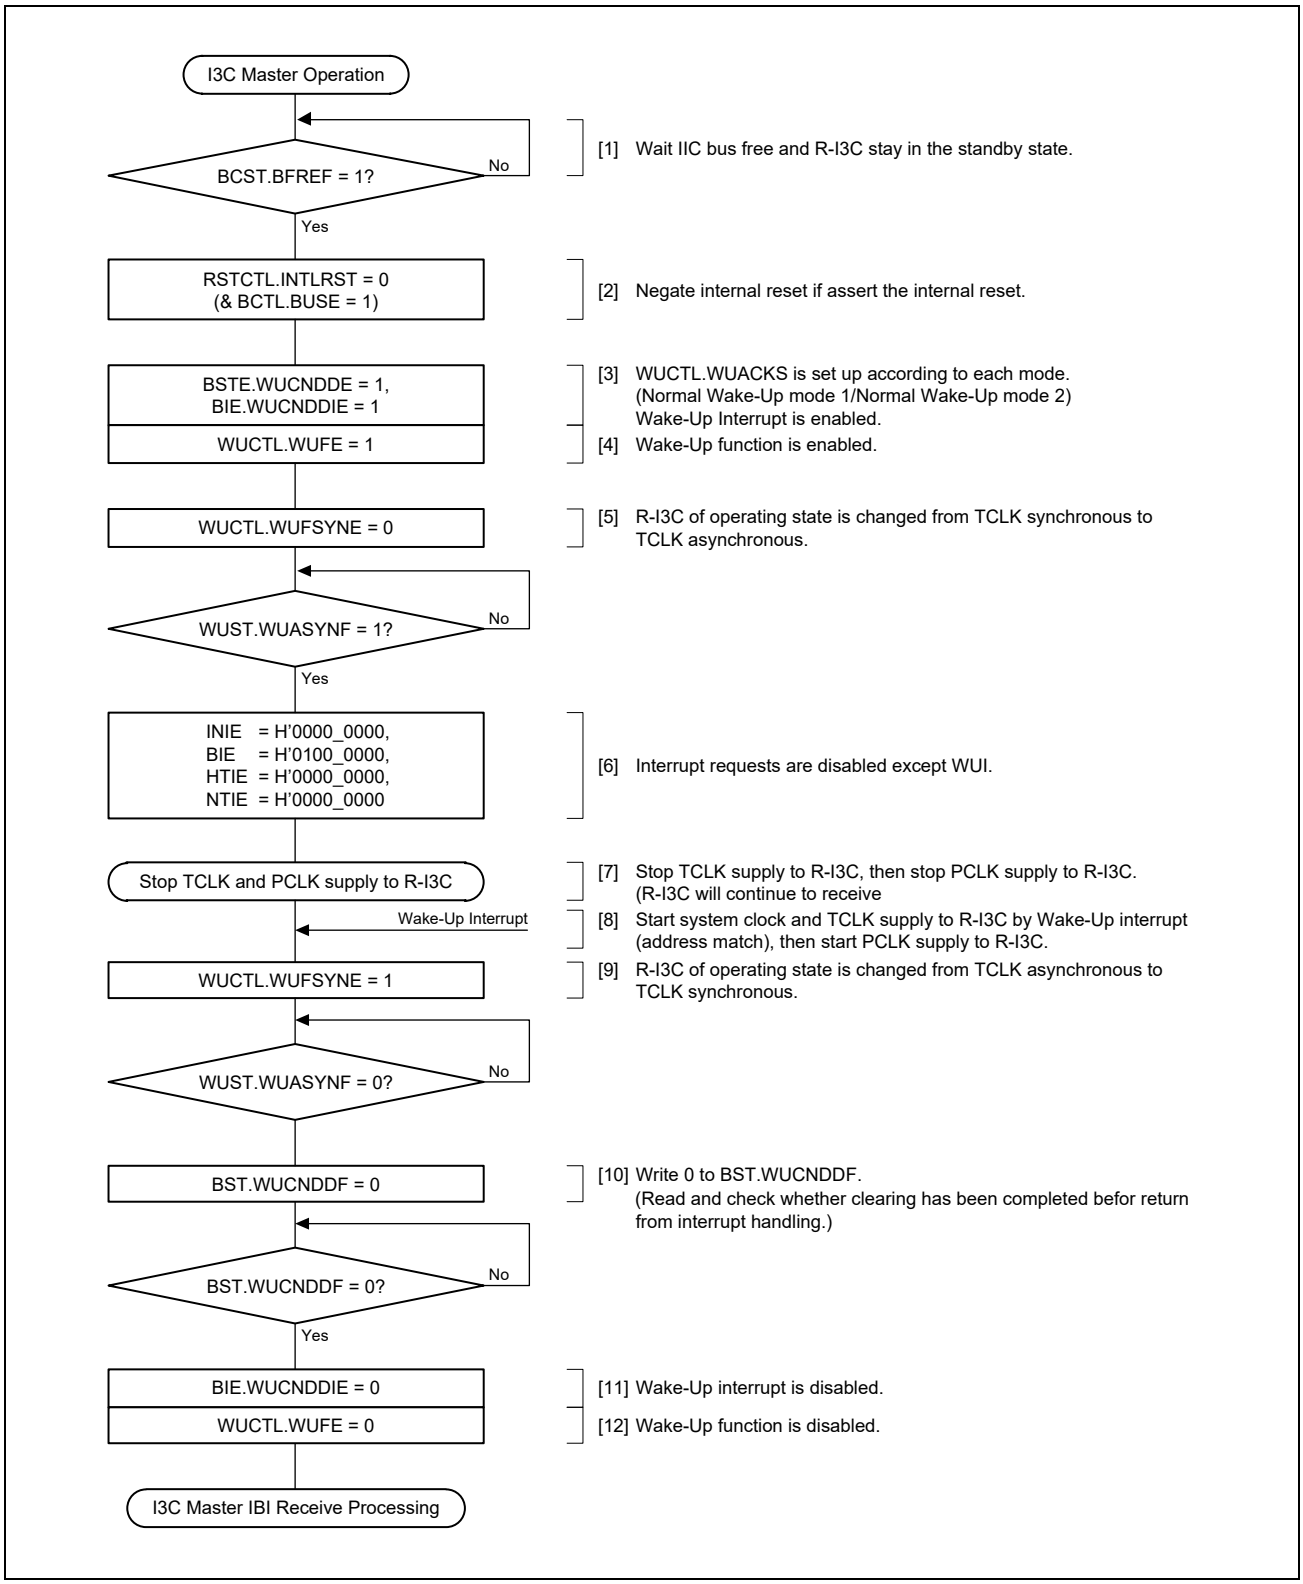


Figure 26.124 Use Case of I3C Master Wake-Up
(Wake-Up Recovery by a Wake-Up Interrupt Triggered by the Match of the Slave Address)

26.3.3.4 Slave Mode Communication Flow

(1) I²C Slave Transmission Flow (Single Buffer Transfer)

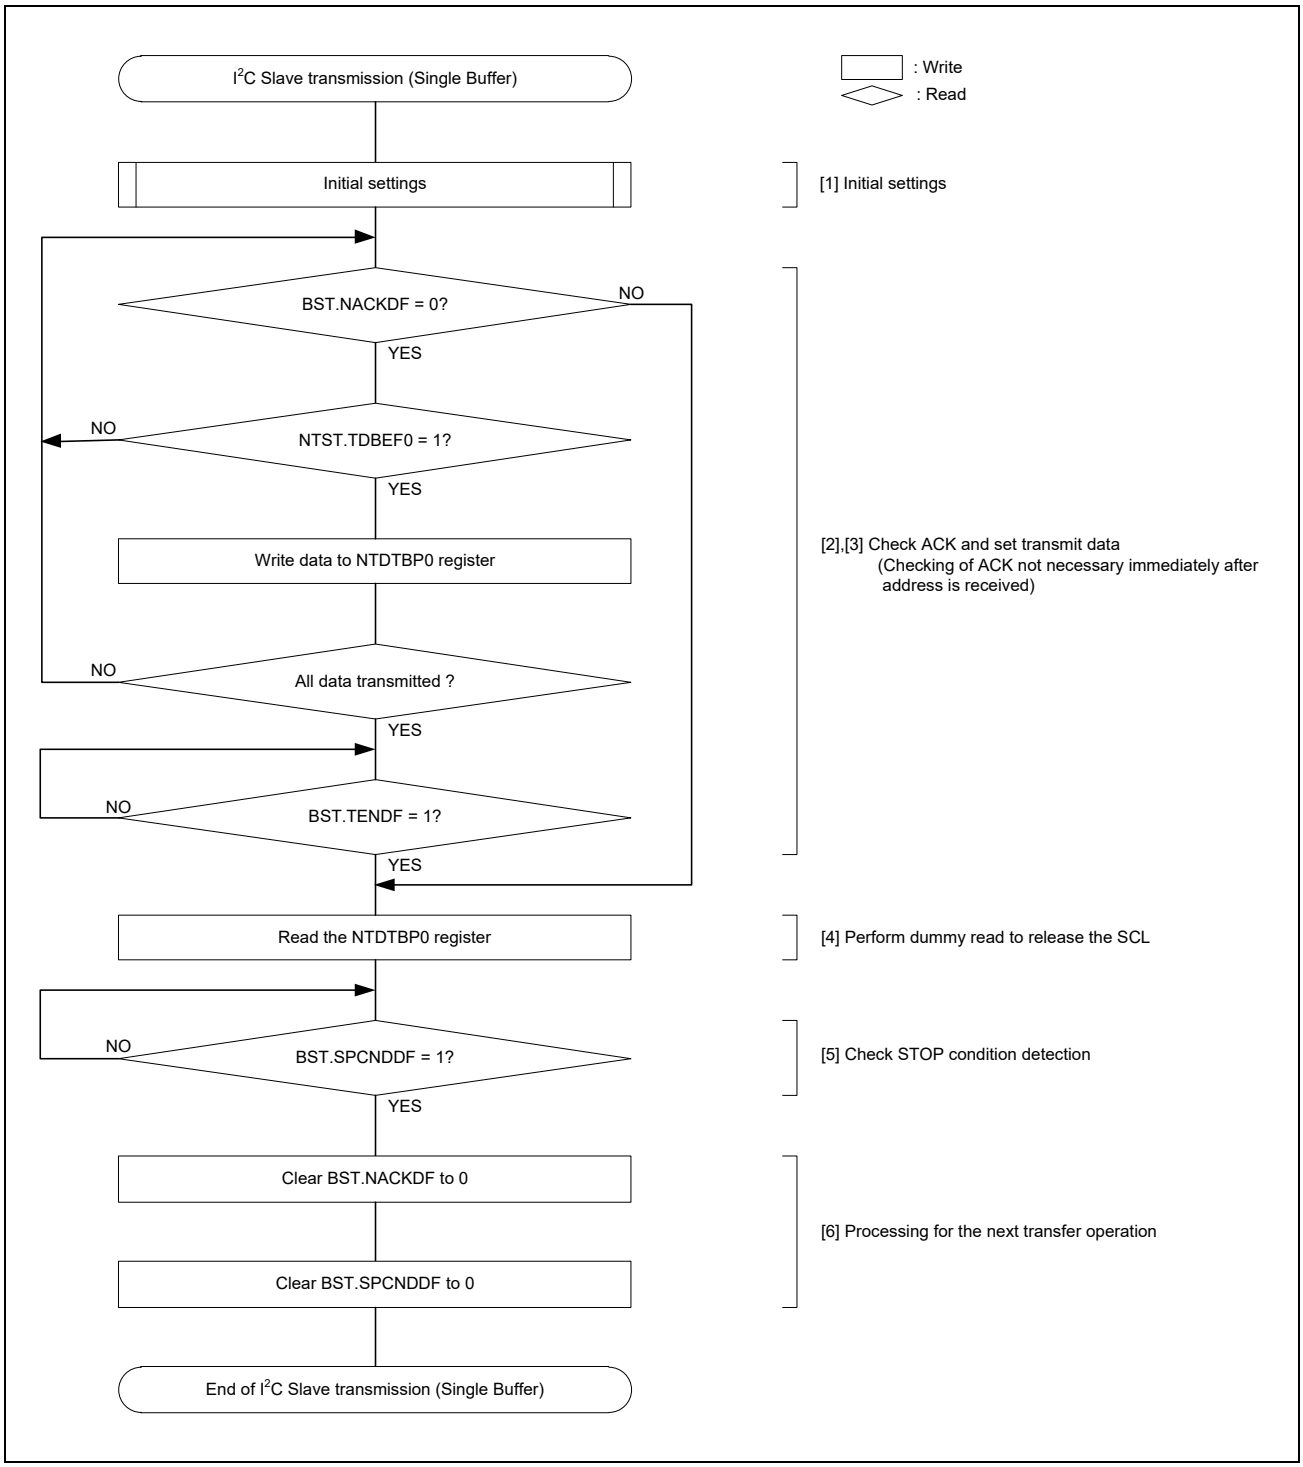

Figure 26.125 Example of I²C Slave Transmission Flowchart (Single Buffer Transfer)

(2) I²C Slave Reception Flow (Single Buffer Transfer)

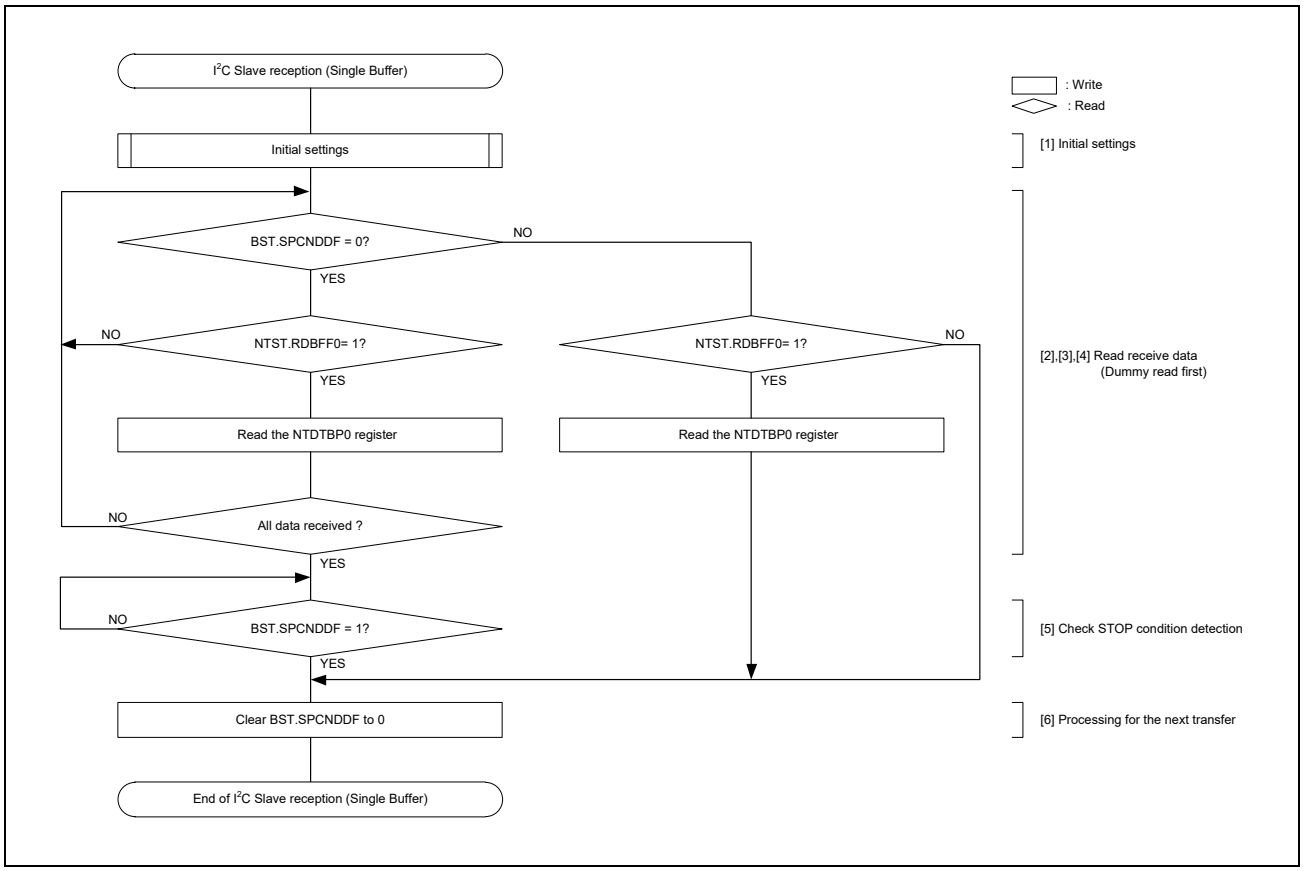

Figure 26.126 Example of I²C Slave Reception Flowchart (Single Buffer Transfer)

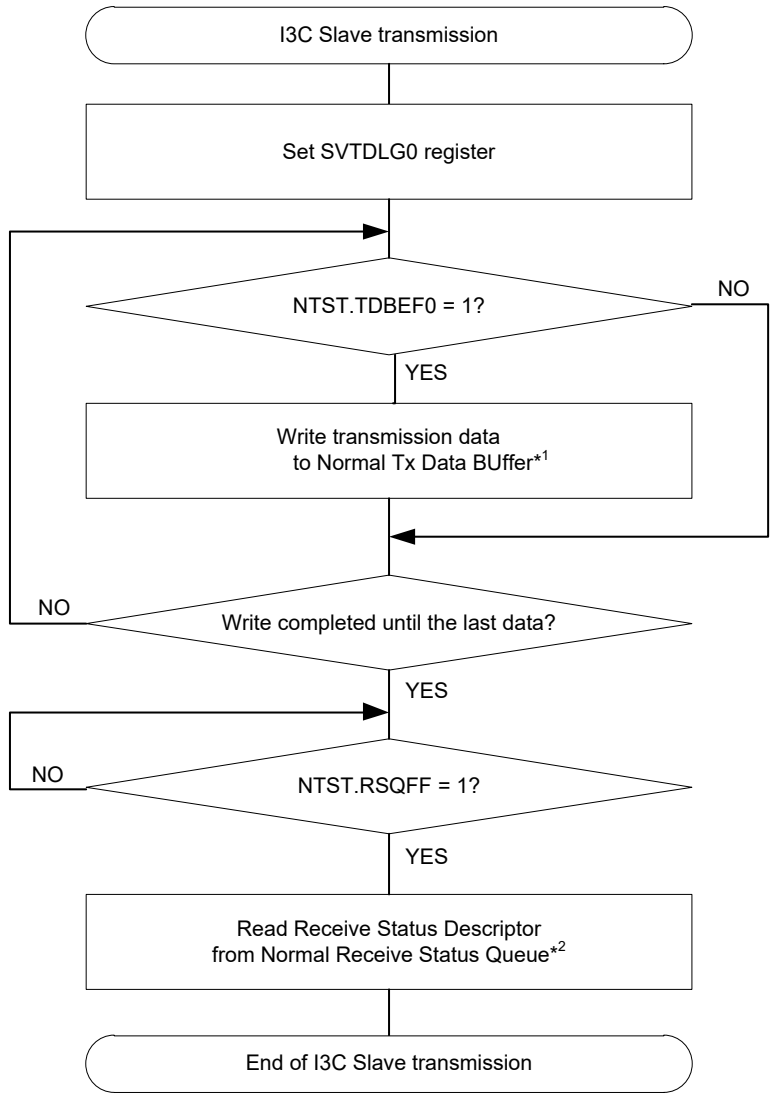
(3) I3C Slave Transmission Flow (Normal FIFO Buffer Transfer)

Slave Transmission Flow in I3C normal FIFO buffer transfer is common to Legacy I^2C, SDR (Private Transfer, Broadcast CCC, Direct CCC).

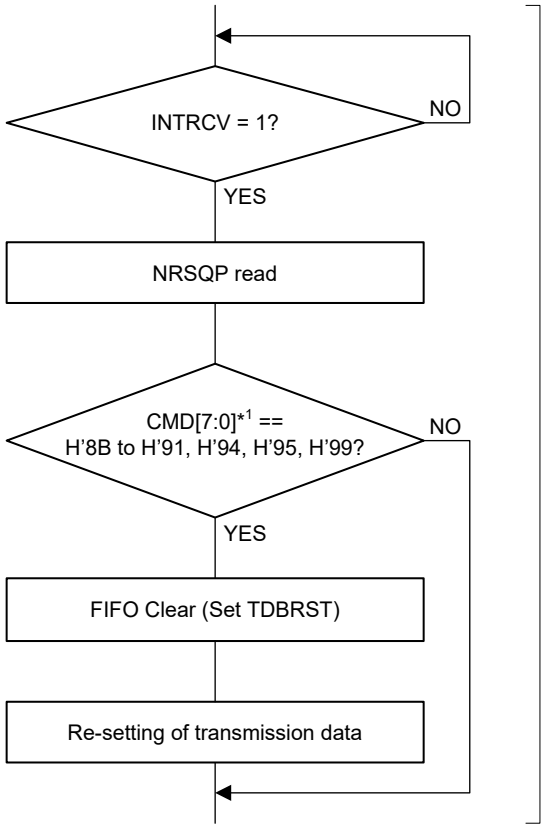


Note 1. In the case the register is write by away other than DTC, clear corresponding flags after write access.

Note 2. In the case the register is read by away other than DTC, clear corresponding flags after read access.

Figure 26.127 Example of I3C Slave Transmission Flowchart (Normal FIFO Buffer Transfer)

When using the I3C as an I3C slave, if I3C slave receives GET CCC while data exists by writing from the NTDTBP0 register to the transmission buffer, follow the flow below.

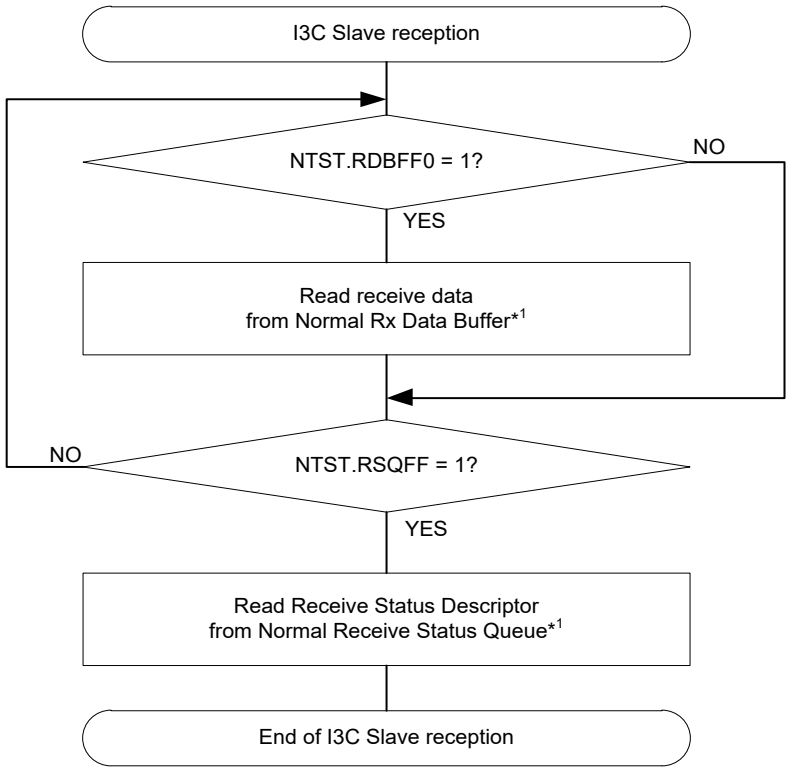


Note 1. CMD[7:0] is the bit field [23:16] of NRSQP (Receive Status Descriptor). GET CCC is when CMD[7:0] is H'8B to H'91, H'95, or H'99.

Figure 26.128 I3C Slave Receives GET CCC while Data Exists by Writing from the NTDTBP0 Register to the Transmission Buffer

(4) I3C Slave Reception Flow (Normal FIFO Buffer Transfer)

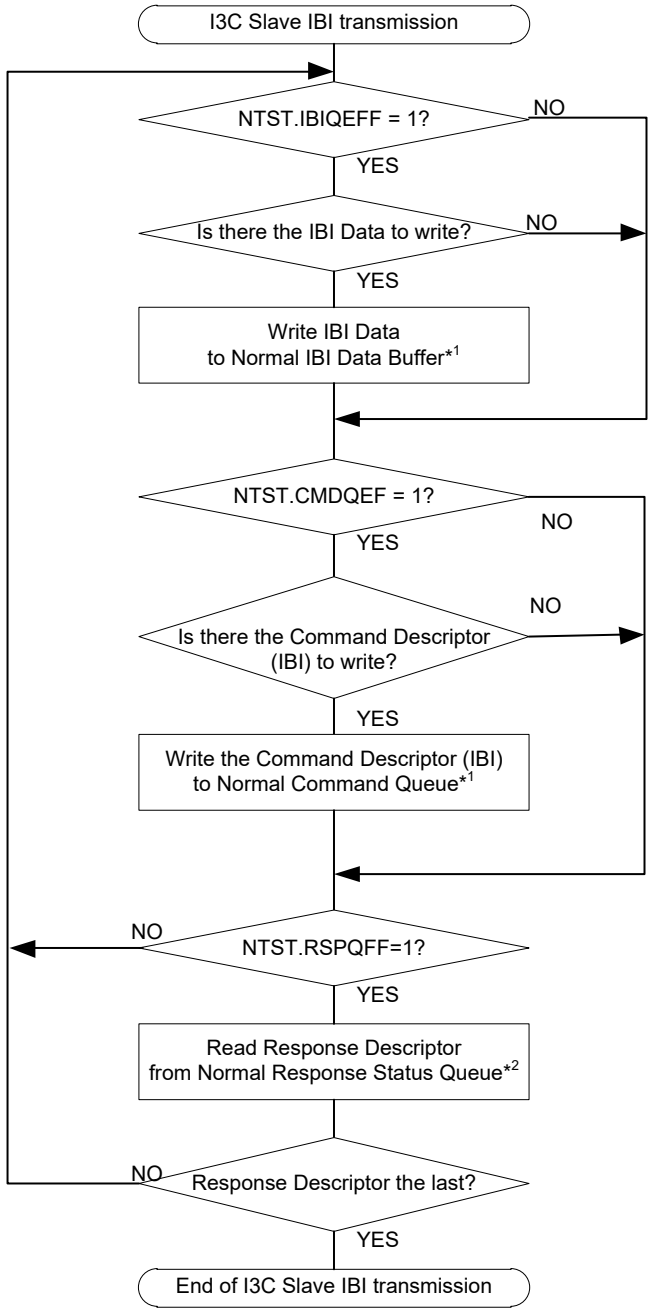
Slave Reception Flow in I3C normal FIFO buffer transfer is common to Legacy I^2C, SDR (Private Transfer, Broadcast CCC, Direct CCC).



Note 1. In the case the register is read by away other than DTC, clear corresponding flags after read access.

Figure 26.129 Example of I3C Slave Reception Flowchart (Normal FIFO Buffer Transfer)

(5) I3C Slave IBI Transmission Flow



Note 1. In the case the register is write by away other than DTC, clear corresponding flags after write access.

Note 2. In the case the register is read by away other than DTC, clear corresponding flags after read access.

Figure 26.130 Example of I3C Slave IBI Transmission Flowchart

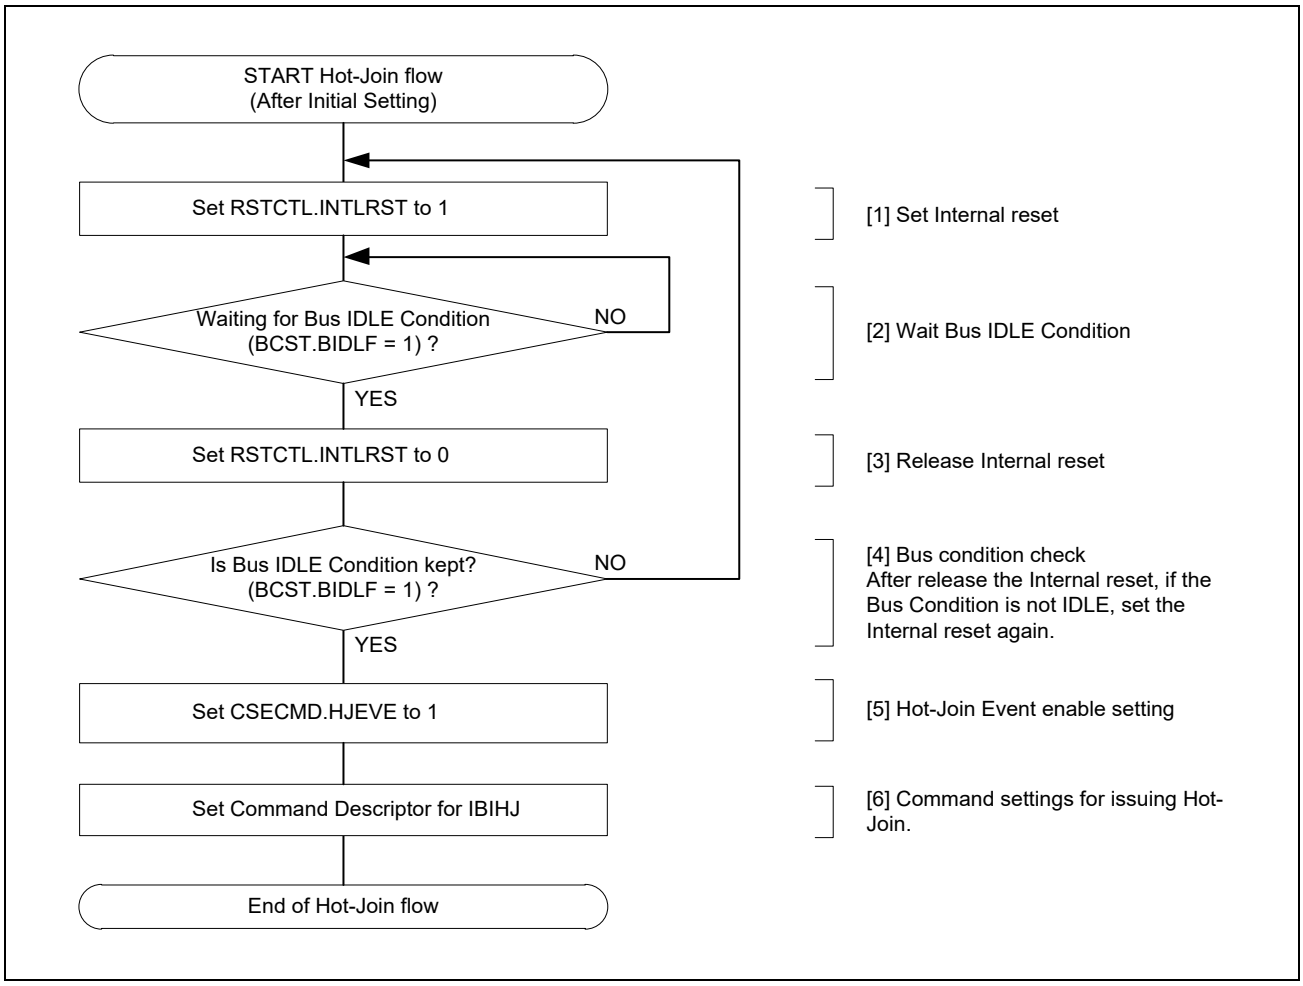


Figure 26.131 Hot-Join Flowchart after the I3C Bud has already been Configured

(6) I3C Slave Wake-Up Flow

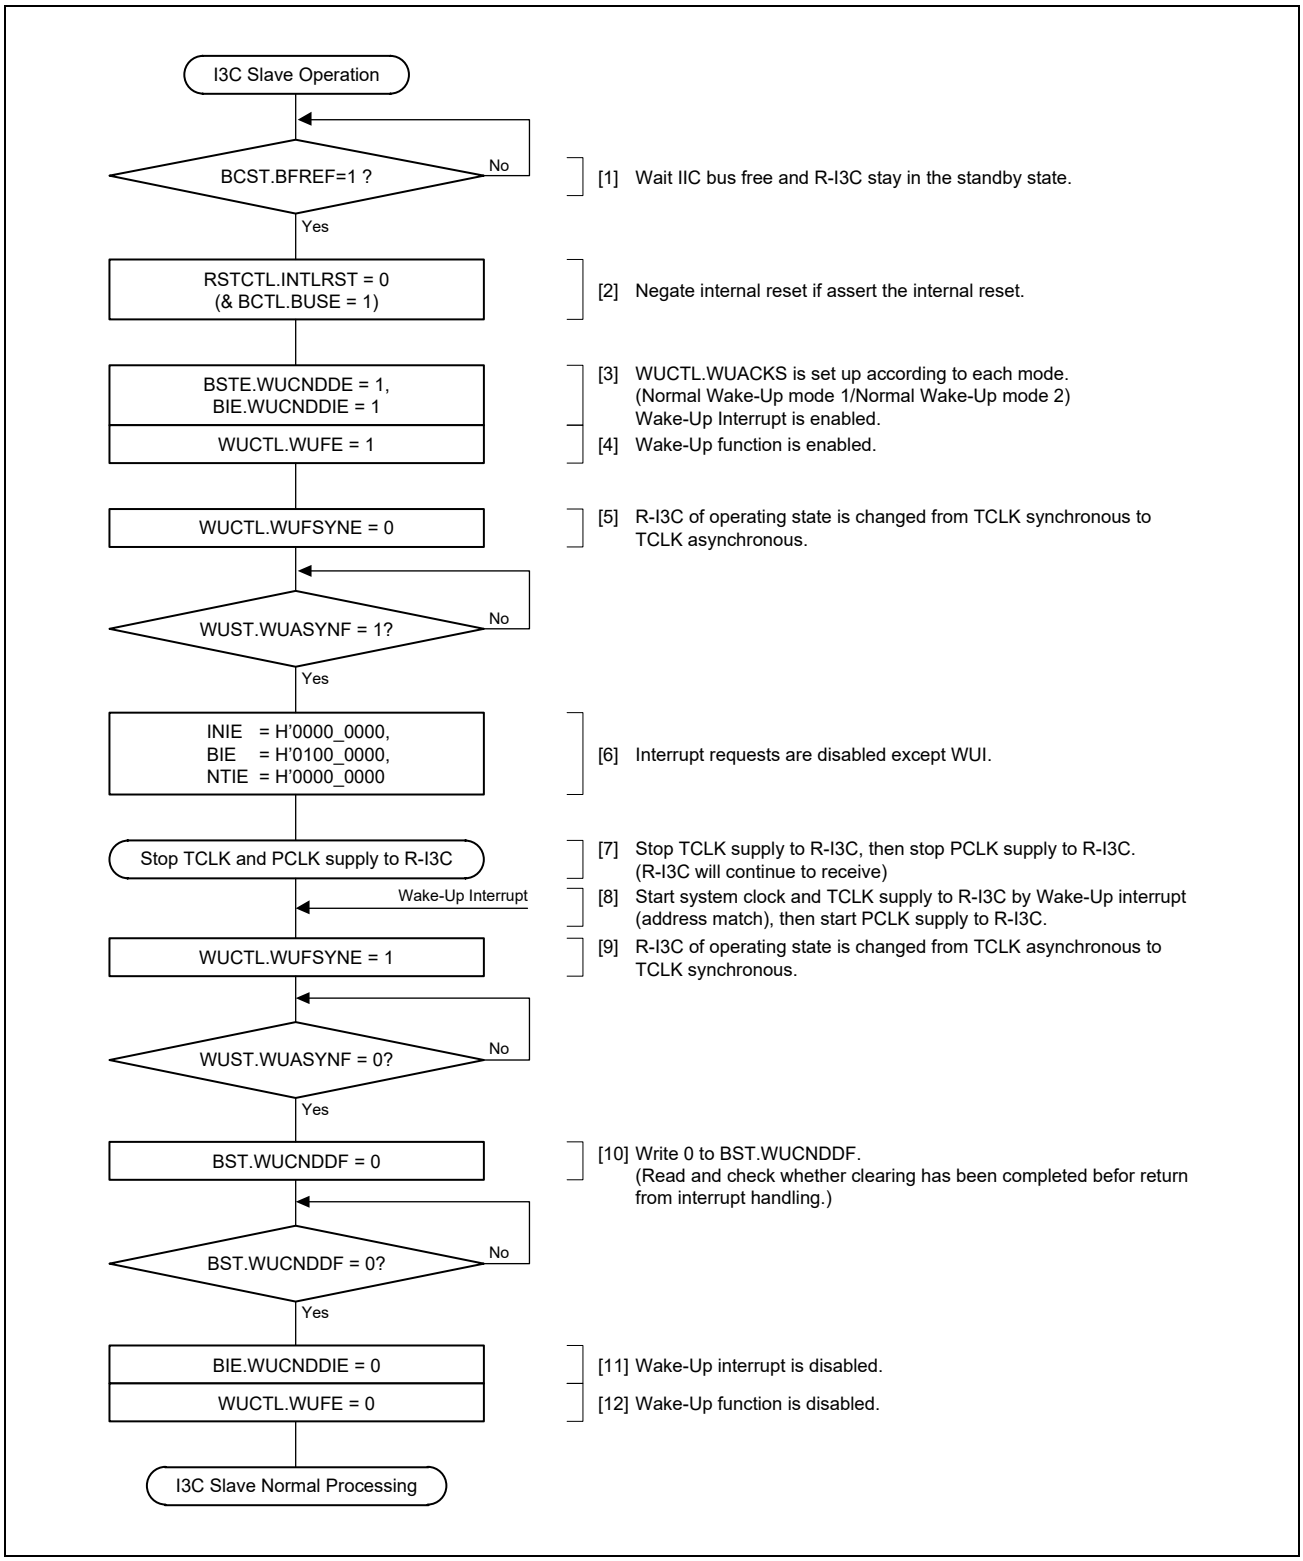

Figure 26.132 Use Case of I3C Slave Wake-Up
(Wake-Up Recovery by a Wake-Up Interrupt Triggered by the Match of the Slave Address)

26.4 Interrupt Sources

I3C can generate the following interrupt requests:

26.4.1 Overview

The I3C has the interrupt factors shown in **Table 26.17**.

The interrupt indicated by Possible in the DTC Activation column are capable of activating data transfer by the DTC.

Table 26.17 Interrupt Generation

Symbol	Interrupt Source		Interrupt Flag	Support			
				I^2C	I3CM	I3C2M	I3CS
I3C_RESP	Normal response status buffer full		NTST.RSPQFF	—	✓	✓	✓
I3C_CMD	Normal command buffer empty		NTST.CMDQEF	—	✓	✓	✓
I3C_IBI	Normal IBI status buffer empty/full		NTST.IBIQEFF	—	✓	✓	✓
I3C_RX	Normal receive data buffer empty/full		NTST.RDBEF0	✓	✓	✓	✓
I3C_TX	Normal transmit data buffer empty		NTST.TDBEF0	✓	✓	✓	✓
I3C_RCV	Normal receive status buffer full		NTST.RSQFF	—	—	✓	✓
I3C_TEND	Transmit end		BST.TENDF	✓	—	—	—
I3C_EEI	Transfer error or event occurrence	Start condition detection interrupt	BST.STCNDDF	✓	✓	✓	✓
		STOP condition detection interrupt	BST.SPCNDDF	✓	✓	✓	✓
		HDR Exit Pattern detection interrupt	BST.HDREXDF	—	✓	✓	✓
		NACK detection interrupt	BST.NACKDF	✓	—	—	—
		Arbitration lost interrupt	BST.ALF	✓	—	—	—
		Timeout detection interrupt	BST.TODF	✓	✓	✓	✓
		Wake-Up Condition detection interrupt	BST. WUCNDDF	✓	✓	✓	✓
		Non-recoverable internal error interrupt	INST.INEF	—	✓	✓	✓
		Transfer Error interrupt	NTST.TEF	—	✓	✓	✓
		Transfer Abort interrupt	NTST.TABTF	—	✓	✓	✓

Note: ✓: Support
—: Not support

Note: I^2C: I^2C Master/Slave (Single Buffer)
I3CM: I3C Master
I3C2M: I3C Secondary Master
I3CS: I3C Slave

For I3C Protocol mode:

For details, refer to the detailed explanation of each flag bit.

- The INTCMD, INTTX0 and INTIBI (I3C Slave) interrupts are cleared under the following conditions.
  On completaion of the last write accsess by DMAC/DTC. Write 0 to this bit after 1 state is read by CPU.

- The INTRESP, INTIBI (I3C Master), INTRX0 and INTRCV interrupts are cleared under the following conditions. On completaion of the last read accsess by DMAC/DTC. Write 0 to this bit after 1 state is read by CPU.
- The INTCMD, INTTX0 and INTIBI (I3C Slave) interrupts are cleared when the number of empty buffers is less than the threshold corresponding to each flag.
- The INTRESP, INTIBI (I3C Master), INTRX0 and INTRCV interrupts are cleared when the number of buffer entries is less than the threshold corresponding to each flag.

26.6 Usage Notes

26.6.1 Settings for the Operating Clock

The clock frequency ratio of PCLKD and PCLKB must be 2:1 or 1:1 when using the I3C module. Operation is not guaranteed for other settings.

27. Renesas Serial Peripheral Interface

This LSI circuit includes three independent Renesas serial peripheral interfaces.

This module is capable of full-duplex synchronous serial communication.

27.1 Features

This module has the following features.

SPI transfer functions

- Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows for serial communications through SPI operation (four-wire method).
- Capable of serial communications in master/slave mode
- Supports mode fault error detection (only in SPI slave mode)
- Supports overrun error detection (only in SPI slave mode)
- Switching of the polarity of the serial transfer clock
- Switching of the clock phase of serial transfer

Data format

- MSB-first/LSB-first selectable
- Transfer bit-length is selectable as 8, 16, or 32 bits.

Bit rate

- RSPCK can be divided by a maximum of 4096 in master mode
- RSPCK can be generated by dividing P0ϕ by the on-chip baud rate generator.
- An externally input clock can be used as a serial clock.

Buffer configuration

- 8 bytes for transmission and 32 bytes for reception

SSL control function

- One SSL signal for each channel
  - In master mode, outputs SSL signal.
  - In slave mode, inputs SSL signal.
- Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay)
  - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Controllable delay from RSPCK stoppage to SSL output negation (SSL negation delay)
  - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Controllable wait for next-access SSL output assertion (next-access delay)
  - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)

- Function for changing SSL polarity

Control in master transfer

- A transfer of up to four commands can be executed sequentially in looped execution.
- For each command, the following can be set:
  - SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB first, burst, RSPCK delay, SSL negation delay, and next-access delay.
  - A transfer can be initiated by writing to the transmit buffer.
  - A transfer can be initiated by clearing the SPTEF bit.
  - MOSI signal value specifiable in SSL negation

Interrupt sources

- Maskable interrupt sources:
  - Receive interrupt (receive buffer full)
  - Transmit interrupt (transmit buffer empty)
  - Error interrupt (mode fault, overrun)

Others

- Provides loop back mode
- Provides a function for disabling (initializing) this module

Figure 27.1 Block Diagram (for One Channel)

27.2 Input/Output Pins

Table 27.1 shows the pin configuration. This module automatically switches the input/output direction of the SSL pin. SSL is set as an output in master mode and as an input in slave mode. Pins RSPCK, MOSI, and MISO are automatically set as inputs or outputs according to the setting of master or slave and the level input on SSL (see **Section 27.4.2, Pin Control**).

Table 27.1 Pin Configuration

Channel	Pin Name	Pin Name	I/O	Function
0	Clock pin	RSPI0_CK	I/O	Clock input/output
	Master transmit data pin	RSPI0_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI0_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI0_SSL	I/O	Slave selection
1	Clock pin	RSPI1_CK	I/O	Clock input/output
	Master transmit data pin	RSPI1_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI1_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI1_SSL	I/O	Slave selection
2	Clock pin	RSPI2_CK	I/O	Clock input/output
	Master transmit data pin	RSPI2_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI2_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI2_SSL	I/O	Slave selection
3	Clock pin	RSPI3_CK	I/O	Clock input/output
	Master transmit data pin	RSPI3_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI3_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI3_SSL	I/O	Slave selection
4	Clock pin	RSPI4_CK	I/O	Clock input/output
	Master transmit data pin	RSPI4_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI4_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI4_SSL	I/O	Slave selection

Note: In the description of the pins, the channel is omitted, and pin names are described as RSPCK, MOSI, MISO, and SSL.

27.3 Register Descriptions

Table 27.2 shows the register configuration. The address of the RSPI register is represented by the offset address from the base address. RSPI base address is as follows:

Base address: H'0_100A_0000 (Overall Address Space)
Base address: H'400A_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base address: H'500A_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 27.2 Register Configuration (1/3)

Channel	Register Name	Abbreviation*1	R/W	Initial Value	Offset Address	Access Size
0	Control register_0	SPCR_0	R/W	H'00	H'A000	8

	Buffer data count setting register_4	SPBFDR_4	R	H'0000	H'B022	16

Note 1. In the description of the register names, the channel is omitted.

Note 2. Only 0 can be written to clear the flag.

27.3.1 Control Register (SPCR)

SPCR sets the operating mode. If the MSTR and MODFEN bits are changed while the function of this module is enabled by setting the SPE bit to 1, subsequent operations cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODFEN	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	SPRIE	0	R/W	Receive Interrupt Enable Enables or disables generation of receive interrupt requests (SPRI) when the number of receive data units in the receive buffer (SPRX) is equal to or greater than the specified receive buffer data triggering number and the SPRF flag in SPSR is set to 1. 0: Disables the generation of receive interrupt requests. 1: Enables the generation of receive interrupt requests.
6	SPE	0	R/W	Function Enable Setting this bit to 1 enables the module function. When the MODF bit in the status register (SPSR) is 1, the SPE bit cannot be set to 1 (see **Section 27.4.6, Error Detection**). Setting the SPE bit to 0 disables the module function, and initializes a part of the module function (see **Section 27.4.7, Initialization**). 0: Disables the module function. 1: Enables the module function.
5	SPTIE	0	R/W	Transmit Interrupt Enable Enables or disables generation of transmit interrupt requests (SPTI) when the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the specified transmit buffer data triggering number and the SPTEF flag in SPSR is set to 1. 0: Disables the generation of transmit interrupt requests. 1: Enables the generation of transmit interrupt requests.
4	SPEIE	0	R/W	Error Interrupt Enable Enables or disables the generation of error interrupt requests when this module detects a mode fault error and sets the MODF bit in the status register (SPSR) to 1, or when this module detects an overrun error and sets the OVRF bit in SPSR to 1 (see **Section 27.4.6, Error Detection**). 0: Disables the generation of error interrupt requests. 1: Enables the generation of error interrupt requests. *Note*: This bit is valid only in SPI slave mode.
3	MSTR	0	R/W	Master/Slave Mode Select Selects master/slave mode. According to MSTR bit settings, this module determines the direction of the RSPCK, MOSI, MISO, and SSL pins. 0: Slave mode 1: Master mode
2	MODFEN	0	R/W	Mode Fault Error Detection Enable Enables or disables the detection of a mode fault error (see **Section 27.4.6, Error Detection**). 0: Disables the detection of a mode fault error. 1: Enables the detection of a mode fault error. *Note*: This bit is valid only in SPI slave mode. When master mode is specified with the MSTR bit, this bit should always be cleared to 0.
1, 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

27.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the SSL signal. If the contents of SSL0P are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSL0P
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SSL0P	0	R/W	SSL Signal Polarity Setting Sets the polarity of the SSL signal. The value of SSL0P indicates the active polarity of the SSL signal. 0: SSL signal 0-active 1: SSL signal 1-active

27.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of this register are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	—	—	MOIFE	MOIFV	—	—	—	SPLP
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5	MOIFE	0	R/W	MOSI Idle Value Fixing Enable Fixes the MOSI output value when this module in master mode is in an SSL negation period (including the SSL retention period during a burst transfer). When MOIFE is 0, this module outputs the last output value from the previous serial transfer during the SSL negation period to the MOSI pin. (The value is undefined when CPHA is 0). When MOIFE is 1, this module outputs the fixed value set in the MOIFV bit to the MOSI pin. 0: MOSI output value equals the last output value from previous transfer. (The value is undefined when CPHA is 0). 1: MOSI output value equals the value set in the MOIFV bit.
4	MOIFV	0	R/W	MOSI Idle Fixed Value If the MOIFE bit is 1 in master mode, this module, according to MOIFV bit settings, determines the MOSI signal value during the SSL negation period (including the SSL retention period during a burst transfer). 0: MOSI Idle fixed value equals 0. 1: MOSI Idle fixed value equals 1.
3 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SPLP	0	R/W	Loopback When the SPLP bit is set to 1, this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects (reverses) the input path and the output path for the shift register. 0: Normal mode 1: Loopback mode

27.3.4 Status Register (SPSR)

SPSR indicates the operating status.

Bit	7	6	5	4	3	2	1	0
	SPRF	TEND	SPTEF	—	—	MODF	—	OVRF
Initial Value	0	1	1	0	0	0	0	0
R/W	R	R	R	R	R	R/(W)*1	R	R/(W)*1

Note 1. Only 0 can be written to clear the flag after reading 1.

Bit	Bit Name	Initial Value	R/W	Description
7	SPRF	0	R	Receive Buffer Full Flag Indicates that the number of receive data units in the receive buffer (SPRX) is equal to or greater than the receive buffer data triggering number specified in the buffer control register (SPBFCR). 0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number. 1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number. [Clearing conditions] • The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number. • Receive buffer data reset is enabled. • Power-on reset [Setting condition] • The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number.
6	TEND	1	R	Transmit End This bit is set to 1 when transmission is completed, and this bit is 0 when transmission is not completed. [Clearing condition] • When transmit data are transferred from the transmit register to the shift register. [Setting condition] • When the number of data units in the transmit buffer (SPTX) is zero when a serial transfer is completed. *Note*: This bit is valid only in SPI master mode.
5	SPTEF	1	R	Transmit Buffer Empty Flag Indicates that the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the transmit buffer data triggering number specified in the buffer control register (SPBFCR). 0: The number of transmit data units in the transmit buffer is equal to or greater than the specified transmit buffer data triggering number. 1: The number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number. [Clearing condition] • When data is written to the transmit buffer until the number of transmit data units in the transmit buffer exceeds the specified transmit buffer data triggering number. [Setting conditions] • When the number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number. • When transmit buffer data reset is enabled. • Power-on reset
4, 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
2	MODF	0	R/(W) *1	Mode Fault Error Flag Indicates the occurrence of a mode fault error. If the MODFEN bit is set to 1 when this module is in slave mode and the SSL pin is negated before the RSPCK cycle necessary for data transfer ends, this module detects a mode fault error. The active level of the SSL signal is determined by the SSL0P bit in the slave select polarity register (SSLP). [Clearing conditions] • SPSR is read when the MODF bit is 1, and then 0 is written to the MODF bit. • Power-on reset 0: No mode fault error occurred 1: A mode fault error occurred *Note*: This bit is valid only in SPI slave mode.
1	—	0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	OVRF	0	R/(W) *1	Overrun Error Flag Indicates the occurrence of an overrun error. If a serial transfer ends when there is not enough space for receiving the specified length of data in the receive buffer (SPRX), this module detects an overrun error, and sets the OVRF bit to 1. [Clearing conditions] • SPSR is read when the OVRF bit is 1, and then 0 is written to the OVRF bit. • Power-on reset 0: No overrun error occurred 1: An overrun error occurred *Note*: This bit is valid only in SPI slave mode.

Note 1. Only 0 can be written to clear the flag after reading 1.

27.3.5 Data Register (SPDR)

SPDR is a buffer that holds data for transmission and reception.

The transmit buffer (SPTX) and receive buffer (SPRX) are independent and are mapped to SPDR.

SPDR should be read or written to in byte, word, or longword units according to the access width specification bit (SPLW) in the data control register (SPDCR).

The bit length to be used is determined by the data length specification bits (SPB3 to SPB0) in the command register (SPCMD).

The access width set by SPDCR must agree with the data length set by SPCMD.

When data is written to SPDR, the data will be written to the transmit buffer from SPDR if the transmit buffer has a space equal to or more than the SPDR access width. If there is not enough space, data will not be written to the transmit buffer. Even if an attempt is made to write data to the buffer, the data is ignored.

When data is read from SPDR, receive data in the receive buffer will be read. If SPDR is read when there is no receive data in the receive buffer, the read value is undefined.

When SPDR is written to with the longword-, word-, or byte-access width, the transmit data should be written to address 0 irrespective of the access width. If data is written to the other addresses, the data is not guaranteed.

When SPDR is read with the longword-, word-, or byte-access width, the receive data should be read from address 0. If data is read from the other addresses, the data is not guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. Undefined

27.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence control method when this module operates in master mode. If the contents of SPSCR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPSLN1	SPSLN0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1	SPSLN1	0	R/W	Sequence Length Specification These bits specify a sequence length when this module in master mode performs sequential operations. This module in master mode changes command registers 0 to 3 (SPCMD0 to SPCMD3) to be referenced and the order in which they are referenced according to the sequence length that is set in the SPSLN1 and SPSLN0 bits. The relationship among the setting of bits SPSLN1 and SPSLN0, sequence length, and SPCMD0 to SPCMD3 referenced by this module is shown below. In slave mode, SPCMD0 is always referenced. Sequence Length / Referenced SPCMD # 00: 1 — 0 → 0 → … 01: 2 — 0 → 1 → 0 → … 10: 3 — 0 → 1 → 2 → 0 → … 11: 4 — 0 → 1 → 2 → 3 → 0 → …
0	SPSLN0	0	R/W	

27.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status when this module operates in master mode.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPCP1	SPCP0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1	SPCP1	0	R	Command Pointer During sequence control, these bits indicate one of the command registers 0 to 3 (SPCMD0 to SPCMD3) that is currently pointed to by the pointer. The relationship between the setting of SPCP1 and SPCP0 and SPCMD0 to SPCMD3 is shown below. For the sequence control, see **Section 27.4.8(1)(c), Sequence Control**. 00: SPCMD0 01: SPCMD1 10: SPCMD2 11: SPCMD3
0	SPCP0	0	R	

27.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	SPR7	SPR6	SPR5	SPR4	SPR3	SPR2	SPR1	SPR0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When this module is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings of SPBR and BRDV.

The bit rate is determined by combinations of SPBR settings and the bit settings in the BRDV1 and BRDV0 bits in the command registers (SPCMD0 to SPCMD3). The equation for calculating the bit rate is given below. In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV1 and BRDV0 bit setting (0, 1, 2, 3).

$$\text{Bit rate} = \frac{\text{f (P0}\phi\text{)}}{2 \times (\text{n} + 1) \times 2^{\text{N}}}$$

Table 27.3 shows examples of the relationship between the SPBR register and BRDV1 and BRDV0 bit settings.

Table 27.3 Relationship between SPBR and BRDV1 and BRDV0 Settings

SPBR (n)	BRDV[1:0] (N)	Division Ratio	Bit Rate*1
			P0ϕ = 100 MHz
0	0	2	Not available
1	0	4	25.00 Mbps
2	0	6	16.67 Mbps
3	0	8	12.50 Mbps
4	0	10	10.00 Mbps
5	0	12	8.33 Mbps
5	1	24	4.17 Mbps
5	2	48	2.08 Mbps
5	3	96	1.04 Mbps
255	3	4096	24.41 Kbps

Note 1. Decide the bit rate to be actually used in the system considering timing specifications.

27.3.9 Data Control Register (SPDCR)

SPDCR selects the width to access SPDR from longword-, word-, and byte-width, and enables or disables dummy data transmission for the master mode operation.

If the contents of SPDCR are changed while bit TEND in the status register (SPSR) indicates that transmission is not completed, the subsequent operation cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	TXDMY	SPLW1	SPLW0	—	—	—	—	—
Initial Value	0	0	1	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	TXDMY	0	R/W	Dummy Data Transmission Enable Enables or disables dummy data transmission. When communication is performed with this bit set to 1, dummy data is transmitted from the MOSI pin and a serial communication can be performed even if there is no transmit data in the transmit buffer. Specifically, if there is no transmit data in the transmit buffer and this bit is set to 1, dummy data is transferred to the shift register. Data previously transmitted from the pin is used as dummy data. If this bit is set to 1 after the initialization and a transfer is performed, the transmitted dummy data is undefined. 0: Disables dummy data transmission. 1: Enables dummy data transmission. *Note*: This bit is valid only in the master mode.
6	SPLW1	0	R/W	Access Width Specification Specifies the width for accessing the data register (SPDR). If the length of data transferred to SPDR does not agree with these bit settings, operation is not guaranteed.*1 00: Setting prohibited 01: SPDR is accessed in bytes (8 bits). 10: SPDR is accessed in words (16 bits). 11: SPDR is accessed in longwords (32 bits).
5	SPLW0	1	R/W	
4 to 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Note 1. The data length is specified by the SPB3 to SPB0 bits in the command register (SPCMD).
See **Section 27.3.5, Data Register (SPDR)**.

27.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period from the beginning of SSL signal assertion to RSPCK oscillation (RSPCK delay) when the SCKDEN bit in the command register (SPCMD) is 1. If the contents of SPCKD are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SCKDL2 to SCKDL0.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SCKDL2	SCKDL1	SCKDL0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SCKDL2	0	R/W	RSPCK Delay Setting These bits set an RSPCK delay value when the SCKDEN bit in SPCMD is 1. The relationship between the setting of SCKDL2 to SCKDL0 and the RSPCK delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK
1	SCKDL1	0	R/W	
0	SCKDL0	0	R/W	

27.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (SSL negation delay) from the transmission of a final RSPCK edge to the negation of the SSL signal during a serial transfer by this module in master mode. If the contents of SSLND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SLNDL2 to SLNDL0.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLNDL2	SLNDL1	SLNDL0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SLNDL2	0	R/W	SSL Negation Delay Setting These bits set an SSL negation delay when the SLNDEN bit in SPCMD is 1. The relationship between the setting of SLNDL2 to SLNDL0 and the SSL negation delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK
1	SLNDL1	0	R/W	
0	SLNDL0	0	R/W	

27.3.12 Next-Access Delay Register (SPND)

SPND sets a non-active period (next-access delay) after termination of a serial transfer when the SPNDEN bit in the command register (SPCMD) is 1. If the contents of SPND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SPNDL2 to SPNDL0.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPNDL2	SPNDL1	SPNDL0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SPNDL2	0	R/W	Next-Access Delay Setting These bits set a next-access delay when the SPNDEN bit in SPCMD is 1. The relationship between the setting of SPNDL2 to SPNDL0 and the next-access delay value is shown below. 000: 1 RSPCK + 2 PΦ 001: 2 RSPCK + 2 PΦ 010: 3 RSPCK + 2 PΦ 011: 4 RSPCK + 2 PΦ 100: 5 RSPCK + 2 PΦ 101: 6 RSPCK + 2 PΦ 110: 7 RSPCK + 2 PΦ 111: 8 RSPCK + 2 PΦ
1	SPNDL1	0	R/W	
0	SPNDL0	0	R/W	

27.3.13 Command Register (SPCMD)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format for master mode operation. Some of the bits in SPCMD0 are used to set a transfer mode for slave mode operation. In master mode, this module sequentially references SPCMD0 to SPCMD3 according to the settings in bits SPSLN1 and SPSLN0 in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD. While bit TEND in the status register (SPSR) indicates that transmission is not completed, correct operation of this module cannot be guaranteed if SPCMD is changed that is referred by this module. SPCMD referenced by this module in master mode can be checked by means of bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the function of this module in slave mode is enabled, operation cannot be guaranteed if the value set in SPCMD0 is changed.

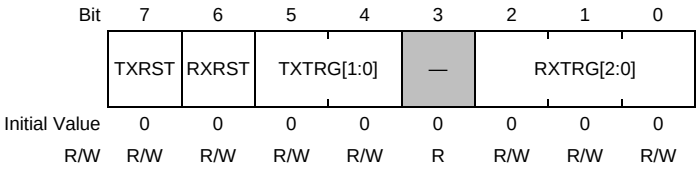
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCKDEN	SLNDEN	SPNDEN	LSBF	SPB3	SPB2	SPB1	SPB0	SSLKP	—	—	—	BRDV1	BRDV0	CPOL	CPHA
Initial Value	0	0	0	0	0	1	1	1	0	0	0	0	1	1	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	SCKDEN	0	R/W	RSPCK Delay Setting Enable Sets the period from the point this module in master mode activates the SSL signal until the RSPCK starts oscillation (RSPCK delay). If the SCKDEN bit is 0, this module sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, this module starts the oscillation of RSPCK at an RSPCK delay in compliance with the clock delay register (SPCKD) settings. To use this module in slave mode, the SCKDEN bit should be set to 0. 0: An RSPCK delay of 1 RSPCK 1: An RSPCK delay equal to SPCKD settings.
14	SLNDEN	0	R/W	SSL Negation Delay Setting Enable Sets the period from the point this module in master mode stops RSPCK oscillation until this module sets the SSL signal inactive (SSL negation delay). If the SLNDEN bit is 0, this module sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, this module negates the SSL signal at an SSL negation delay in compliance with the slave select negation delay register (SSLND) settings. To use this module in slave mode, the SLNDEN bit should be set to 0. 0: An SSL negation delay of 1 RSPCK 1: An SSL negation delay equal to SSLND settings.
13	SPNDEN	0	R/W	Next-Access Delay Enable Sets the period from the point this module in master mode terminates a serial transfer and sets the SSL signal inactive until this module enables the SSL signal assertion for the next access (next-access delay). If the SPNDEN bit is 0, this module sets the next-access delay to 1 RSPCK + 2P0ϕ. If the SPNDEN bit is 1, this module inserts a next-access delay in compliance with the next-access delay register (SPND) settings. To use this module in slave mode, the SPNDEN bit should be set to 0. 0: A next-access delay of 1 RSPCK + 2 P0ϕ 1: A next-access delay equal to SPND settings.
12	LSBF	0	R/W	LSB First Sets the data format in master mode or slave mode to MSB first or LSB first. 0: MSB first 1: LSB first

Bit	Bit Name	Initial Value	R/W	Description
11	SPB3	0	R/W	Data Length Setting These bits set a transfer data length in master mode or slave mode. 0100 to 0111: 8 bits 1111: 16 bits 0010, 0011: 32 bits Others: Setting prohibited
10	SPB2	1	R/W	
9	SPB1	1	R/W	
8	SPB0	1	R/W	
7	SSLKP	0	R/W	SSL Signal Level Keeping When this module in master mode performs a serial transfer, this bit specifies whether the SSL signal level for the current command is to be kept or negated between the SSL negation timing associated with the current command and the SSL assertion timing associated with the next command. To use this module in slave mode, the SSLKP bit should be set to 0. 0: Negates the SSL signal upon completion of transfer. 1: Keeps the SSL signal level from the end of the transfer until the beginning of the next access.
6 to 4	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
3	BRDV1	1	R/W	Bit Rate Division Setting These bits are used to determine the bit rate. A bit rate is determined by combinations of bits BRDV1 and BRDV 0 and the settings in the bit rate register (SPBR) (see **Section 27.3.8, Bit Rate Register (SPBR)**). The settings in SPBR determine the base bit rate. The settings in bits BRDV1 and BRDV0 are used to select a bit rate which is obtained by dividing the base bit rate by 1, 2, 4, or 8. In the bits SPCMD0 to SPCMD3, different BRDV1 and BRDV0 settings can be specified. This permits the execution of serial transfers at a different bit rate for each command. 00: Select the base bit rate. 01: Select the base bit rate divided by 2. 10: Select the base bit rate divided by 4. 11: Select the base bit rate divided by 8.
2	BRDV0	1	R/W	
1	CPOL	0	R/W	RSPCK Polarity Setting Sets an RSPCK polarity in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK polarity should be set for both modules. 0: RSPCK = 0 when idle 1: RSPCK = 1 when idle
0	CPHA	1	R/W	RSPCK Phase Setting Sets an RSPCK phase in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK phase should be set for both modules. 0: Data sampling on odd edge, data variation on even edge 1: Data variation on odd edge, data sampling on even edge

27.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTX) or receive buffer (SPRX) and sets the number of triggering data units.



Bit	Bit Name	Initial Value	R/W	Description
7	TXRST	0	R/W	Transmit Buffer Data Reset Resets the transmit buffer to an empty state. Transmit data in the transmit buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation.*1 1: Enables the reset operation *Note 1.* The reset operation is performed after a power-on reset.
6	RXRST	0	R/W	Receive Buffer Data Reset Resets the receive buffer to an empty state. Receive data in the receive buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation.*1 1: Enables the reset operation *Note 1.* The reset operation is performed after a power-on reset.
5, 4	TXTRG[1:0]	00	R/W	Transmit Buffer Data Triggering Number*2 Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTX) is equal to or less than the specified triggering number, the SPTEF flag is set to 1. 00: 7 bytes (1)*1 01: 6 bytes (2)*1 10: 4 bytes (4)*1 11: 0 bytes (8)*1 *Note 1.* The value in the parenthesis shows the number of available bytes in the transmit buffer (SPTX). *Note 2.* When transferring the data by using DMA, set the following values according to the data transfer length. (The data transfer length is set in SPBn (n = 0-3) of the command register (SPCMD)). 1) Data transfer length is 1 byte SPBFCR (TXTRG): 01 (6 bytes) or 10 (4 bytes) or 11 (0 byte) 2) Data transfer length is 2 bytes SPBFCR (TXTRG): 10 (4 bytes) or 11 (0 byte) 3) Data transfer length is 4bytes SPBFCR (TXTRG): 11 (0 byte)
3	—	0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	RXTRG[2:0]	000	R/W	Receive Buffer Data Triggering Number Specifies the timing at which the receive buffer full state is determined, that is when the SPRF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRX) is equal to or greater than the specified triggering number, the SPRF flag is set to 1. 000: 1 byte (31)*1 001: 2 bytes (30)*1 010: 4 bytes (28)*1 011: 8 bytes (24)*1 100: 16 bytes (16)*1 101: 24 bytes (8)*1 110: 32 bytes (0)*1 111: 5 bytes (27)*1 *Note 1.* The value in the parenthesis shows the number of available bytes in the receive buffer (SPRX).

27.3.15 Buffer Data Count Setting Register (SPBFDR)

SPBFDR indicates the number of data units stored in the transmit buffer (SPTX) and receive buffer (SPRX). The upper eight bits indicate the number of transmit data units in SPTX and the lower eight bits indicate the number of receive data units in SPRX.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	T[3:0]				—	—	R[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
11 to 8	T[3:0]	0000	R	Indicates the number of bytes of data to be transmitted in SPTX. 0000b indicates that SPTX is empty. 1000b indicates that SPTX is full.
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5 to 0	R[5:0]	000000	R	Shows the number of bytes of received data in SPRX. 000000b indicates that SPRX is empty. 100000b indicates that SPRX is full.

27.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data.

27.4.1 Overview of Operations

This module is capable of serial transfers in slave mode and master mode. A particular mode of this module can be selected by using the MSTR bit in the control register (SPCR). **Table 27.4** gives the relationship between the modes and SPCR settings, and a description of each mode.

Table 27.4 Relationship between Modes and SPCR and Description of Each Mode

Mode	Slave (SPI Operation)	Master (SPI Operation)
MSTR bit setting	0	1
MODFEN bit setting	0 or 1	0
RSPCK signal	Input	Output
MOSI signal	Input	Output
MISO signal	Output/Hi-Z	Input
SSL signal	Input	Output
SSL polarity modification function	Supported	Supported
Transfer rate	Up to P0ϕ/8	Up to P0ϕ/2 (Up to P0ϕ/4 when P0ϕ is 100 MHz)
Clock source	RSPCK input	On-chip baud rate generator
Clock polarity	Two	Two
Clock phase	Two	Two
First transfer bit	MSB/LSB	MSB/LSB
Transfer data length	8, 16, or 32 bits	8, 16, or 32 bits
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0, 1)
RSPCK delay control	Not supported	Supported
SSL negation delay control	Not supported	Supported
Next-access delay control	Not supported	Supported
Transfer activation method	SSL input active or RSPCK oscillation	Transmit buffer is written when SPE = 1
Sequence control	Not supported	Supported
Transmit buffer empty detection	Supported	Supported
Receive buffer full detection	Supported	Supported
Overrun error detection	Supported	Not Supported
Mode fault error detection	Supported (MODFEN = 1)	Not supported

27.4.2 Pin Control

According to the MSTR bit in the control register (SPCR), this module can automatically switch pin directions and output modes. **Table 27.5** shows the relationship between pin states and bit settings.

Table 27.5 Relationship between Pin States and Bit Settings

Mode	Pin	Pin State*1
Master mode (SPI operation) (MSTR = 1)	RSPCK	CMOS output
	SSL	CMOS output
	MOSI	CMOS output
	MISO	Input
Slave mode (SPI operation) (MSTR = 0)	RSPCK	Input
	SSL	Input
	MOSI	Input
	MISO*1	CMOS output/Hi-Z

Note 1. When SSL is at the non-active level or the SPE bit in SPCR is cleared to 0, the pin state is Hi-Z.

This module in master mode (SPI operation) determines MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) according to MOIFE and MOIFV bit settings in SPPCR, as shown in **Table 27.6**.

Table 27.6 MOSI Signal Value Determination during SSL Negation Period

MOIFE	MOIFV	MOSI Signal Value during SSL Negation Period
0	0, 1	Last output value from previous transfer (The value is undefined when CPHA is 0)
1	0	Always 0
1	1	Always 1

27.4.3 System Configuration Example

(1) Master/Slave (with This LSI Acting as Master)

Figure 27.2 shows a master/slave system configuration example when this LSI is used as a master. In master/slave configuration, the SSL output of this LSI (master) is not used. The SSL input of the slave is fixed to the low level, and the slave is always maintained in a selected state. In the transfer format corresponding to the case where the CPHA bit in the control register (SPCR) is 0, there are slave devices for which the SSL signal cannot be fixed to the active level. In situations where the SSL signal cannot be fixed, the SSL output of this LSI should be connected to the SSL input of the slave device.

This LSI (master) always drives the RSPCK and MOSI. The slave always drives the MISO.

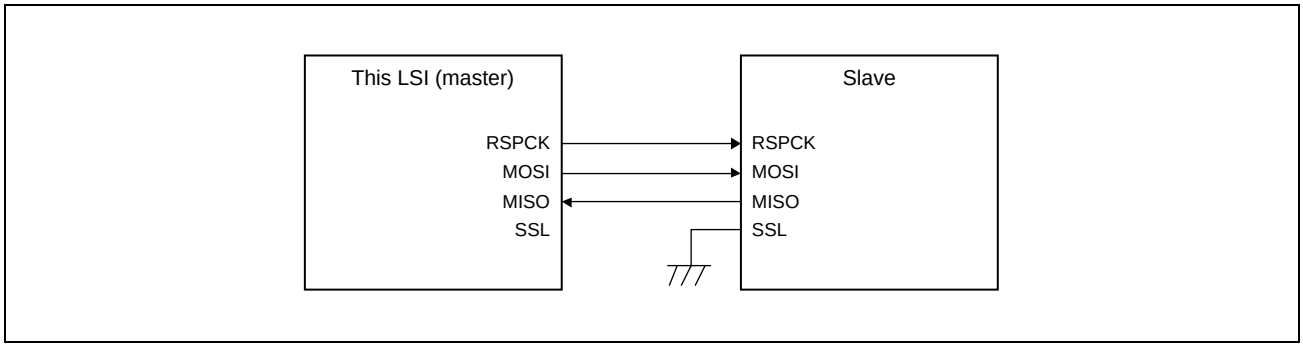


Figure 27.2 Master/Slave Configuration Example (This LSI = Master)

(2) Master/Slave (with This LSI Acting as Slave)

Figure 27.3 shows a master/slave system configuration example when this LSI is used as a slave. When this LSI is to operate as a slave, the SSL pin is used as SSL input. The master always drives the RSPCK and MOSI. This LSI (slave) always drives the MISO. When SSL is at the non-active level, the pin state is Hi-Z.

In the slave configuration in which the CPHA bit in the command register (SPCMD) is set to 1, the SSL input of this LSI (slave) is fixed to the 0 level, this LSI (slave) is always maintained in a selected state, and in this manner it is possible to execute serial transfer (**Figure 27.4**).

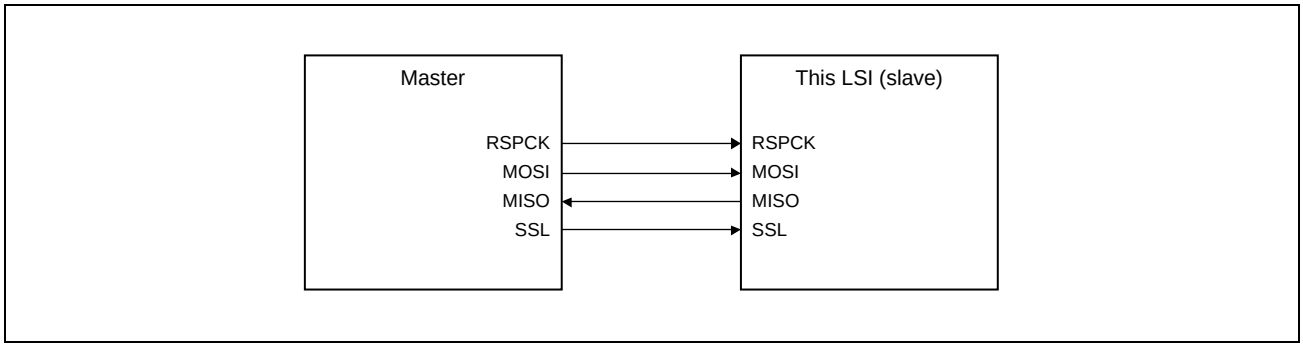

Figure 27.3 Master/Slave Configuration Example (This LSI = Slave)

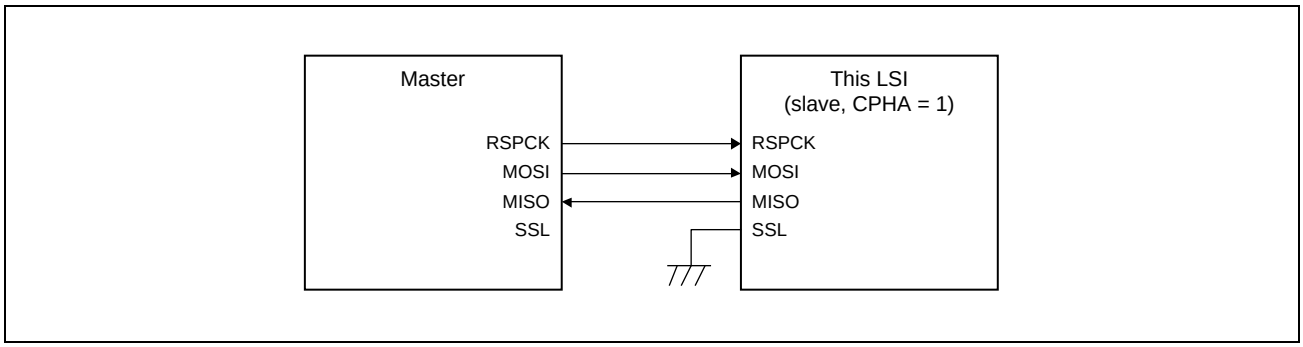

Figure 27.4 Master/Slave Configuration Example (This LSI = Slave, CPHA = 1)

(3) Master/Multi-Slave (with This LSI Acting as Slave)

Figure 27.5 shows a master/multi-slave system configuration example when this LSI is used as a slave. In the example of **Figure 27.5**, the system is comprised of a master and two LSIs (slave X and slave Y).

The RSPCK and MOSI outputs of the master are connected to the RSPCK and MOSI inputs of the LSIs (slave X and slave Y). The MISO outputs of the LSIs (slave X and slave Y) are all connected to the MISO input of the master. SSLX and SSLY outputs of the master are connected to the SSL inputs of the LSIs (slave X and slave Y), respectively.

The master always drives RSPCK, MOSI, SSLX, and SSLY. Of the LSIs (slave X and slave Y), the slave that receives low level input into the SSL0 input drives MISO.

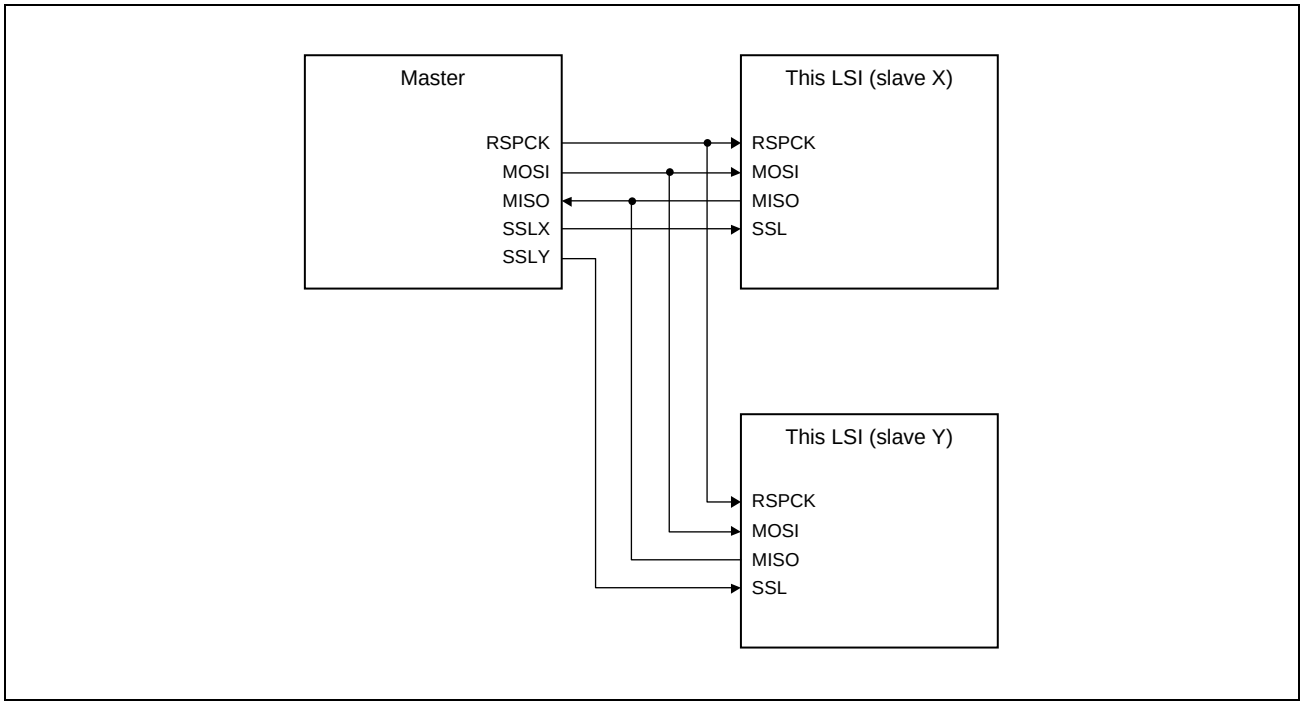

Figure 27.5 Master/Multi-Slave Configuration Example (This LSI = Slave)

27.4.4 Transfer Format

(1) CPHA = 0

Figure 27.6 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 0. In **Figure 27.6**, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the settings of this module. For details, see **Section 27.4.2, Pin Control**.

When the CPHA bit is 0, the driving of valid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The first RSPCK signal change timing that occurs after the SSL signal assertion becomes the first transfer data fetching timing. After this timing, data is sampled at every 1 RSPCK cycle. The change timing for MOSI and MISO signals is always 1/2 RSPCK cycle after the transfer data fetch timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1 denotes a period from an SSL signal assertion to RSPCK oscillation (RSPCK delay). t2 denotes a period from the cessation of RSPCK oscillation to an SSL signal negation (SSL negation delay). t3 denotes a period in which SSL signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the system. For a description of t1, t2, and t3 when this module is in master mode, see **Section 27.4.3(1), Master/Slave (with This LSI Acting as Master)**.

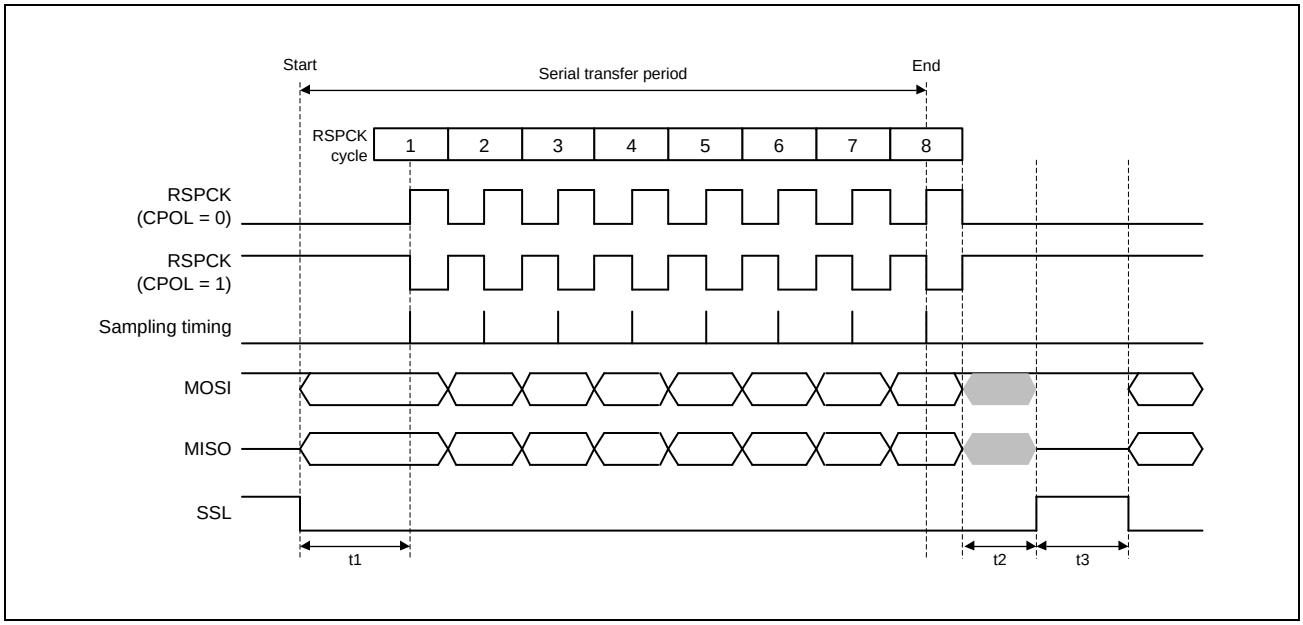

Figure 27.6 Transfer Format (CPHA = 0)

(2) CPHA = 1

Figure 27.7 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 1. In **Figure 27.7**, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the modes (master or slave). For details, see **Section 27.4.2, Pin Control**.

When the CPHA bit is 1, the driving of invalid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The driving of valid data to the MOSI and MISO signals commences at the first RSPCK signal change timing that occurs after the SSL signal assertion. After this timing, data is updated at every 1 RSPCK cycle. The transfer data fetch timing is always 1/2 RSPCK cycle after the data update timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1, t2, and t3 are the same as those in the case of CPHA = 0. For a description of t1, t2, and t3 when this module is in master mode, see **Section 27.4.3(1), Master/Slave (with This LSI Acting as Master)**.

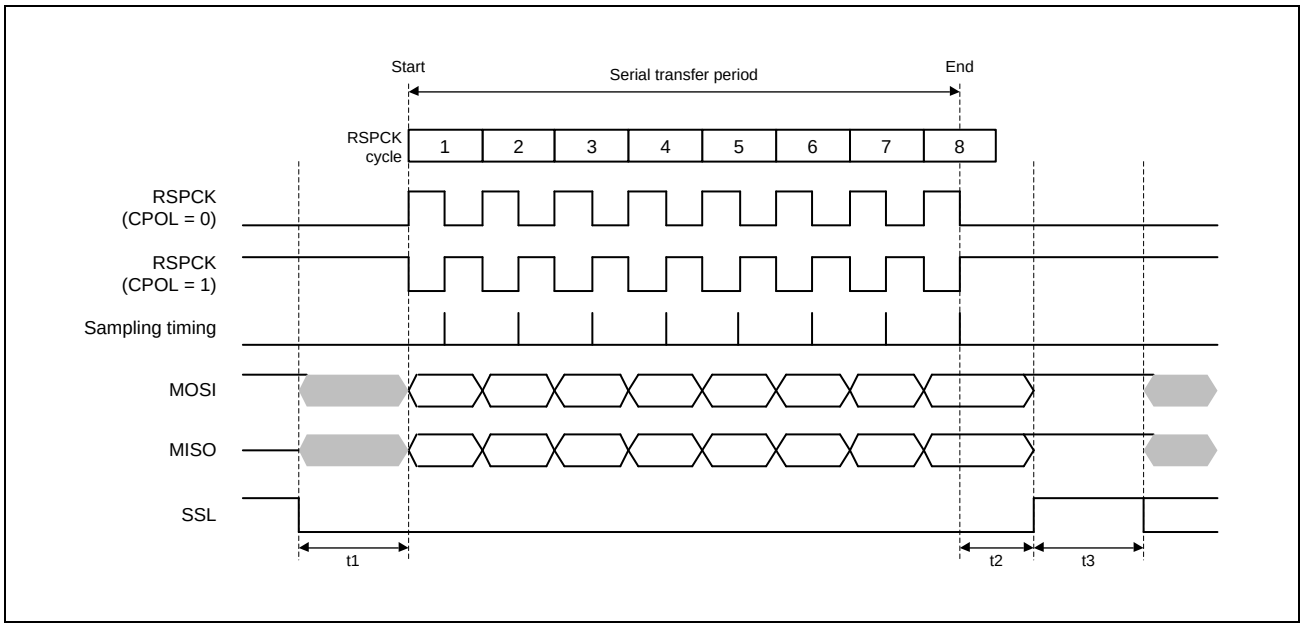

Figure 27.7 Transfer Format (CPHA = 1)

27.4.5 Data Format

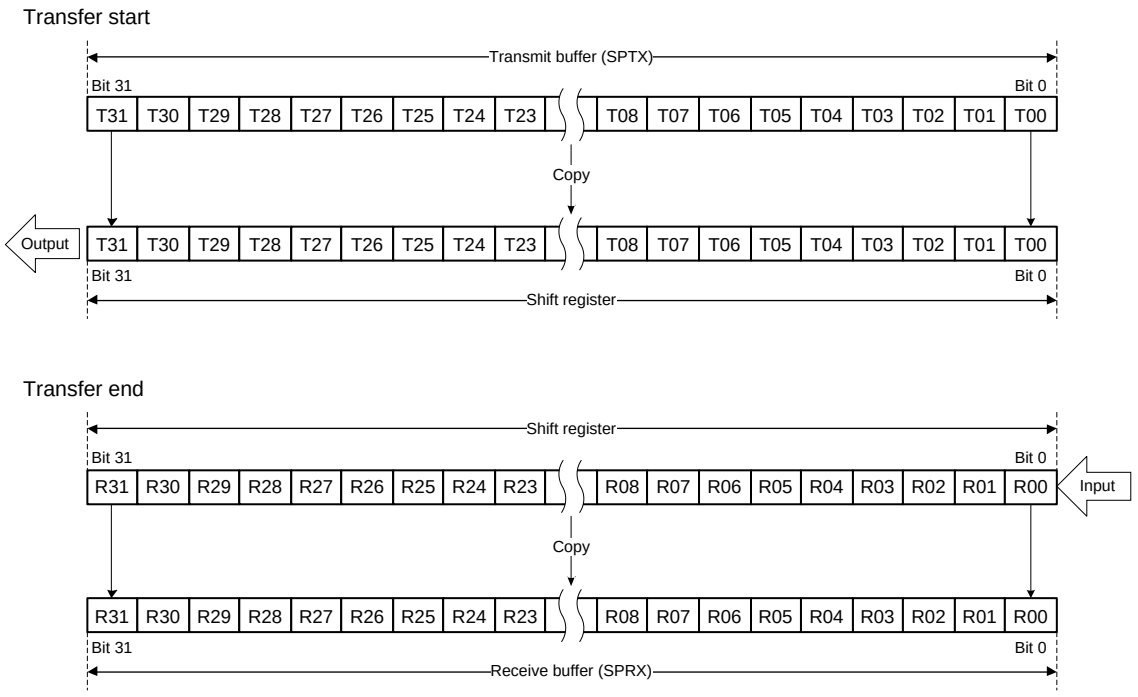
The data format depends on the settings in the command register (SPCMD). Irrespective of MSB/LSB first, this module treats the range from the LSB of the data register (SPDR) to the assigned data length as transfer data.

(1) MSB First Transfer (32-Bit Data)

Figure 27.8 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer of SPDR. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R31 to R00 is stored in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R31 to R00 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

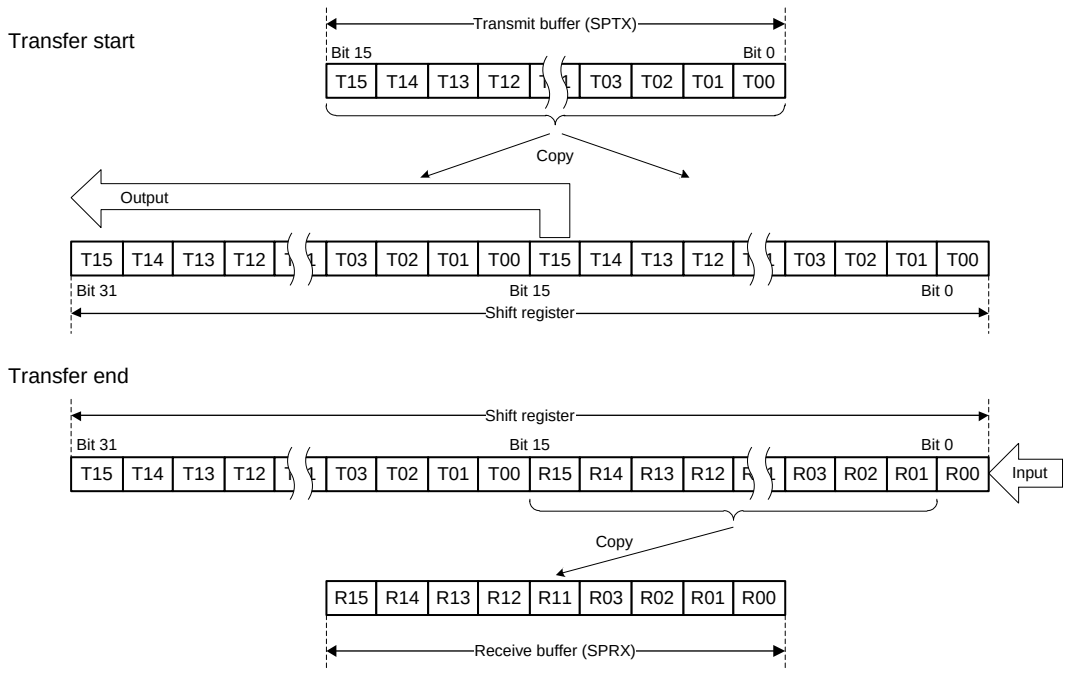
Figure 27.8 MSB First Transfer (32-Bit Data)

(2) MSB First Transfer (16-Bit Data)

Figure 27.9 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 15 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R15 to R00 is stored in bits 15 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 16 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R15 to R00 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

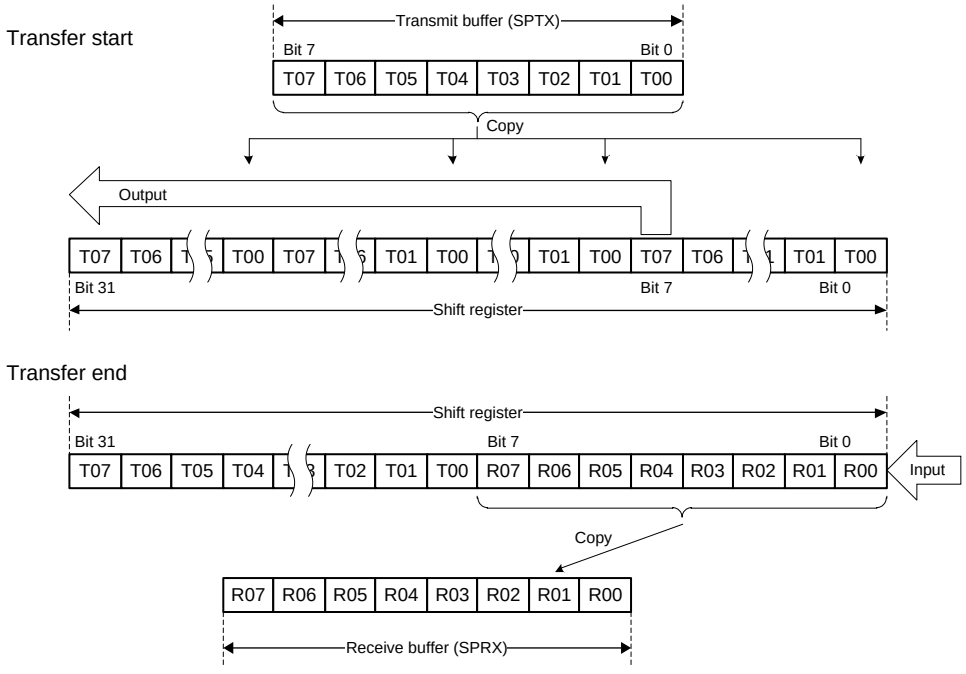
Figure 27.9 MSB First Transfer (16-Bit Data)

(3) MSB First Transfer (8-Bit Data)

Figure 27.10 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 7 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R07 to R00 is stored in bits 7 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 8 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary area in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R07 to R00 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MOSI (master)/MISO (slave)

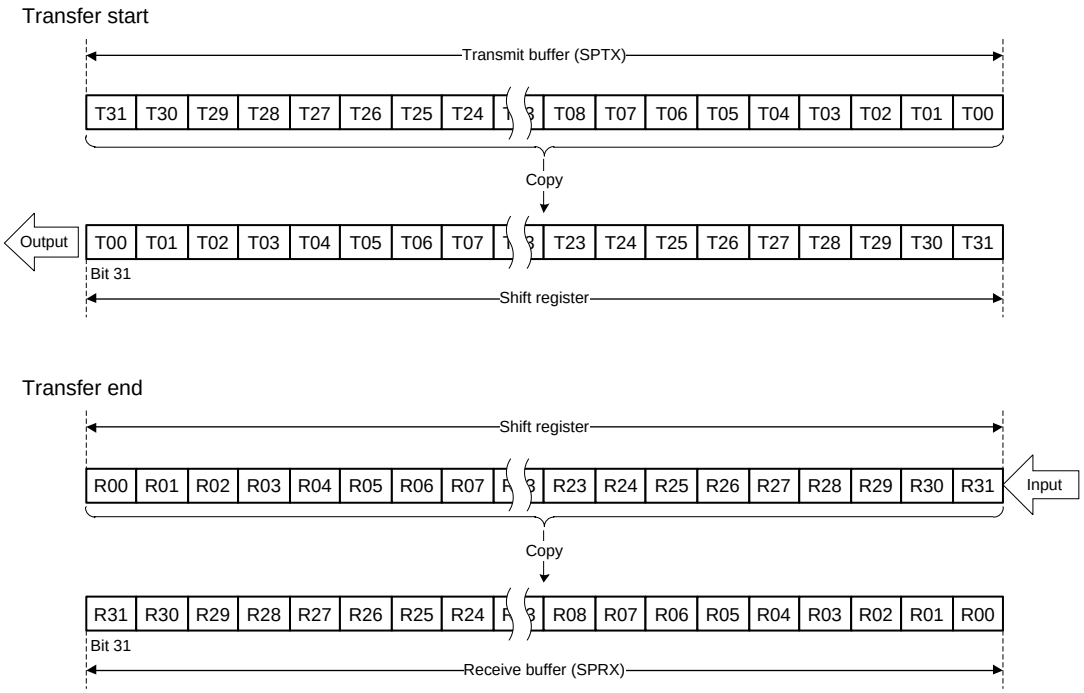
Figure 27.10 MSB First Transfer (8-Bit Data)

(4) LSB First Transfer (32-Bit Data)

Figure 27.11 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R00 to R31 is stored in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of the SPDR, received data R00 to R31 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

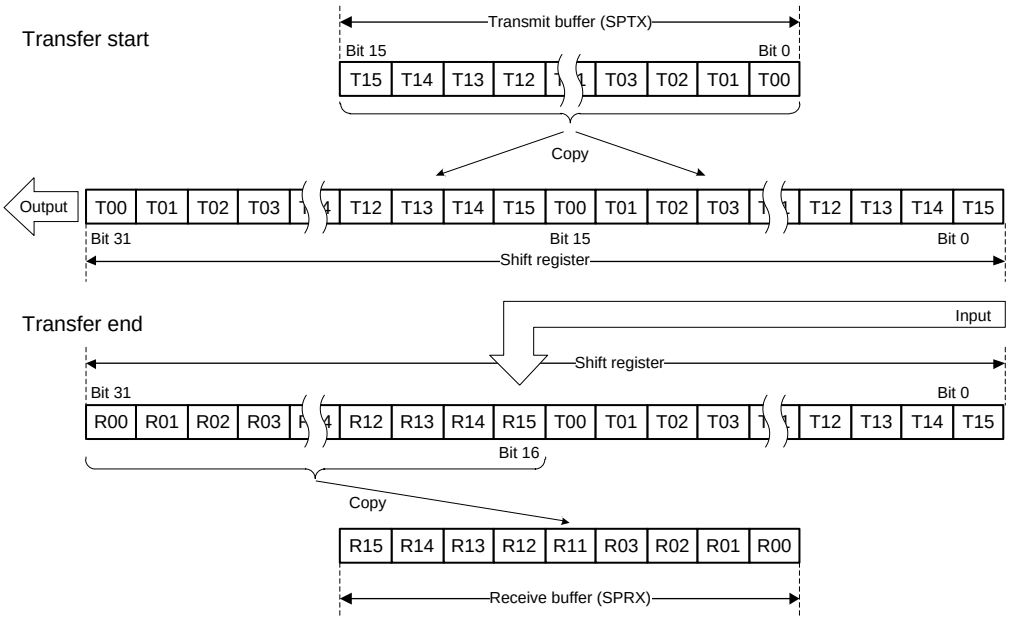
Figure 27.11 LSB First Transfer (32-Bit Data)

(5) LSB First Transfer (16-Bit Data)

Figure 27.12 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 16 in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R00 to R15 is stored in bits 31 to 16 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 15 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R15 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

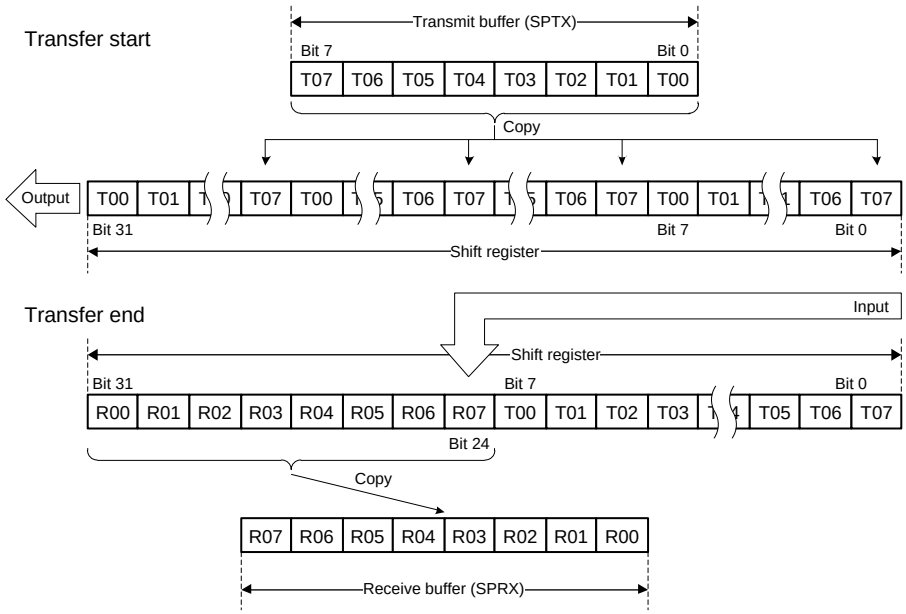
Figure 27.12 LSB First Transfer (16-Bit Data)

(6) LSB First Transfer (8-Bit Data)

Figure 27.13 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 24 in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R00 to R07 is stored in bits 31 to 24 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 23 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R07 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 27.13 LSB First Transfer (8-Bit Data)

27.4.6 Error Detection

In the normal serial transfer, the data written to the transmit buffer of the data register (SPDR) is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer or the status at the beginning or end of serial transfer, in some cases non-normal transfers can be executed.

If a non-normal transfer operation occurs, this module detects the event as an overrun error or a mode fault error. **Table 27.7** shows the relationship between non-normal transfer operations and the error detection function.

Table 27.7 Relationship between Non-Normal Transfer Operations and Error Detection Function

	Occurrence Condition	Operation	Error Detection
A	SPDR is written when the transmit buffer is full.	Missing write data.	None
B	Serial transfer is started in slave mode when transmit data is still not loaded on the shift register.	Data received in previous serial transfer is serially transmitted.	None
C	SPDR is read when the receive buffer is empty.	The output data is undefined.	None
D	Serial transfer terminates when the receive buffer is full.	Missing serial receive data.	Overrun error (only in slave mode)
E	The SSL input signal is negated during serial transfer in slave mode.	Serial transfer suspended. Missing send/receive data. Operation disabled.	Mode fault error

On operation A shown in **Table 27.7**, this module does not detect an error. Whether SPDR can be written to or not can be checked using the T[3:0] bits in the buffer data count setting register (SPBFDR).

Likewise, this module does not detect an error on operation B. In a serial transfer that was started before the shift register was updated, this module sends the data that was received in the previous serial transfer, and does not treat the operation indicated in B as an error. Note that the received data from the previous serial transfer is retained in the receive buffer of SPDR, thus it can be correctly read.

Similarly, this module does not detect an error on operation C. To prevent extraneous data from being read, the number of receive data units stored in the receive buffer should be read from the R[5:0] bits in the buffer data count setting register (SPBFDR).

An overrun error shown in D is described in **Section 27.4.6(1), Overrun Error**. A mode fault error shown in E is described in **Section 27.4.6(2), Mode Fault Error**.

(1) Overrun Error

If serial transfer ends when the receive buffer of the data register (SPDR) is full, this module detects an overrun error, and sets the OVRF bit in SPSR to 1. When the OVRF bit is 1, this module does not copy data from the shift register to the receive buffer so that the data prior to the occurrence of the error is retained in the receive buffer. To reset the OVRF bit in SPSR to 0, either perform a power-on reset, or write a 0 to the OVRF bit after SPSR has been read with the OVRF bit set to 1.

Figure 27.14 shows an example of operation of the SPRF and OVRF bits in SPSR. The SPSR and SPDR accesses shown in **Figure 27.14** indicate the condition of accesses to SPSR and SPDR, respectively, where I denotes an idle cycle, W a write cycle, and R a read cycle. In the example of **Figure 27.14**, this module performs an 8-bit serial transfer in which the CPHA bit in the command register (SPCMD) is 1, and CPOL is 0. The numbers given under the RSPCK waveform represent the number of RSPCK cycles (i.e., the number of transferred bits).

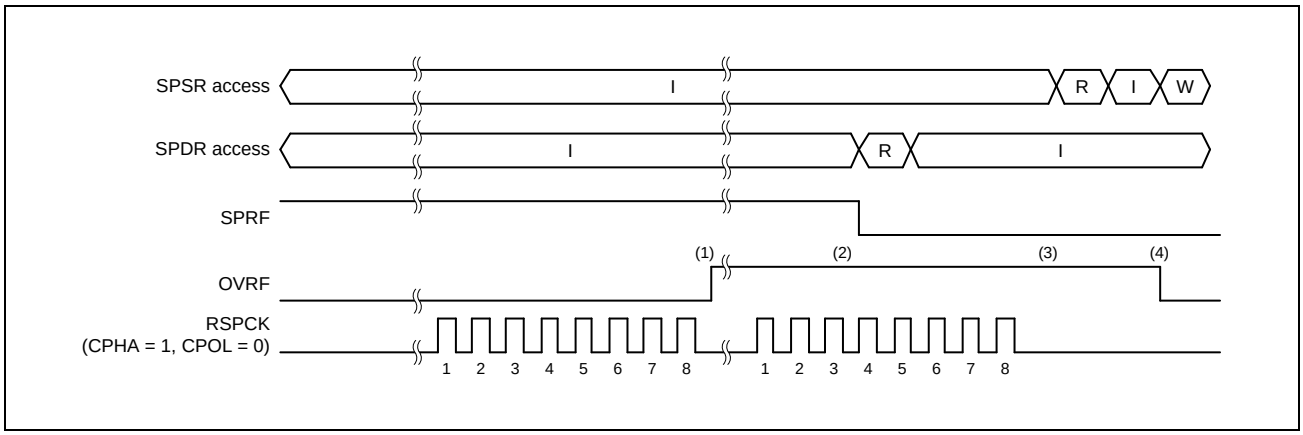


Figure 27.14 SPRF and OVRF Bit Operation Example

The operation of the flags at the timing shown in steps (1) to (4) in the figure is described below.

1. If a serial transfer terminates when the receive buffer does not have a space for the receive data length, this module detects an overrun error, and sets the OVRF bit to 1. This module does not copy the data in the shift register to the receive buffer.
2. The OVFR bit is not cleared even when SPDR is read and thus the number of data bytes in the receive buffer becomes less than the number of the receive buffer data triggering number specified by the RXTRG bits.
3. If the serial transfer terminates in an overrun error state, this module determines that the shift register is empty; in this manner, data transfer is enabled from the transmit buffer to the shift register.
4. If 0 is written to the OVRF bit after SPSR is read with OVRF = 1, this module clears the OVRF bit.

The occurrence of an overrun can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. When executing a serial transfer without using an error interrupt, measures should be taken to ensure the early detection of overrun errors, such as reading SPSR immediately after SPDR is read.

The OVRF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition in which the OVRF bit is set to 1, 0 is written to the OVRF bit.
- Power-on reset

NOTE

When the receive buffer has area enough to store receive data with an overrun error, this module receives receive data.

(2) Mode Fault Error

When the MSTR bit is 0, this module operates in slave mode. This module detects a mode fault error if the SSL input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched) when the MODFEN bit is 1 in slave mode.

Upon detecting a mode fault error, this module stops driving of the output signals and clears the SPE bit in SPCR to 0. When the SPE bit is cleared to 0, the function of this module is disabled, and this module stops driving external signals. For details of disabling the function of this module by clearing the SPE bit to 0, see **Section 27.4.7, Initialization**.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. To detect a mode fault error without using an error interrupt, it is necessary to poll SPSR.

When the MODF bit is 1, writing 1 to the SPE bit is ignored. To enable the function of this module after the detection of a mode fault error, the MODF bit must be set to 0. The MODF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition where the MODF bit has turned 1, 0 is written to the MODF bit.
- Power-on reset

27.4.7 Initialization

If 0 is written to the SPE bit in the control register (SPCR) or this module clears the SPE bit to 0 because of the detection of a mode fault error, this module disables the module function, and initializes a part of the module function. When a power-on reset is generated, this module initializes all of the module function. An explanation follows of initialization by the clearing of the SPE bit.

(1) Initialization by Clearing SPE Bit

When the SPE bit in SPCR is cleared, this module performs the following initialization:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state
- Initializing the TEND bit in SPSR

Initialization by the clearing of the SPE bit does not initialize the control bits of this module. For this reason, this module can be started in the same transfer mode as prior to the initialization if the SPE bit is re-set to 1.

27.4.8 SPI Operation

(1) Multi-Master Mode Operation

This section explains the operation in multi-master mode.

(a) Starting Serial Transfer

A serial transfer is started when transmit data is copied from the transmit buffer to the shift register, the shift register becomes full, and the receive buffer has a space for the receive data length. If transmit data has already been written to the shift register, data is not copied from the transmit buffer to the shift register.

For details of the transfer format, see **Section 27.4.4, Transfer Format**.

(b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register (SPCMD), this module terminates the serial transfer after transmitting an RSPCK edge corresponding to the final sampling timing. After the serial transfer is completed, receive data is copied from the shift register to the receive buffer. If the receive buffer does not have a space for the receive data length after receive data is copied from the shift register to the receive buffer, another serial transfer will not be performed. In order to perform another serial transfer, data for the receive data length should be read from the receive buffer to secure the space for the receive data.

It should be noted that the final sampling timing varies depending on the bit length of transfer data. In master mode, the data length depends on the settings in bits SPB3 to SPB0 in SPCMD. For details on the transfer format, see **Section 27.4.4, Transfer Format**.

(c) Sequence Control

The transfer format that is employed in master mode is determined by the sequence control register (SPSCR), command registers 0 to 3 (SPCMD0 to SPCMD3), the bit rate register (SPBR), the clock delay register (SPCKD), the slave select negation delay register (SSLND), and the next-access delay register (SPND).

SPSCR is a register used to determine the sequence configuration for serial transfers that are executed by this module in master mode. The following items are set in command registers SPCMD0 to SPCMD3: SSL output signal value, MSB/LSB first, data length, some of the bit rate settings, RSPCK polarity/phase, whether SPCKD is to be referenced, whether SSLND is to be referenced, and whether SPND is to be referenced. SPBR holds some of the bit rate settings; SPCKD, a clock delay value; SSLND, an SSL negation delay; and SPND, a next-access delay value.

According to the sequence length that is assigned to SPSCR, this module makes up a sequence comprised of a part or all of SPCMD0 to SPCMD3. This module contains a pointer to the SPCMD that makes up the sequence. The value of this pointer can be checked by reading bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the SPE bit in the control register (SPCR) is set to 1 and the function of this module is enabled, this module loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. This module increments the pointer each time the next-access delay period for a data transfer ends. Upon completion of the serial transfer that corresponds to the final command comprising the sequence, this module sets the pointer in SPCMD0, and in this manner the sequence is executed repeatedly.

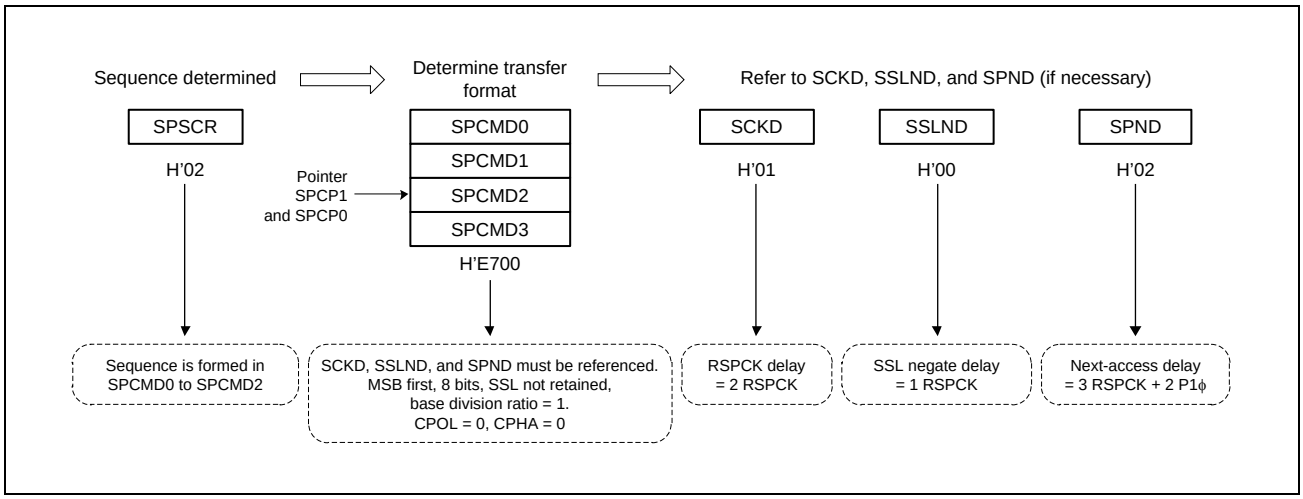

Figure 27.15 Determination Procedure of Serial Transfer Mode in Master Mode

(d) Burst Transfer

If the SSLKP bit in the command register (SPCMD) that this module references during the current serial transfer is 1, this module keeps the SSL signal level during the serial transfer until the beginning of the SSL signal assertion for the next serial transfer. If the SSL signal level for the next serial transfer is the same as the SSL signal level for the current serial transfer, this module can execute continuous serial transfers while keeping the SSL signal assertion status (burst transfer).

Figure 27.16 shows an example of an SSL signal operation for the case where a burst transfer is implemented using SPCMD0 and SPCMD1 settings. The text below explains operations (1) to (7) as depicted in **Figure 27.16**. It should be noted that the polarity of the SSL output signal depends on the settings in the slave select polarity register (SSLP).

1. Based on SPCMD0, this module asserts the SSL signal and inserts RSPCK delays.
2. Serial transfers are executed according to SPCMD0.
3. SSL negation delays are inserted.
4. Because the SSLKP bit in SPCMD0 is 1, this module keeps the SSL signal value on SPCMD0. This period is sustained, at the shortest, for a period equal to the next-access delay of SPCMD0. If the shift register is empty after the passage of a minimum period, this period is sustained until such time as the transmit data is stored in the shift register for another transfer.
5. Based on SPCMD1, this module asserts the SSL signal and inserts RSPCK delays.
6. Serial transfers are executed according to SPCMD1.
7. Because the SSLKP bit in SPCMD1 is 0, this module negates the SSL signal. In addition, a next-access delay is inserted according to SPCMD1.

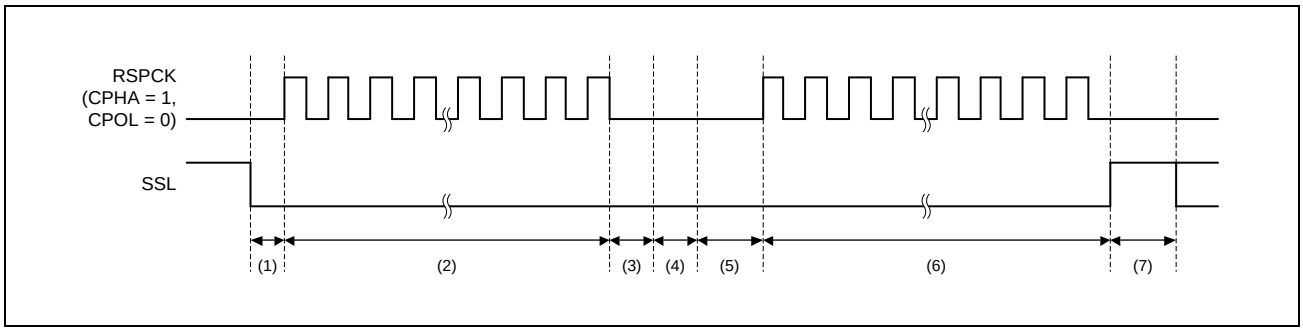

Figure 27.16 Example of Burst Transfer Operation using SSLKP Bit

If the SSL signal settings in the SPCMD in which 1 is assigned to the SSLKP bit are different from the SSL signal output settings in the SPCMD to be used in the next transfer, this module switches the SSL signal status to SSL signal assertion ((5) in **Figure 27.16**) corresponding to the command for the next transfer. Notice that if such an SSL signal switching occurs, the slaves that drive the MISO signal compete, and the possibility arises of the collision of signal levels.

This module in master mode references within the module the SSL signal operation for the case where the SSLKP bit is not used. Even when the CPHA bit in SPCMD is 0, this module can accurately start serial transfers by asserting the SSL signal for the next transfer. For this reason, burst transfers in master mode can be executed irrespective of CPHA bit settings (see **Section 27.4.8(2), Slave Mode Operation**).

(e) RSPCK Delay (t1)

The RSPCK delay value in master mode depends on SCKDEN bit settings in the command register (SPCMD) and on clock delay register (SPCKD) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an RSPCK delay value during serial transfer by using the SCKDEN bit in the selected SPCMD and SPCKD, as shown in **Table 27.8**. For a definition of RSPCK delay, see **Section 27.4.4, Transfer Format**.

Table 27.8 Relationship among SCKDEN and SPCKD Settings and RSPCK Delay Values

SCKDEN	SPCKD	RSPCK Delay Value
0	000 to 111	1 RSPCK
1	000	1 RSPCK
	001	2 RSPCK
	010	3 RSPCK
	011	4 RSPCK
	100	5 RSPCK
	101	6 RSPCK
	110	7 RSPCK
	111	8 RSPCK

(f) SSL Negation Delay (t2)

The SSL negation delay value in master mode depends on SLNDEN bit settings in the command register (SPCMD) and on SSL negation delay register (SSLND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an SSL negation delay value during serial transfer by using the SLNDEN bit in the selected SPCMD and SSLND, as shown in **Table 27.9**. For a definition of SSL negation delay, see **Section 27.4.4, Transfer Format**.

Table 27.9 Relationship among SLNDEN and SSLND Settings and SSL Negation Delay Values

SLNDEN	SSLND	SSL Negation Delay Value
0	000 to 111	1 RSPCK
1	000	1 RSPCK
	001	2 RSPCK
	010	3 RSPCK
	011	4 RSPCK
	100	5 RSPCK
	101	6 RSPCK
	110	7 RSPCK
	111	8 RSPCK

(g) Next-Access Delay (t3)

The next-access delay value in master mode depends on SPNDEN bit settings in the command register (SPCMD) and on next-access delay register (SPND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines a next-access delay value during serial transfer by using the SPNDEN bit in the selected SPCMD and SPND, as shown in **Table 27.10**. For a definition of next-access delay, see **Section 27.4.4, Transfer Format**.

Table 27.10 Relationship among SPNDEN and SPND Settings and Next-Access Delay Values

SPNDEN	SPND	Next-Access Delay Value
0	000 to 111	1 RSPCK + 2 P0ϕ
1	000	1 RSPCK + 2 P0ϕ
	001	2 RSPCK + 2 P0ϕ
	010	3 RSPCK + 2 P0ϕ
	011	4 RSPCK + 2 P0ϕ
	100	5 RSPCK + 2 P0ϕ
	101	6 RSPCK + 2 P0ϕ
	110	7 RSPCK + 2 P0ϕ
	111	8 RSPCK + 2 P0ϕ

(h) Initialization Flowchart

Figure 27.17 is a flowchart illustrating an example of initialization in SPI operation when this module is used in master mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

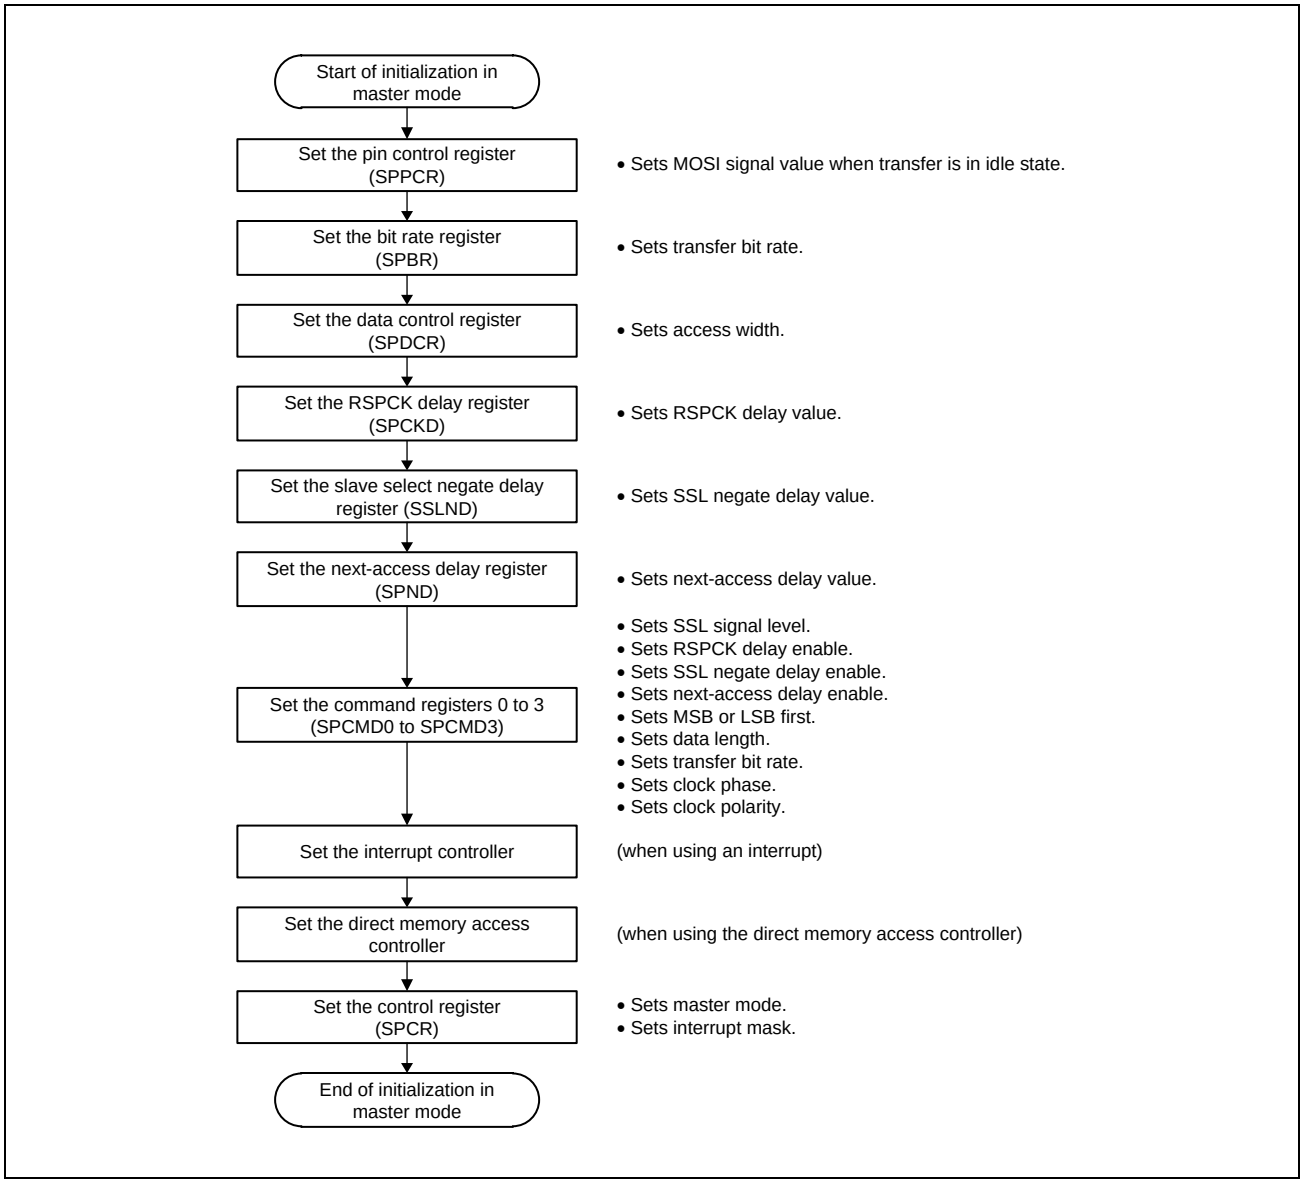

Figure 27.17 Example of Initialization Flowchart in Master Mode

(i) Transfer Operation Flowchart

Figure 27.18 is a flowchart illustrating a transfer in SPI operation when this module is used in master mode.

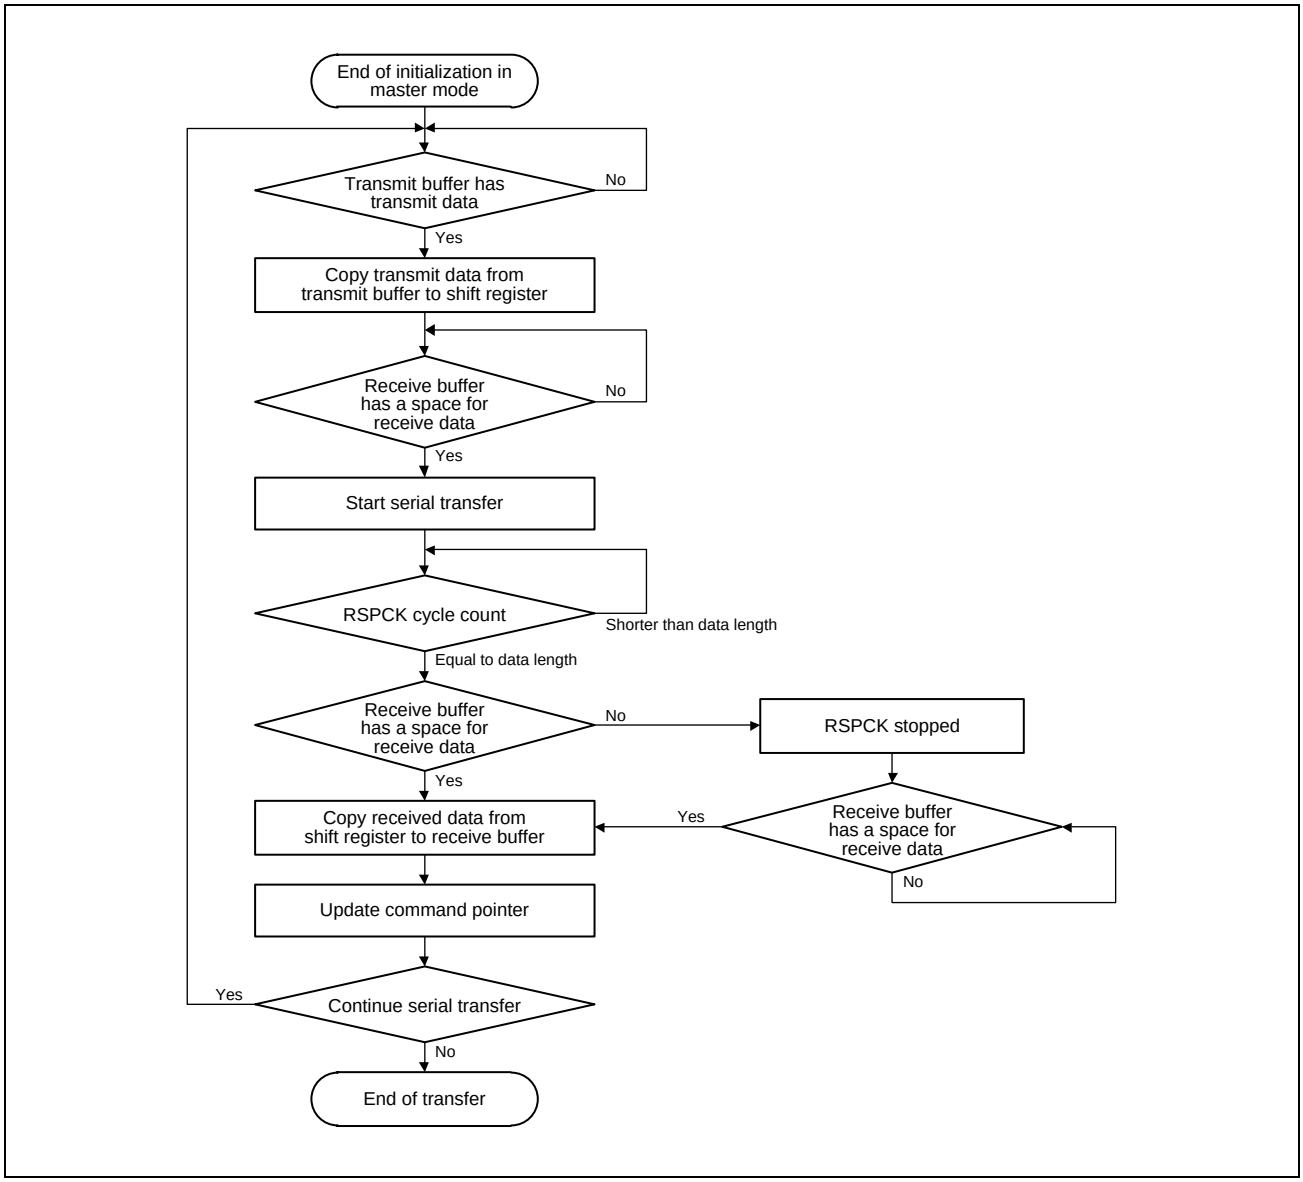

Figure 27.18 Transfer Operation Flowchart in Master Mode

(2) Slave Mode Operation

(a) Starting Serial Transfer

If this module detects an SSL input signal assertion when the CPHA bit in the command register 0 (SPCMD0) is 0, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 0, the asserting of the SSL input signal triggers the start of a serial transfer.

If this module detects the first RSPCK edge in an SSL signal asserted condition when the CPHA bit is 1, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 1, the first RSPCK edge in an SSL signal asserted condition triggers the start of a serial transfer.

When detecting the start of a serial transfer in a condition in which the shift register is empty, this module changes the status of the shift register to “full”, so that data cannot be copied from the transmit buffer to the shift register when serial transfer is in progress. If the shift register was full before the serial transfer started, this module leaves the status of the shift register intact, in the full state.

Irrespective of CPHA bit settings, this module starts driving MISO output signals at the SSL signal assertion timing. Whether the data output from this module is valid or invalid differs depending on CPHA bit settings.

For details on the transfer format, see **Section 27.4.4, Transfer Format**. The polarity of the SSL input signal depends on the setting of the SSL0P bit in the slave select polarity register (SSLP).

(b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register 0 (SPCMD0), this module terminates the serial transfer after detecting an RSPCK edge corresponding to the final sampling timing. When the receive buffer has an enough space for receive data, this module copies received data from the shift register to the receive buffer of the data register (SPDR) upon termination of the serial transfer. Irrespective of the value of the SPRF bit, this module changes the status of the shift register to “empty” upon termination of the serial transfer. If this module detects an SSL input signal negation from the beginning of serial transfer to the end of serial transfer, a mode fault error occurs (see **Section 27.4.6, Error Detection**).

The final sampling timing changes depending on the bit length of the transfer data. In slave mode, the data length depends on the settings in bits SPB3 to SPB0 bits in SPCMD0. The polarity of the SSL input signal depends on the setting in the SSL0P bit in the slave select polarity register (SSLP). For details on the transfer format, see **Section 27.4.4, Transfer Format**.

(c) Notes on Slave Operations

If the CPHA bit in the command register 0(SPCMD0) is 0, this module starts serial transfers when it detects the assertion edge for an SSL input signal. In the type of configuration shown in **Figure 27.4** as an example, if this module is used in single-slave mode, the SSL signal is always fixed at active state. Therefore, when the CPHA bit is set to 0, this module cannot correctly start a serial transfer. To correctly execute send/receive operation in a configuration in which the SSL input signal is fixed at active state, the CPHA bit should be set to 1. When it is necessary to set the CPHA bit to 0, the SSL input signal should not be fixed.

(d) Burst Transfer

If the CPHA bit in the command register 0 (SPCMD0) is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSL input signal. If the CPHA bit is 1, the period from the first RSPCK edge to the sampling timing for the reception of the final bit in an SSL signal active state corresponds to a serial transfer period. Even when the SSL input signal remains at the active level, this module can accommodate burst transfers because it can detect the start of access.

If the CPHA bit is 0, for the reason given in **Section 27.4.8(2)(c), Notes on Slave Operations**, second and subsequent serial transfers during the burst transfer cannot be executed correctly.

(e) Initialization Flowchart

Figure 27.19 is a flowchart illustrating an example of initialization in SPI operation when this module is used in slave mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

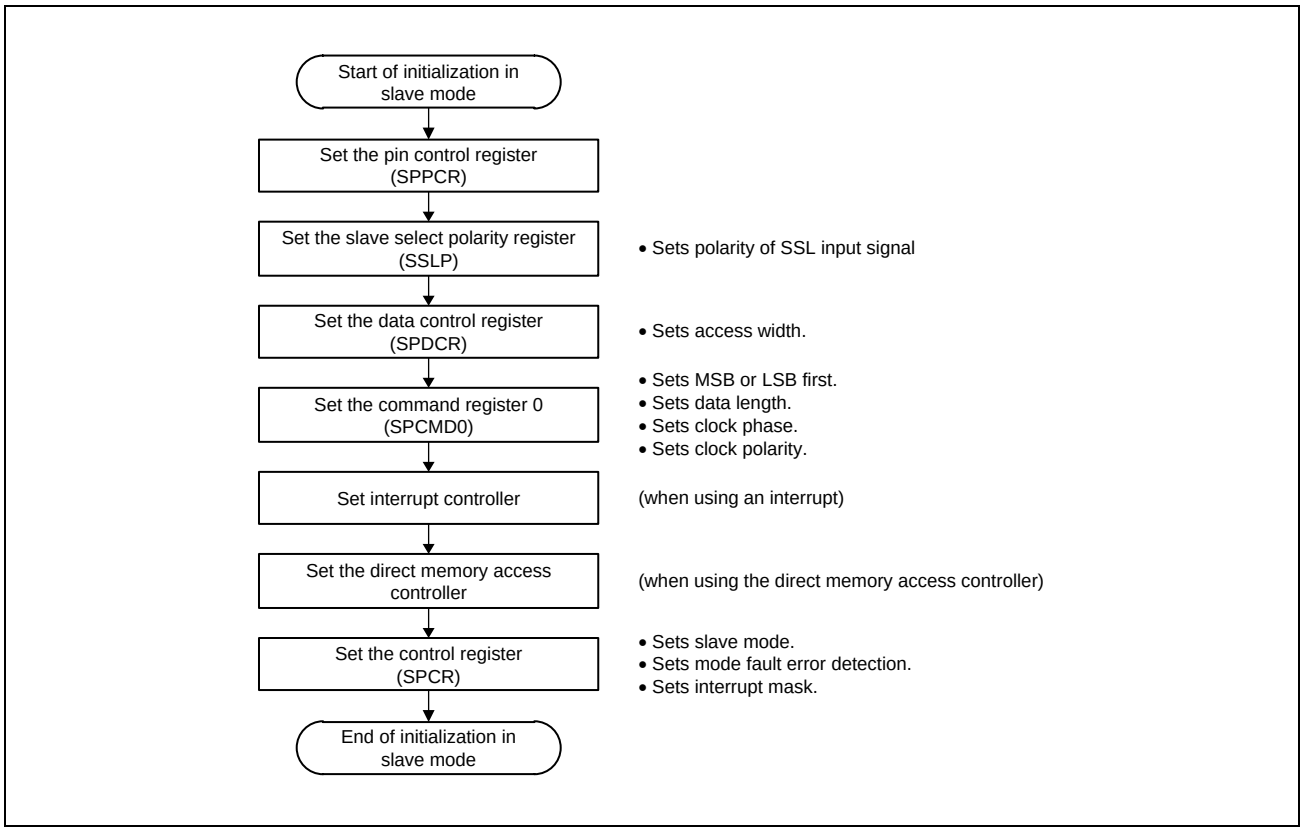

Figure 27.19 Example of Initialization Flowchart in Slave Mode

(f) Transfer Operation Flowchart (CPHA = 0)

Figure 27.20 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) set to 0.

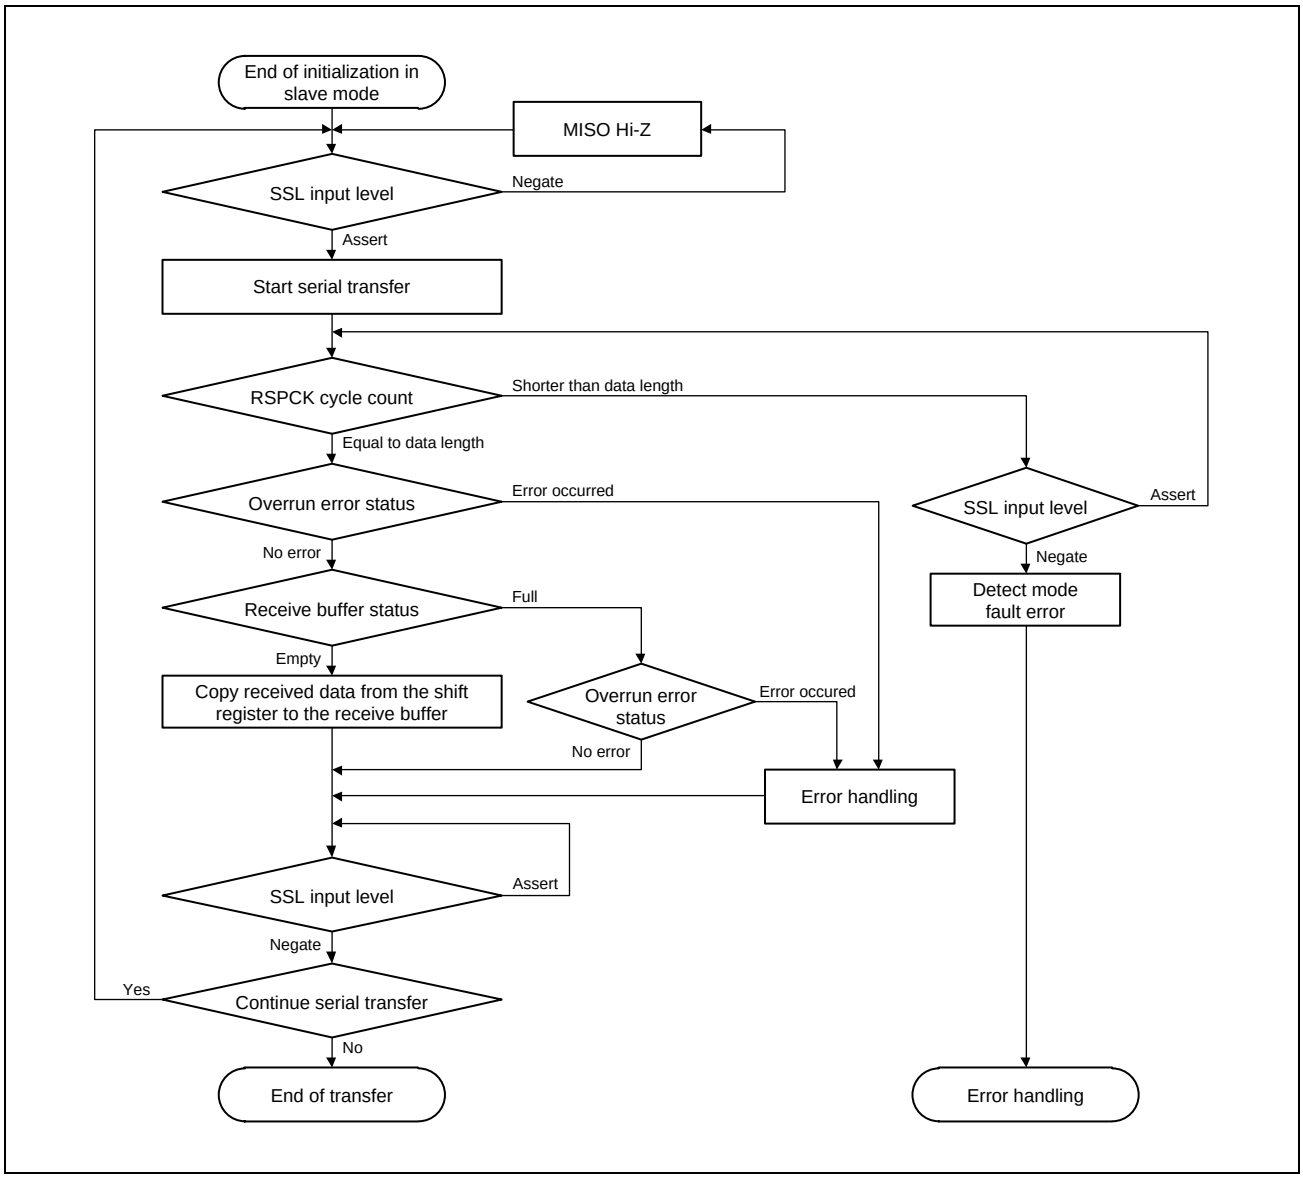

Figure 27.20 Transfer Operation Flowchart in Slave (CPHA = 0)

(g) Transfer Operation Flowchart (CPHA = 1)

Figure 27.21 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) and the MODFEN bit in the control register (SPCR) set to 1, respectively. The subsequent operation is not guaranteed when the serial transfer is started with the MODFEN bit set to 0 and the SSL input level is negated with the number of RSPCK cycles shorter than the data length.

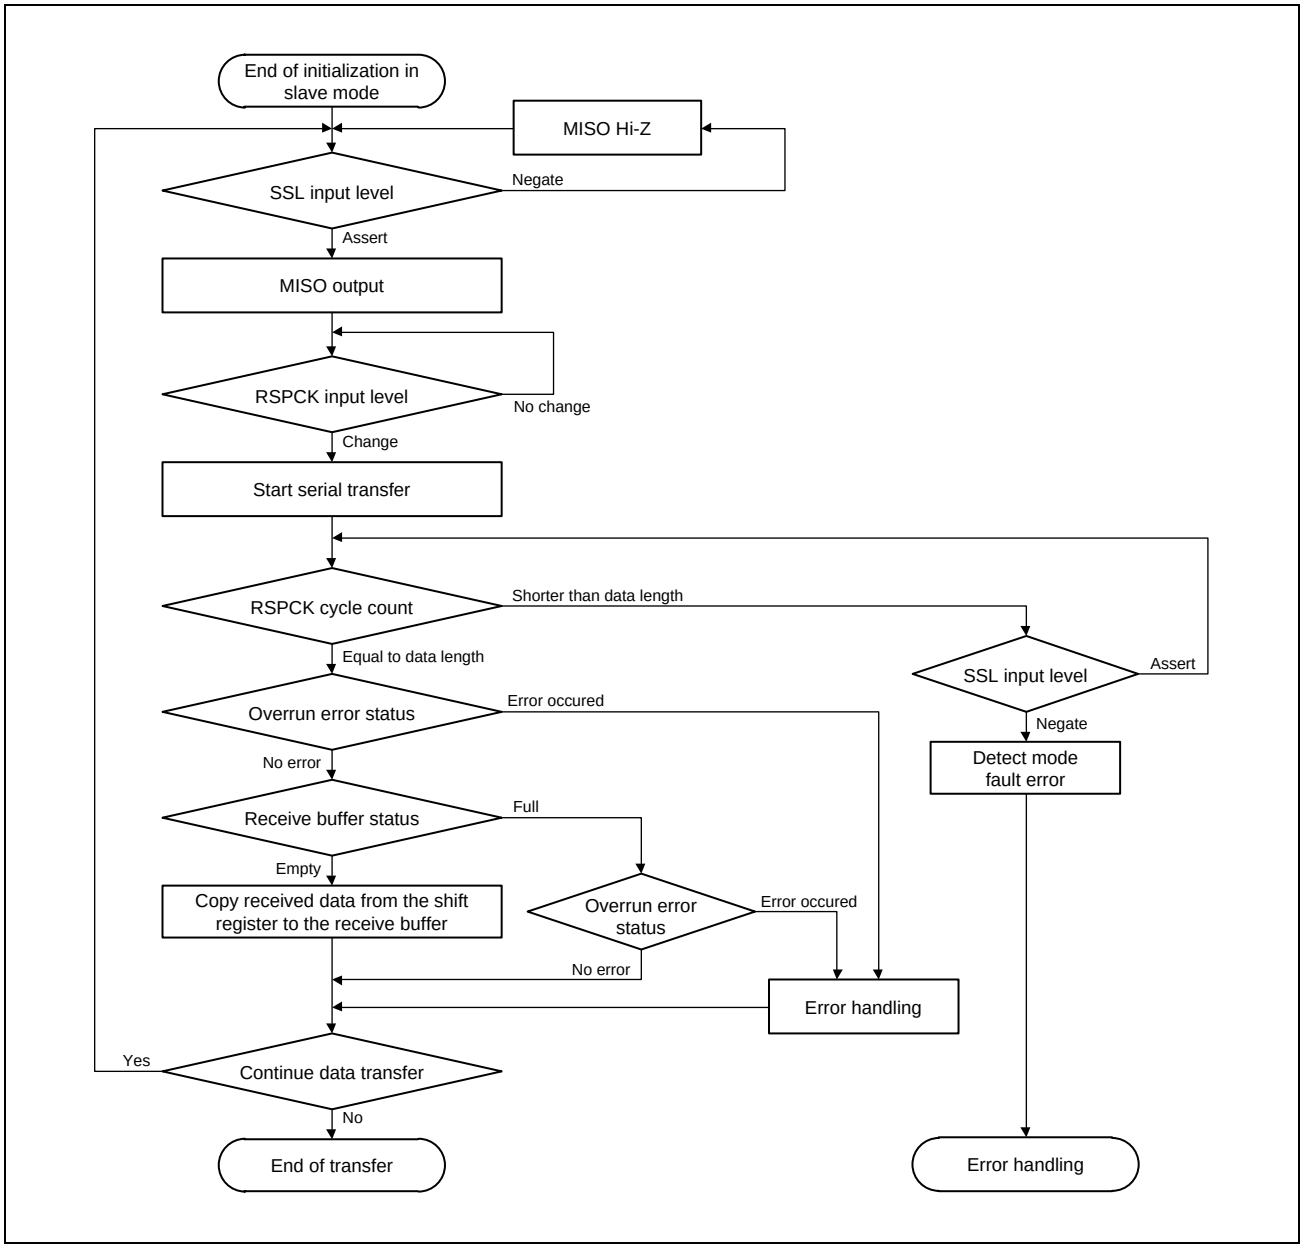

Figure 27.21 Transfer Operation Flowchart in Slave Mode (CPHA = 1)

27.4.9 Error Handling

Figure 27.22 and **Figure 27.23** show the error handling. The following error handling is used to return from the error state after an error in master or slave mode.

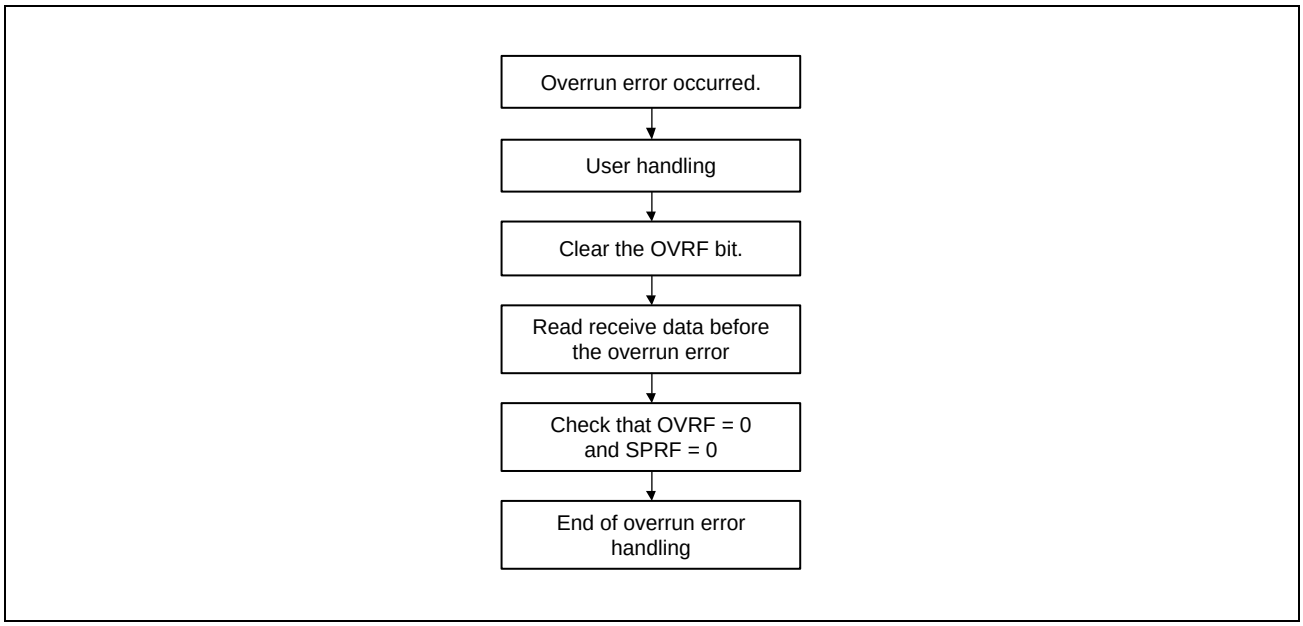

Figure 27.22 Error Handling (Overrun Error)

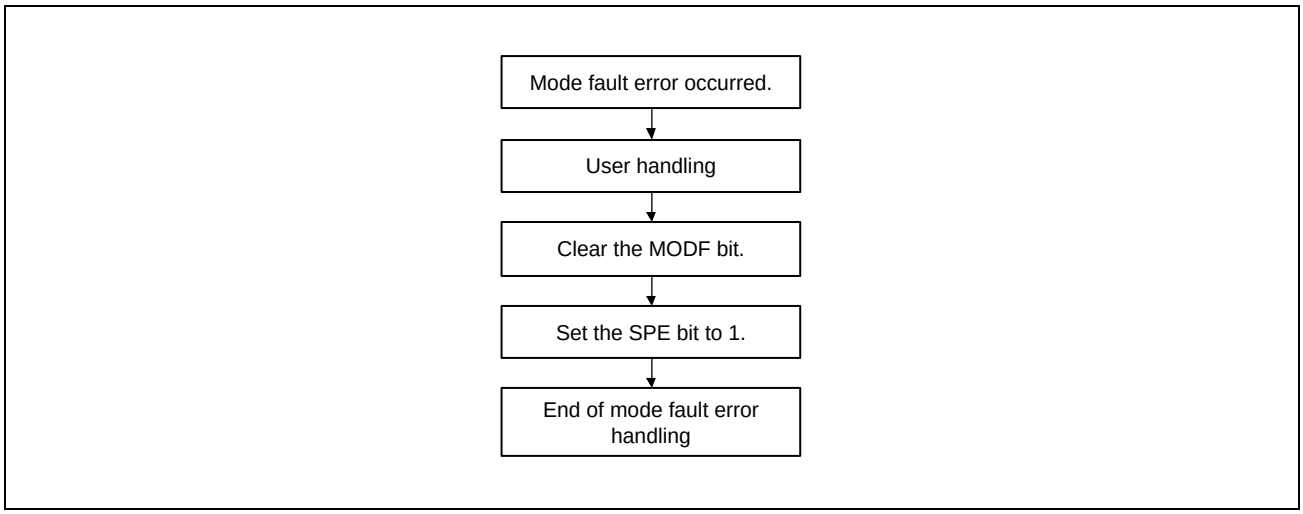

Figure 27.23 Error Handling (Mode Fault Error)

27.4.10 Loopback Mode

When 1 is written to the SPLP bit in the pin control register (SPPCR), this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects the input path and the output path (reversed) of the shift register. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data becomes the received data. **Figure 27.24** shows the configuration of the shift register input/output paths for the case where this module in master mode is set in loopback mode.

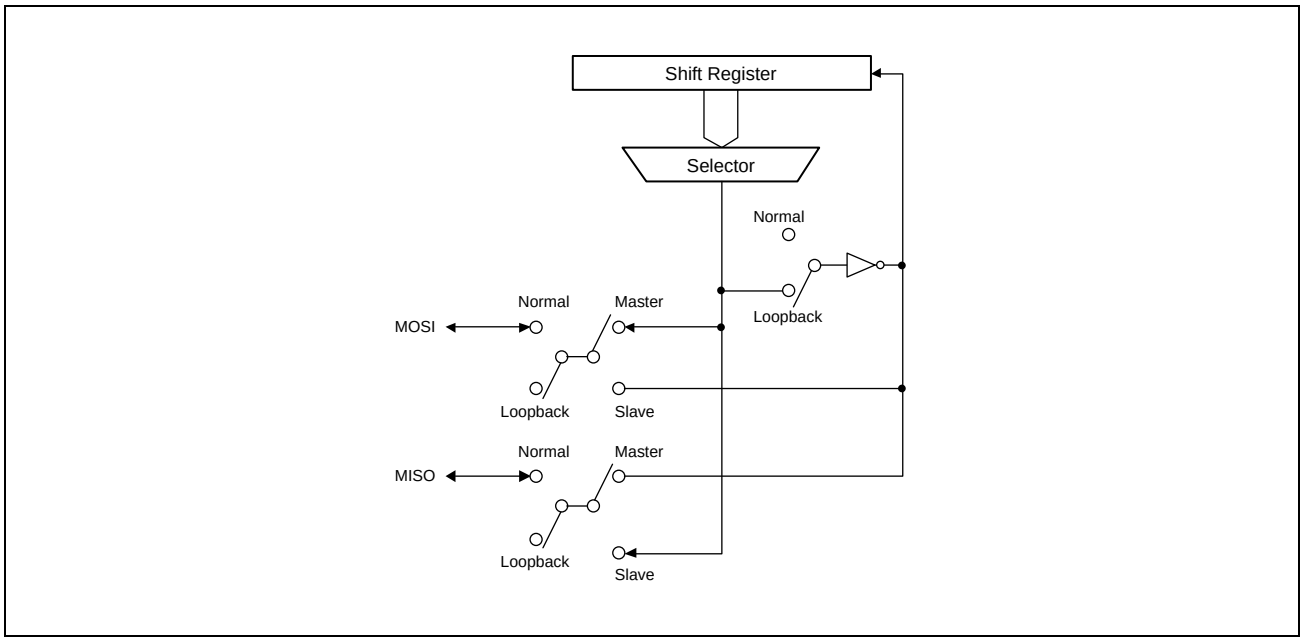

Figure 27.24 Configuration of Shift Register Input/Output Paths in Loopback Mode (Master Mode)

27.4.11 Interrupt Sources

This module has interrupt sources of receive buffer full, transmit buffer empty, mode fault, and overrun. In addition, the direct memory access controller can be activated by the receive buffer full or transmit buffer empty interrupt for data transfer.

Table 27.11 shows the interrupt sources.

When any of the interrupt conditions in **Table 27.11** is met, an interrupt is generated. The interrupt sources should be cleared with data transfer by the CPU or direct memory access controller.

Table 27.11 Interrupt Sources

Name	Interrupt Source	Abbreviation	Interrupt Condition	Activation of Direct Memory Access Controller
SPRI	Receive buffer full	RXI	(SPRIE = 1) • (SPRF = 1)	Possible
SPTI	Transmit buffer empty	TXI	(SPTIE = 1) • (SPTEF = 1)	Possible
SPEI	Mode fault	MOI	(SPEIE = 1) • (MODF = 1)	—
	Overrun	OVI	(SPEIE = 1) • (OVRF = 1)	—

28. Expanded Serial Peripheral Interface (xSPI)

28.1 Overview

This LSI has one unit of Expanded Serial Peripheral Interface (xSPI). The xSPI protocol specifies the interface for Memory Devices, which provides high data throughput, low signal count, and limited backward compatibility with legacy SPI devices. The electrical interface can deliver up to 266 MB per second raw data throughput.

Table 28.1 lists the xSPI specifications.

Table 28.1 xSPI Specifications

Item	Description
Number of channels	1 channel
Protocol	Compliant for the xSPI protocol
Data transmission and reception	Issue the transaction for up to 2 Slave as Master
Transfer speed	Support the transfer at xSPI200 or xSPI266
Mode	• Support Protocol modes below – 1/4/8pin with SDR/DDR (1S-1S-1S, 8D-8D-8D) – 2/4pin with SDR (1S-4S-4S, 4S-4S-4S) • Configurable address length • Configurable initial access latency cycle • Support XiP mode
xSPI function	• Support Write Data Mask • Support In-band Reset • Memory-mapping – Support up to 256 MBytes address space – Prefetch function for burst-read with low latency – Outstanding buffer for burst-write with high throughput • Manual command – Configurable up to 4 commands – Status Register Polling function – Automatic command issuing after released reset: up to 4 commands • Output Clock port timing shift • Input Strobe port timing shift

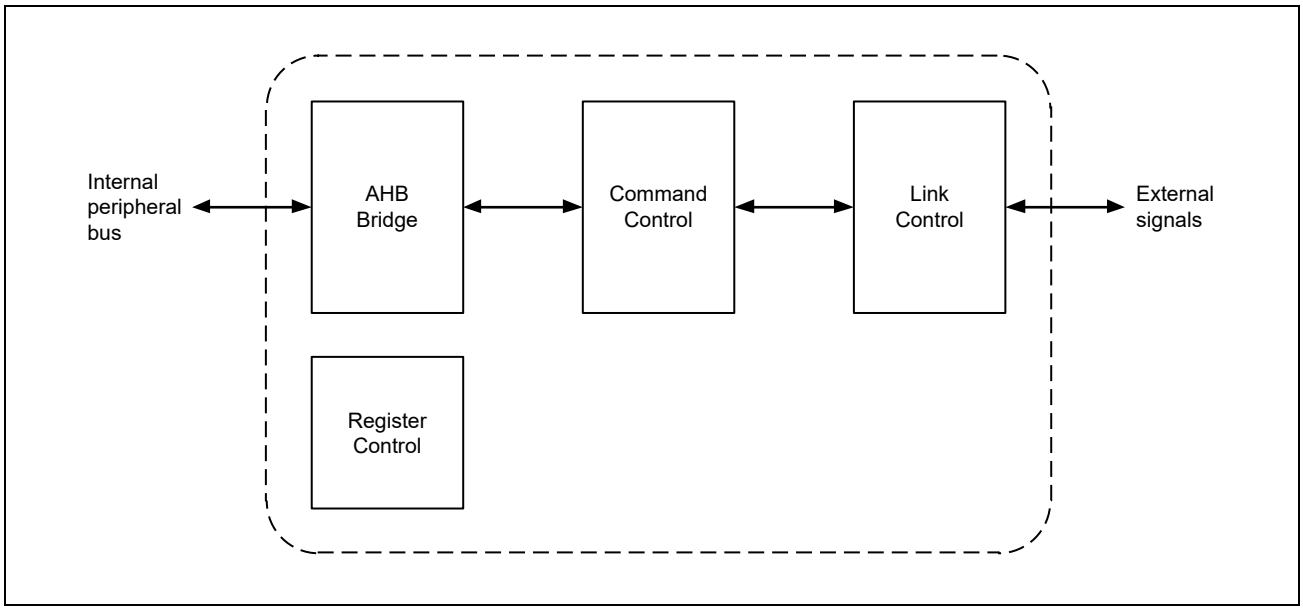

Figure 28.1 Block Diagram

28.2 Input/Output Pins

Table 28.2 xSPI I/O Pins

Pin Name	I/O	Function
XSPI_SPCLK	Output	SPI Clock
XSPI_CS0#	Output	Chip Select for slave0
XSPI_CS1#	Output	Chip Select for slave1
XSPI_DS	I/O	Read Data Strobe / Write Data Mask
XSPI_IO0	I/O	Data 0 input/output
XSPI_IO1	I/O	Data 1 input/output
XSPI_IO2	I/O	Data 2 input/output
XSPI_IO3	I/O	Data 3 input/output
XSPI_IO4	I/O	Data 4 input/output
XSPI_IO5	I/O	Data 5 input/output
XSPI_IO6	I/O	Data 6 input/output
XSPI_IO7	I/O	Data 7 input/output
XSPI_RESET0#	Output	Master reset status for slave0
XSPI_RESET1#	Output	Master reset status for slave1
XSPI_WP0#	Output	Write Protect for slave0
XSPI_WP1#	Output	Write Protect for slave1

Table 28.3 Address Map

Channel	Internal Address	Space
xSPI	H'2000_0000 to H'2FFF_FFFF	CS0
	—*1	CS1

Note 1. By default, CS1 does not have an address space. The address space of CS0 and CS1 can be set by registers in Section SYSC. When setting the address spaces of CS0 and CS1, overlapping addresses is prohibited.

28.3 Register Descriptions

Table 28.4 shows the register configuration. The address of the xSPI register is represented by the offset address from the base address. xSPI base address is as follows:

Base address: H'0_1006_0000 (Overall Address Space)
Base address: H'4006_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base address: H'5006_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above is in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 28.4 Register Configuration (1/2)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
xSPI Wrapper Configuration Register	WRAPCFG	R/W	H'0000_0000	H'000	32

28.3.1 xSPI Configuration Registers

These registers configure xSPI Master function. These registers should be configured in the initialization phase before issuing xSPI transaction.

28.3.1.1 xSPI Wrapper Configuration Register (WRAPCFG)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	DSSFTCS1[4:0]					—	—	—	CKSFTCS1[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DSSFTCS0[4:0]					—	—	—	CKSFTCS0[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	DSSFTCS1 [4:0]	All 0	R/W	DS shift for slave1 The function is same as one of slave0.
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	CKSFTCS1 [4:0]	All 0	R/W	CK shift for slave1 The function is same as one of slave0.
15 to 13	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
12 to 8	DSSFTCS0 [4:0]	All 0	R/W	DS shift for slave0 These bits configure the number of delay cell for XSPI_DS pin. It is used to adjust the DS sampling timing. 1 cell delay is around 125 ps. When enabled automatic calibration, it can be updated automatically. H'00: No shift H'01: Add a delay of 1 cell ⋮ H'1E: Add a delay of 30 cells H'1F: Add a delay of 31 cells
7 to 5	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
4 to 0	CKSFTCS0 [4:0]	All 0	R/W	CK shift for slave0 This field configures the number of delay cell for a XSPI_SPCLK port. It is used to adjust the CK driving timing. 1 cell delay is around 125 ps. When enabled automatic calibration, it can be updated automatically. H'00: No shift H'01: Add a delay of 1 cell ⋮ H'1E: Add a delay of 30 cells H'1F: Add a delay of 31 cells

28.3.1.2 xSPI Common Configuration Register (COMCFG)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OENEGEX	OEASTEX
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
17	OENEGEX	0b	R/W	Output Enable Negating extension This bit extends 1 cycle output enable of Data and DS during output enable negating. This bit should not be used in case of no latency cycle. Because SPI output data could be conflicted with SPI input data. 0: No extend 1 cycle Output enable 1: Extend 1 cycle Output enable
16	OEASTEX	0b	R/W	Output Enable Asserting extension This bit extends 1 cycle output enable of Data and DS during output enable asserting. When set to 1, CS asserting should be extended (LIOCFGCSn.CSASTEX = 1 (n = 0, 1)). This bit shall not be used in case of no latency cycle. Because xSPI output data could be conflicted with xSPI input data. 0: No extend 1 cycle Output enable 1: Extend 1 cycle Output enable
15 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

28.3.1.3 xSPI Bridge Map Configuration Register (BMCFG)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMBTIM[7:0]								—	—	—	—	—	—	—	PREEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

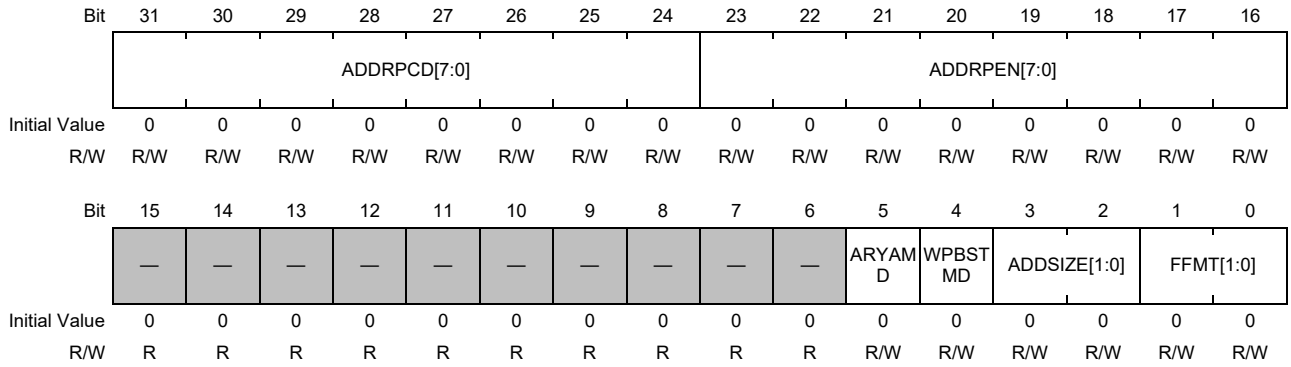
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWRSIZE[7:0]								MWRCOMB	—	—	—	—	—	—	WRMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CMBTIM[7:0]	All 0	R/W	Combination timer This field specifies expiration period of combination timer.H'00 means disabling the combination timer. When the timer is expired, the data in the combination buffer is pushed to memory device.
23 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	PREEN	0b	R/W	Prefetch enable This bit enables prefetch function for read transaction in memory-mapping mode. It could reduce the latency for AHB read transaction with incremental address. 0: Disable prefetch function 1: Enable prefetch function
15 to 8	MWRSIZE [7:0]	All 0	R/W	Memory Write Size These bits select the size to combine incremental address in memory-mapping mode. It transmits an xSPI frame with the data combined up to the configured size while the address is incremental. When detected non-incremental address or a read transaction before reaching to the target size, it transmits the pending data into xSPI bus. H'00: Combine incremental address up to 4 bytes H'01: Combine incremental address up to 8 bytes ⋮ H'0E: Combine incremental address up to 60 bytes H'0F: Combine incremental address up to 64 bytes Others: Setting prohibited
7	MWRCOMB	0b	R/W	Memory Write Combination mode This field selects to combine the xSPI data in write access of memory mapping-mode. When this field is set to "0", xSPI data size depends on system bus's burst type and size. When this field is set to "1", the data size depends on MWRSIZE field. *Note*: When this field is set to "1", any write transaction could be held in this xSPI master temporarily. 0: Disable combination mode 1: Enable combination mode
6 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	WRMD	0b	R/W	System bus Write Response mode This field selects the timing of system bus write response in memory-mapping mode. When this field is set to “1”, it returns the response after transmitting a frame on xSPI bus. *Note*: When this mode is enabled, Memory Write Combination mode shall be disabled. 0: Return response after storing to Internal Write Buffer 1: Return response after issuing write transaction to xSPI bus

28.3.1.4 xSPI Command Map Configuration Register 0 CSn (CMCFG0CSn) (n = 0, 1)

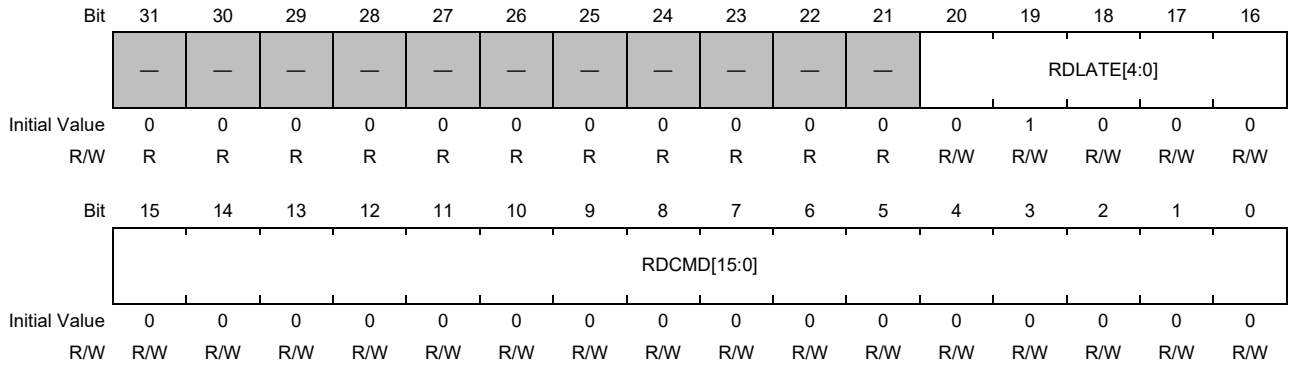
This register has functions to configure xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADDRPCD [7:0]	All 0	R/W	Address Replace Code These bits configure the code to replace the MSByte of system bus address in memory-mapping mode. It replaces the corresponding bits when Address Replace Enable bit is set to 1.
23 to 16	ADDRPEN [7:0]	All 0	R/W	Address Replace Enable These bits select the bits to replace for MSByte of system bus address in memory-mapping mode. 0: No replacement (xSPI frame address field is same as system bus address) 1: Replacement
15 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5	ARYAMD	0b	R/W	Array address mode 0: Normal address mode 1: Array address mode When this field is set to 1, address for memory is mapped as {A [25:10], A [9:4], 6{RSV}, A [3:0]} where A [25:0] is normal address, and RSV is reserved value(0b). This field is effective only when FFMT [1:0] = 01b.
4	WPBSTMD	0b	R/W	Wrapping burst mode 0: Separate xSPI transfer at the wrapping address boundary 1: Not separate xSPI transfer at the wrapping address boundary
3, 2	ADDSIZE[1:0]	00b	R/W	Address size These bits configure the number of address byte in memory-mapping mode. In case of 8D-8D-8D profile 2.0, it should be configured to 4 bytes. 0 0: 1 byte (256 bytes address space) 0 1: 2 bytes (64 Kbytes address space) 1 0: 3 bytes (16 Mbytes address space) 1 1: 4 bytes (4 Gbytes address space)
1, 0	FFMT[1:0]	00b	R/W	Frame format These bits configure xSPI frame format in memory-mapping mode. Please see **Table 28.10** for detail. 0 0: Normal format: Command 1 byte, Address ADDSIZE, Data to AHB transaction. 0 1: 8D-8D-8D profile 1.0 format: Command 2 bytes, Address ADDSIZE, Data to AHB transaction 1 0: 8D-8D-8D profile 2.0 Command Modifier format: Command & Modifier 6 bytes, Data to AHB transaction 1 1: 8D-8D-8D profile 2.0 Commands with Extended Command Modifier format: Command & Modifier 6 bytes, Data to AHB transaction

28.3.1.5 xSPI Command Map Configuration Register 1 CSn (CMCFG1CSn) (n = 0, 1)

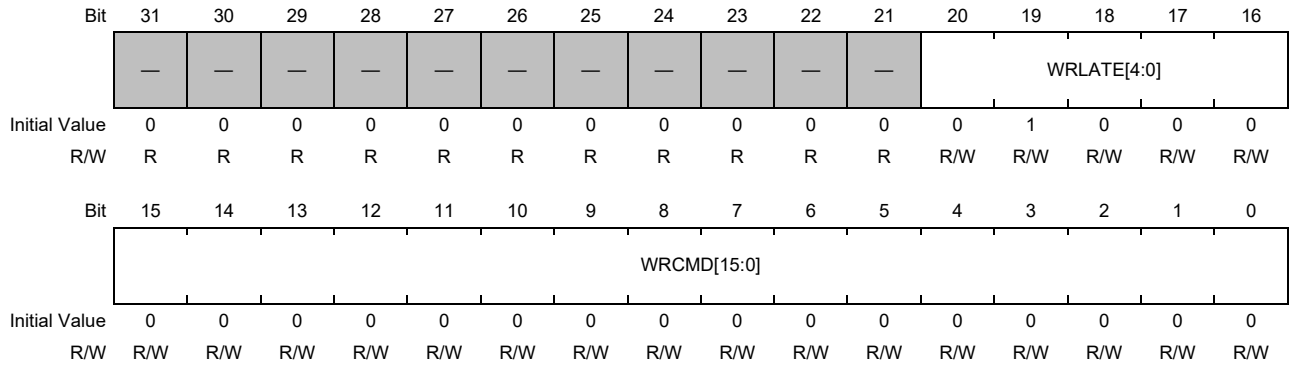
This register has functions to configure xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	RDLATE[4:0]	H'08	R/W	Read latency cycle These bits configure the latency cycle of read transaction in memory-mapping mode. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 0	RDCMD[15:0]	All 0	R/W	Read command These bits configure the command field of read transaction in memory-mapping mode. Normal format and 8D-8D-8D profile 2.0 format use only upper 1 byte. 8D-8D-8D profile 1.0 format uses 2 bytes.

28.3.1.6 xSPI Command Map Configuration Register 2 CSn (CMCFG2CSn) (n = 0, 1)

This register has functions to configure xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	WRLATE[4:0]	H'08	R/W	Write latency cycle These bits configure the latency cycle of write transaction in memory-mapping mode. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 0	WRCMD [15:0]	All 0	R/W	Write command These bits configure the command field of write transaction in memory-mapping mode. Normal format and 8D-8D-8D profile 2.0 format use only upper 1 byte. 8D-8D-8D profile 1.0 format uses 2 bytes.

28.3.1.7 xSPI Link I/O Configuration Register CSn (LIOCFGCSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DDRSMPEX[3:0]				SDRSMPSFT[3:0]				SDRSMPMD	SDRDRV	CSNEGEX	CSASTEX	CSMIN[3:0]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	WRMSKMD	LATEMD	PRTMD[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DDRSMPEX[3:0]	All 0	R/W	DDR sampling window extend These bits configure the cycle of extending the sampling window in DDR. In DDR, the input data is sampled during the expected cycle soon after latency cycle. The input data out of range is ignored. It can be configured depending on DS propagation delay. H'0: Expand no cycle H'1: Expand 1 cycle ⋮ H'6: Expand 6 cycles H'7: Expand 7 cycles Others: Setting prohibited
27 to 24	SDRSMPSFT[3:0]	All 0	R/W	SDR Sampling window shift These bits shift the timing of CK sampling in SDR. In case of using DS in SDR, there is no influence on the behavior. In case of DDR or using DS in SDR, it should be set to 0. H'0: Sample without delay H'1: Sample at 1 cycle delay ⋮ H'6: Sample at 6 cycle delay H'7: Sample at 7 cycle delay Others: Setting prohibited
23	SDRSMPMD	0b	R/W	SDR Sampling mode This bit selects the edge of sampling in SDR. In DDR, regardless of this setting, it samples data input ports with both edges of DS. When set to 1, it samples at rising-edge before falling-edge. 0: Samples data input at falling-edge 1: Samples data input at rising-edge
22	SDRDRV	0b	R/W	SDR driving timing This bit configures the timing of data output in SDR. This bit should not be used in case of no latency cycle. Because SPI output data could be conflicted with SPI input data. 0: Drive at 1/2 cycle before CK rising-edge 1: Drive at CK rising-edge
21	CSNEGEX	0b	R/W	CS negating extension This bit extends 1 cycle chip select pins when negating. 0: No extension 1: Extend 1 cycle

Bit	Bit Name	Initial Value	R/W	Description
20	CSASTEX	0b	R/W	CS asserting extension This bit extends 1 cycle chip select pins when asserting. 0: No extension 1: Extend 1 cycle
19 to 16	CSMIN[3:0]	H'7	R/W	CS minimum idle term This bit configures the minimum cycle between xSPI frames. H'0: 1 cycle H'1: 2 cycles ⋮ H'E: 15 cycles H'F: 16 cycles
15 to 12	—	0b	R	Reserved These bits are read as 0. The write value should be 0.
11	WRMSKMD	0b	R/W	Write mask mode This bit selects to use Data strobe port as write data mask. It could be useful for write access of odd byte. It is used only for 8D-8D-8D protocol mode. 0: Write mask disable 1: Write mask enable
10	LATEMD	0b	R/W	Latency mode This bit selects the behavior of initial access latency phase for both direct-manual mode and memory-mapping mode. When set to 0, the latency cycle is equal to each configured cycle from transmitting address field. When set to 1, the latency cycle is incremented from the last byte-pair of Address field and is extended 2 times of each configured cycle depending on data strobe port. It is used only for profile 2.0 frame format of 8D-8D-8D protocol mode with 6 bytes command/address field. Please refer to xSPI protocol for detail.
9 to 0	PRTMD[9:0]	All 0	R/W	Protocol mode These bits configure the protocol mode and the pin to sample data inputs. In case of using not SPI clock but Data strobe for sampling in SDR mode, it is required to set PRTMD[9] to 1. H'000: 1S-1S-1S H'3FF: 8D-8D-8D H'090: 1S-4S-4S H'092: 4S-4S-4S Others: Setting prohibited

Value: Function	Frame format	Usage
0: Configurable latency	profile 2.0	The configurable latency cycle should be set as minus 1.
	Others	Latency cycle increments after address field.
1: Variable latency	profile 2.0	Latency cycle increments from address [23:16]. And it should not be set to 1.
	Others	Not support

28.3.2 xSPI Control Registers

These registers control xSPI Master function.

28.3.2.1 xSPI Bridge Map Control Register 0 (BMCTL0)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
7 to 4	—	All 1	R	Reserved These bits are read as 1. The write value should be 1.
3, 2	CS1ACC[1:0]	11b	R/W	System bus channel to slave1 memory area access enable These bits enable the access from system bus channel to CS1 memory. 0 0: Read/Write disable 0 1: Read enable, Write disable 1 0: Read disable, Write enable 1 1: Read/Write enable
1, 0	CS0ACC[1:0]	11b	R/W	System bus channel to slave0 memory area access enable These bits enable the access from system bus channel to CS0 memory. 0 0: Read/Write disable 0 1: Read enable, Write disable 1 0: Read disable, Write enable 1 1: Read/Write enable

28.3.2.2 xSPI Bridge Map Control Register 1 (BMCTL1)

This register has functions to control xSPI Master function.

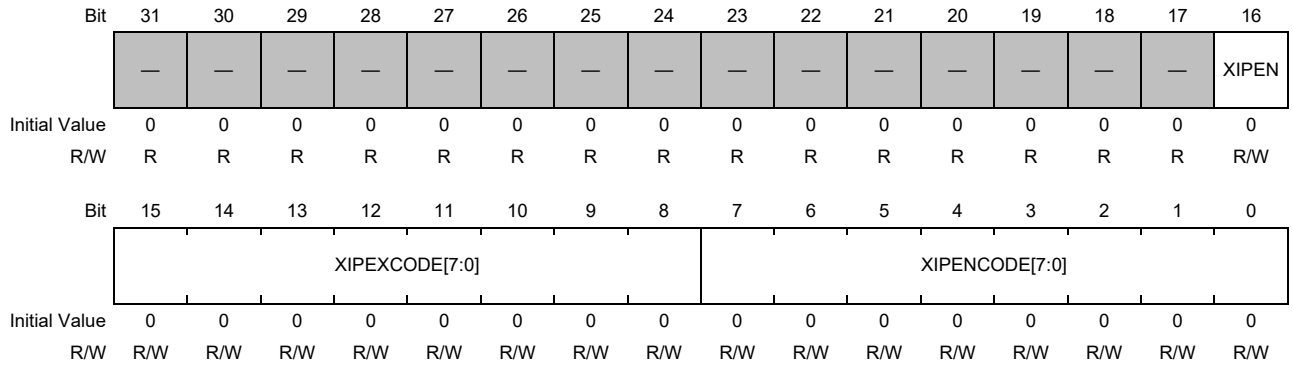
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PBUFCLR	—	MWRPUSH	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	W	R	W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved The write value should be 0.
10	PBUFCLR	0b	W	Prefetch Buffer clear This bit requests to clear the prefetch buffer when enabled the prefetch function. It should not be set during memory access (COMSTT.MEMACC = 1). 0: No command 1: Clear request
9	—	0b	R	Reserved The write value should be 0.
8	MWRPUSH	0b	W	Memory Write Data Push This bit requests to push the pending data in combination mode. 0: No command 1: Push request
7 to 0	—	All 0	R	Reserved The write value should be 0.

28.3.2.3 xSPI Command Map Control Register (CMCTL)

This register has functions to control xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	XIPEN	0b	R/W	XiP mode enable This bit enables XiP mode in memory-mapping mode. When set to 1, XiP enter code is inserted in the latency field, and the command field in next transaction is omitted. When set to 0, XiP exit code is inserted in the latency field. And it is set to 0 automatically when transmitting XiP disable pattern. It should not be used for 8D-8D-8D protocol mode profile 2.0 frame format. 0: Disable XiP mode 1: Enable XiP mode
15 to 8	XIPEXCODE [7:0]	All 0	R/W	XiP mode exit code These bits configure the code to exit XiP mode in memory-mapping mode.
7 to 0	XIPENCODE [7:0]	All 0	R/W	XiP mode enter code These bits configure the code to enter XiP mode in memory-mapping mode.

28.3.2.4 xSPI Command Manual Control Register 0 (CDCTL0)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PERREP[3:0]				—	—	—	PERITV[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TRNUM[1:0]		CSSEL	—	PERMD	TRREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
27 to 24	PERREP[3:0]	All 0	R/W	Periodic transaction repeat These bits configure the number of transaction repetitions in periodic manual-command mode. H'0: 1 (= 2^0) time H'1: 2 (= 2^1) times ⋮ H'E: 16384 (= 2^{14}) times H'F: 32768 (= 2^{15}) times
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	PERITV[4:0]	All 0	R/W	Periodic transaction interval These bits configure the interval of transaction in periodic manual-command mode. Too short interval compared with CPU bus cycle could result in no store into command buffer0. The interval should be longer than 4 times of CPU bus cycle. H'00: 2 (= 2^1) cycles H'01: 4 (= 2^2) cycles ⋮ H'1E: 2,147,483,648 (= 2^{31}) cycles H'1F: 4,294,967,296 (= 2^{32}) cycles
15 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5, 4	TRNUM[1:0]	00b	R/W	Transaction number These bits configure the number of transactions in normal manual-command mode. In periodic manual-command, regardless of this setting, it issues the transaction using only command buffer 0. 0 0: Issue 1 command (using command buffer 0) 0 1: Issue 2 commands (using command buffer 0-1) 1 0: Issue 3 commands (using command buffer 0-2) 1 1: Issue 4 commands (using command buffer 0-3)
3	CSSEL	0b	R/W	Chip select This bit selects a target memory to issue manual-command. 0: CS0 1: CS1
2	—	0b	R	Reserved This bit is read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	PERMD	0b	R/W	Periodic mode This bit enables the periodic transaction mode. When set to 1, it repeats a transaction periodically and compares the read value with the expected value. It alternates the status polling operation for external memory. 0: Direct manual-command mode 1: Periodic manual-command mode
0	TRREQ	0b	R/W	Transaction request This bit requests to issue the transaction of manual-command. When set to 1, it starts the transaction. It is cleared to 0 when the transaction completed. The transaction is canceled by clearing to 0 while the transaction is ongoing. 0: No transaction 1: Request transaction

28.3.2.5 xSPI Command Manual Control Register 1 (CDCTL1)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEREXP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEREXP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEREXP [31:0]	All 0	R/W	Periodic transaction expected value These bits configure the expected value to compare with the read value in periodic manual- command mode. For example, in case of comparing 1 byte, the lower byte should be configured.

28.3.2.6 xSPI Command Manual Control Register 2 (CDCTL2)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PERMSK[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PERMSK[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PERMSK [31:0]	All 0	R/W	Periodic transaction masked value These bits configure the masked value for the expected value in periodic manual-command mode. When set 1 to any bit, the corresponding bit configured as expected value (CDCTL1.PEREXP[31:0]) is ignored. In 8D-8D-8D, the data bytes are transferred only in byte pairs on xSPI bus. It means the dummy read data could be stored. It should be masked for unused bits. For example, in case of read lower 1 byte, it should be configured to H'FFFF_FF00.

28.3.2.7 xSPI Command Manual Type Buf n (CDTBUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRTYPE	—	LATE[4:0]					DATASIZE[3:0]				ADDSIZE[2:0]			CMDSIZE[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CMD[15:0]	All 0	R/W	Command (1-2 bytes) These bits configure the command field in manual-command mode. The number of bytes configured in Command Size bit is transferred. 1S-1S-1S: CMD[15:8] is command field, CMD[7:0] is not used. 8D-8D-8D profile 1.0: CMD[15:8] is command field, CMD[7:0] is extension field. 8D-8D-8D profile 2.0: CMD[15:0] is upper 2 bytes of command & modifier field. (bit 47-32 in xSPI protocol)
15	TRTYPE	0b	R/W	Transaction Type This bit selects the type of transaction. 0: Read transaction (Readout data from slave device) 1: Not read transaction
14	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
13 to 9	LATE[4:0]	All 0	R/W	Latency cycle These bits configure the latency cycle in manual-command mode. H'0: No latency H'1: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
8 to 5	DATASIZE[3:0]	All 0	R/W	Write/Read Data Size These bits configure the size of data field. In 8D-8D-8D, the data bytes are transferred only in byte pairs on xSPI bus. For example, even if configuring 1 byte for read, 2 bytes data is received. The last byte should be ignored. The 0 bytes must not be configured for read transaction. H'0: 0 bytes (No data phase) H'1: 1 byte : H'7: 7 bytes H'8: 8 bytes Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
4 to 2	ADDSIZE[2:0]	All 0	R/W	Address size These bits configure the size of address field. 0 0 0: 0 bytes (No address phase) 0 0 1: 1 byte 0 1 0: 2 bytes 0 1 1: 3 bytes 1 0 0: 4 bytes Others: Setting prohibited
1, 0	CMDSIZE [1:0]	All 0	R/W	Command Size These bits configure the size of command field. In case of 8D-8D-8D, it should be fixed to 10b. It should not be configured both command size and address size to zero. 0 0: 0 bytes (No command phase) 0 1: 1 byte 1 0: 2 bytes Others: Setting prohibited

28.3.2.8 xSPI Command Manual Address Buf n (CDABUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

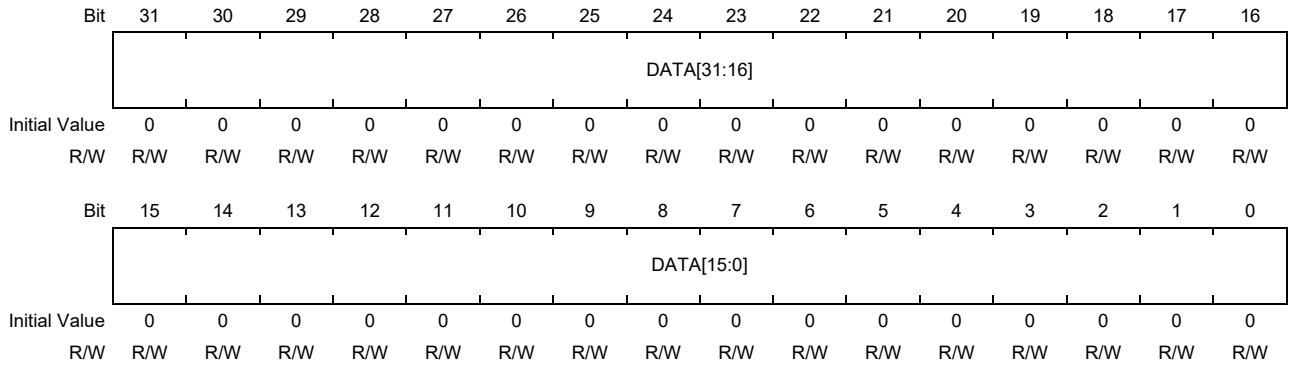
	DATA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	All 0	R/W	Write/Read Data These bits configure the data field in manual-command mode. In case of write transaction, the write data should be configured. In case of read transaction, the read data is stored.

28.3.2.10 xSPI Command Manual Data 1 Buf n (CDD1BUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	All 0	R/W	Write/Read Data These bits configure the data field in manual-command mode. In case of write transaction, the write data should be configured. In case of read transaction, the read data is stored.

28.3.2.11 xSPI Link Pattern Control Register 0 (LPCTL0)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

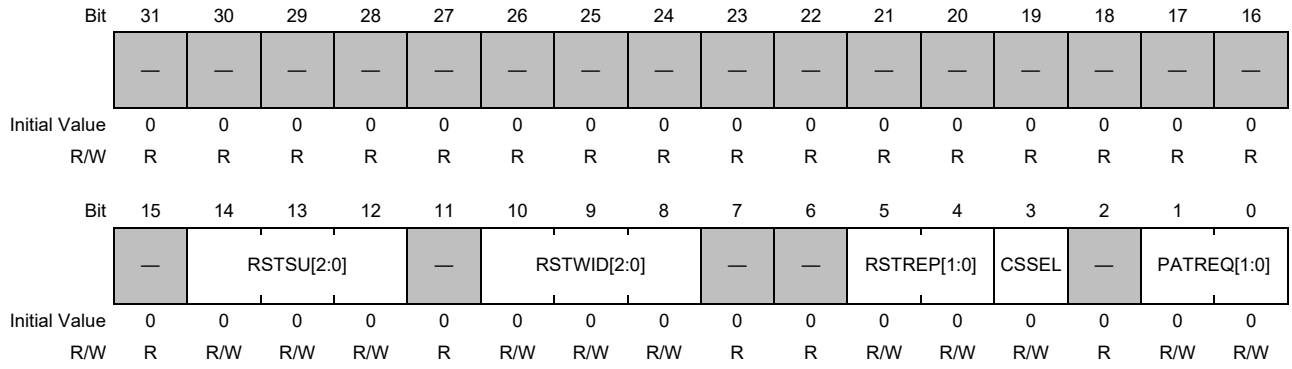
	—	—	—	—	—	—	—	—	—	—	XDPIN[1:0]		CSSEL	—	—	PATREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	XD2VAL	0b	R/W	XiP Disable pattern 2nd phase value This bit selects the value of 2nd phase in XiP disable pattern. 0: Low drive 1: High drive
30, 29	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	XD2LEN[4:0]	All 0	R/W	XiP Disable pattern 2nd phase length These bits select the length of 2nd phase in XiP disable pattern. H'00: 0 cycles H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
23	XD1VAL	0b	R/W	XiP Disable pattern 1st phase value This bit selects the value of 1st phase in XiP disable pattern. 0: Low drive 1: High drive
22, 21	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	XD1LEN[4:0]	All 0	R/W	XiP Disable pattern 1st phase length These bits select the length of 1st phase in XiP disable pattern. The pattern with zero-length both 1st phase and 2nd phase should not be configured. H'0: 0 cycles H'1: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5, 4	XDPIN[1:0]	00b	R/W	XiP Disable pattern pin These bits select the data output pins to transmit XiP Disable pattern. 0 0: 1 pin 0 1: 2 pins 1 0: 4 pins 1 1: 8 pins

Bit	Bit Name	Initial Value	R/W	Description
3	CSSEL	0b	R/W	Chip select This bit selects a target memory to issue a pattern. 0: slave0 (CS0) 1: slave1 (CS1)
2, 1	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
0	PATREQ	0b	R/W	Pattern request This bit requests to issue the pattern. When set to 1, it starts the pattern. It is cleared to 0 when the pattern completed. 0: No request XiP Disable pattern 1: Request XiP Disable pattern

28.3.2.12 xSPI Link Pattern Control Register 1 (LPCTL1)

This register has functions to control xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
14 to 12	RSTSU[2:0]	000b	R/W	Reset pattern data output setup time These bits configure the number of setup cycle for data output based on the edge of CS in reset pattern. It needs enough setup time because xSPI slave samples any data at the rising edge of CS. This cycle of setup time should be less than the cycle of reset pattern width (RSTWID[2:0]). 0 0 0: 1 cycle 0 0 1: 2 cycles ⋮ 1 1 0: 7 cycles 1 1 1: 8 cycles
11	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
10 to 8	RSTWID[2:0]	000b	R/W	Reset pattern width These bits configure the width of cycle in reset pattern and CS only pattern. It toggles CS with the configured cycle. 0 0 0: 2 (= 2^1) cycles 0 0 1: 4 (= 2^2) cycles ⋮ 1 1 0: 128 (= 2^7) cycles 1 1 1: 256 (= 2^8) cycles
7, 6	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
5, 4	RSTREP[1:0]	00b	R/W	Reset pattern repeat These bits select the repeating time to toggle CS from LOW to HIGH. 0 0: 4 times (Specified on Reset Signaling Protocol) 0 1: 5 times 1 0: 6 times 1 1: 7 times
3	CSSEL	0b	R/W	Chip select This bit selects a target memory to issue a pattern. 0: slave0 (CS0) 1: slave1 (CS1)

Bit	Bit Name	Initial Value	R/W	Description
2	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
1, 0	PATREQ[1:0]	00b	R/W	Pattern request These bits request to issue the pattern. When set to 01b or 10b, it starts the pattern. It is cleared to 00b when the pattern completed. 0 0: No request 0 1: Request Reset pattern 1 0: Request CS only pattern 1 1: Setting prohibited

28.3.2.13 xSPI Link I/O Control Register (LIOCTL)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSTCS1	RSTCS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WPCS1	WPCS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved This bit is read as 0. The write value should be 0.
17	RSTCS1	1b	R/W	Reset drive for slave1 This function is same as RSTCS0. 0: Drive Low level 1: Drive High level
16	RSTCS0	1b	R/W	Reset drive for slave0 This bit controls the value of xSPI reset port. It can be useful only for xSPI slave with reset port. 0: Drive Low level 1: Drive High level
15 to 2	—	All 0	R	Reserved This bit is read as 0. The write value should be 0.
1	WPCS1	1b	R/W	WP drive for slave1 This function is same as WPCS0. 0: Drive Low level 1: Drive High level
0	WPCS0	1b	R/W	WP drive for slave0 This bit controls the value of Write Protect port. It can be useful only for xSPI slave with write protect port. 0: Drive Low level 1: Drive High level

28.3.2.14 xSPI Command Calibration Control Register 0 CSn (CCCTL0CSn) (n = 0, 1)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CASFTEND[4:0]					—	—	—	CASFTSTA[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CAITV[4:0]					—	—	—	—	—	—	CANOWR	CAEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	CASFTEND [4:0]	All 1	R/W	Calibration DS shift end value These bits configure the end value of DS shift. It should be equal or more than the start value (CASFTSTA).
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	CASFTSTA [4:0]	All 0	R/W	Calibration DS shift start value These bits configure the start value of DS shift.
15 to 13	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
12 to 8	CAITV[4:0]	All 0	R/W	Calibration interval These bits configure the interval between calibration patterns. H'00: 2 (= 2^1) cycle wait H'01: 4 (= 2^2) cycle wait ⋮ H'1E: 2,147,483,648 (= 2^{31}) cycle wait H'1F: 4,294,967,296 (= 2^{32}) cycle wait
7 to 2	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
1	CANOWR	0b	R/W	Calibration no write mode This bit selects to omit write command in calibration sequence. It can be used for any slave device with fixed calibration pattern data. 0: Calibration sequence with write command 1: Calibration sequence without write command
0	CAEN	0b	R/W	Automatic Calibration Enable This bit enables the automatic calibration. When set to 1, it transmits the calibration sequence periodically and adjusts the value of phase shift. When set to 0 during the calibration sequence, it stops after completed ongoing calibration sequence, and then this bit is cleared. 0: Disable automatic calibration 1: Enable automatic calibration

28.3.2.15 xSPI Command Calibration Control Register 1 CSn (CCCTL1CSn) (n = 0, 1)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CARDLATE[4:0]					—	—	—	CAWRLATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CADATASIZE[3:0]				CAADDSIZE[2:0]			CACMDSIZE [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	CARDLATE [4:0]	All 0	R/W	Read Latency cycle These bits configure the latency cycle in calibration frame. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	CAWRLATE [4:0]	All 0	R/W	Write Latency cycle These bits configure the latency cycle in calibration frame. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8 to 5	CADATASIZE [3:0]	All 0	R/W	Write/Read Data Size These bits configure the size of data field. In 8D-8D-8D, it should be configured with even byte. H'0: 1 byte H'1: 2 bytes ⋮ H'E: 15 bytes H'F: 16 bytes
4 to 2	CAADDSIZE [2:0]	000b	R/W	Address size These bits configure the size of address field. 0 0 0: 0 bytes (No address phase) 0 0 1: 1 byte 0 1 0: 2 bytes 0 1 1: 3 bytes 1 0 0: 4 bytes Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CACMDSIZE [1:0]	00b	R/W	Command Size These bits configure the size of command field. In case of 8D-8D-8D, it should be fixed to 10b. It should not be configured both command size and address size to zero. 0 0: 0 bytes (No command phase) 0 1: 1 byte 1 0: 2 bytes 1 1: Setting prohibited

28.3.2.16 xSPI Command Calibration Control Register 2 CSn (CCCTL2CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CARDCMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAWRCMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CARDCMD [15:0]	All 0	R/W	Calibration pattern read command These bits configure the calibration pattern read command.
15 to 0	CAWRCMD [15:0]	All 0	R/W	Calibration pattern write command These bits configure the calibration pattern write command.

28.3.2.17 xSPI Command Calibration Control Register 3 CSn (CCCTL3CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

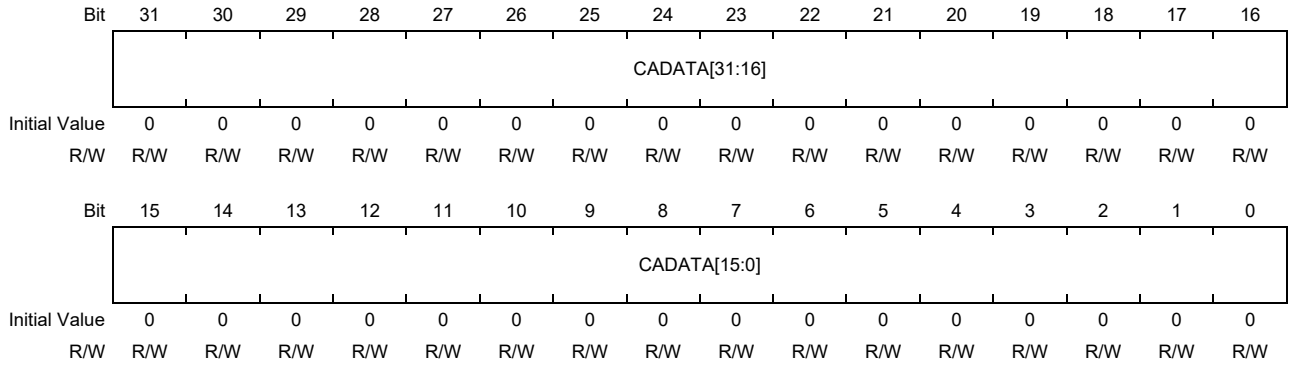
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAADD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAADD[31:0]	All 0	R/W	Calibration pattern address These bits configure the calibration pattern address.

28.3.2.18 xSPI Command Calibration Control Register 4 CSn (CCCTL4CSn) (n = 0, 1)

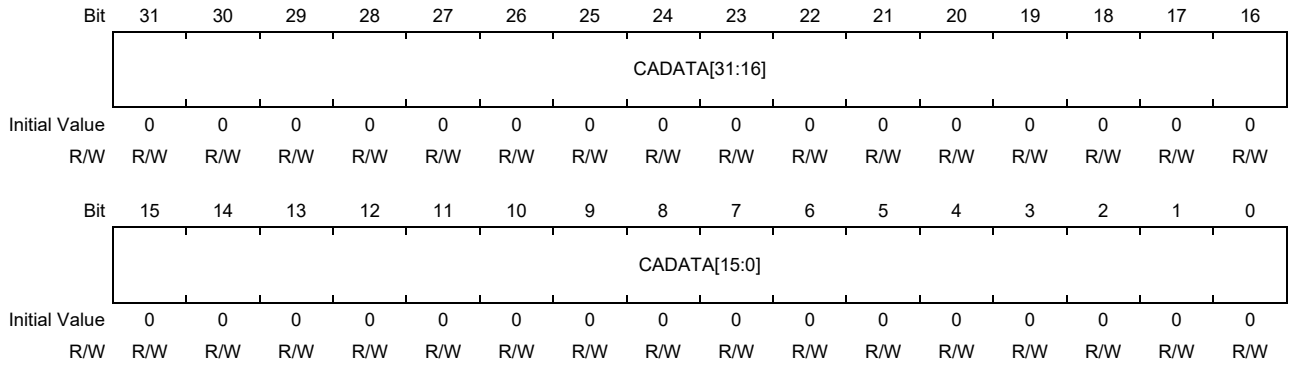
This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

28.3.2.19 xSPI Command Calibration Control Register 5 CSn (CCCTL5CSn) (n = 0, 1)

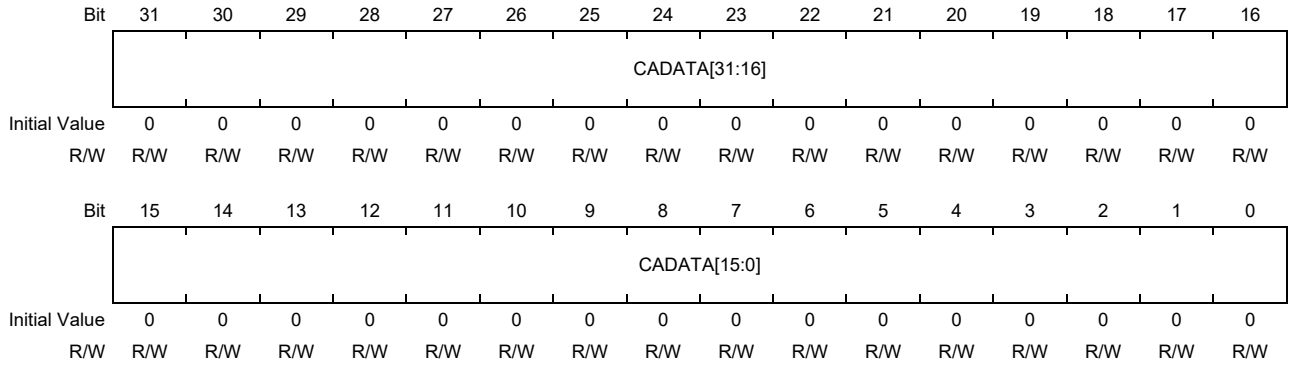
This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

28.3.2.20 xSPI Command Calibration Control Register 6 CSn (CCCTL6CSn) (n = 0, 1)

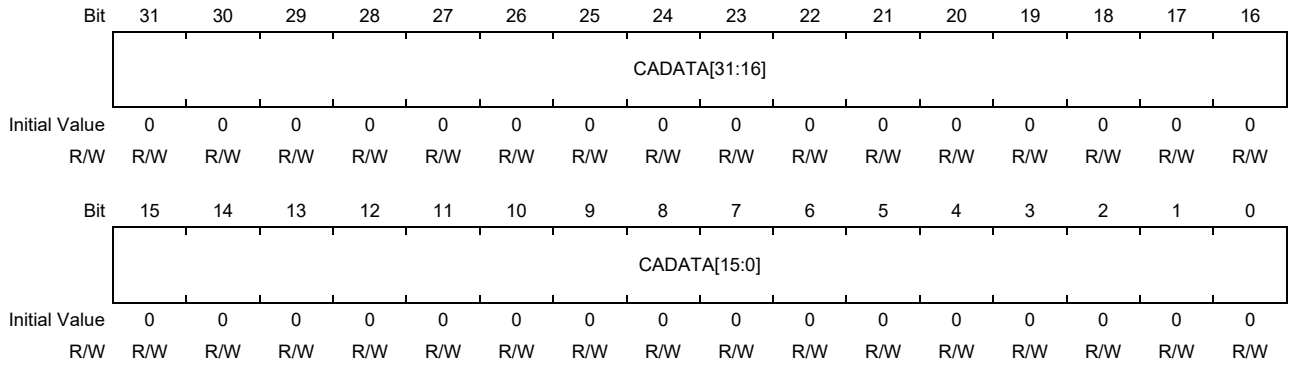
This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

28.3.2.21 xSPI Command Calibration Control Register 7 CSn (CCCTL7CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

28.3.3 xSPI Status Registers

These registers monitor the status of xSPI Master.

28.3.3.1 xSPI Version Register (VERSTT)

This register indicates the status of xSPI Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VER[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VER[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VER[31:0]	All 0	R	Version These bits indicate this IP version.

28.3.3.2 xSPI Common Status Register (COMSTT)

This register indicates the status of xSPI Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WRBUFNE	—	PBUFNE	—	—	—	MEMACC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	WRBUFNE	0b	R	Write Buffer Not Empty 0: Empty 1: Not empty
5	—	0b	R	Reserved This bit is read as 0.
4	PBUFNE	0b	R	Prefetch Buffer Not Empty 0: Empty 1: Not empty
3 to 1	—	000b	R	Reserved These bits are read as 0.
0	MEMACC	0b	R	Memory access ongoing 0: System bus channel is not accessing to memory. 1: System bus channel is accessing to memory.

28.3.3.3 xSPI Calibration Status Register CSn (CASTTCSn) (n = 0, 1)

This register indicates the status of xSPI Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUC[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CASUC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CASUC[31:0]	All 0	R	Calibration Success These bits indicate the calibration success for each DS shift value. It is updated when completed each calibration sequence. CASUC[x] indicates calibration success in DS shift value = x.

28.3.4 xSPI Interrupt Registers

These registers control the interrupt function of xSPI Master.

28.3.4.1 xSPI Interrupt Status Register (INTS)

This register indicates the status of interrupt. The bits in this register are cleared to 0 when writing 1 on the corresponding bit of INTC register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1	CASUCCS0	CAFAILCS1	CAFAILCS0	—	—	—	—	—	—	—	BUSERR	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	DSTOCS1	DSTOCS0	PERTO	INICMP	PATCMP	CMDCMP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1	0b	R	Calibration success for slave1 This function is same as CASUCCS0. 0: No detection 1: Detection
30	CASUCCS0	0b	R	Calibration success for slave0 This bit is set to 1 when success calibration. 0: No detection 1: Detection
29	CAFAILCS1	0b	R	Calibration failed for slave1 This function is same as CAFAILCS0. 0: No detection 1: Detection
28	CAFAILCS0	0b	R	Calibration failed for slave0 This bit is set to 1 when failed calibration. 0: No detection 1: Detection
27 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BUSERR	0b	R	System bus error This field is set to “1” when system bus responds error.
19 to 6	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	DSTOCS1	0b	R	DS timeout for slave1 This function is same as DSTOCS0. 0: No detection 1: Detection

Bit	Bit Name	Initial Value	R/W	Description
4	DSTOCS0	0b	R	DS timeout for slave0 This bit is set to 1 when lost DS in read transaction with using DS. It means not receiving the data during expected read phase. In this case, xSPI master stops the read transaction and the following transaction. 0: No detection 1: Detection
3	PERTO	0b	R	Periodic transaction timeout This bit is set to 1 when the read value does not match with the expected value in periodic manual-command mode. 0: No detection 1: Detection
2	INICMP	0b	R	Initial Sequence Completed This bit is set to 1 when completed the initial sequence. 0: No detection 1: Detection
1	PATCMP	0b	R	Pattern Completed This bit is set to 1 when completed the requested pattern. 0: No detection 1: Detection
0	CMDCMP	0b	R	Command Completed This bit is set to 1 when completed the requested manual-command. In direct manual-command, it means all transactions completed. In periodic manual-command, it means the read data matches with the expected data. 0: No detection 1: Detection

28.3.4.2 xSPI Interrupt Clear Register (INTC)

This register clears the status of interrupt.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1C	CASUCCS0C	CAFAILCS1C	CAFAILCS0C	—	—	—	—	—	—	—	BUSERRCH0C	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	R	R	R	R	R	R	R	W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	DSTOCS1C	DSTOCS0C	PERTOC	INICMPC	PATCMPC	CMDCMPC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	W	W	R	R	W	W	R	R	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1C	0b	W	Calibration success for slave1 interrupt clear 0: No change interrupt status 1: Clear interrupt status
30	CASUCCS0C	0b	W	Calibration success for slave0 interrupt clear 0: No change interrupt status 1: Clear interrupt status
29	CAFAILCS1C	0b	W	Calibration failed for slave1 interrupt clear 0: No change interrupt status 1: Clear interrupt status
28	CAFAILCS0C	0b	W	Calibration failed for slave0 interrupt clear 0: No change interrupt status 1: Clear interrupt status
27 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BUSERRC	0b	W	System bus error for interrupt clear 0: No change interrupt status 1: Clear interrupt status
19 to 6	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	DSTOCS1C	0b	W	DS timeout for slave1 interrupt clear 0: No change interrupt status 1: Clear interrupt status
4	DSTOCS0C	0b	W	DS timeout for slave0 interrupt clear 0: No change interrupt status 1: Clear interrupt status
3	PERTOC	0b	W	Periodic transaction timeout interrupt clear 0: No change interrupt status 1: Clear interrupt status
2	INICMPC	0b	W	Initial Sequence Completed interrupt clear 0: No change interrupt status 1: Clear interrupt status
1	PATCMPC	0b	W	Pattern Completed interrupt clear 0: No change interrupt status 1: Clear interrupt status

Bit	Bit Name	Initial Value	R/W	Description
0	CMDCMPC	0b	W	Command Completed interrupt clear 0: No change interrupt status 1: Clear interrupt status

28.3.4.3 xSPI Interrupt Enable Register (INTE)

This register enables the interrupt.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1E	CASUCCS0E	CAFAILCS1E	CAFAILCS0E	—	—	—	—	—	—	—	BUSERRE	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

28.4 Operation

xSPI Master interface has the functions to issue the transaction for external memory with xSPI Slave interface. It allows to write to registers in external memory or read from it.

This xSPI Master mainly has two modes to issue the transaction. One is a manual-command mode; Software configures all fields of xSPI frame and starts the transaction by software request. The other is a memory-mapping mode; it automatically converts system bus access for pre-configured memory area into xSPI transaction. It enables to access from system bus to external memory area outside of chip via xSPI bus.

This section describes the xSPI bus operation, the direct control of xSPI frame (manual-command), the control of memory access (memory-mapping), the error operation, and the flow to operation.

28.4.1 xSPI Bus

This section describes the xSPI bus operation.

28.4.1.1 Supported Protocol Mode

This xSPI Master supports various protocol modes. It is configured by Protocol mode bits (LIOCFGCSn.PRTMD[9:0]). The table below shows the summary of protocol modes.

Table 28.5 Supported Protocol Mode

Protocol Mode	Function	PRTMD [9:0]	Note
1S-1S-1S	Command, Address, and Data fields are transferred at SDR with using 1 pin. Read data is sampled with CK.	H'000	Specified by xSPI protocol
8D-8D-8D	Command, Address, and Data fields are transferred at DDR with using 8 pins. Read data is sampled with DS.	H'3FF	Specified by xSPI protocol
1S-4S-4S	Command field is transferred at SDR with using 1 pin. Address and Data fields are transferred at SDR with using 4 pins. Read data is sampled with CK.	H'090	—
4S-4S-4S	Command, Address, and Data fields are transferred at SDR with using 4 pins. Read data is sampled with CK.	H'092	—

Note: In case of XiP mode enable, XiP code is inserted in Latency field. It is valid only for memory-mapping mode.

The table below shows a description of the main internal signals.

Table 28.6 Internal Signals

Signal Name	I/O	Function
clk_spi	I	xSPI control clock
spi_ck	O	xSPI Clock (Same as XSPI_SPCLK pin)
spi_cs0	O	xSPI Chip Select for slave0 (Same as XSPI_CS0# pin)
spi_cs1	O	xSPI Chip Select for slave1 (Same as XSPI_CS1# pin)
spi_doe[7:0]	O	xSPI Data Output Enable
spi_do[7:0]	O	xSPI Data Output
spi_di[7:0]	I	xSPI Data Input
spi_dsoe	O	xSPI Data Strobe Output Enable
spi_dso	O	xSPI Data Strobe Output
spi_dsi	I	xSPI Data Strobe Input

The bytes of Command and Address fields are transferred in highest order to lowest order sequence. The sequential bytes of Data field are transferred in lowest address to highest address order. In case of using multiple pins, the least significant bit of each byte is placed on spi_do/di[0] with each higher order bit on the successively higher numbered spi_do/di signals.

The figure below shows timing-chart for 1S-1S-1S protocol mode. The spi_do[0] signal is used for output data and the spi_di[1] signal is used for input data.

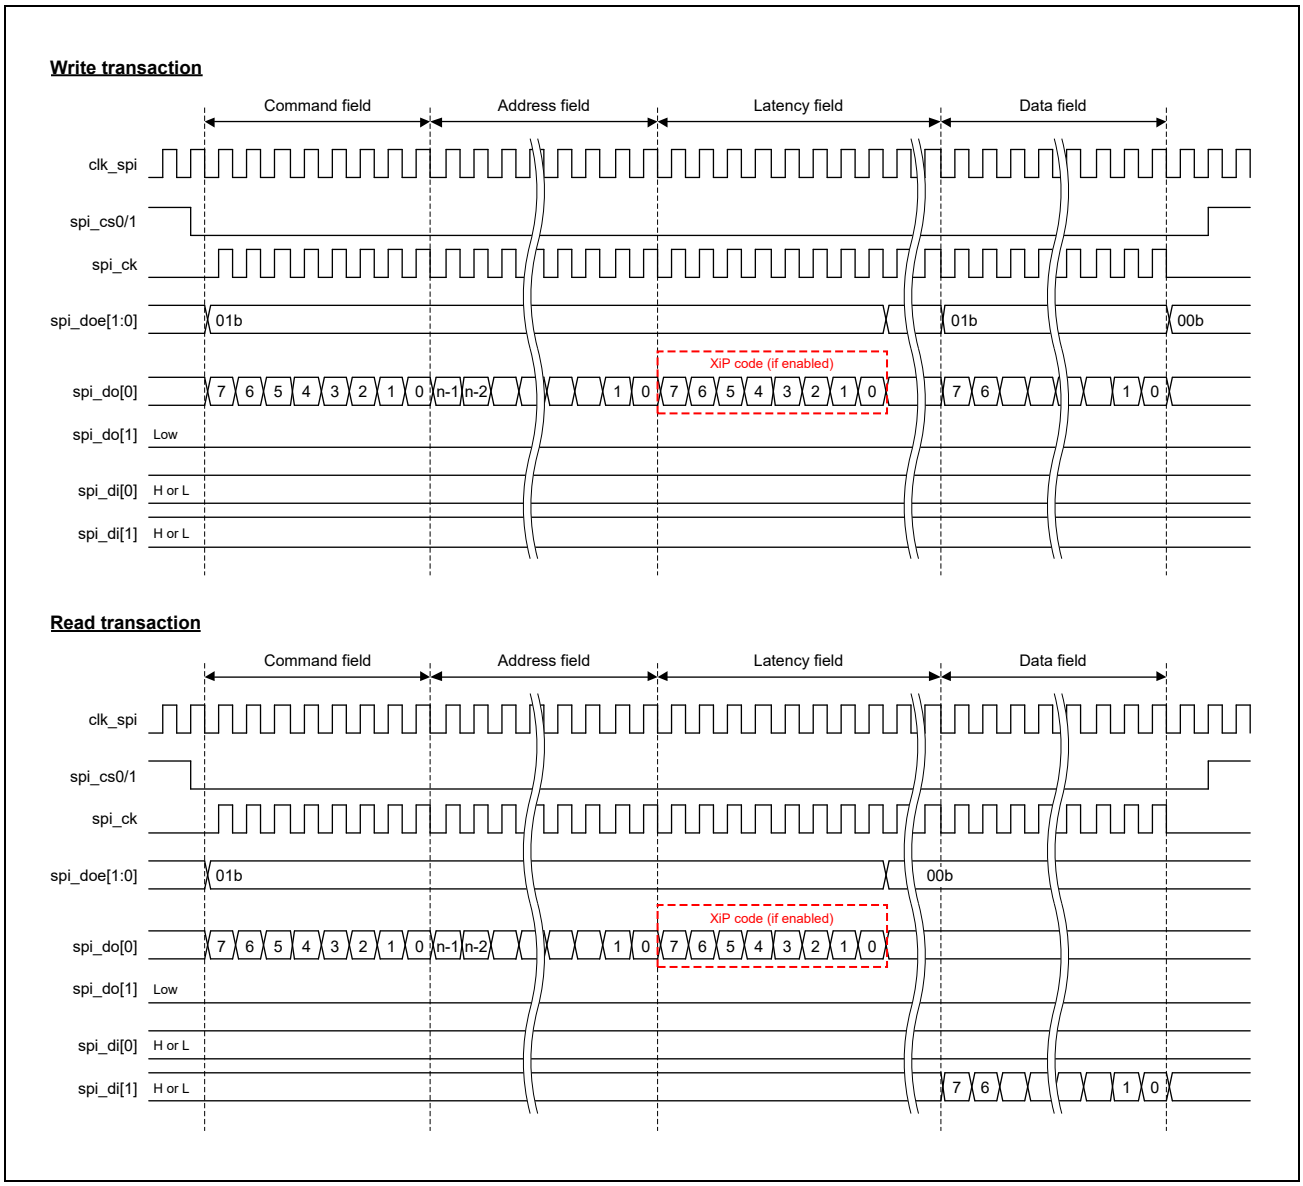

Figure 28.2 1S-1S-1S Timing-Chart

The figure below shows timing-chart for 8D-8D-8D profile 1.0 protocol mode. In 8D-8D-8D, the data is always transmitted with byte-pair. In case each field is odd byte, last one byte is padded with invalid data.

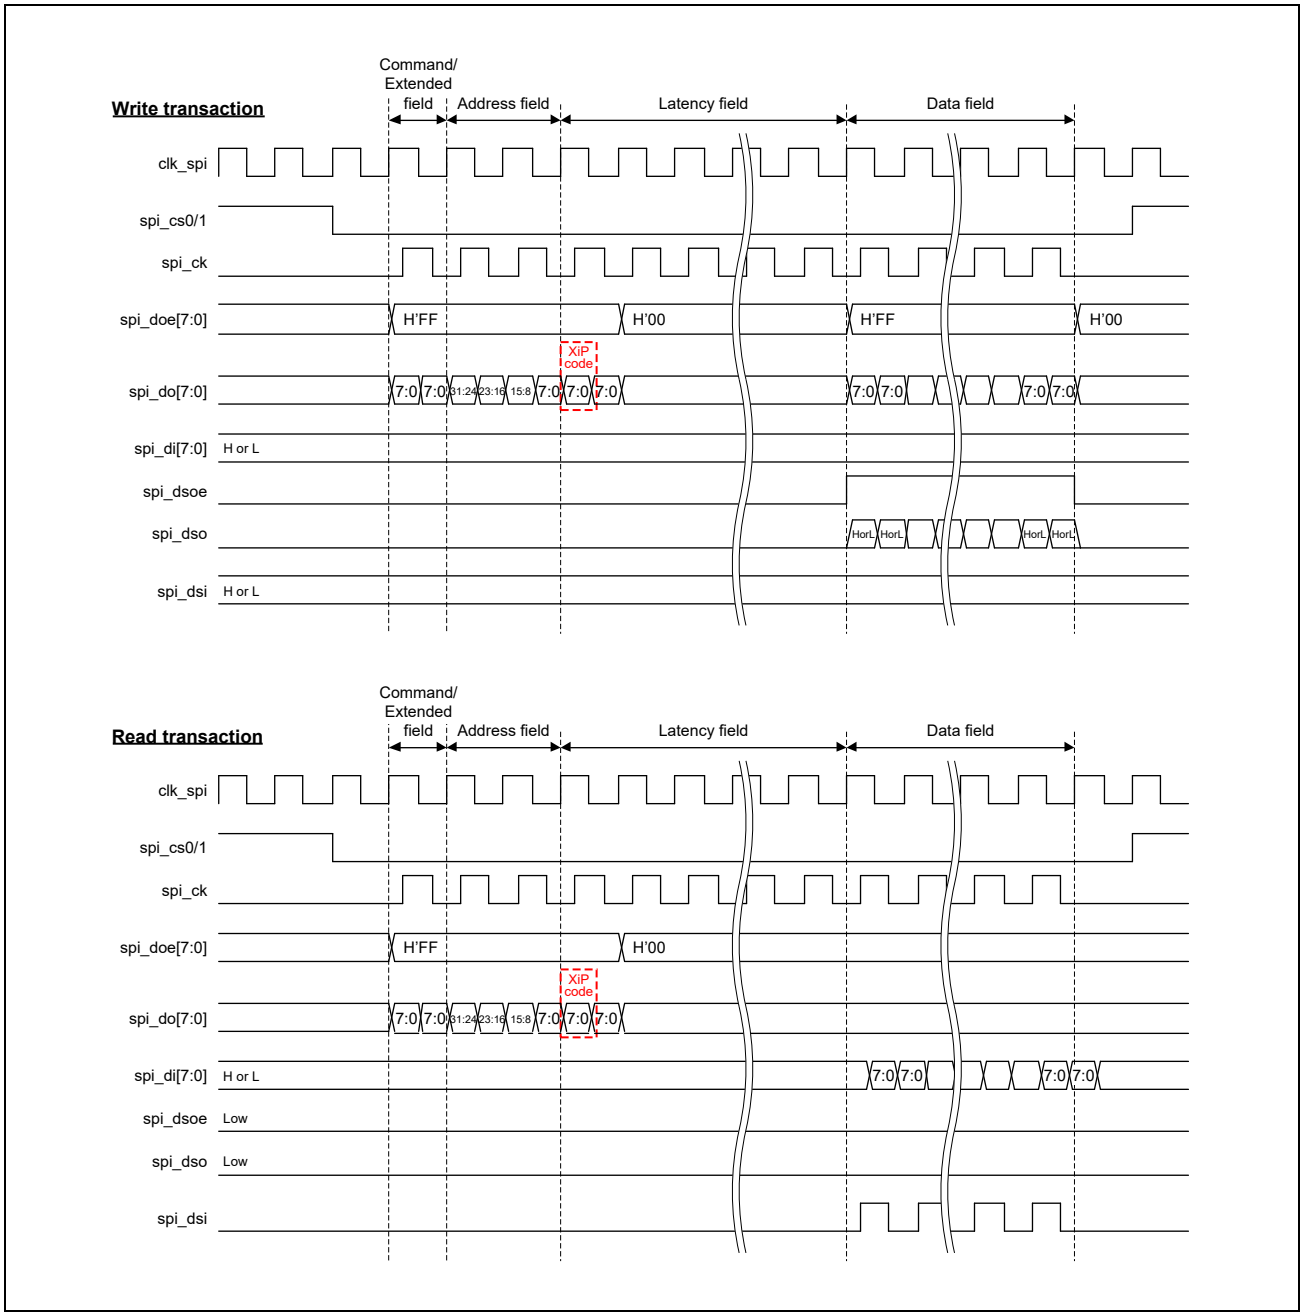

Figure 28.3 8D-8D-8D profile 1.0 Timing-Chart

The figure below shows timing-chart for 8D-8D-8D profile 2.0 protocol mode. In 8D-8D-8D, the data is always transmitted with byte-pair. In case each field is odd byte, last one byte is padded with invalid data.

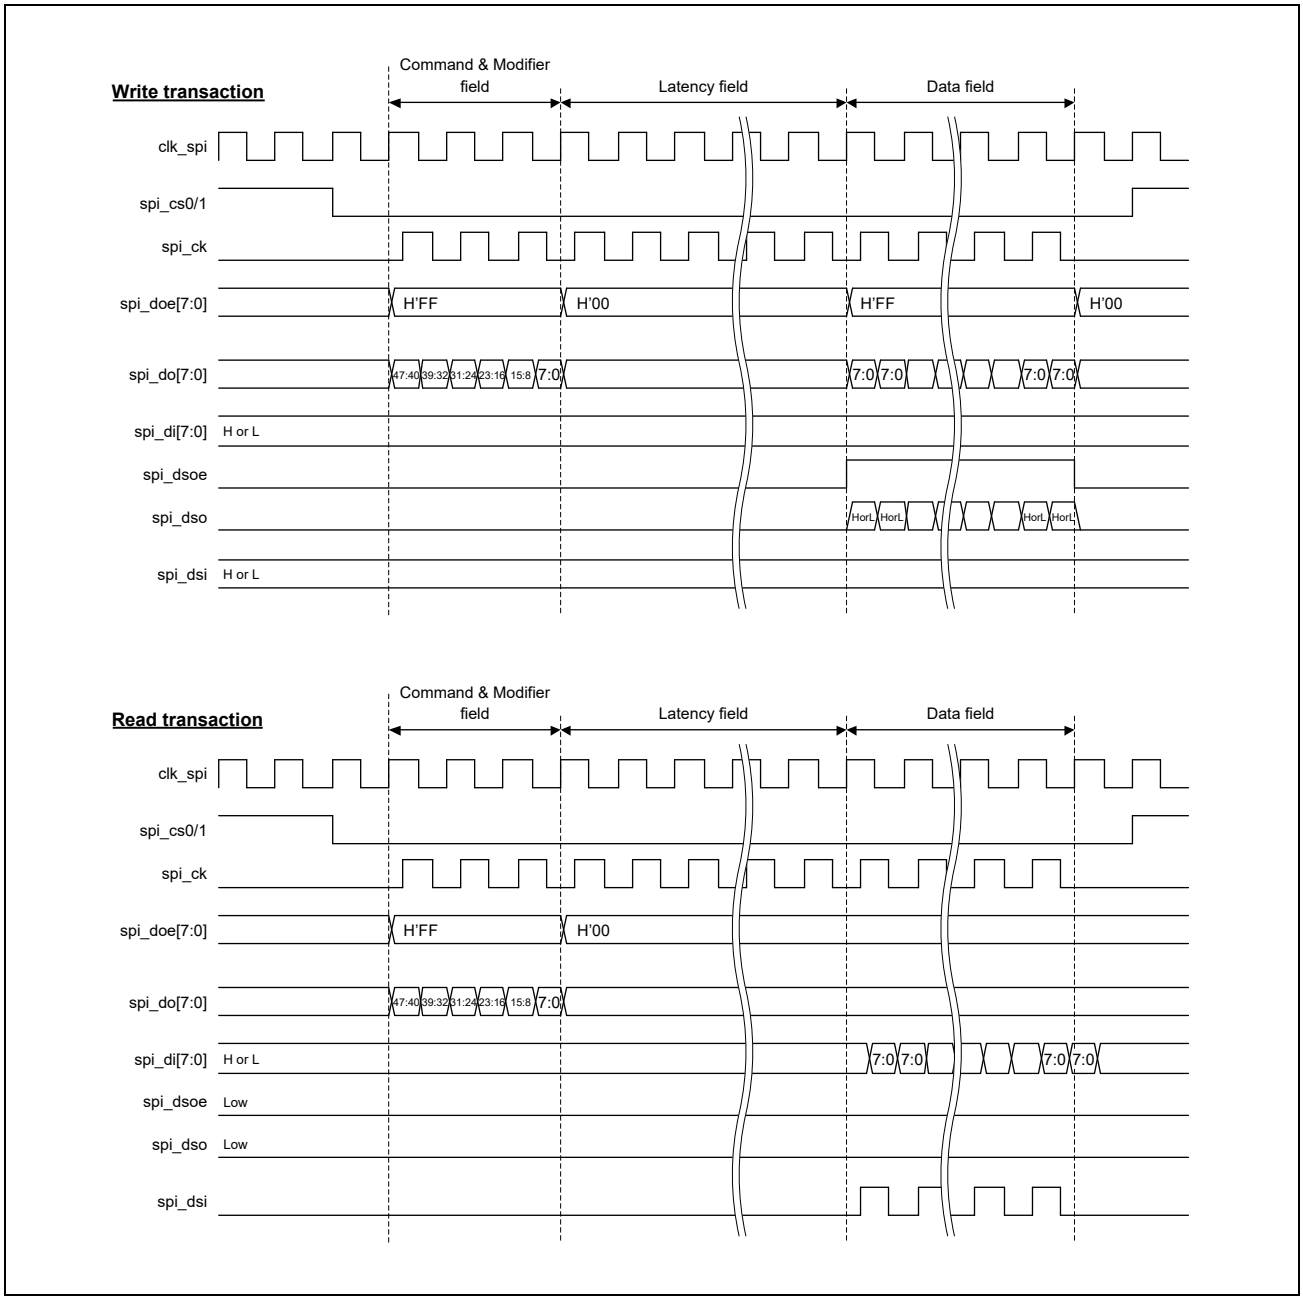

Figure 28.4 8D-8D-8D Profile 2.0 Timing-Chart

28.4.1.2 xSPI Frame Interval

The interval between xSPI frames is configured with CS minimum idle term bits (LIOCFGCSn.CSMIN[3:0]). It depends on the specification of xSPI slave device.

28.4.1.3 xSPI Signals Timing Control

This xSPI Master supports both SDR and DDR. And it is possible to sample input data with Data-Strobe (DS) signal at SDR. For the various mode support and easy implementation, this xSPI Master could adjust the timing to drive/sample xSPI interface signals statically. The table below shows the summary of xSPI Interface signal timing control.

Table 28.7 Summary of xSPI Signals Timing Control

Signal	Mode	Default Operation	Timing Control (n = 0, 1)
CS (spi_cs) drive	—	Asserting 1 cycle before the rising-edge of first spi_ck	1 cycle extension for asserting with LIOCFGCSn.CSASTEX bit
		Negating 1.5 cycle after the falling-edge of last spi_ck	1 cycle extension for negating with LIOCFGCSn.CSNEGEX bit
CK (spi_ck) drive	SDR without DS	Reference point	—
	SDR with DS		
	DDR with DS	Reference point	0 to 1 cycle phase shift with WRAPCFG.CKSFTCSx bit
DO/DOE (spi_do/doe) drive	SDR without DS	Falling edge of clk_spi	0 or 0.5 cycle shift with LIOCFGCSn.SDRDRV bit
	SDR with DS		
	DDR with DS	Both edges of clk_spi	—
DI (spi_di) sample	SDR without DS	Falling edge of spi_ck on expected data size	0 to 7 cycle shift (1 cycle unit) with LIOCFGCSn.SDRSMPSFT[3:0] bits 0 or 0.5 cycle shift with LIOCFGCSn.SDRSMPMD bit
	SDR with DS	Falling edge of spi_dsi signal on expected data size	Sample at rising edge with LIOCFGCSn.SDRSMPMD bit 0 to 1 cycle phase shift with WRAPCFG.DSSFTCSn[4:0] bits 0 to 7 cycle extension with LIOCFGCSn.DDRSMPEX[3:0] bits
	DDR with DS	Both edges of spi_dsi signal on expected data size	0 to 1 cycle phase shift with WRAPCFG.DSSFTCSn[4:0] bits 0 to 7 cycle extension with LIOCFGCSn.DDRSMPEX[3:0] bits

Note: In DDR on xSPI protocol, CK or DS should be aligned for center of data. It means to shift the phase by 0.25 cycle (90 degrees). This xSPI master supports to adjust this phase depending on the usage conditions.

The figure below shows the default operation and timing control for SDR without DS.

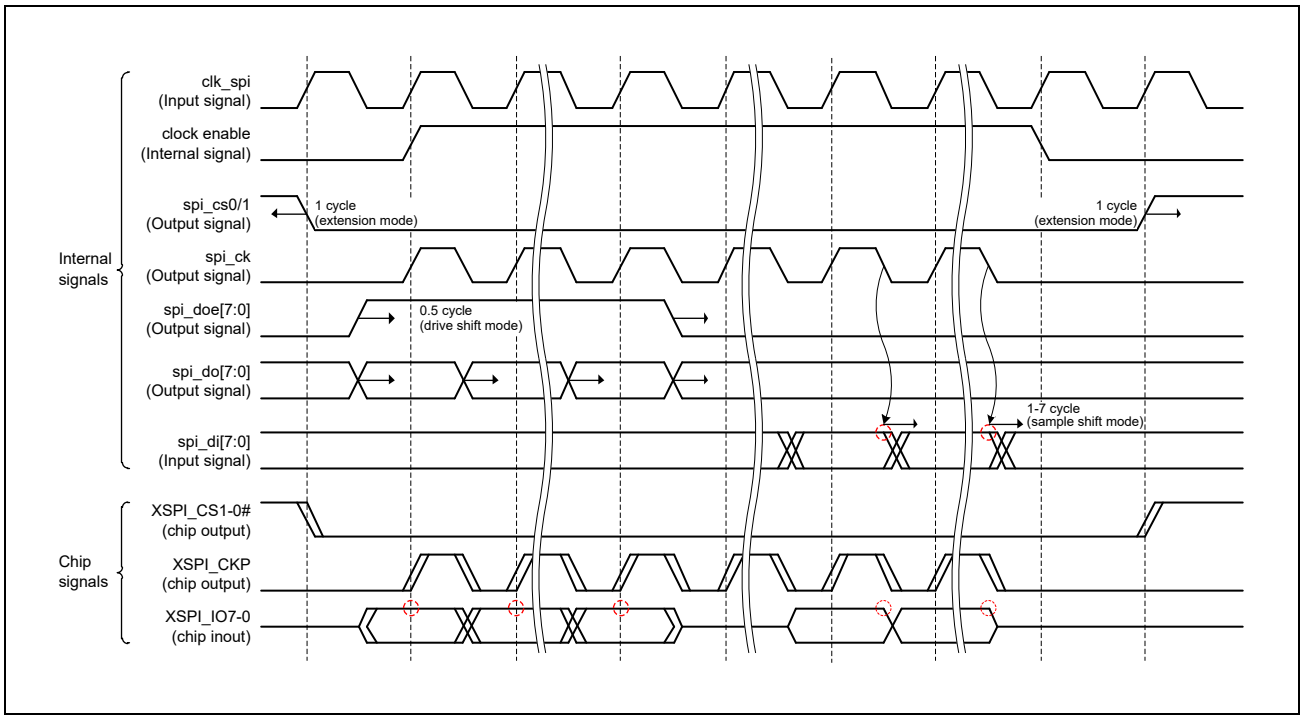

Figure 28.5 Timing Control for SDR without DS

The figure below shows the default operation and timing control for SDR with DS.

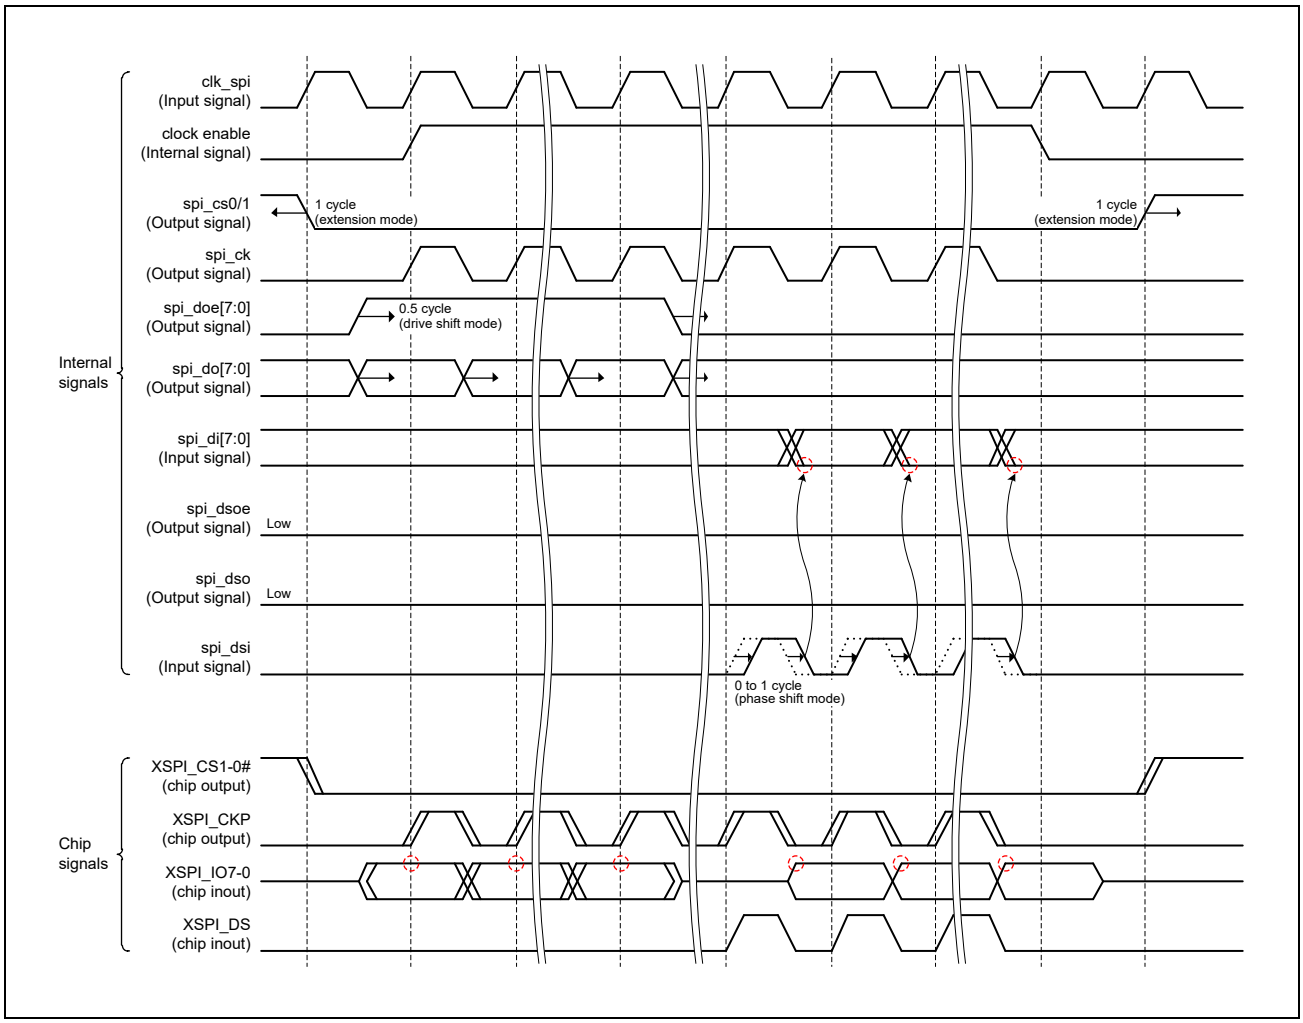

Figure 28.6 Timing Control for SDR with DS

The figure below shows the default operation and timing control for DDR with DS.

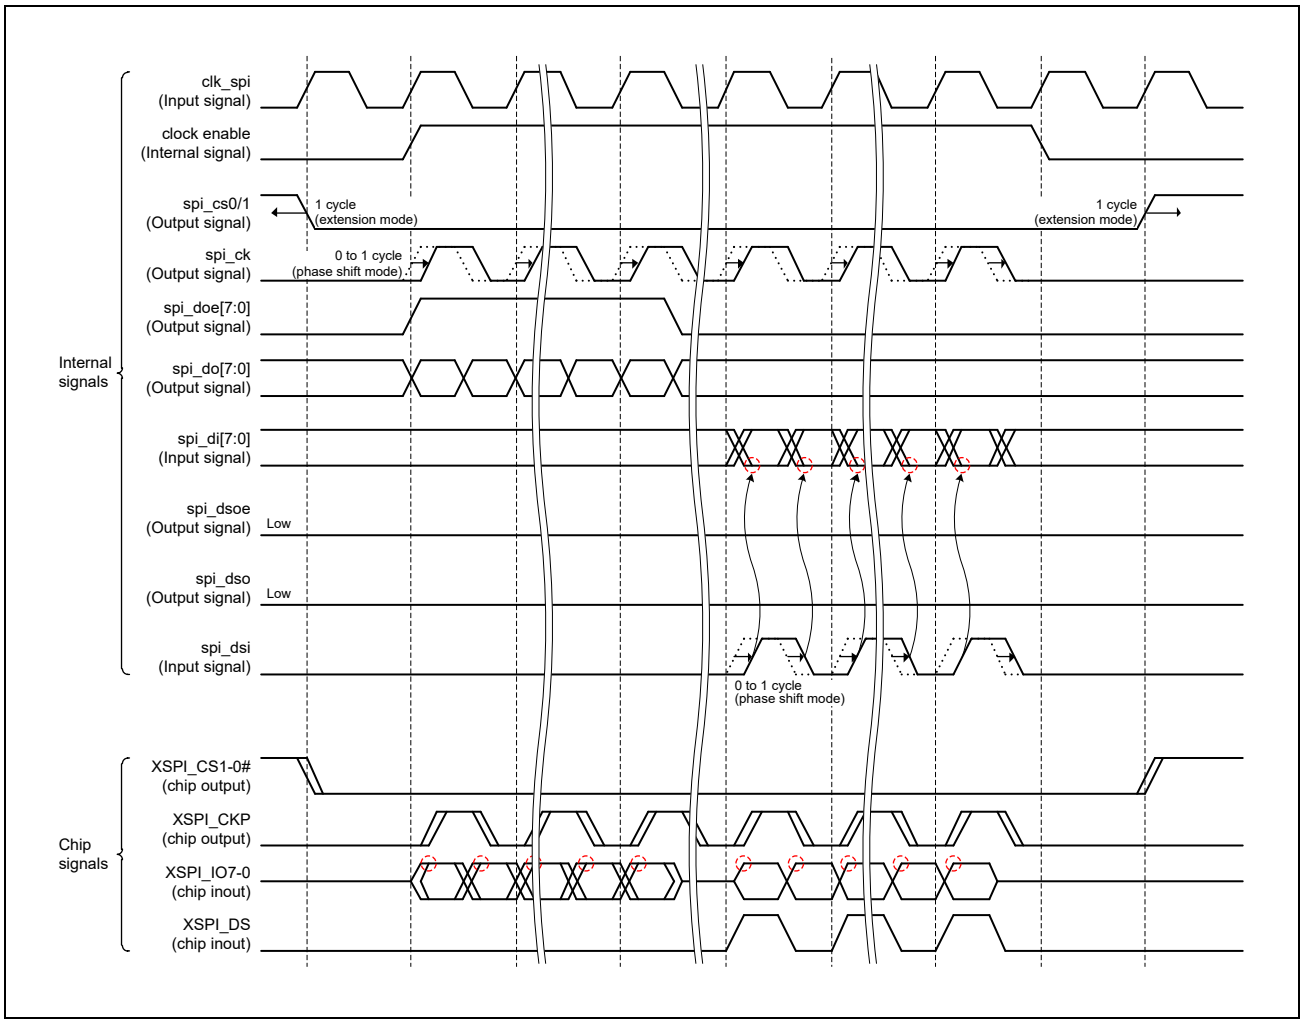

Figure 28.7 Timing Control for DDR with DS

28.4.2 Manual-command

This section describes the manual-command mode. The manual-command has two functional modes: direct mode and periodic mode.

28.4.2.1 Direct Mode

This mode sequentially can issue up to four xSPI transactions configured and requested by Software. A series of transaction can be issued by a transaction request (CDCTL0.TRREQ = 1 with PERMD = 0). The number of transactions (CDCTL0.TRNUM[1:0]) can be configured up to 4. It can be used to change the mode or read the status of xSPI slave device.

The table below shows the configured register bits for direct manual-command. The operating flow is illustrated in **Figure 28.20**.

Table 28.8 Manual-Command Configuration for Direct Mode

Transaction	Transaction Type	Command	Command Size	Address	Address Size	Data (x = 0, 1)	Data Size	Latency Cycle
1st Transaction	CDTBUF0.TRTYPE	CDTBUF0.CMD[15:0]	CDTBUF0.CMDSIZE[1:0]	CDABUF0.ADD[31:0]	CDTBUF0.ADDSIZE[2:0]	CDDxBUF0.DATA[31:0]	CDTBUF0.DATASIZE[3:0]	CDTBUF0.LATE[4:0]
2nd Transaction	CDTBUF1.TRTYPE	CDTBUF1.CMD[15:0]	CDTBUF1.CMDSIZE[1:0]	CDABUF1.ADD[31:0]	CDTBUF1.ADDSIZE[2:0]	CDDxBUF1.DATA[31:0]	CDTBUF1.DATASIZE[3:0]	CDTBUF1.LATE[4:0]
3rd Transaction	CDTBUF2.TRTYPE	CDTBUF2.CMD[15:0]	CDTBUF2.CMDSIZE[1:0]	CDABUF2.ADD[31:0]	CDTBUF2.ADDSIZE[2:0]	CDDxBUF2.DATA[31:0]	CDTBUF2.DATASIZE[3:0]	CDTBUF2.LATE[4:0]
4th Transaction	CDTBUF3.TRTYPE	CDTBUF3.CMD[15:0]	CDTBUF3.CMDSIZE[1:0]	CDABUF3.ADD[31:0]	CDTBUF3.ADDSIZE[2:0]	CDDxBUF3.DATA[31:0]	CDTBUF3.DATASIZE[3:0]	CDTBUF3.LATE[4:0]

28.4.2.2 Periodic Mode

This mode periodically issues an xSPI read transaction configured and requested by Software. And it can compare the read value up to 4 bytes with expected value. The transaction is issued by a transaction request (CDCTL0.TRREQ = 1 with PERMD = 1). It can be used to alternate the status polling operation of xSPI slave device.

The periodic term is configured in Periodic transaction interval bits (CDCTL0.PERITV[4:0]). The expected value is configured in Periodic transaction expected and masked value bits (CDCTL1.PEREXP[31:0] and CDCTL2.PERMSK[31:0]). The table below shows the configured register bits for periodic manual-command. The operating flow is illustrated in **Figure 28.21**.

Table 28.9 Manual-Command Configuration for Periodic Mode

Transaction	Transaction Type	Command	Command Size	Address	Address Size	Data (x = 0, 1)	Data Size	Latency Cycle
Read Transaction	CDTBUF0.TRTYPE = 0	CDTBUF0.CMD[15:0]	CDTBUF0.CMDSIZE[1:0]	CDABUF0.ADD[31:0]	CDTBUF0.ADDSIZE[2:0]	CDDxBUF0.DATA[31:0]	CDTBUF0.DATASIZE[3:0]	CDTBUF0.LATE[4:0]

28.4.3 Memory-mapping

This section describes the memory-mapping mode. This mode automatically converts system bus access for pre-configured memory area into xSPI transaction.

28.4.3.1 Configuration

In this operation, the payload of address and data field are delivered from system bus signals. The information of command field and size are delivered from the configured register bits. The table below shows the register bits configured for memory- mapping.

Table 28.10 Memory-Mapping Configuration for Memory Area Access (n = 0, 1)

AHB Transaction	Format Change Mode	Command	Command Size	Address Size	Latency Cycle
Write for slave n memory area	Normal	CMCFG2CSn.WRCMD [15:8]	1 byte	CMCFG0CSn.ADDSIZE[1:0]	CMCFG2CSn.WRLATE[4:0]
	8D-8D-8D profile 1.0	CMCFG2CSn.WRCMD [15:0]	2 bytes		
	8D-8D-8D profile 2.0 Command Modifier	CMCFG2CSn.WRCMD [15:8]	1 byte	5 bytes	
	8D-8D-8D profile 2.0 Extended Command Modifier	CMCFG2CSn.WRCMD [15:13]	3 bits	45 bits	
Read for slave n memory area	Normal	CMCFG1CSn.RDCMD [15:8]	1 byte	CMCFG0CSn.ADDSIZE[1:0]	CMCFG1CSn.RDLATE[4:0]
	8D-8D-8D profile 1.0	CMCFG1CSn.RDCMD [15:0]	2 bytes		
	8D-8D-8D profile 2.0 Command Modifier	CMCFG1CSn.RDCMD [15:8]	1 byte	5 bytes	
	8D-8D-8D profile 2.0 Extended Command Modifier	CMCFG1CSn.RDCMD [15:13]	3 bits	45 bits	

Note: The MSByte of Address can be replaced with Address Replace Enable and Code bits (CMCFG0CSn.ADDRPEN[7:0]/ADDRPCD[7:0]).

28.4.3.2 Write Access Operation

At accepting write access for memory area from system bus, this xSPI Master stores all payload data in internal bridge buffer and then issues a write transaction into xSPI slave. The figure below shows the operation summary.

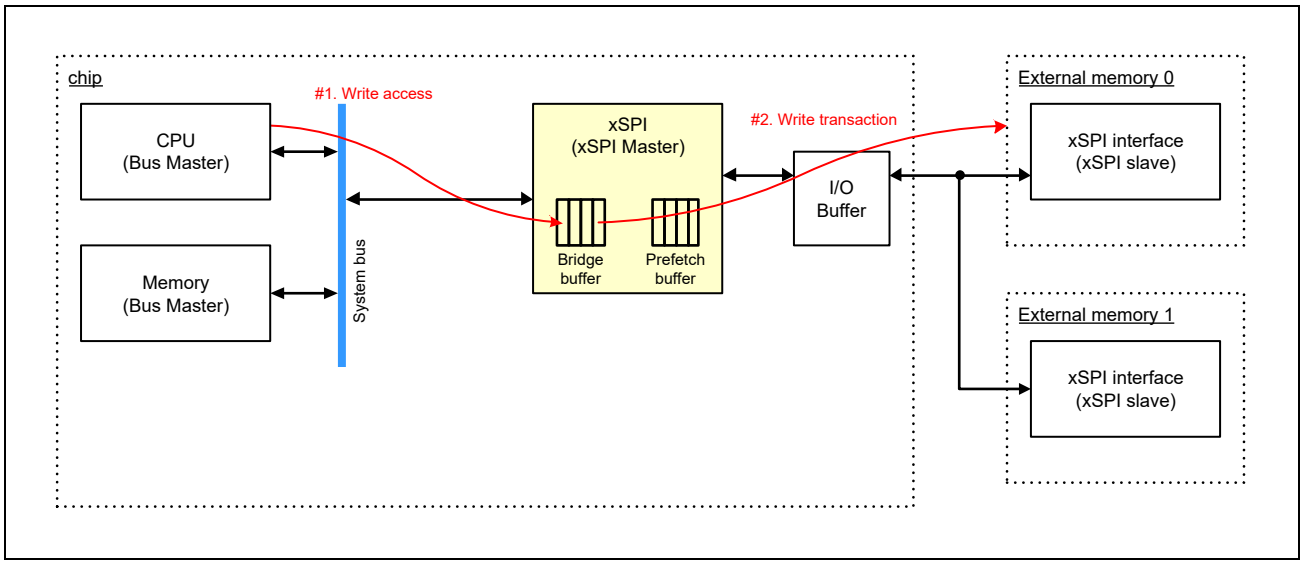

Figure 28.8 Write Access for Memory Area

The operation of xSPI bus changes depending on System bus's burst type. When HBURST is SINGLE or INCR, one AHB transaction occurs for one xSPI frame. When HBURST is INCR4, INCR8, or INCR16, AHB transactions equal to burst size occur for one xSPI frame. When HBURST is WRAP4, WRAP8, or WRAP16, AHB transactions occur for two xSPI frames. The figure below shows the relationship between AHB and xSPI frames.

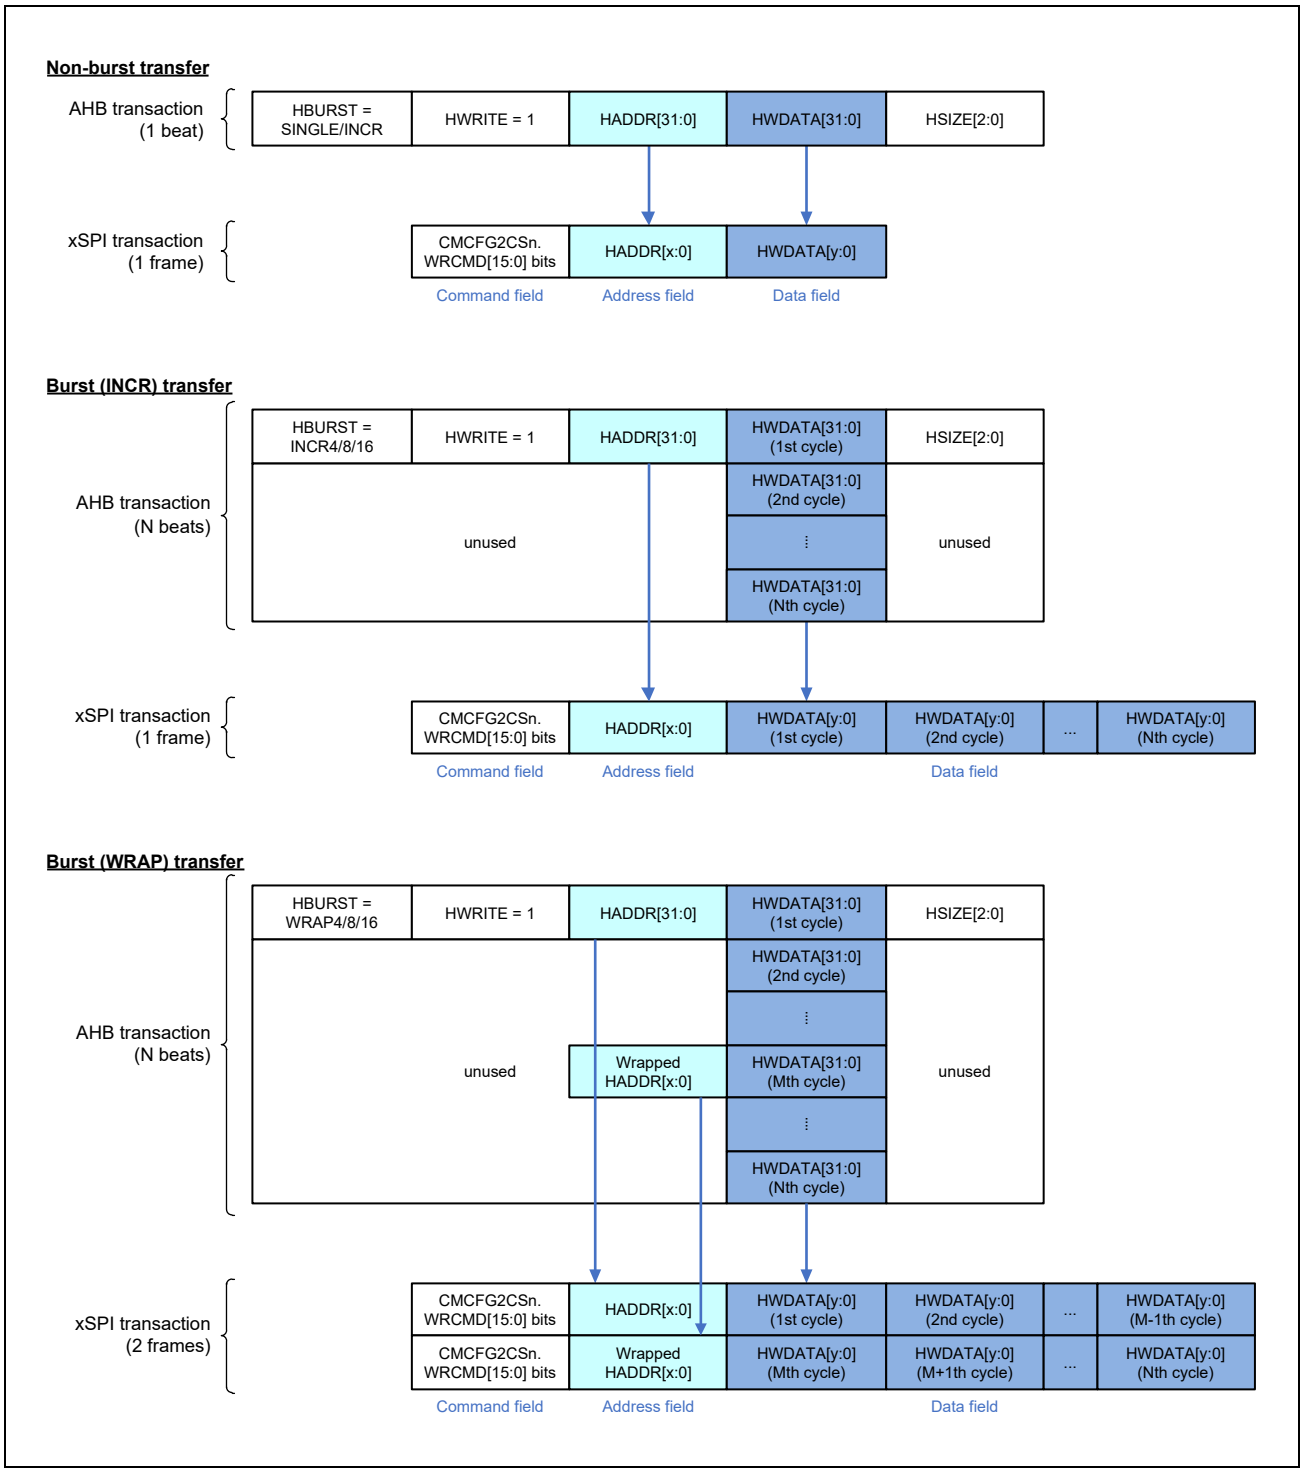

Figure 28.9 xSPI Frame Format in Write Access (Normal Format)

28.4.3.3 Combination Function

At the system bus write access for memory area, this xSPI master has the function to combinate the write data for high throughput on xSPI bus. When this function is enabled (BMCFG.MWRCOMB = 1), this xSPI master transmits a xSPI frame with the selected size while the sequential address is incremental. When non-incremental address access is detected, or when the access for different slave is detected, or when a read transaction is detected, even though reaching to the target size (BMCFG.MWRSIZE), this xSPI master transmits the pending data into xSPI bus. And also, when Memory Write Data Push bit (BMCTL1.MWRPUSH) is set, this xSPI master transmits the pending data into xSPI bus.

This function could be useful for any slave device to request a chunk of data at a time. In the case, system bus master shall continue to provide the fixed data size with incremental address. Ex. there is any device to request to write in page unit. The figure below shows the operation when enable the combination function.

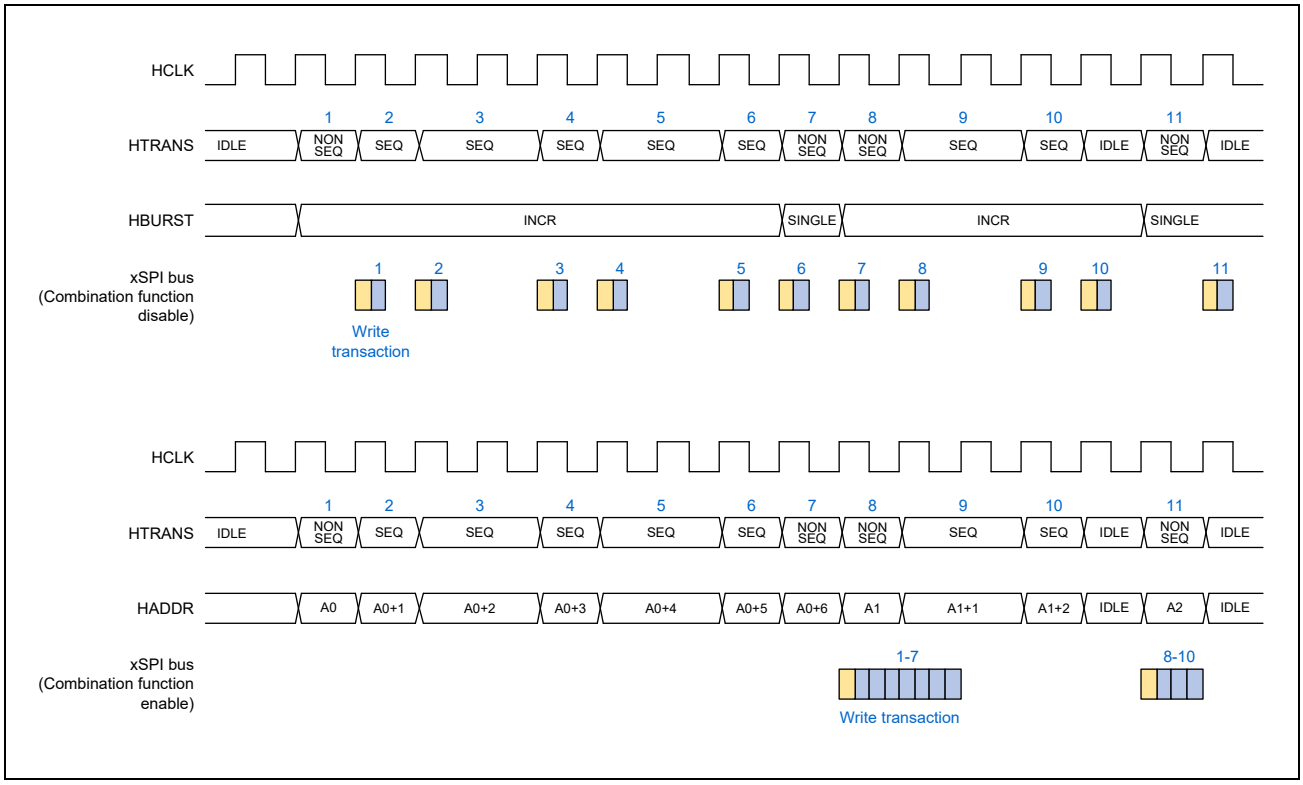

Figure 28.10 Combination Function

28.4.3.4 Read Access Operation

At the read access for memory area, soon after detected the read access, This xSPI Master issues a read transaction into xSPI slave. The figure below shows the operation summary.

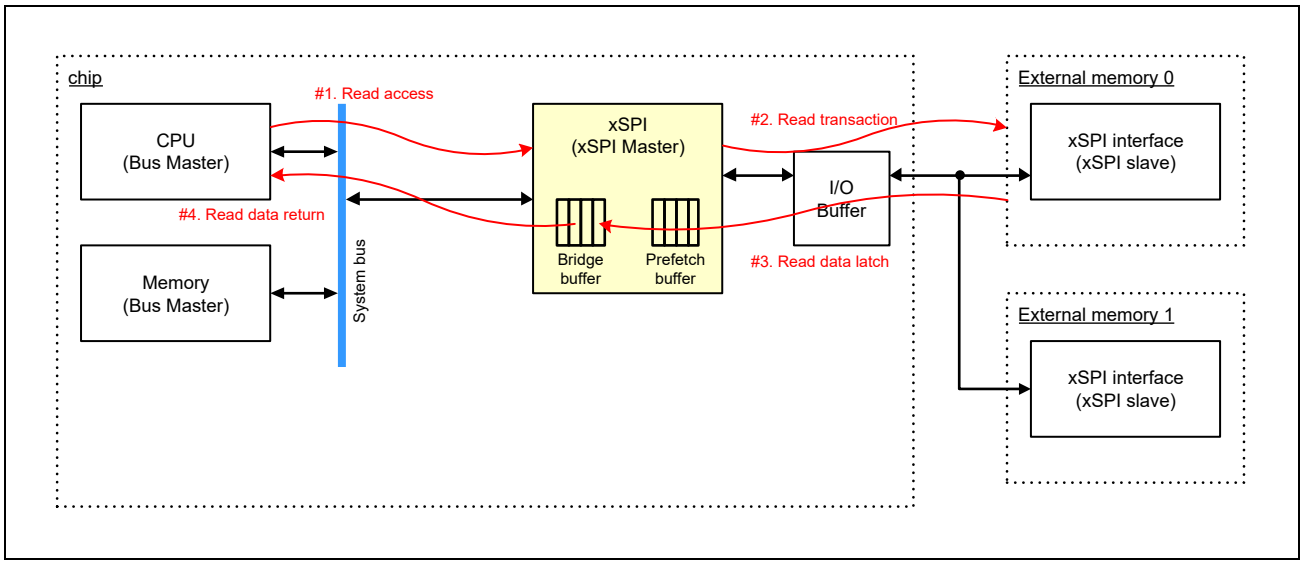

Figure 28.11 Read Access for Memory Area

The operation of xSPI bus changes depending on burst type. When the type is single or increment type, one system bus's read transaction triggers one xSPI frame. When the type is wrap type and the CMCFG0CSx.WPBSTMD is 0, one system bus read transactions triggers two xSPI frame. The figure below shows the relationship between AHB and xSPI frame.

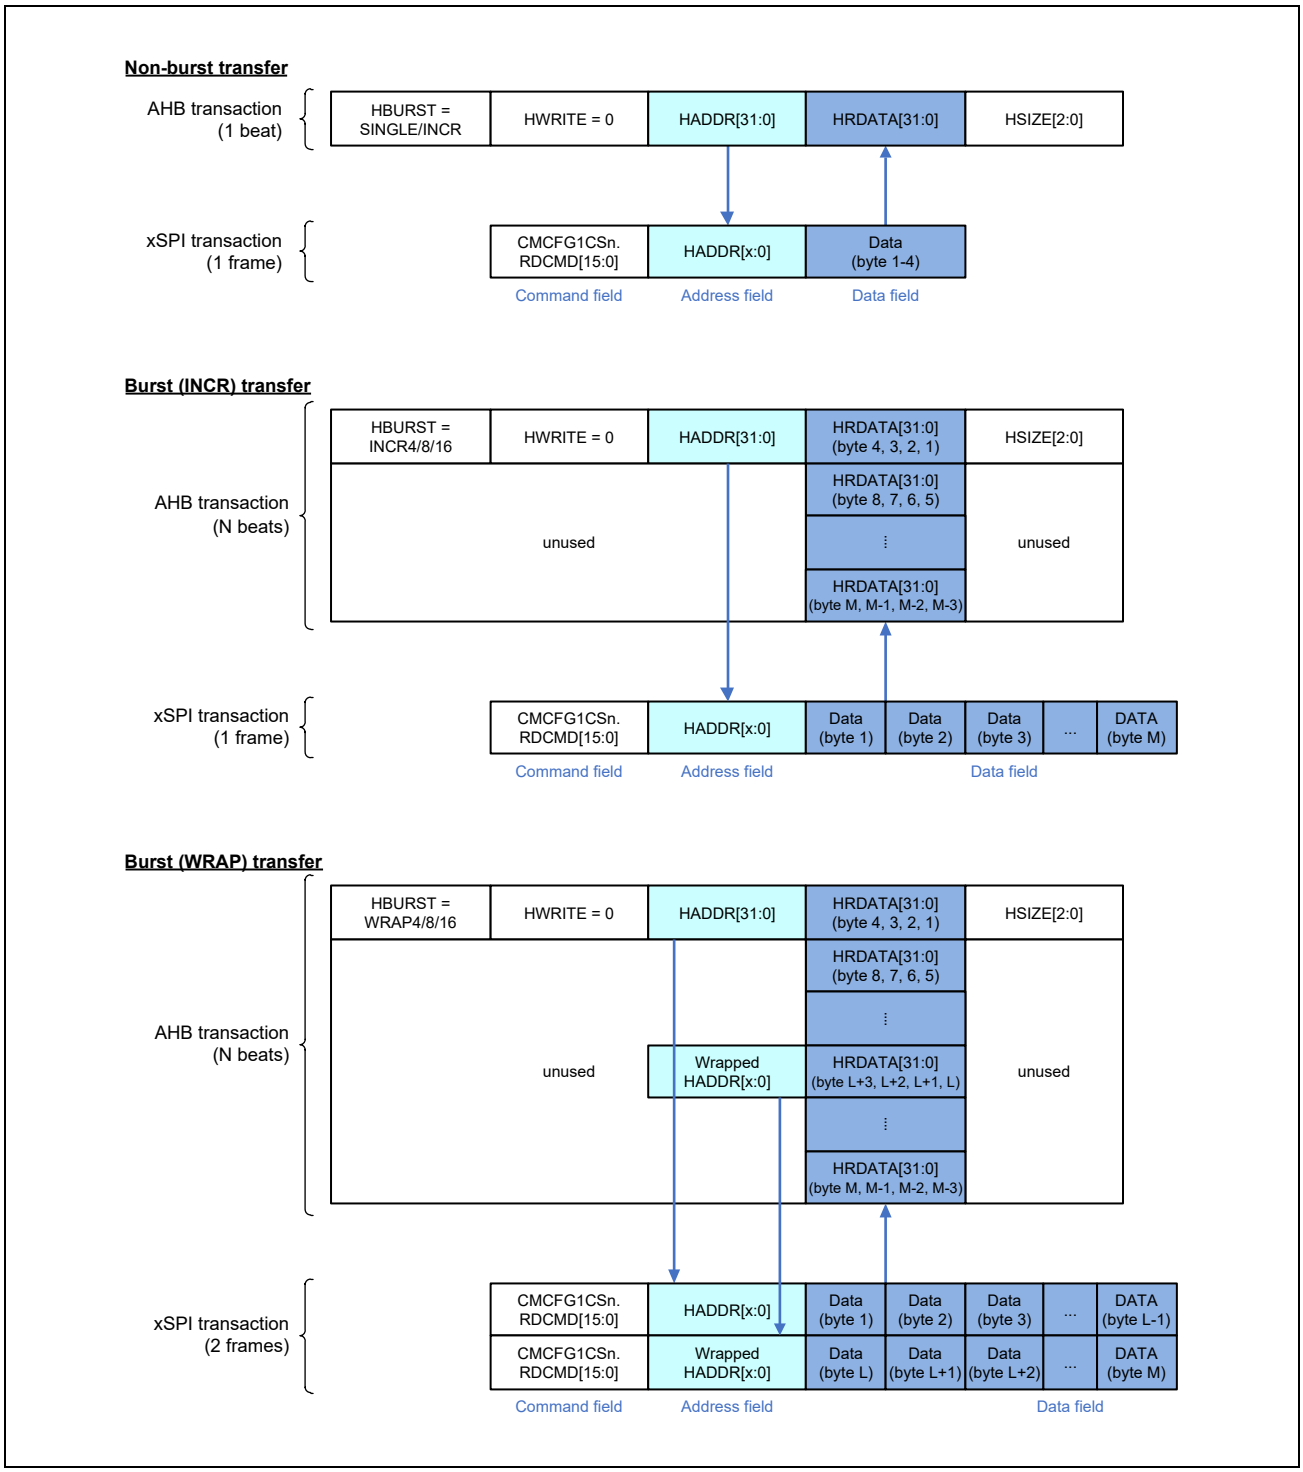

Figure 28.12 xSPI Frame Format in Read Access (Normal Format)

28.4.3.5 Prefetch Function

At the read access for memory area from system bus, this xSPI Master has the function to prefetch the read data for reducing the latency. When this function is enabled (BMCFG.PREEN = 1), this xSPI Master continues to read the incremental address and store the read data from xSPI slave in internal prefetch buffer. And this xSPI master searches in prefetch buffer for the following read access from system bus. If the target read data is found in prefetch buffer, this xSPI Master returns the data from prefetch buffer. If it is not found, this xSPI Master clears the prefetch buffer and newly issues a read transaction into xSPI slave. This function is effective in application such as the consecutive read addresses are close. But it is not effective in application such as the consecutive read addresses are not incremental because xSPI read frame for prefetch uses xSPI bus. The figure below shows the operation summary.

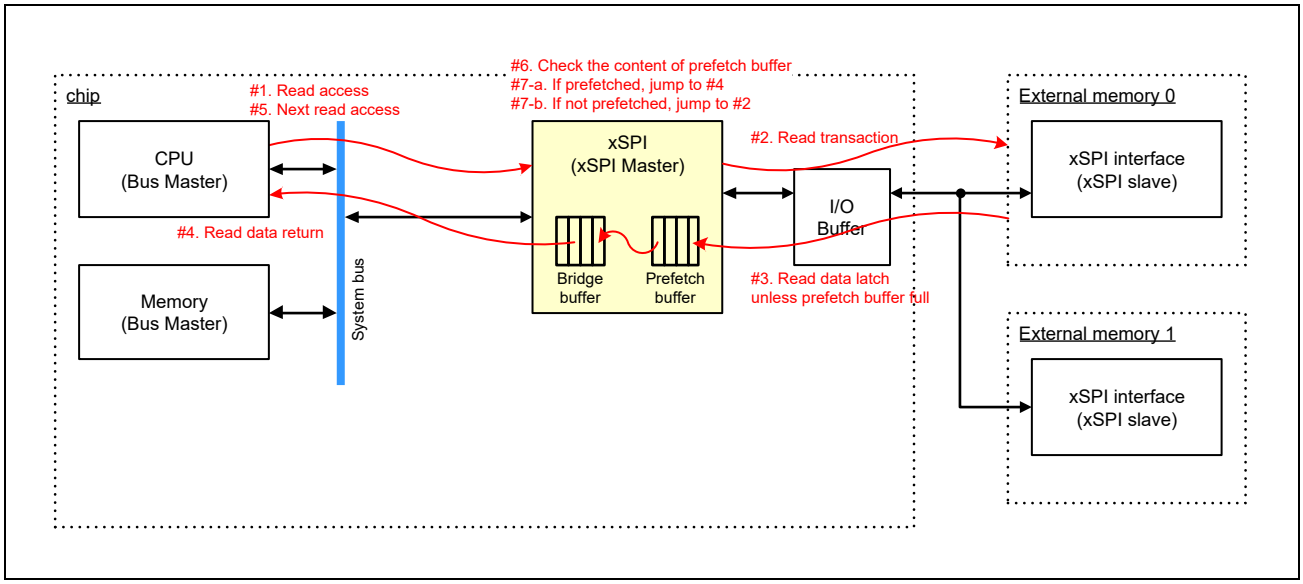

Figure 28.13 Read Access for Memory Area with Prefetch Enabled

NOTE

When this prefetch function is enabled, Bus Master could read from not a slave device but the internal prefetch buffer. When accessed to the same address from multiple Bus Masters, this xSPI Master does not guarantee to read the latest data. If Bus Master intend to read the latest data from a slave device, the Master shall clear the prefetch buffer (BMCTL1.PBUFCLR) before issuing read.

28.4.3.6 XiP Mode

Some slave devices have a mode (XiP mode) in which the command phase is not required for lower latency. While in this mode, the xSPI master skips sending the command and the slave device implicitly performs the command that was executed in the previous transaction. When enabled XiP mode bit (CMCTL.XIPEN = 1), this xSPI master inserts XiP enter code (CMCTL.XIPENCODE[7:0]) in latency field. When disabled XiP mode bit (CMCTL.XIPEN = 0), this xSPI master inserts XiP exit code (CMCTL.XIPEXCODE[7:0]) in latency field. This function is available only for memory-mapping mode.

And when this xSPI master transmits XiP disable pattern, this master clears XiP mode bit and disables XiP mode configured for both channels. Note that it is not possible to disable XiP mode for only one channel by transmitting XiP disable pattern.

NOTE

- When enough latency cycle does not exist for XiP code, this xSPI Master could not insert XiP code.
- XiP mode could be used only for unidirectional access to a slave. The write transaction and read transaction shall be separated.

28.4.4 Pattern Control

This xSPI Master has the function to transmit 3 type of patterns which is not xSPI frame format. The pattern is triggered by setting trigger bit (LPCTL0-1.PATREQ).

28.4.4.1 XiP Disable Pattern

XiP Disable pattern‘s length and value are configured by LPCTL0.XD1LEN / XD1VAL / XD2LEN / XD2VAL. It uses spi_ck, spi_doe/do signals. The number of output pin could be configured by XiP Disable pattern pin bit (LPCTL0.XDPIN). It may be used to disable XiP mode for legacy SPI. The figure below shows the timing-chart.

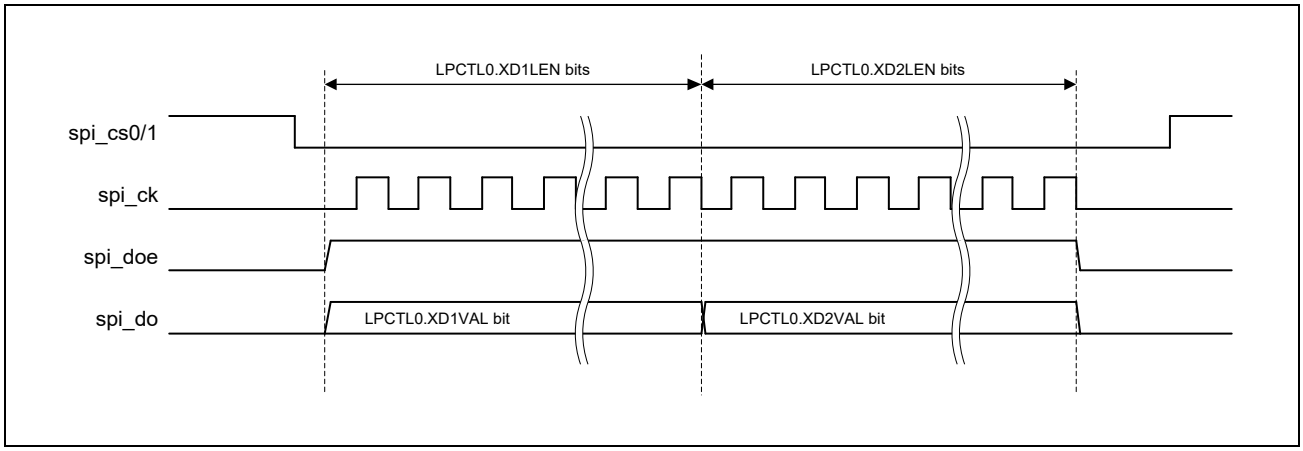

Figure 28.14 XiP Disable Pattern

NOTE

When transmitting XiP Disable pattern, spi_ck shall not be shifted (WRAPCFG.CKSFTCSx = 0).

28.4.4.2 Reset Pattern

Reset pattern is specified in Serial Flash Reset Signaling Protocol. CS Low/High width is configured with Reset Pattern Length bit (LPCTL1.RSTWID). xSPI slave will sample the data input at the rising edge of CS. Setup time for data output is configured with Reset pattern data output setup time bit (LPCTL1.RSTSU). The setup time shall be always less than Reset pattern width. The figure below shows the timing-chart.

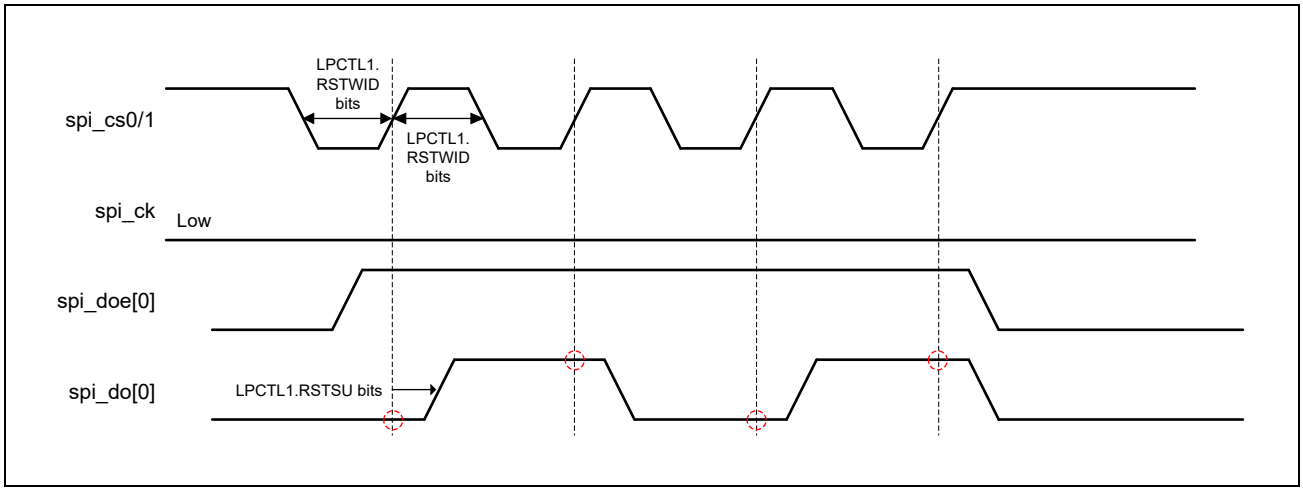

Figure 28.15 Reset Pattern

NOTE

In the protocol specification, CS Low/High width is defined as minimum 500 ns, and Setup time is defined as minimum 6 ns.

28.4.4.3 CS Only Pattern

CS Only pattern activates CS port with the configured length bit (LPCTL1.RSTWID). It may be used to resume from Deep Power Down state. The figure below shows the timing-chart.

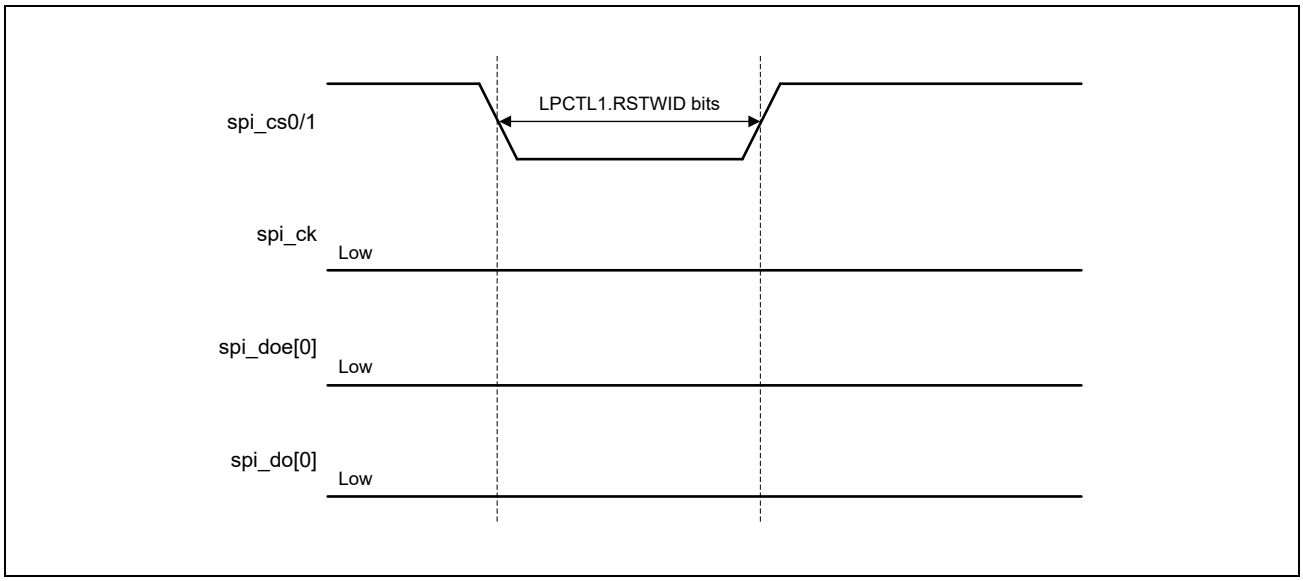

Figure 28.16 CS Only Pattern

28.4.5 Integrity Checking

This xSPI Master can detect some errors. The table below shows the error list and the detail behavior.

When reset of xSPI master is needed due to fatal error, set module reset register (MRCTLA) to reset xSPI master. After confirming it is reset surely, release module reset.

Table 28.11 Error List

Error Type	Event	Flag Bit	Note (Action)
Calibration failed	When the read data did not match the expected value during automatic calibration	INTS.CAFAILCS0-1	It results in writing unexpected data to xSPI slave.
System bus error	When an error response occurred on system bus slave interface for memory-mapping	INTS.BUSERR	This is a fatal error. This xSPI master shall be initialized. When detected this error in system bus write transaction, the internal bridge buffer is cleared. It means the pending write data is lost.
DS timeout	When DS does not toggle in read transaction with using DS	INTS.DSTOCS0-1	Both xSPI master and xSPI slave should be reset for fatal error.
Periodic transaction timeout	When the read value does not match with the expected value in periodic manual-command mode	INTS.PERTO	Depending on the status of function

28.4.6 Interrupts

This xSPI Master has an interrupt port.

It can monitor with Interrupt Status Register (INTS). In case of initialization phase, it can be programmable with Interrupt Enable register (INTE). The table below shows the related register bit.

Table 28.12 xSPI Interrupt Sources

Name	Interrupt Sources
XSPI_INT (int_spi_level)	Interrupt
XSPI_INTERR (int_spi_err_level)	Error interrupt

Table 28.13 Interrupt Register Bit

Flag Bit (INTS)	Enable Bit (INTE)	Clear Bit (INTC)	Interrupt Sources
CASUCCS1	CASUCCS1E	CASUCCS1C	XSPI_INT
CASUCCS0	CASUCCS0E	CASUCCS0C	
CAFAILCS1	CAFAILCS1E	CAFAILCS1C	XSPI_INTERR
CAFAILCS0	CAFAILCS0E	CAFAILCS0C	
BUSERR	BUSERRE	BUSERRC	XSPI_INTERR
DSTOCS1	DSTOCS1E	DSTOCS1C	XSPI_INTERR
DSTOCS0	DSTOCS0E	DSTOCS0C	
PERTO	PERTOE	PERTOC	XSPI_INTERR
INICMP	INICMPE	INICMPC	XSPI_INT
PATCMP	PATCMPE	PATCMPC	XSPI_INT
CMDCMP	CMDCMPE	CMDCMPC	XSPI_INT

28.4.7 Flows of Operations

28.4.7.1 Flow of Configuration

The figure below shows flow of configuration.

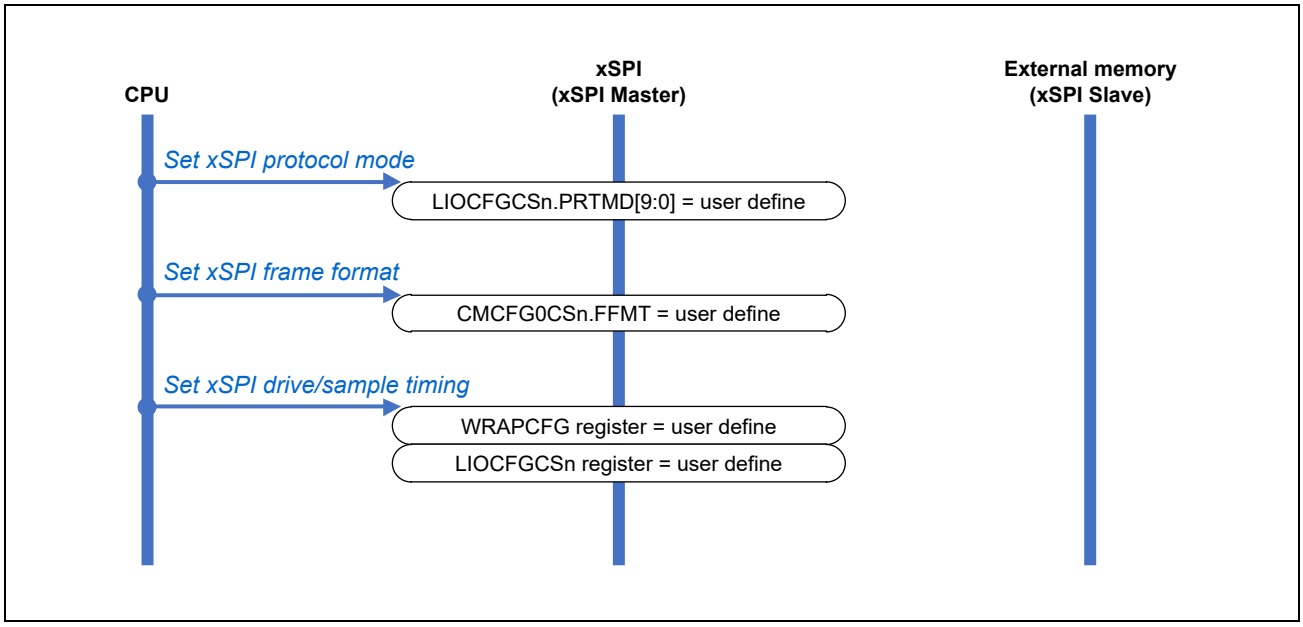

Figure 28.17 Flow of Configuration

28.4.7.2 Flow of Communication Stop

The figure below shows flow of communication stop.

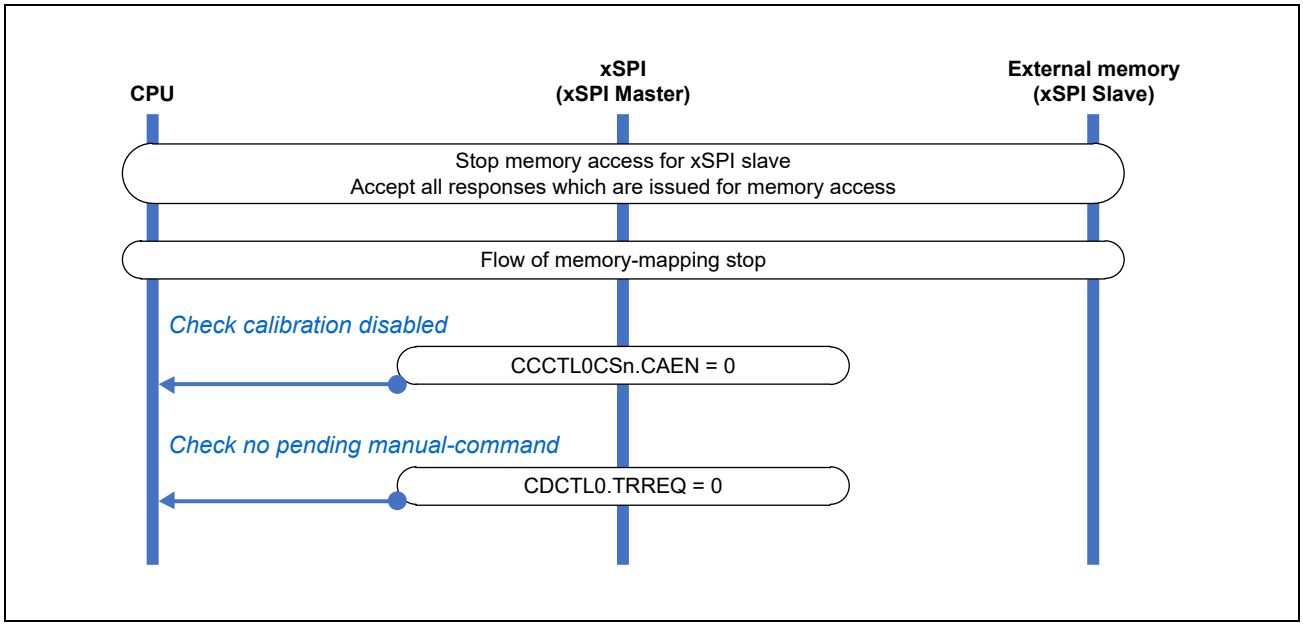

Figure 28.18 Flow of Communication Stop

NOTE

In case of re-config of any configuration register, all communication with xSPI slave shall be stopped completely. It means that the automatic calibration is disabled, and there is no pending manual-command and memory-mapping access.

28.4.7.3 Flow of Automatic Calibration

The figure below shows flow of automatic calibration.

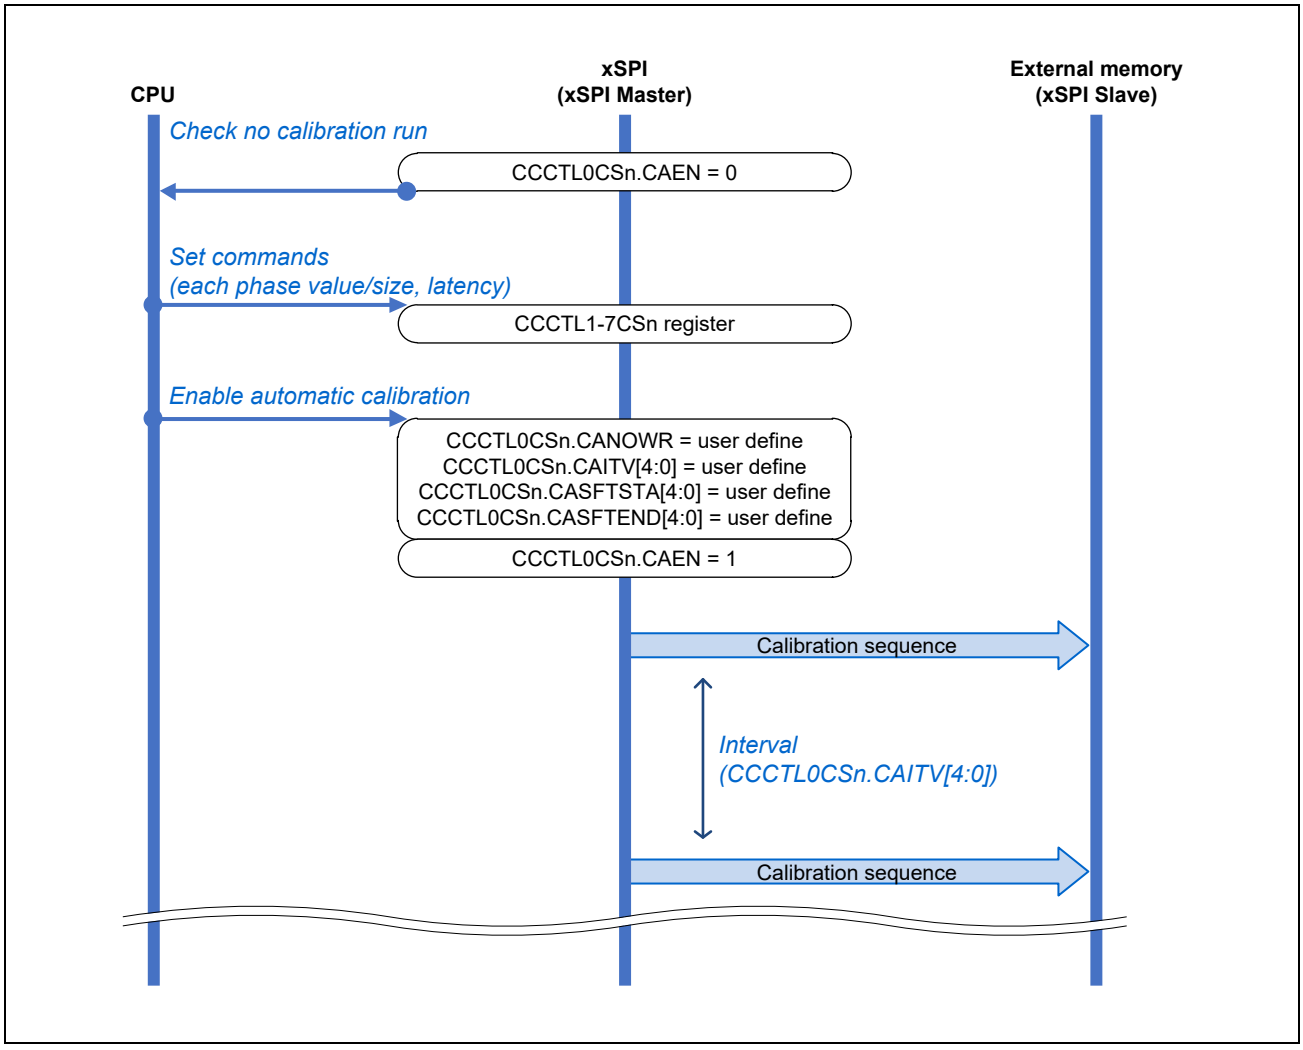

Figure 28.19 Flow of Automatic Calibration

28.4.7.4 Flow of Manual-command Procedure

The figure below shows manual-command procedure for direct mode.

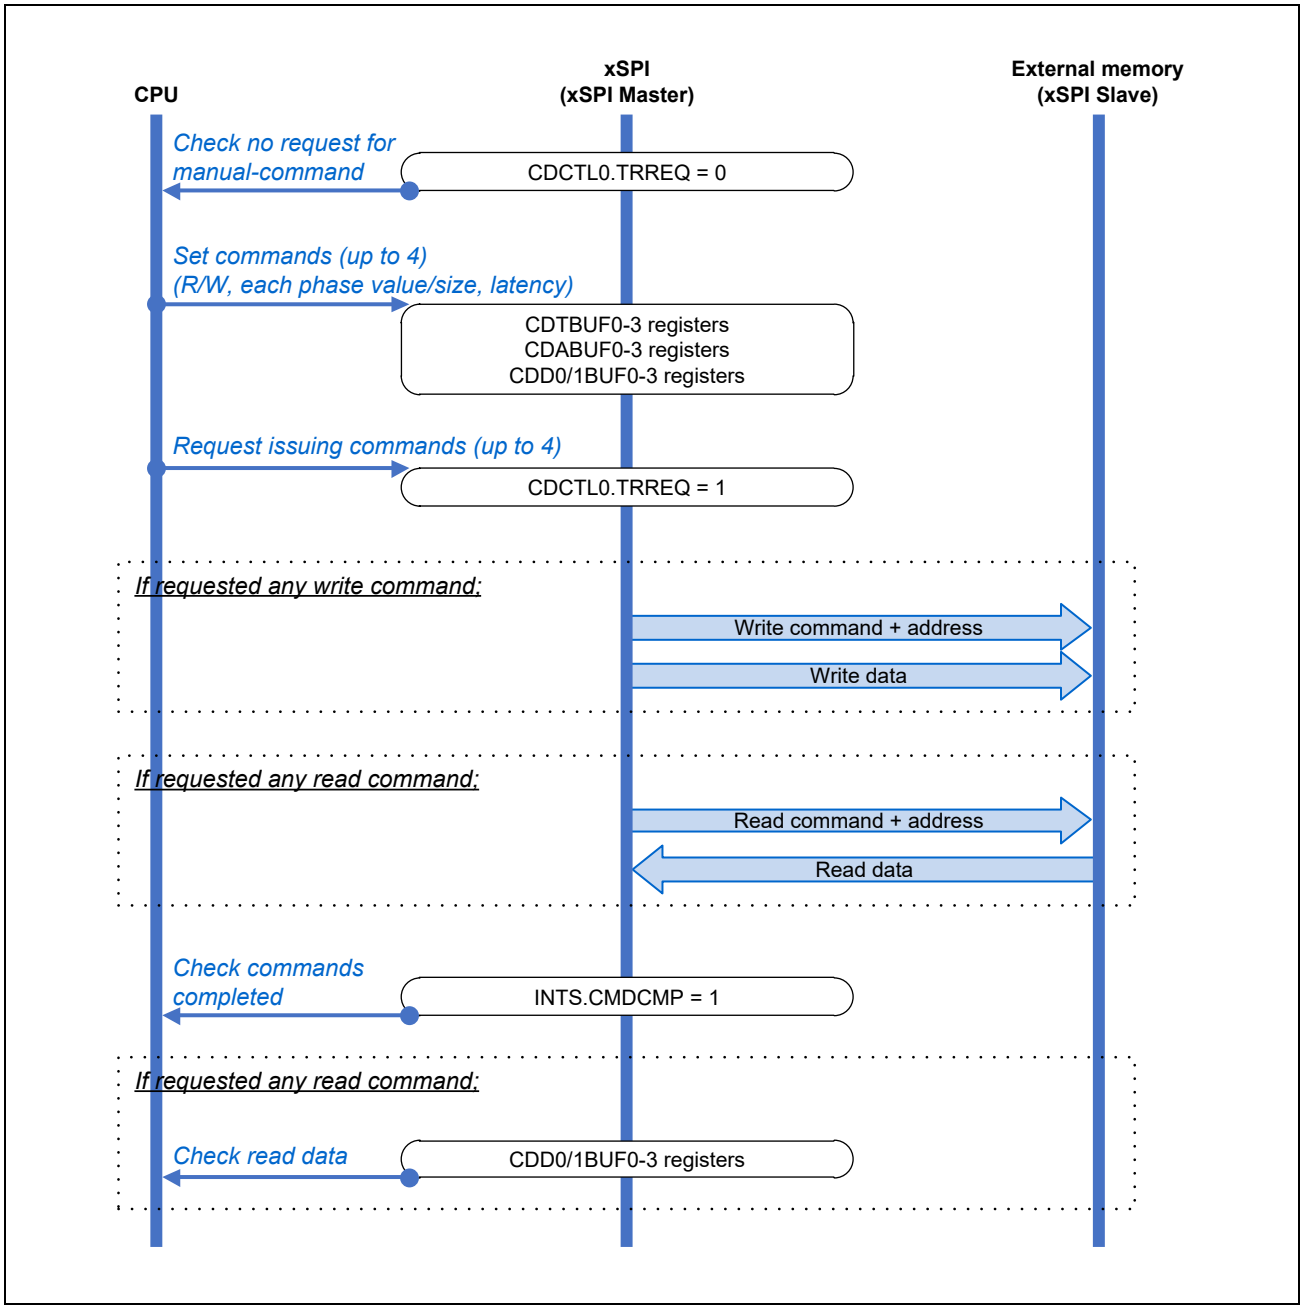

Figure 28.20 Flow of Manual-Command Procedure for Direct Mode

The figure below shows manual-command procedure for periodic mode.

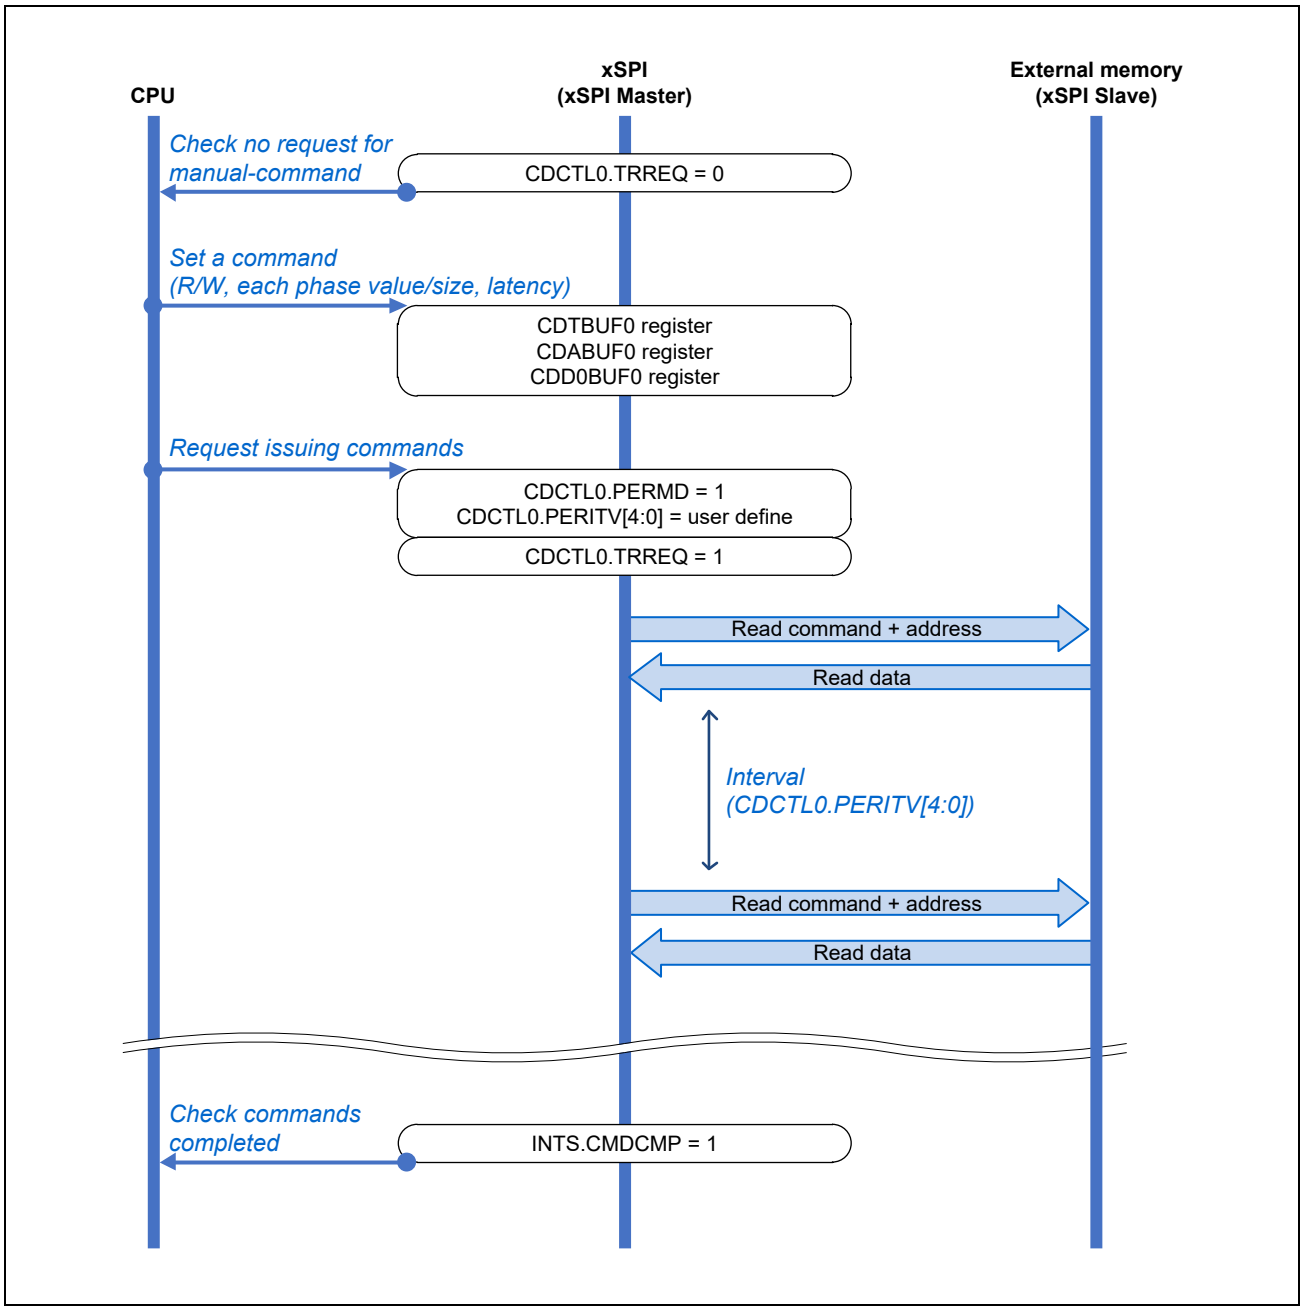

Figure 28.21 Flow of Manual-Command Procedure for Periodic Mode

28.4.7.5 Flow of Memory-Mapping

The figure below shows flow of memory-mapping.

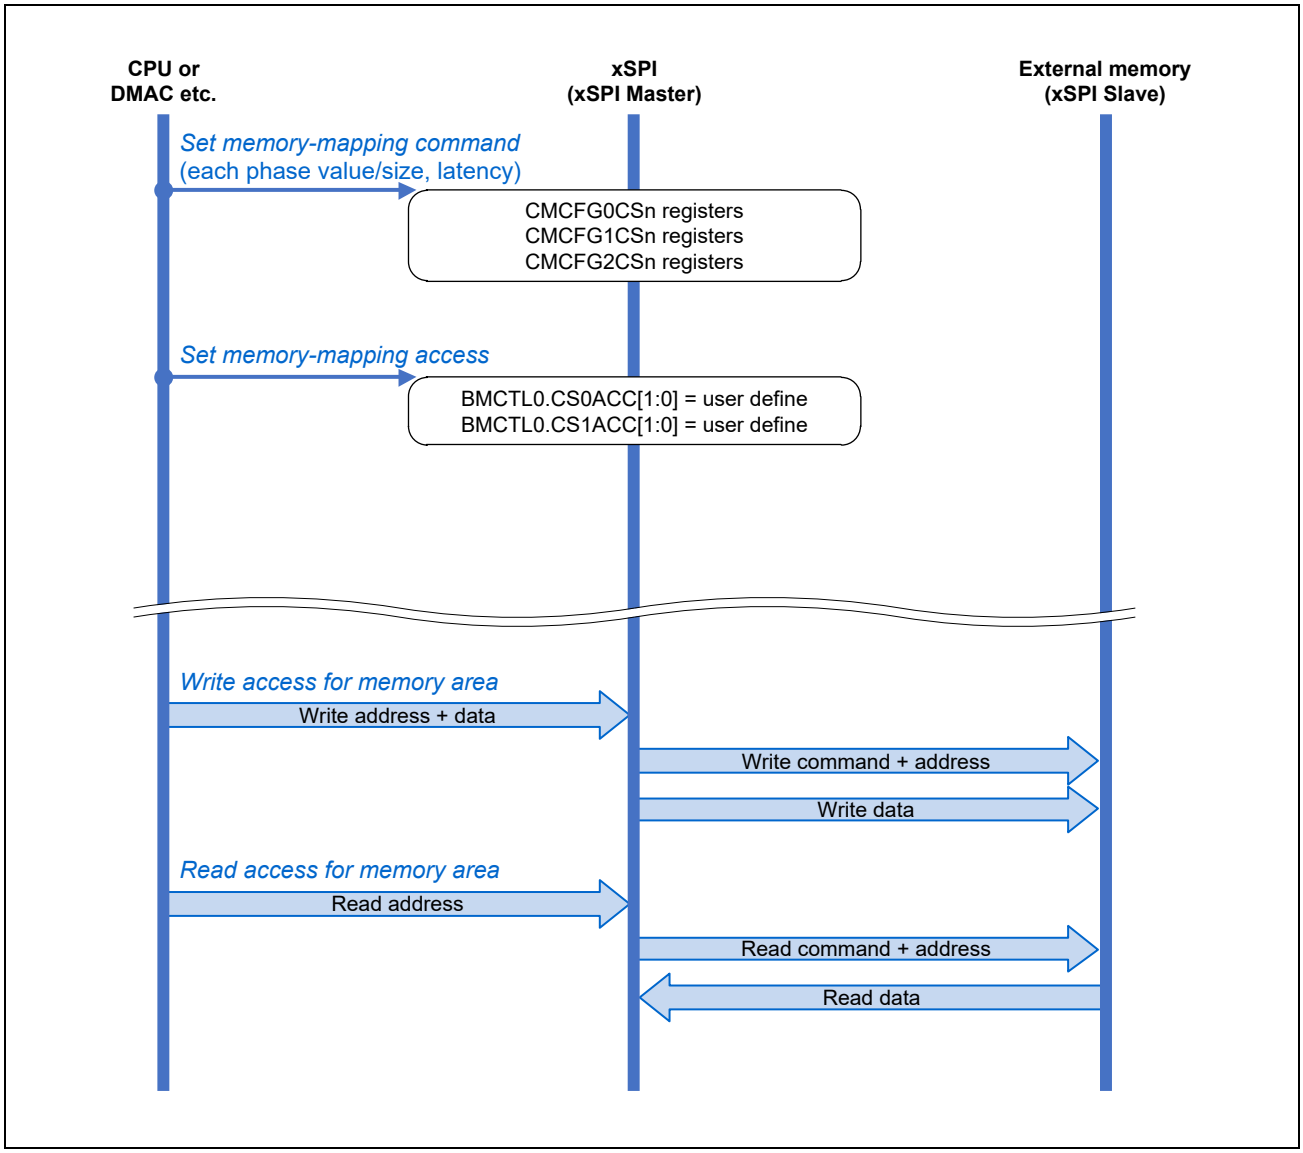

Figure 28.22 Flow of Memory-Mapping

28.4.7.6 Flow of Memory-mapping Stop

The figure below shows flow of memory-mapping stop.

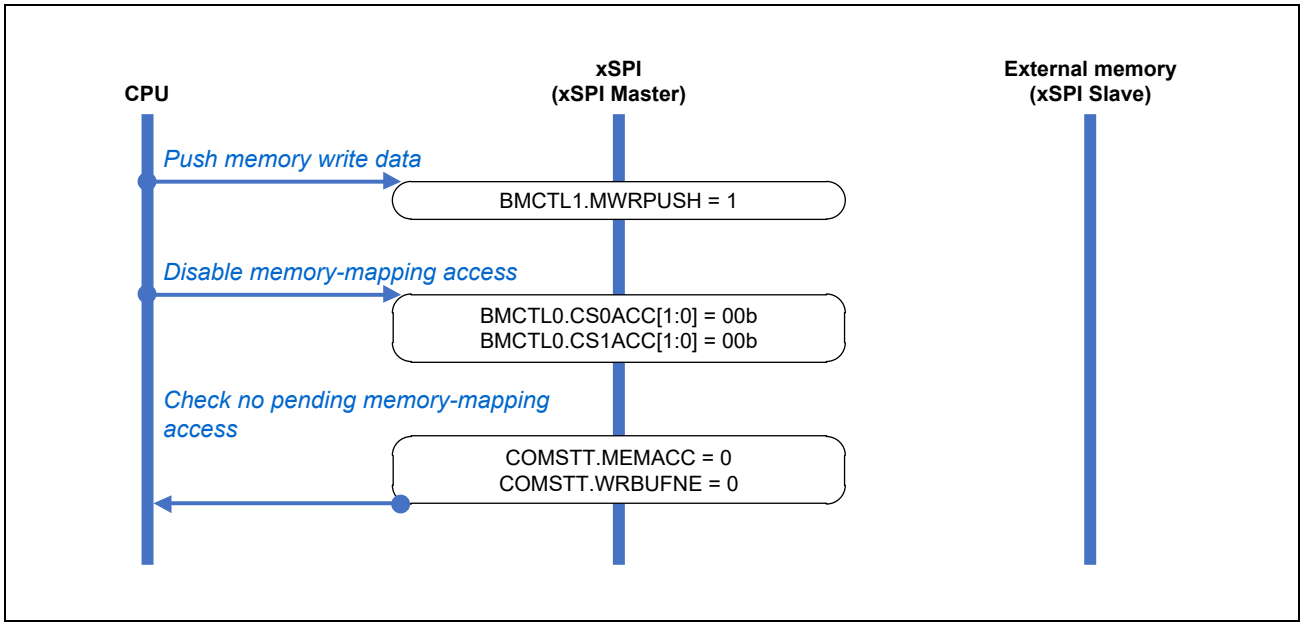

Figure 28.23 Flow of Memory-Mapping Stop

28.4.7.7 Flow of Pattern Request

The figure below shows flow of pattern request. Before requesting any pattern, any ongoing commands should be completed or canceled.

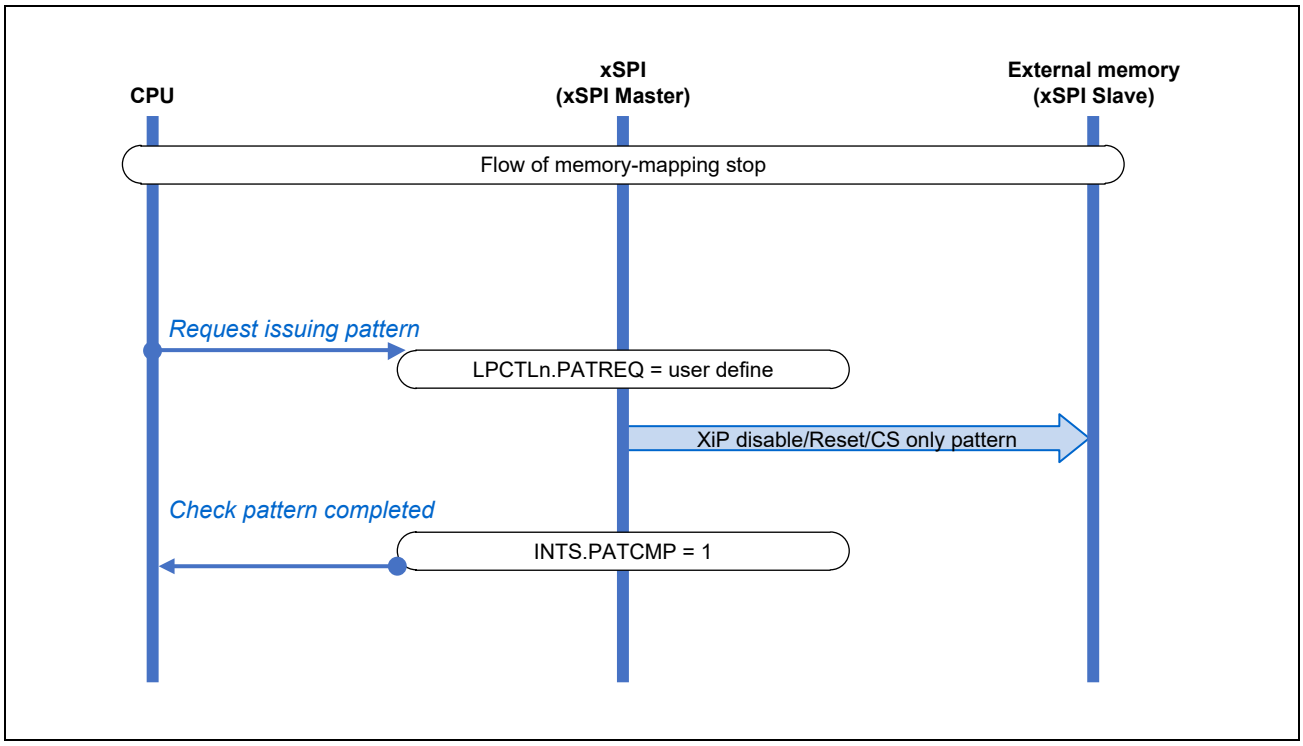

Figure 28.24 Flow of Pattern Request

28.4.7.8 Flow of XiP Mode

The figure below shows flow of XiP mode enable/disable.

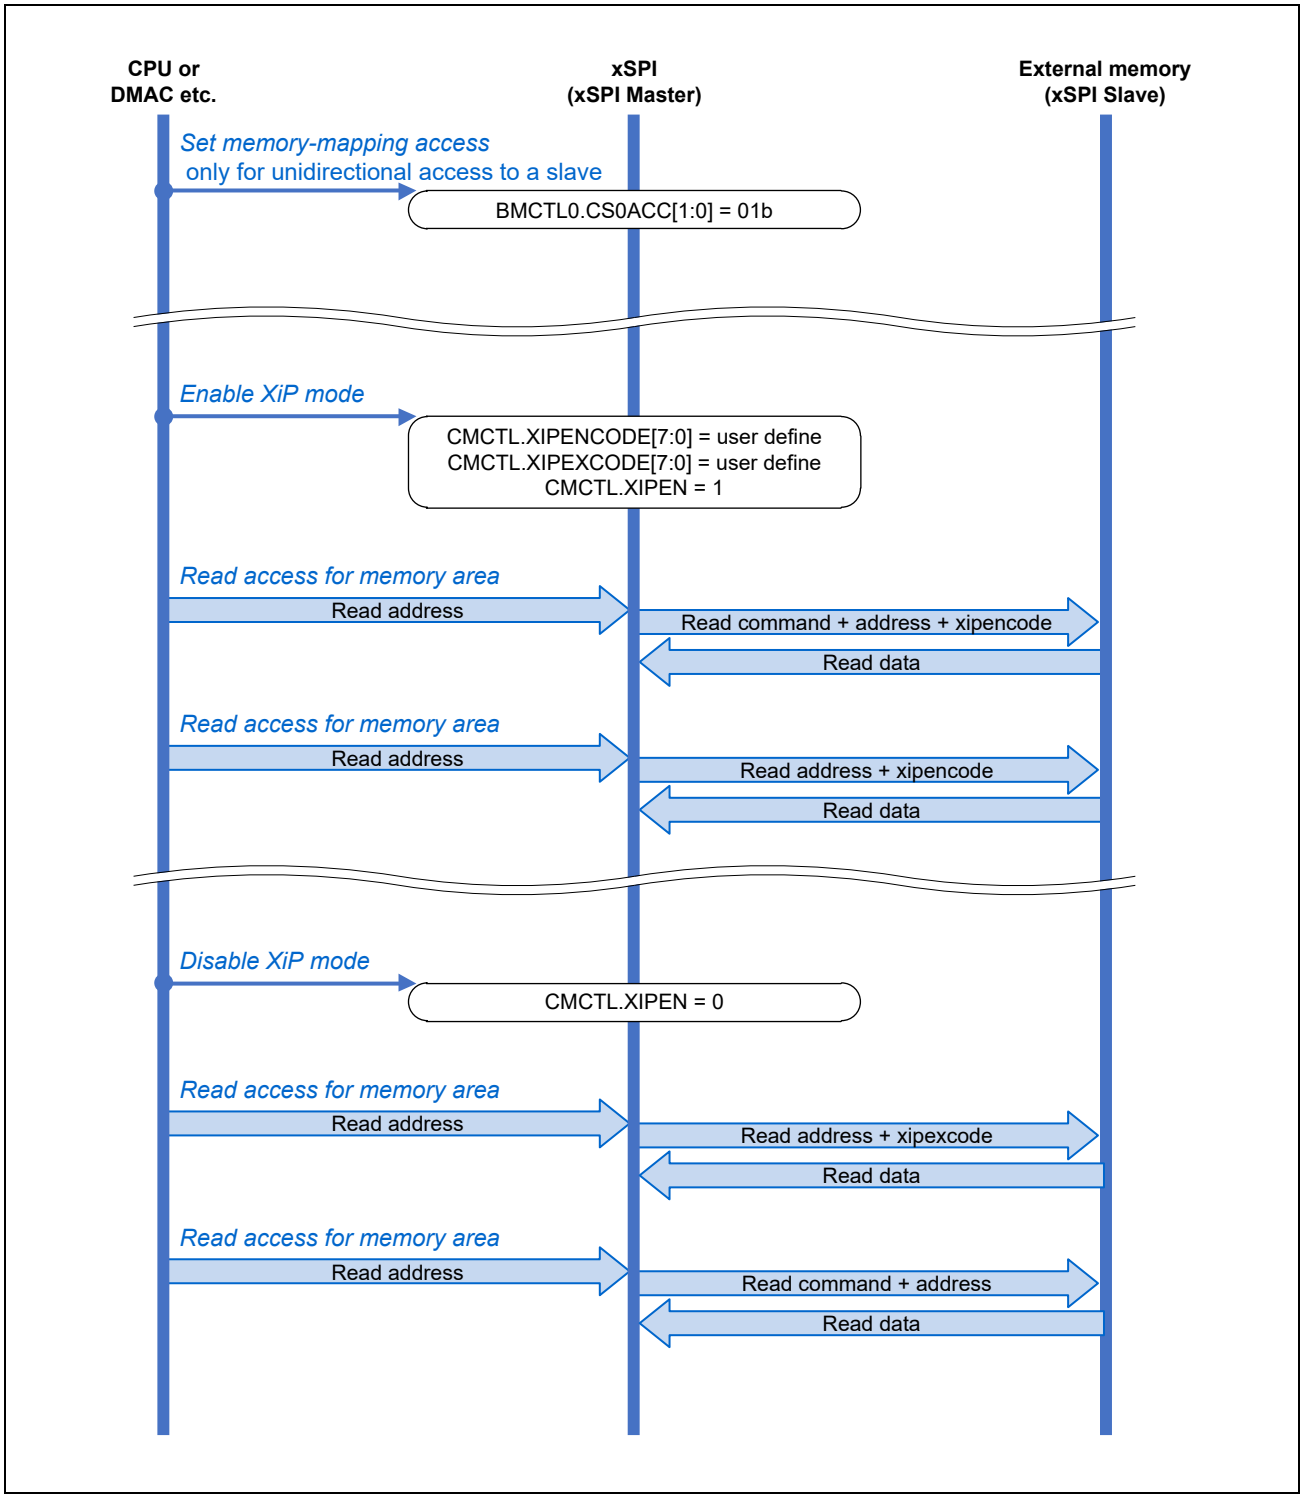

Figure 28.25 Flow of XiP Mode Enable/Disable

28.4.8 Usage Notes

DDR access without DS is not supported.

29. Octa Memory Controller

The Octa memory controller enables the connection of OctaFlash™ and OctaRAM™ to this LSI chip.

NOTE

OctaFlash™ and OctaRAM™ are trademarks of Macronix International Co., Ltd.

29.1 Features

- Macronix Serial Multi I/O (MXSMIO®) Octa Peripheral Interface (OPI) for high-end consumer applications is supported.
- One each of an OctaFlash device and an OctaRAM device compliant with the OPI specifications are connectable.
- A chip select signal is assigned to each memory device (XSPI_CS0#: OctaFlash; XSPI_CS1#: OctaRAM).

  Note: Only one of the memory devices can operate (be read or written to) at a time.

- Supported device interfaces

  SPI: Serial peripheral interface (OctaFlash, SPI mode)

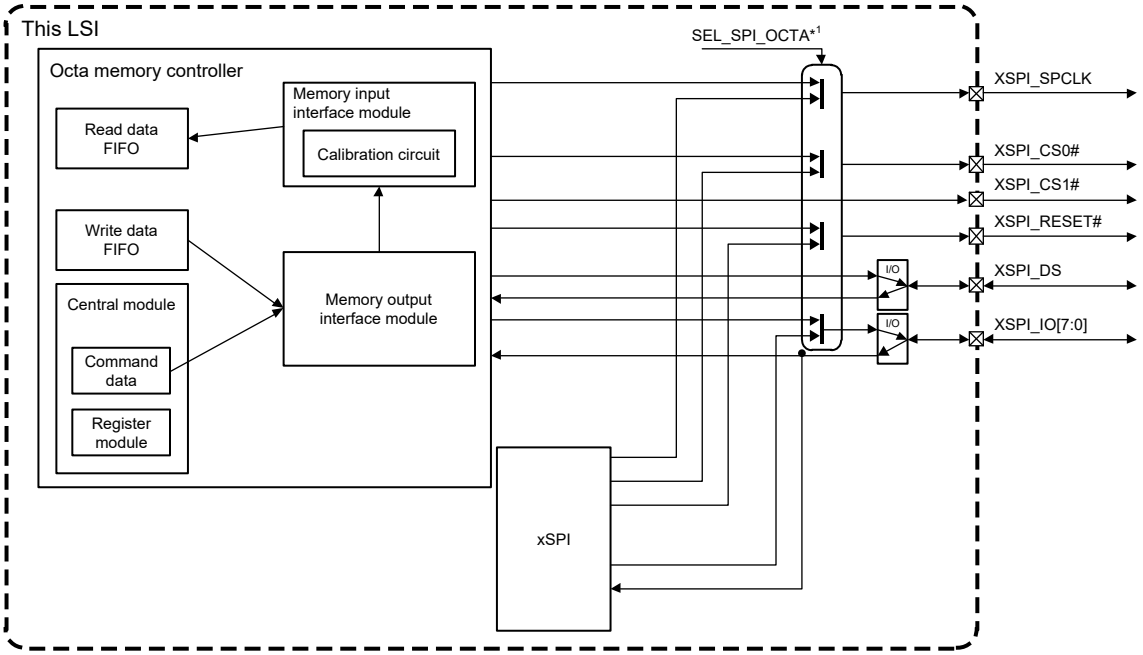
  SOPI: Single Octa I/O (8 bits) (OctaFlash, single data rate)

  DOPI: Double Octa I/O (8 bits) (OctaFlash and OctaRAM, double data rate)

- 3-byte and 4-byte OctaFlash address commands are supported.
- 4-byte OctaRAM address commands are supported.
- The read-while-write (RWW) operation is supported.
- 1LC and 2LC (latency count) OctaRAM devices are supported.
- The error corrected signal (ECS#) is available, and ECC errors can be detected (for OctaFlash only).
- Fast boot mode is not supported.
- Direct access (memory-mapped reading and writing) by the CPU to memory devices in separate flash and RAM address spaces is supported.
- XSPI_SPCLK: 100 MHz
- PVcc_HO: 1.8 V

29.2 Block Diagram

Figure 29.1 shows a block diagram of this module.



Note 1. Before access to the external memory, set up the SEL_SPI_OCTA bit in the xSPI / Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA). For the SEL_SPI_OCTA bit, refer to **Section 6, System Controller (SYSC)**.

Figure 29.1 Block Diagram

29.3 Input/Output Pins

Table 29.1 shows the pin configuration.

Table 29.1 Configuration of Octa Memory Controller Pins

Pin	I/O	Name	Function
XSPI_SPCLK	Output	Clock	Clock output
XSPI_CS0#	Output	Chip select 0	Chip select signal for an OctaFlash device
XSPI_CS1#	Output	Chip select 1	Chip select signal for an OctaRAM device
XSPI_DS	Input/Output	Read/write data strobe	Read data strobe/write data mask signal
XSPI_IO7 to XSPI_IO0	Input/Output	Data	Data input/output
XSPI_RESET#	Output	Reset output	Reset signal for both OctaFlash and OctaRAM devices

Note: XSPI_ECS# is an input pin that is multiplexed with alternative pin functions that are driven by the 3.3-V power supply. The other pins are solely used for functions that are driven by the 1.8-V power supply.

29.3.1 Device Interface

The device interface is compatible with OctaFlash/OctaRAM interface.

When reading data from the memory or programming the memory with data, the bit order changes with the I/O mode.

The bit order is shown below:

Table 29.2 Bit order in accordance with I/O mode

I/O Mode	Bit Order (MSB)
Read data from device	
1 I/O (SPI)	XSPI_IO1 input
8 I/O (SOPI)	XSPI_IO7 to XSPI_IO4, XSPI_IO3 to XSPI_IO0 input
8 I/O (DOPI)	XSPI_IO7 to XSPI_IO4, XSPI_IO3 to XSPI_IO0 input. Order of data: {D1, D0}, {D3, D2}, ...
Program/Write data to device	
1 I/O (SPI)	XSPI_IO0 output
8 I/O (SOPI)	XSPI_IO7 to XSPI_IO4, XSPI_IO3 to XSPI_IO0 output
8 I/O (DOPI)	XSPI_IO7 to XSPI_IO4, XSPI_IO3 to XSPI_IO0 output. Order of data: {D1, D0}, {D3, D2}, ...

29.4 Register Descriptions

Base address: H'1008_0000 (Overall Address Space)
Base address: H'4008_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base address: H'5008_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 29.3 shows the register configuration.

Access to the flash memory or RAM is allowed in either of the following modes.

Memory-map mode

Reading from and writing to the memory array areas of OctaFlash memory or RAM is possible.

Configuration mode

Transfer of any commands and data is possible.

Table 29.3 Octa Memory Controller Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Device command register	DCR	R/W	H'0000_0000	H'00	32
Device address register	DAR	R/W	H'0000_0000	H'04	32
Device command setting register	DCSR	R/W	H'0000_0000	H'08	32
Device size register 0	DSR0	R/W	H'0000_0000	H'0C	32
Device size register 1	DSR1	R/W	H'0000_0000	H'10	32
Memory delay trim register	MDTR	R/W	H'0600_9400	H'14	32
Auto-calibration timer register	ACTR	R/W	H'1000_0000	H'18	32

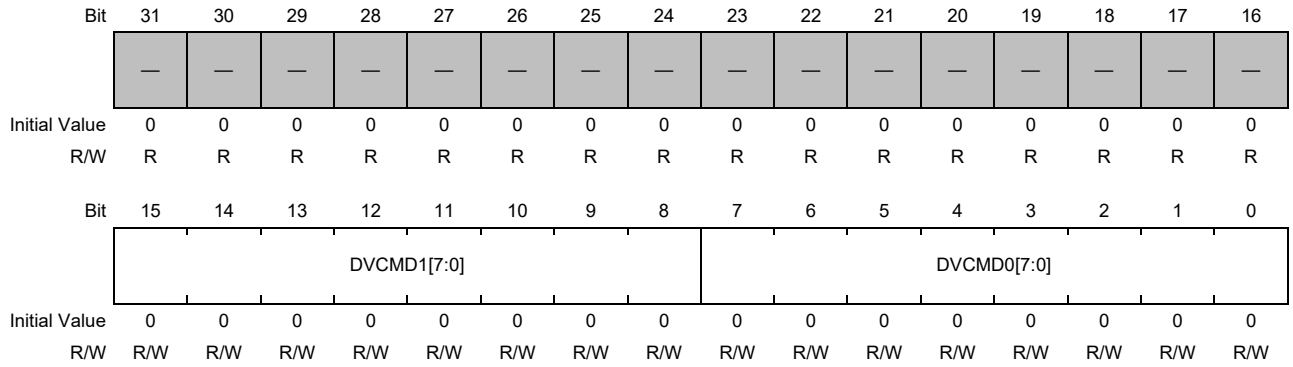
29.4.1 Device Command Register (DCR)

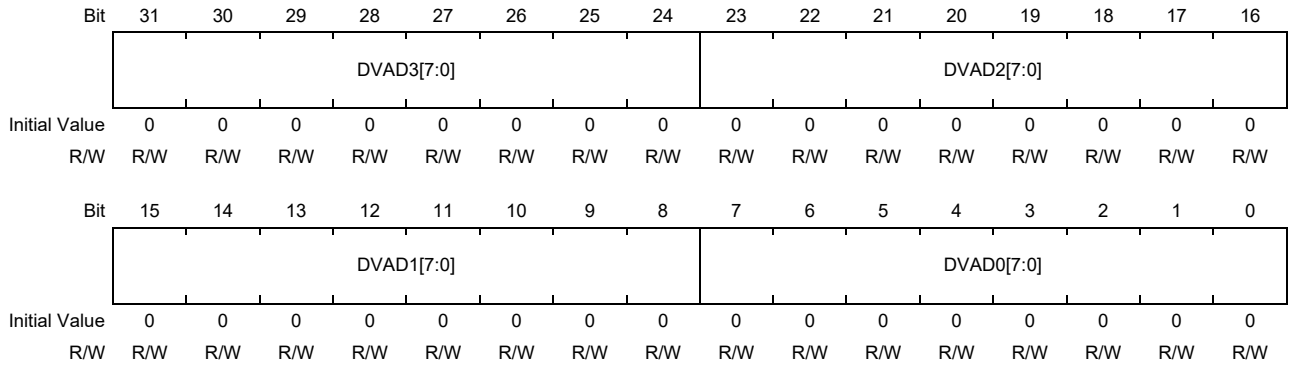
DCR sets the device commands for controller operation.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	DVCMD1[7:0]	All 0	R/W	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[15:8] as the 1st byte to memory.
7 to 0	DVCMD0[7:0]	All 0	R/W	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 1, the controller will send DCR[7:0] as the 1st byte to memory. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[7:0] as the 2nd byte to memory.

29.4.2 Device Address Register (DAR)

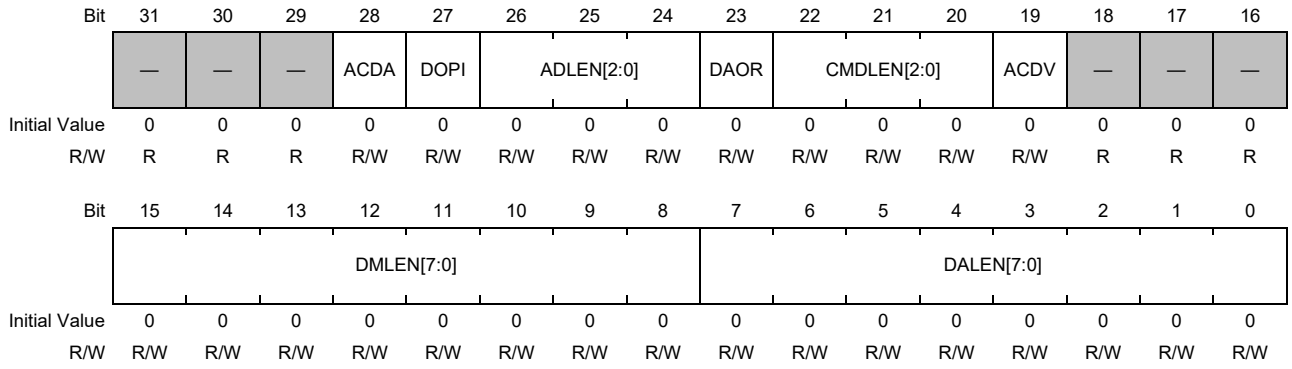
DAR sets the device address for controller operation.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DVAD3[7:0]	All 0	R/W	Device Address data 3 Set the device address data. When DCSR.ADLEN[2:0] = 4 only, set as the first byte.
23 to 16	DVAD2[7:0]	All 0	R/W	Device Address data 2 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the first byte. When DCSR.ADLEN[2:0] = 4, set as the second byte.
15 to 8	DVAD1[7:0]	All 0	R/W	Device Address data 1 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the second byte. When DCSR.ADLEN[2:0] = 4, set as the third byte.
7 to 0	DVAD0[7:0]	All 0	R/W	Device Address data 0 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the third byte. When DCSR.ADLEN[2:0] = 4, set as the fourth byte.

29.4.3 Device Command Setting Register (DCSR)

DCSR sets device commands.

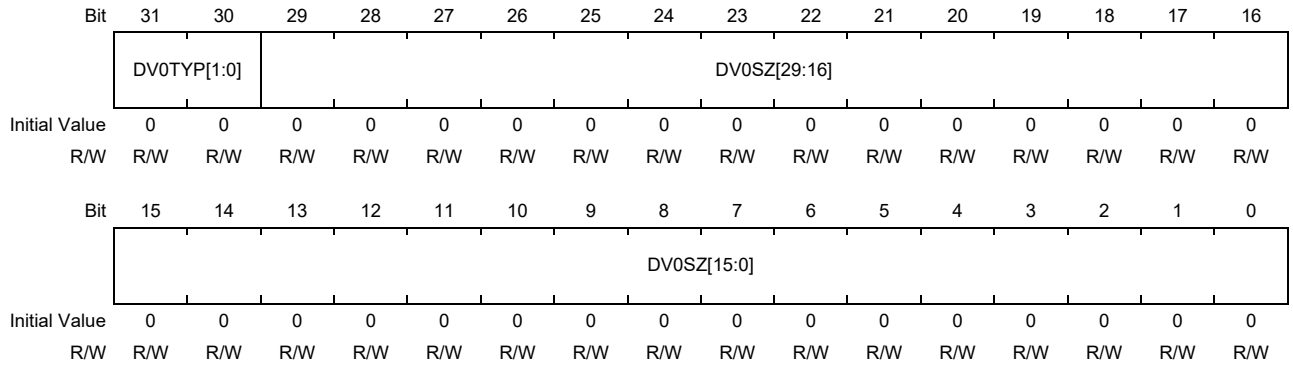


Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	ACDA	0	R/W	Data Access Control Set data access or register access 0: Register access Do not arrange the transfer data. 1: Data access (1) The address bit0 will be forced to 0 in DOPI mode. (2) If DAR[0] of the lead type command is 1, byte 0 from the device will be dropped in DOPI mode. (3) The AXI read data will be arranged according to the DAR. For example: When DAR[1:0] = 1, the first valid data is stored in RDATA[15:8]. (4) The AXI write data is used according to the DAR in DOPI mode. For example: If the target device is Flash Memory and DAR[1:0] = 1, the first byte sent to the flash memory is forced to H'FF. If the target device is RAM and DAR[1: 0] = 1, the first byte sent to RAM is masked by DQSM. (5) When the target device is RAM, the address sent to the memory changes according to RAM specification.
27	DOPI	0	R/W	DOPI single byte setting Even in DOPI mode, set this bit to 1 when the read data has only one byte in each cycle. For example: OctaFlash RDID, RDSR command 0: Each cycle has two bytes data. (normal DOPI mode) 1: Each cycle has one byte data. (The byte data changes at the rising edge of the clock and does not change at the falling edge of the clock.)
26 to 24	ADLEN[2:0]	000	R/W	Transfer address length setting Sets the length of the address to be transferred in bytes.
23	DAOR	0	R/W	Data order setting Sets the byte order of data during read and write operations. 0: byte0, byte1, byte2, byte3 1: byte1, byte0, byte3, byte2
22 to 20	CMDLEN[2:0]	000	R/W	Transfer command length setting Sets the length of the command to be transferred in bytes.
19	ACDV	0	R/W	Access Device setting Sets the device to be accessed. 0: Send commands to device 0. 1: Send commands to device 1.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	DMLEN[7:0]	All 0	R/W	Dummy cycle (latency) setting Sets the length of dummy cycle (latency) in XSPI_SPCLK units.
7 to 0	DALEN[7:0]	All 0	R/W	Transfer data length setting Sets the length of data to be transferred in bytes. When [7:0] is 0, there are no transmission data to memory and reception data from memory.

29.4.4 Device Size Register 0 (DSR0)

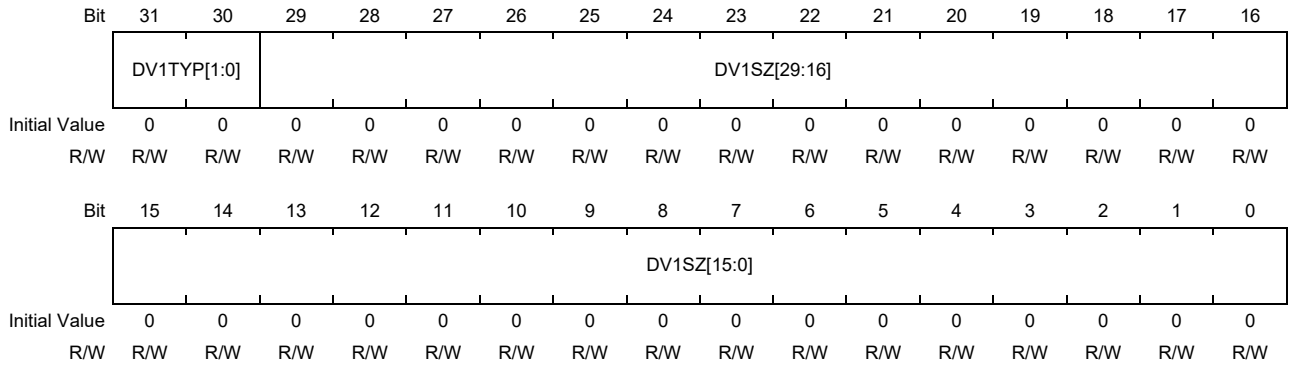
DSR0 specifies the type of memory to be accessed as device 0 and the size of the flash memory.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	DV0TYP[1:0]	00	R/W	Device 0 type setting Set to 00.
29 to 0	DV0SZ[29:0]	All 0	R/W	Device 0 size setting Set a 30-bit value for the size of memory connected as device 0. [Examples] H'0080_0000: 8 Mbytes flash memory H'0100_0000: 16 Mbytes flash memory H'0200_0000: 32 Mbytes flash memory H'0400_0000: 64 Mbytes flash memory H'0800_0000: 128 Mbytes flash memory

29.4.5 Device Size Register 1 (DSR1)

DSR1 specifies the type of memory to be accessed as device 1 and the size of the RAM.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	DV1TYP[1:0]	00	R/W	Device 1 type setting Set to 01.
29 to 0	DV1SZ[29:0]	All 0	R/W	Device 1 size setting Set a 30-bit value for the size of memory connected as device 1. [Examples] H'0080_0000: 8 Mbytes RAM H'0100_0000: 16 Mbytes RAM H'0200_0000: 32 Mbytes RAM H'0400_0000: 64 Mbytes RAM

29.4.6 Memory Delay Trim Register (MDTR)

MDTR sets the timing adjustment of memory access.

For the information about the auto-calibration, refer to **Section 29.5, Operation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	DQSEDOPI[3:0]				DV1DEL[7:0]							
Initial Value	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DQSESOPI[3:0]				DQSERAM[3:0]				DV0DEL[7:0]							
Initial Value	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	DQSEDOPI [3:0]	H'6	R/W	XSPI_DS enable counter Setting for the flash memory in the DOPI mode
23 to 16	DV1DEL[7:0]	All 0	R/W	Device 1 delay setting These bits specify the number of cycles of delay to be inserted in the input strobe signal (XSPI_DS) to adjust the timing for latching data during read access to device 1 in the DOPI mode (the RAM).
15 to 12	DQSESOPI [3:0]	H'9	R/W	XSPI_DS enable counter Setting for the flash memory in the DOPI mode
11 to 8	DQSERAM [3:0]	H'4	R/W	XSPI_DS enable counter Setting for the RAM in the DOPI mode
7 to 0	DV0DEL[7:0]	All 0	R/W	Device 0 delay setting These bits specify the delay cycles to be inserted on the input strobe signal (XSPI_DS) to adjust the timing for latching data during read access to device 0 in the SOPI or DOPI mode for the flash memory.

During a read operation with the XSPI_DS clock input (in the SOPI or DOPI mode), the XSPI_DS clock transitions from the high-impedance state to the input state (for receiving a value of 0 from the external device) after the command and address phases are completed. To obtain valid data, adjust the DQS enable counter and delay cycles.

XSPI_DS enable counter setting (XSPI_SPCLK units)

0000: 1 clock cycle
0001: 2 clock cycles
0010: 3 clock cycles
0010: 4 clock cycles
…
1111: 16 clock cycles

XSPI_DS enable counter setting examples

Table 29.4 Examples of Setting the XSPI_DS Enable Counter for OctaRAM

Number of Dummy Cycles (Latency)	RAM	
	Pre-Cycle On	Pre-Cycle Off
3	4	4 to 5
4	4 to 5	4 to 6
5	4 to 6	4 to 7
6	4 to 7	4 to 8
7	4 to 8	4 to 9
8	4 to 9	4 to 10

Table 29.5 Examples of Setting the XSPI_DS Enable Counter for OctaFlash Memory

Number of Dummy Cycles (Latency)	SOPI	DOPI	
	Pre-Cycle On	Pre-Cycle On	Pre-Cycle Off
4	8 to 9	5 to 6	5 to 7
6	8 to 11	5 to 8	5 to 9
8	8 to 13	5 to 10	5 to 11
10	8 to 15	5 to 12	5 to 13
12	8 to 15	5 to 14	5 to 15
14	8 to 15	5 to 15	5 to 15
16	8 to 15	5 to 15	5 to 15
18	8 to 15	5 to 15	5 to 15
20	8 to 15	5 to 15	5 to 15

These two tables list cases of DQS delay.

If DQS delay cycle is not within this range, refer to **Section 29.7, XSPI_DS Enable Counter**, and recalculate the correct range.

29.4.7 Auto-Calibration Timer Register (ACTR)

ACTR sets the cycle at which automatic calibration is executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTP[31:16]															
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTP[31:0]	H'1000_0000	R/W	Automatic calibration cycle time setting Sets performing cycle for the automatic calibration with 32 bits. Automatic calibration cycle time (ns) = CTP[31:0] × SCLK / 2 When automatic calibration is enabled (CDSR.ACMODE[1:0] = H'1) and the value of the internal timer is equal to that of this register, automatic calibration will start.

29.4.8 Auto-Calibration Address Register 0 (ACAR0)

ACAR0 sets the address in OctaFlash memory for writing to and reading from in auto-calibration of device 0.

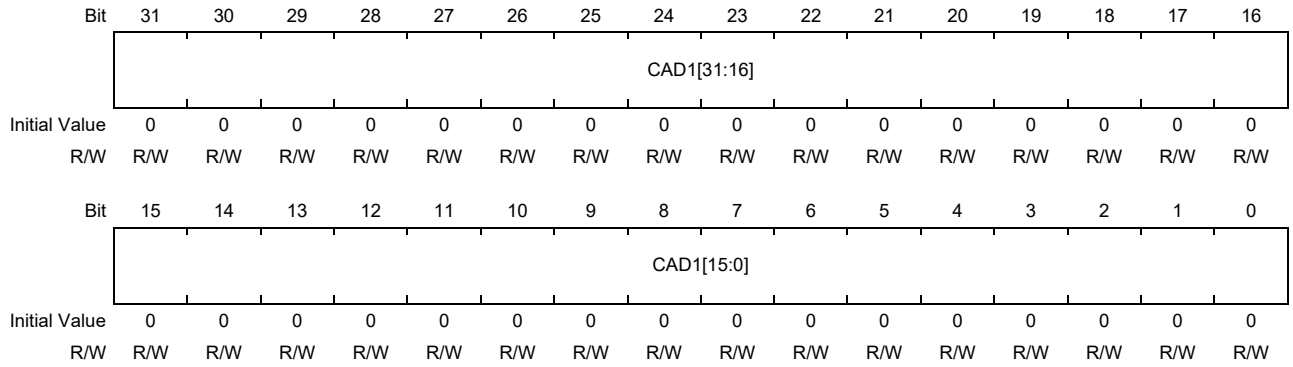
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAD0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAD0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAD0[31:0]	All 0	R/W	Automatic calibration address These bits set the address in OctaFlash memory for writing to and reading from in auto-calibration of device 0. *Note*: Set an address in terms of the memory space of the OctaFlash device, not in the OctaFlash space within this LSI chip.

29.4.9 Auto-Calibration Address Register 1 (ACAR1)

ACAR1 sets the address in OctaRAM for writing to and reading from in auto-calibration of device 1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAD1[31:0]	All 0	R/W	Automatic calibration address These bits set the address in OctaRAM for writing to and reading from in auto-calibration of device 1. *Note*: Set an address in terms of the memory space of the OctaRAM device, not in the OctaRAM space within this LSI chip.

29.4.10 Device Memory Map Read Chip Select Timing Setting Register (DRCSTR)

DRCSTR sets the timing of memory-mapped reading for each device.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DVRDLO1[1:0]		DVRDHI1[2:0]			DVRDCMD1[2:0]			—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DVRDLO0[1:0]		DVRDHI0[2:0]			DVRDCMD0[2:0]			CTR0	CTRW0[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DVRDLO1 [1:0]	00	R/W	Device 1 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the read operation for the device 1. Timing definition from XSPI_CS1# low to the first XSPI_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
29, 27	DVRDHI1[2:0]	000	R/W	Device 1 select signal High timing setting*1 Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last XSPI_SPCLK low to XSPI_CS1# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles *Note*: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	DVRDCMD1 [2:0]	000	R/W	Device 1 Command execution interval*1 Indicates the timing, between command and command for device 1. Timing, until the XSPI_CS1# signal goes from High to the next Low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVRDLO0 [1:0]	00	R/W	Device 0 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the read operation for the device 0. Timing definition from XSPI_CS0# low to the first XSPI_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVRDHI0[2:0]	000	R/W	Device 0 select signal pull-up timing setting*1 Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last XSPI_SPCLK low to XSPI_CS0# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles *Note*: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	DVRDCMD0 [2:0]	000	R/W	Device 0 Command execution interval setting*1 Indicates the timing between command to command for the device 0. Timing definition from XSPI_CS0# high to the next XSPI_CS0# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7	CTR0	0	R/W	Device 0 Continuous read setting When the continuous read is enabled, wait for the continuous read operation to be performed using the value set in CTRW0[6:0]. Do not set this bit to 1 except for OctaFlash DOPI mode. 0: Continuous read disabled for device 0 1: Continuous read enabled for device 0
6 to 0	CTRW0[6:0]	All 0	R/W	Device 0 continuous read cycle setting When continuous read of Device 0 is enabled, the selection signal is fixed at Low for the set clock cycle, after the read operation is performed. If the number of clock cycles exceeds twice the value set in these bits before the next read operation is performed, the select signal is returned to High.

Note 1. These clock cycles are values in internal clock units. In XSPI_SPCLK units, the clock cycle is 1/2 of the above table.

29.4.11 Device Memory Map Write Chip Select Timing Setting Register (DWCSTR)

DWCSTR sets the timing of memory-mapped writing for each device.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DVWLO1[1:0]		DVWHI1[2:0]			DVWCMD1[2:0]			—	—	—	—	—	—	—	—

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DVWLO1[1:0]	00	R/W	Device 1 select signal pull-down timing setting*1 Indicates the timing between the device 1 select signal pull-down to the write operation. Timing definition from XSPI_CS1# low to the first XSPI_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
29 to 27	DVWHI1[2:0]	000	R/W	Device 1 select signal pull-up timing setting*1 Indicates the timing, from the end of write operation to the select signal is pulled up. Timing definition from the last XSPI_SPCLK low to XSPI_CS1# high DOPI mode 000: 1.5 clock cycles 001: 2.5 clock cycles 010: 3.5 clock cycles 011: 4.5 clock cycles 100: 5.5 clock cycles 101: 6.5 clock cycles 110: 7.5 clock cycles 111: 8.5 clock cycles Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	DVWCMD1 [2:0]	000	R/W	Device 1 Command execution interval setting*1 Indicates the timing between command to command for the device 1. Timing definition from XSPI_CS1# high to the next XSPI_CS1# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVWLO0[1:0]	00	R/W	Device 0 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the write operation for the device 0. Timing definition from XSPI_CS0# low to the first XSPI_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVWHI0[2:0]	000	R/W	Device 0 select signal pull-up timing setting*1 Indicates the timing, from the end of write operation to the select signal is pulled up. Timing definition from the last XSPI_SPCLK low to XSPI_CS0# high DOPI mode 000: 1.5 clock cycles 001: 2.5 clock cycles 010: 3.5 clock cycles 011: 4.5 clock cycles 100: 5.5 clock cycles 101: 6.5 clock cycles 110: 7.5 clock cycles 111: 8.5 clock cycles Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	DVWCMD0 [2:0]	000	R/W	Device 0 Command execution interval setting*1 Indicates the timing between command to command for the device 0. Timing definition from XSPI_CS0# high to the next XSPI_CS0# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. These clock cycles are values in internal clock units. In XSPI_SPCLK units, the clock cycle is 1/2 of the above table.

29.4.12 Device Chip Select Timing Setting Register (DCSTR)

DCSTR sets the timing of operations in configuration mode.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DVSELLO[1:0]		DVSELHI[2:0]			DVSELCMD[2:0]			—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVSELLO [1:0]	All 0	R/W	Device select signal pull-down timing setting*1 Indicates the timing, from the device selection signal is pulled-down to the command execution. Timing definition from XSPI_CS[1:0]# low to the first XSPI_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
13 to 11	DVSELHI[2:0]	000	R/W	Device select signal pull-up timing setting*1 Indicates the timing when the select signal is pulled up from the end of the command execution. Timing definition from the last XSPI_SPCLK low to XSPI_CS[1:0]# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles *Note*: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles
10 to 8	DVSELCMD [2:0]	000	R/W	Device Command execution interval setting*1 Indicates the timing between command to command. Timing definition from XSPI_CS[1:0]# high to the next XSPI_CS[1:0]# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. These clock cycles are values in internal clock units. In XSPI_SPCLK units, the clock cycle is 1/2 of the above table.

29.4.13 Controller and Device Setting Register (CDSR)

CDSR controls the automatic calibration, pre-cycle setting, and device transfer type of the controller and each of the devices.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DLFT	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ACMODE[1:0]		ACMEME[1:0]		—	—	—	—	DV1PC	DV0PC	DV1TTYP[1:0]		DV0TTYP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

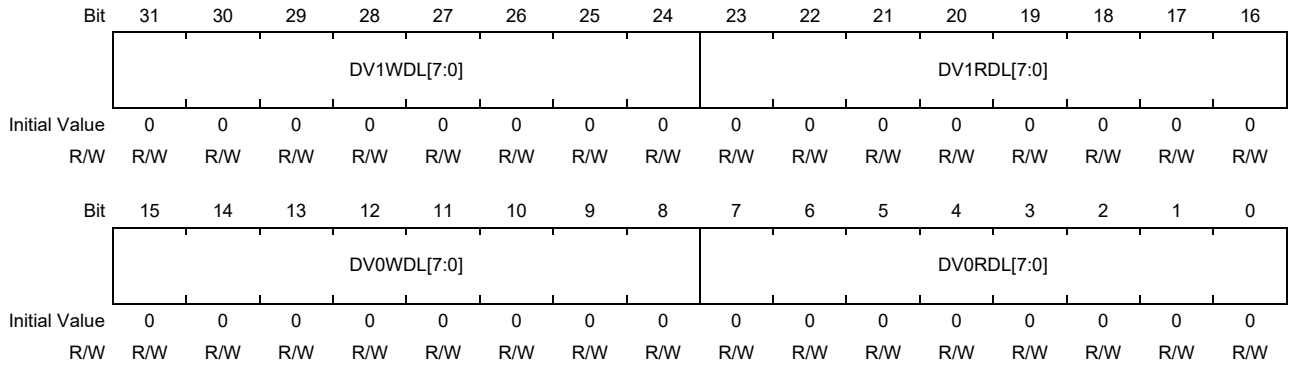
Bit	Bit Name	Initial Value	R/W	Description
31	DLFT	0	R/W	Deadlock Free Timer Enable Enable the timer to prevent the occurrence of controller deadlock. The timeout status is reset only by a system reset. 0: Enable timer 1: Disable timer *Note*: This function is available only when XSPI_SPCLK is 100 MHz. Otherwise, disable the timer.
30 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ACMODE[1:0]	00	R/W	Automatic calibration mode 00: Automatic calibration is disabled.*1 01: Automatic calibration is enabled. 10: Setting prohibited. 11: Setting prohibited. The ACMODE bits should be set to disabled during read access to the OctaFlash device. Automatic calibration is only available in the DOPI mode.
11, 10	ACMEME[1:0]	00	R/W	Automatic calibration memory enable setting Automatic calibration supports only DOPI mode. To end DOPI mode, disable automatic calibration. [1]: Enable for device 1 1: Enable 0: Disable [0]: Enable for device 0 1: Enable 0: Disable
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DV1PC	0	R/W	Device1_memory pre-cycle setting 0: Disable 1: Enable
4	DV0PC	0	R/W	Device0_memory pre-cycle setting 0: Disable 1: Enable

Bit	Bit Name	Initial Value	R/W	Description
3, 2	DV1TTYP [1:0]	00	R/W	Device1_transfer_type setting 00: SPI mode 01: SOPI mode 10: DOPI mode 11: Setting prohibited
1, 0	DV0TTYP [1:0]	00	R/W	Device0_transfer_type setting 00: SPI mode 01: SOPI mode 10: DOPI mode 11: Setting prohibited

Note 1. When automatic calibration is disabled, the device 0 delay (OctaFlash) and device 1 delay (OctaRAM) should be manually specified in the memory delay trim register (MDTR) (see **Section 29.4.6, Memory Delay Trim Register (MDTR)**). Set this register with reference to “initial setting MDTR (OctaFlash memory)” and “initial setting MDTR (OctaRAM)” in **Figure 29.16**.

29.4.14 Memory Map Dummy Length Register (MDLR)

MDLR sets the number of dummy cycles (latency) for writing and reading the memory map.

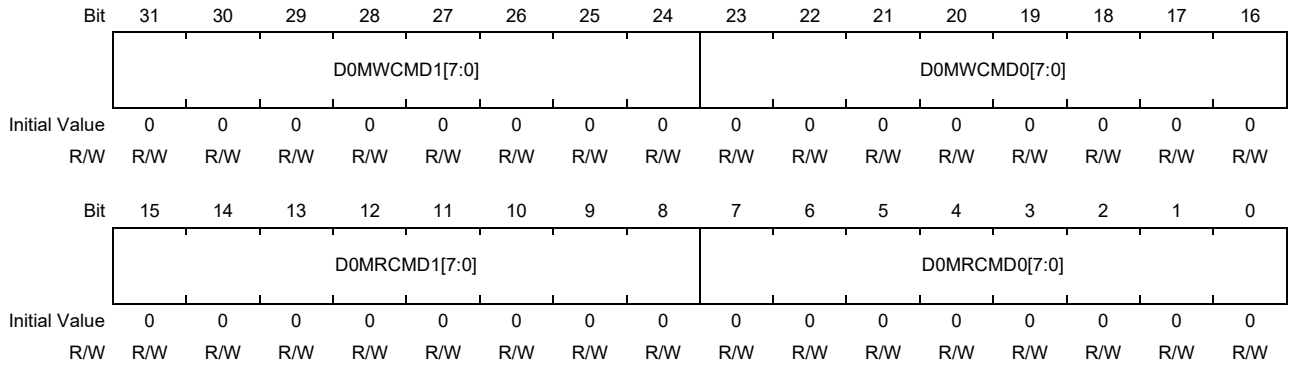


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DV1WDL[7:0]	All 0	R/W	Device 1 Write dummy cycles (latency) setting Set the dummy length when writing to device 1 in XSPI_SPCLK cycles unit.
23 to 16	DV1RDL[7:0]	All 0	R/W	Device 1 Read dummy cycles (latency) setting Set the dummy length when reading to device 1 in XSPI_SPCLK cycles unit.
15 to 8	DV0WDL[7:0]	All 0	R/W	Device 0 Write dummy cycles (latency) setting Set the dummy length when writing to device 0 in XSPI_SPCLK cycles unit.
7 to 0	DV0RDL[7:0]	All 0	R/W	Device 0 Read dummy cycles (latency) setting Set the dummy length when reading to device 0 in XSPI_SPCLK cycles unit.

Note: When changing the dummy cycles (latency) for the OctaFlash device, modify the setting on the memory and then modify the setting in the DMLEN[7:0] bits in the device command setting register (DCSR) so that the dummy length becomes the same between the memory and this Octa memory controller. After that, execute the status read command to confirm the memory status.

29.4.15 Memory Map Read/Write Command Register 0 (MRWCR0)

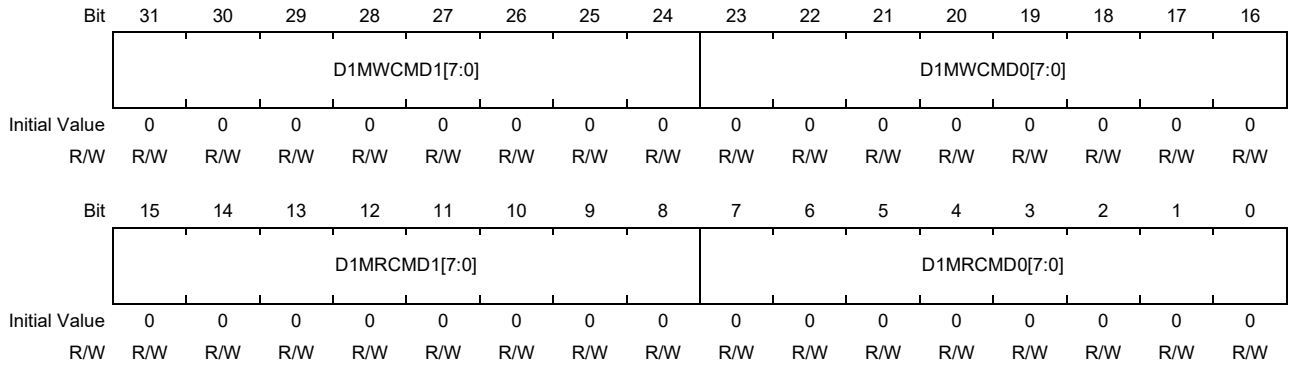
MRWCR0 sets the read/write commands for the device 0.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	D0MWCMD1 [7:0]	All 0	R/W	Memory map write command 1 setting, Set the memory map write command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
23 to 16	D0MWCMD0 [7:0]	All 0	R/W	Memory map write command 0 setting, Set the memory map write command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
15 to 8	D0MRCMD1 [7:0]	All 0	R/W	Memory map read command 1 setting Set the memory map read command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
7 to 0	D0MRCMD0 [7:0]	All 0	R/W	Memory map read command 0 setting, Set the memory map read command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].

29.4.16 Memory Map Read/Write Command Register 1 (MRWCR1)

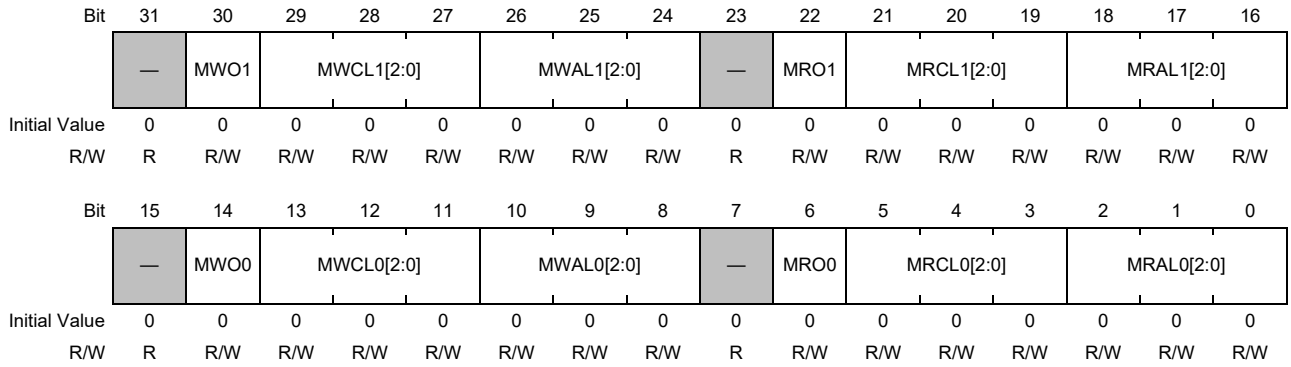
MRWCR1 sets the read/write commands for the device 1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	D1MWCMD1 [7:0]	All 0	R/W	Memory map write command 1 setting Set the memory map write command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
23 to 16	D1MWCMD0 [7:0]	All 0	R/W	Memory map write command 0 setting Set the memory map write command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
15 to 8	D1MRCMD1 [7:0]	All 0	R/W	Memory map read command 1 setting Set the memory map read command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
7 to 0	D1MRCMD0 [7:0]	All 0	R/W	Memory map read command 0 setting Set the memory map read command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].

29.4.17 Memory Map Read/Write Setting Register (MRWCSR)

MRWCSR sets the memory map read/write operations.



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MWO1	MWCL1[2:0]			MWAL1[2:0]			—	MRO1	MRCL1[2:0]			MRAL1[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MWO0	MWCL0[2:0]			MWAL0[2:0]			—	MRO0	MRCL0[2:0]			MRAL0[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	MWO1	0	R/W	Device 1 write order setting 0: Write order is byte0, byte1, byte2, byte3. 1: Write order is byte1, byte0, byte3, byte2.
29 to 27	MWCL1[2:0]	000	R/W	Device 1 write command length setting Set the number of bytes in the write command for device 1.
26 to 24	MWAL1[2:0]	000	R/W	Device 1 write address length setting Set the memory map write address byte length for device 1.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	MRO1	0	R/W	Device 1 read order setting 0: Read order is byte0, byte1, byte2, byte3. 1: Read order is byte1, byte0, byte3, byte2. *Note*: This setting is only valid in the DOPI mode. It has no effect in the SOPI or SPI mode.
21 to 19	MRCL1[2:0]	000	R/W	Device 1 read command length setting Set the read command byte length for device 1.
18 to 16	MRAL1[2:0]	000	R/W	Device 1 read address length setting Set the memory map read address byte length for device 1.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	MWO0	0	R/W	Device 0 write order setting 0: Write order is byte0, byte1, byte2, byte3. 1: Write order is byte1, byte0, byte3, byte2.
13 to 11	MWCL0[2:0]	000	R/W	Device 0 write command length setting Set the write command byte length for device 0.
10 to 8	MWAL0[2:0]	000	R/W	Device 0 write address length setting Set the memory map write address byte length for device 0.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	MRO0	0	R/W	Device 0 read order setting 0: Read order is byte0, byte1, byte2, byte3. 1: Read order is byte1, byte0, byte3, byte2. *Note*: This setting is only valid in the DOPI mode. It has no effect in the SOPI or SPI mode.
5 to 3	MRCL0[2:0]	000	R/W	Device 0 read command length setting Set the write command byte length for device 0.
2 to 0	MRAL0[2:0]	000	R/W	Device 0 read address length setting Set the memory map read address byte length for device 0.

29.4.18 Error Status Register (ESR)

ESR indicates the error status when performing memory map read and write commands.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWESR[7:0]								MRESR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	0	R	Reserved These bits are always read as 0.
15 to 8	MWESR[7:0]	All 0	R	Memory map write error status H'80 : invalid command H'01 : write data length error
7 to 0	MRESR[7:0]	All 0	R	Memory map read error status H'80 : invalid command H'01 : ECC error H'02 : preamble error H'03 : wait XSPI_DS timeout

29.4.19 Configure Write without Data Register (CWNDR)

CWNDR is used to execute a write command without data in the configuration mode. Writing 0 to this register makes this module issue a write command without actually writing data to memory.
Specify an address in DAR, a command in DCSR, and command data in DCR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	W	The write value should always be 0.

29.4.20 Configure Write Data Register (CWDR)

CWDR is used to set the data for writing when a write command is to be executed in the configuration mode. Writing to this register makes the controller to issue a write command and transfer the data to be written. The byte order of data transferred by the controller to the memory is in accord with the setting of the DAOR bit in CDSR. Specify an address in DAR, a command in DCSR, and command data in DCR.

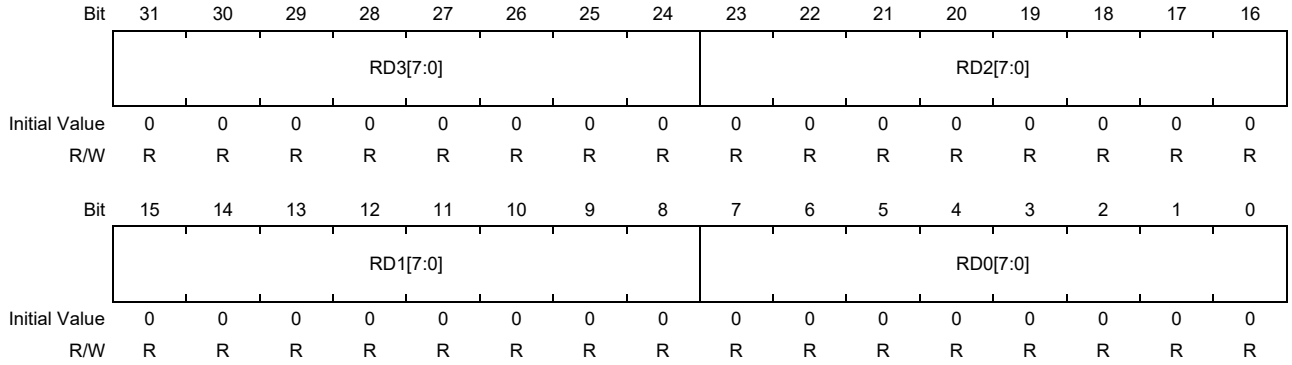
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WD3[7:0]								WD2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WD1[7:0]								WD0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	WD3[7:0]	All 0	W	Write data 3 Set the third byte of the write data.
23 to 16	WD2[7:0]	All 0	W	Write data 2 Set the second byte of the write data.
15 to 8	WD1[7:0]	All 0	W	Write data 1 Set the first byte of the write data.
7 to 0	WD0[7:0]	All 0	W	Write data 0 Set the zeroth byte of the write data.

29.4.21 Configure Read Register (CRR)

CRR is used to execute a read command in the configuration mode and holds the data that are read. Reading from this register makes the controller issue a read command and the data that are read are stored in this register. Specify an address in DAR, a command in DCSR, and command data in DCR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RD3[7:0]	All 0	R	Read data 3 Store the third byte of the read data.
23 to 16	RD2[7:0]	All 0	R	Read data 2 Store the second byte of the read data.
15 to 8	RD1[7:0]	All 0	R	Read data 1 Store the first byte of the read data.
7 to 0	RD0[7:0]	All 0	R	Read data 0 Store the zeroth byte of the read data.

29.4.22 Device Reset Register (RSTCNT)

RSTCNT is used to control O_MEM_RESET_N.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSTVAL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	RSTVAL	0	R/W	Output value of O_MEM_RESET_N 0: O_MEM_RESET_N = L 1: O_MEM_RESET_N = H

29.4.23 Address Extend Register (AER)

AER is used to extend the accessible range of OctaRAM.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	AAS		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
2 to 0	AAS	000b	R/W	Accessible address space 000b: H'0_2800_0000 to H'0_287F_FFFF (8 Mbytes) 001b: H'0_2800_0000 to H'0_28FF_FFFF (16 Mbytes) 011b: H'0_2800_0000 to H'0_29FF_FFFF (32 Mbytes) 111b: H'0_2800_0000 to H'0_2BFF_FFFF (64 Mbytes) Others: Prohibited.

29.5 Operation

29.5.1 Octa Memory Controller System Configuration

Figure 29.2 shows an example of connections between the Octa memory controller in this LSI and OctaFlash and OctaRAM devices.

CS0# should be connected to the OctaFlash device and CS1# should be connected to the OctaRAM device.

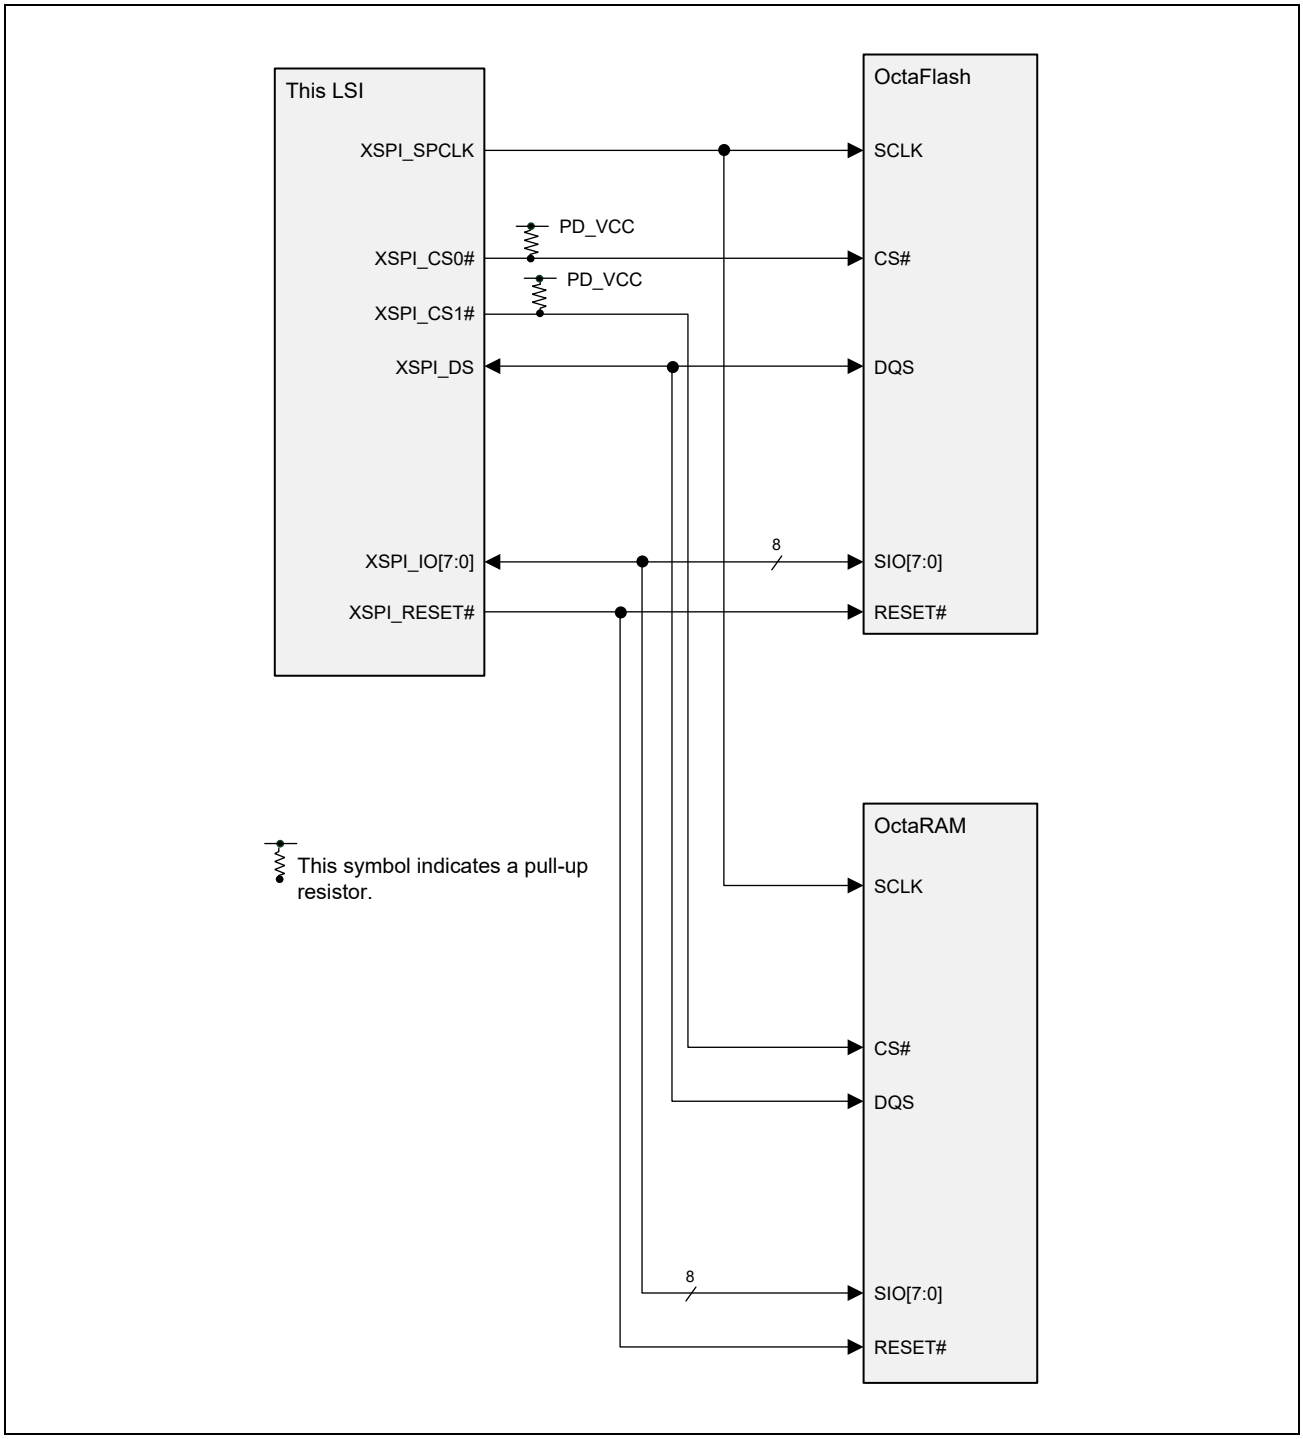


Figure 29.2 Example of Connections between this LSI and OctaFlash and OctaRAM Devices

29.5.2 Address Map

In the memory-map mode, OctaFlash is allocated to the OctaFlash space (H'2000_0000 to H'27FF_FFFF), and OctaRAM is allocated to the OctaRAM space (H'2800_0000 to H'2BFF_FFFF).

One OctaFlash device and one OctaRAM device can be connected to this LSI, and up to 128 Mbytes can be accessed in OctaFlash and up to 64 Mbytes can be accessed in OctaRAM.

	Internal Address	Maximum Accessible Area
OctaFlash	H'2000_0000 to H'27FF_FFFF	Up to 128 Mbytes
OctaRAM	H'2800_0000 to H'2BFF_FFFF	Up to 64 Mbytes

29.5.3 Octa Memory Interface

This section describes the Octa memory interface.

29.5.3.1 Write Operation

The Octa memory controller outputs a command and an address and writes one or more data bytes by using lines XSPI_CS0# (XSPI_CS1#), XSPI_SPCLK, and XSPI_IO7 to XSPI_IO0.

The write operation for OctaRAM has latency cycles before data is written to memory.

Figure 29.3 to **Figure 29.5** show waveforms of the write operation in the OctaFlash interface, and **Figure 29.6** shows a waveform of the write operation in the OctaRAM interface.

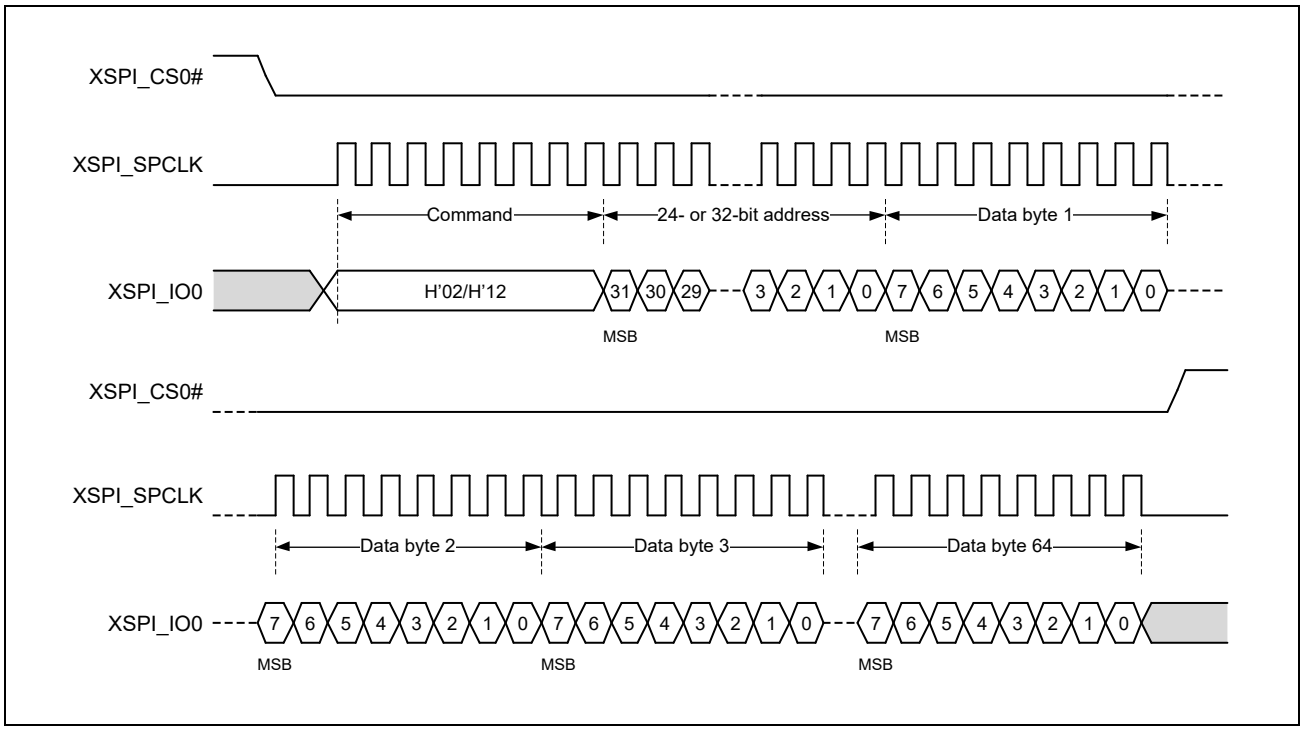

Figure 29.3 Waveform of Write Operation in OctaFlash Interface (SPI Mode)

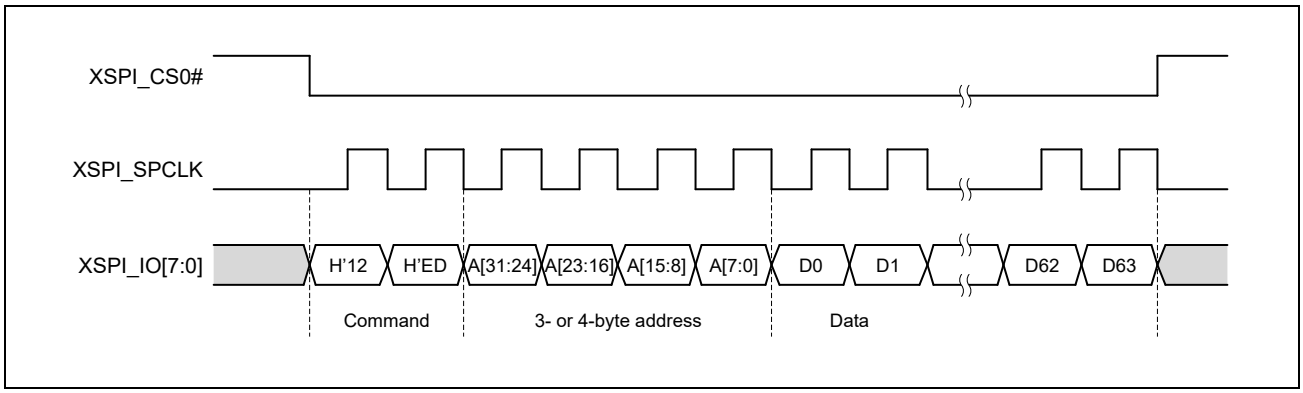

Figure 29.4 Waveform of Write Operation in OctaFlash Interface (SOPI Mode)

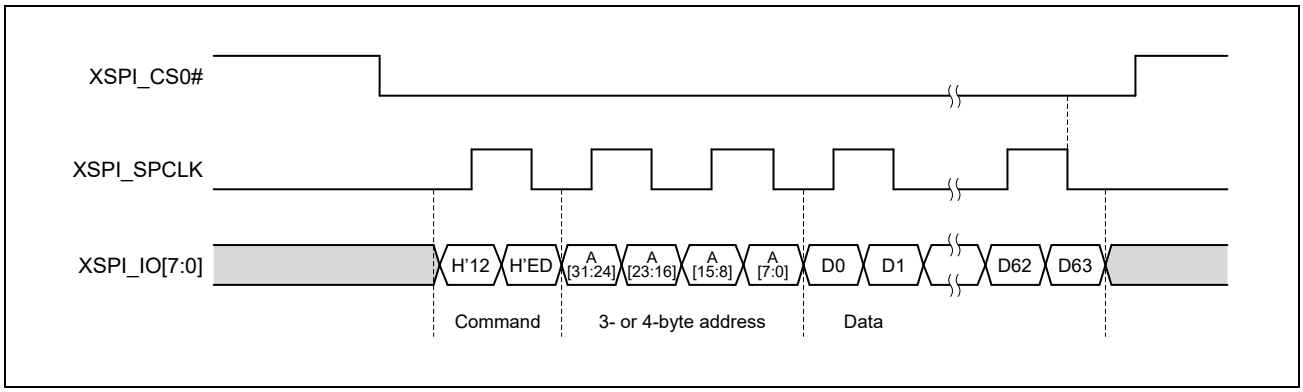

Figure 29.5 Waveform of Write Operation in OctaFlash Interface (DOPI Mode)

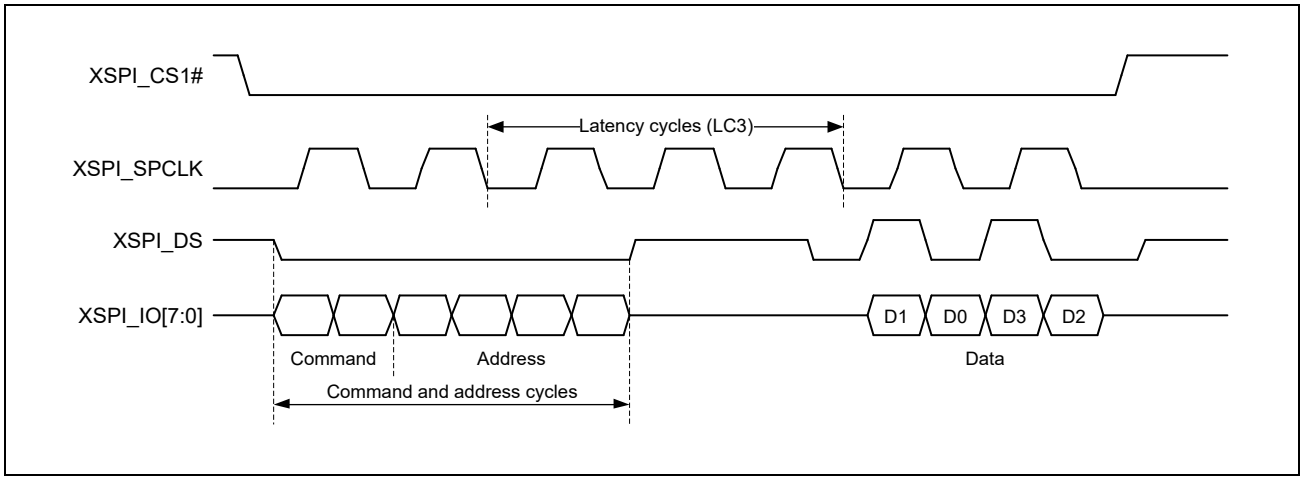

Figure 29.6 Waveform of Write Operation in OctaRAM Interface

29.5.3.2 Read Operation

The Octa memory controller outputs a command and an address and reads one or more data bytes by using lines XSPI_CS0# (XSPI_CS1#), XSPI_SPCLK, and XSPI_IO7 to XSPI_IO0.

The read operation for OctaFlash and OctaRAM has latency cycles before data is read from memory.

The number of latency cycles should be specified in the memory map dummy length setting register (MDLR) (see **Section 29.4.14**) in accordance with the setting in the memory device.

Figure 29.7 to **Figure 29.9** show waveforms of the read operation in the OctaFlash interface, and **Figure 29.10** shows a waveform of the read operation in the OctaRAM interface.

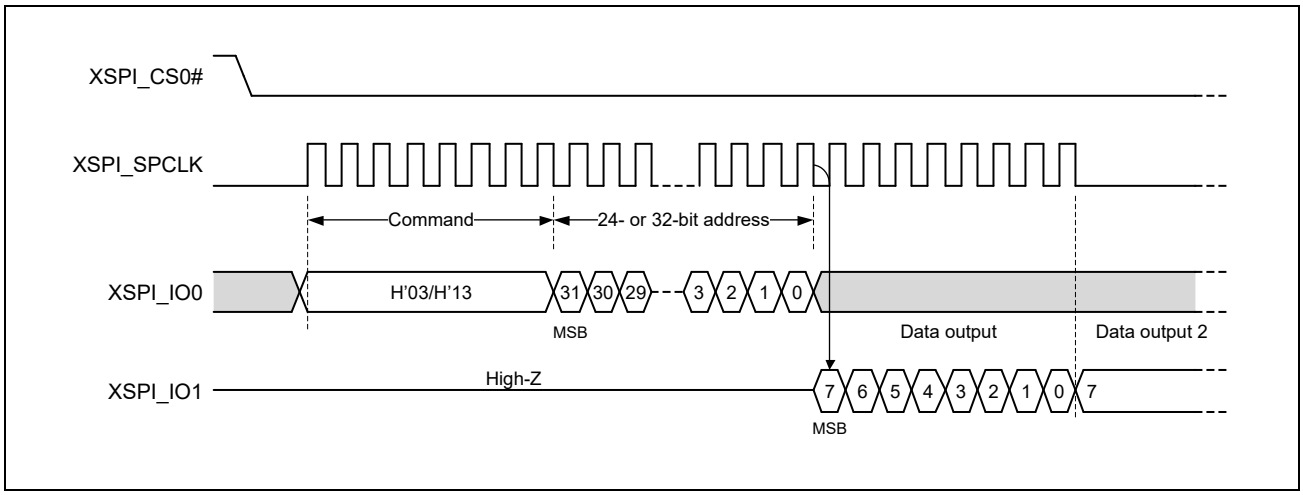

Figure 29.7 Waveform of Read Operation in OctaFlash Interface (SPI Mode)

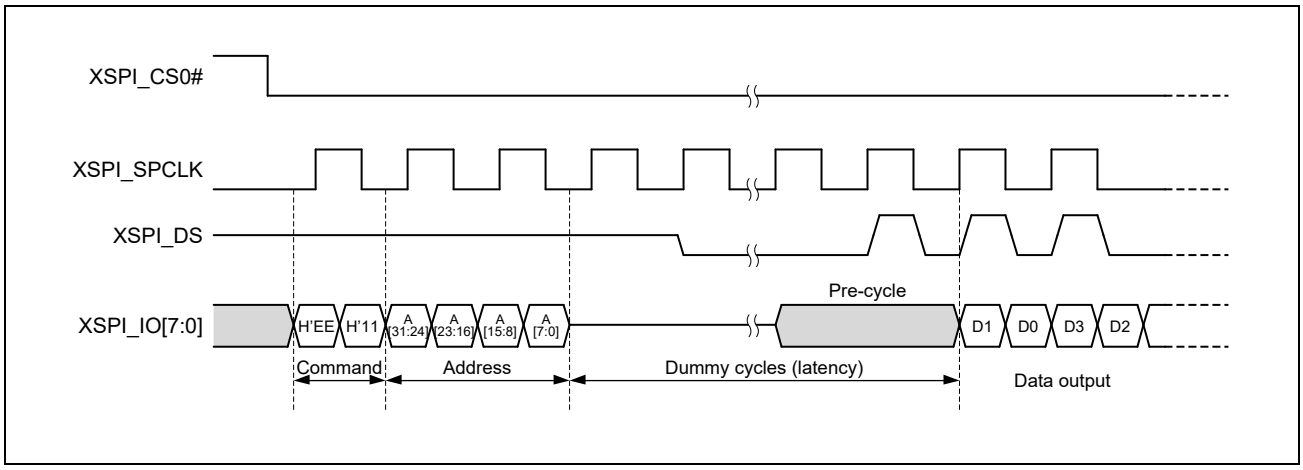

Figure 29.9 Waveform of Read Operation in OctaFlash Interface (DOPI Mode with Pre-cycle Enabled)

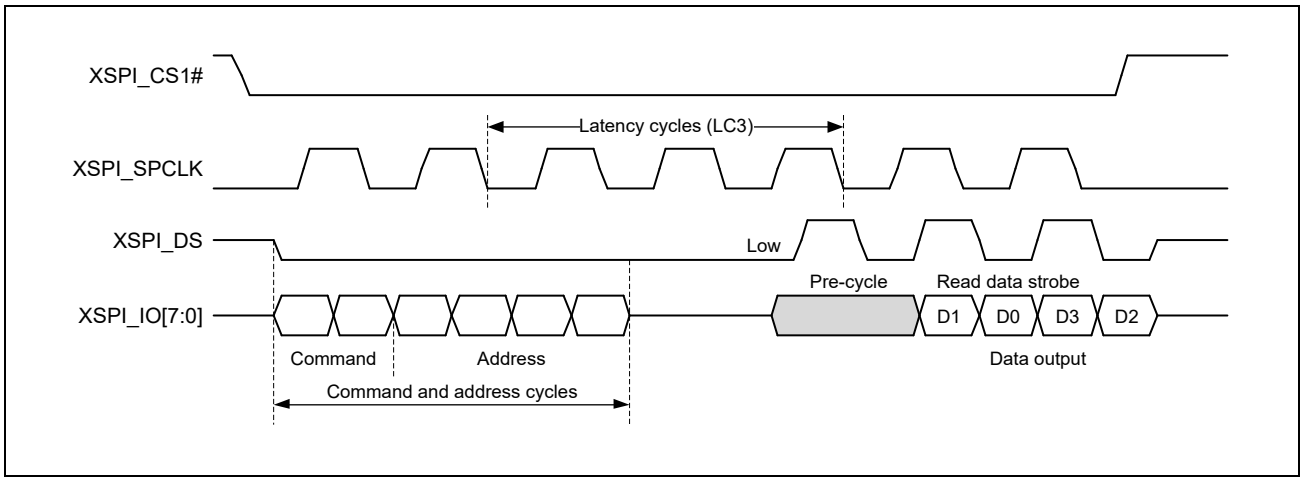

Figure 29.10 Waveform of Read Operation in OctaRAM Interface (with Pre-cycle Enabled)

29.5.4 Data Alignment in the OctaFlash and OctaRAM Spaces

Figure 29.11 shows the memory data alignment in the OctaFlash and OctaRAM spaces.

Figure 29.12 shows the data alignment when the configuration register in OctaFlash or OctaRAM is accessed.

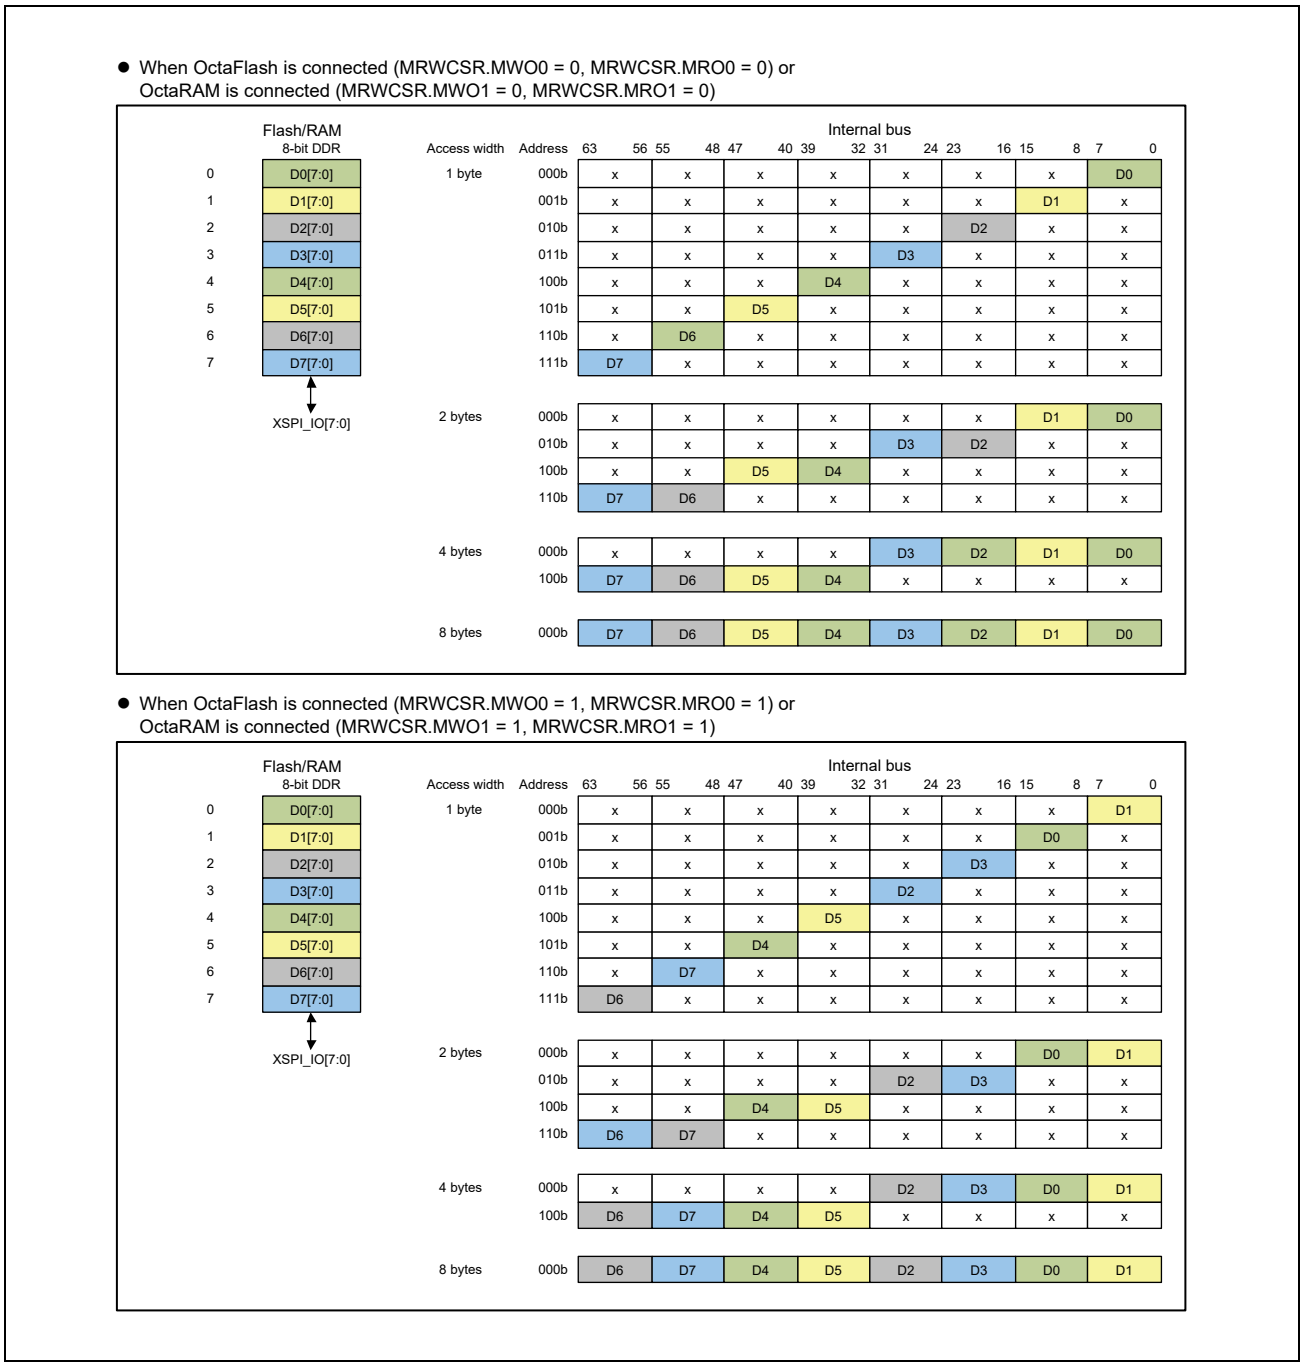

Figure 29.11 Memory Data Alignment in the OctaFlash and OctaRAM Spaces

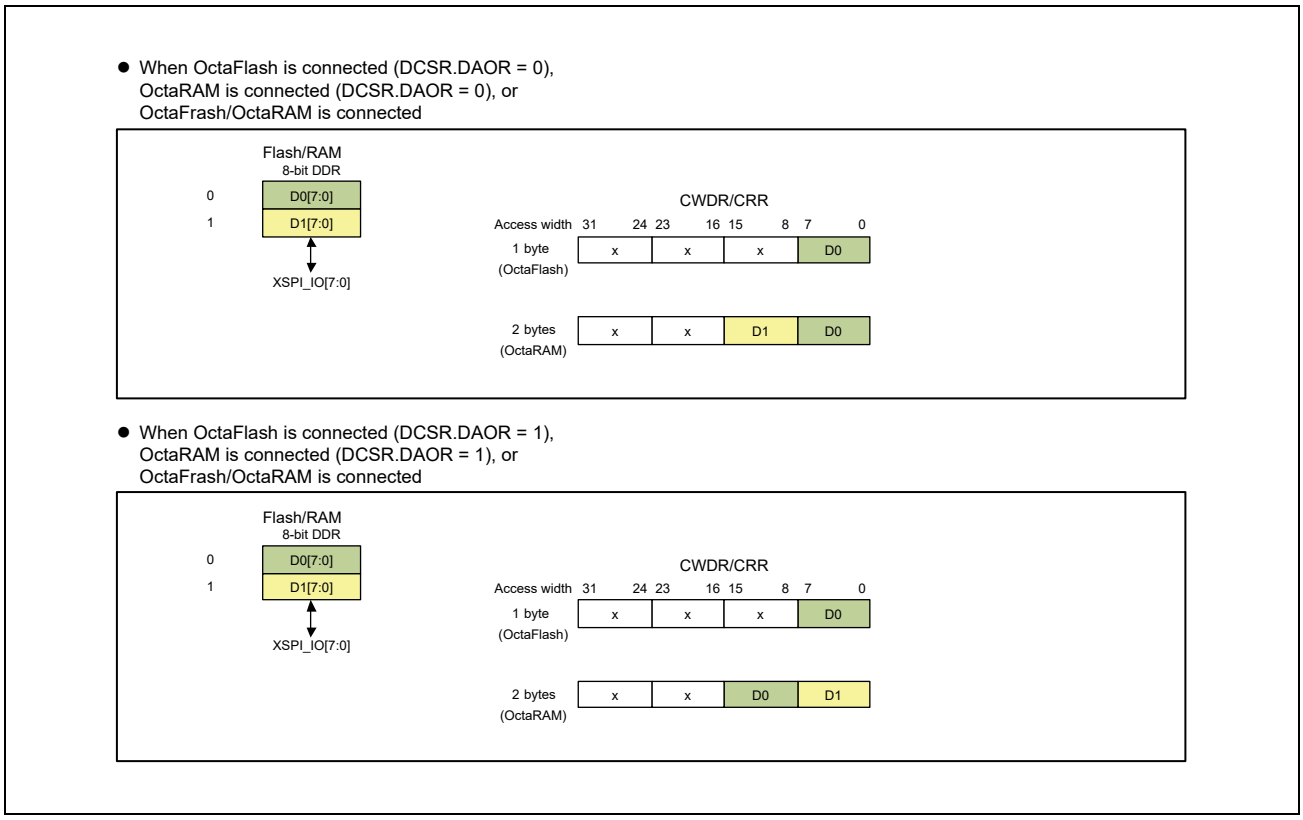

Figure 29.12 Configuration Register Data Alignment in the OctaFlash and OctaRAM Spaces

29.5.5 One-Byte Write Access to an Octa Memory Device in the DOPI Mode

This section describes one-byte write access in the DOPI mode.

Writing to the Octa memory device in the DOPI mode is handled in 2-byte units.

When the target device is OctaRAM, the output XSPI_DS signal of the controller can be used to mask bytes by driving it to the high level during the operation of writing. This allows the masking of invalid write data.

When the target device is OctaFlash, one-byte write access must not be attempted since OctaFlash only supports two byte access.

Figure 29.13 shows the waveforms in one-byte write access in the DOPI mode.

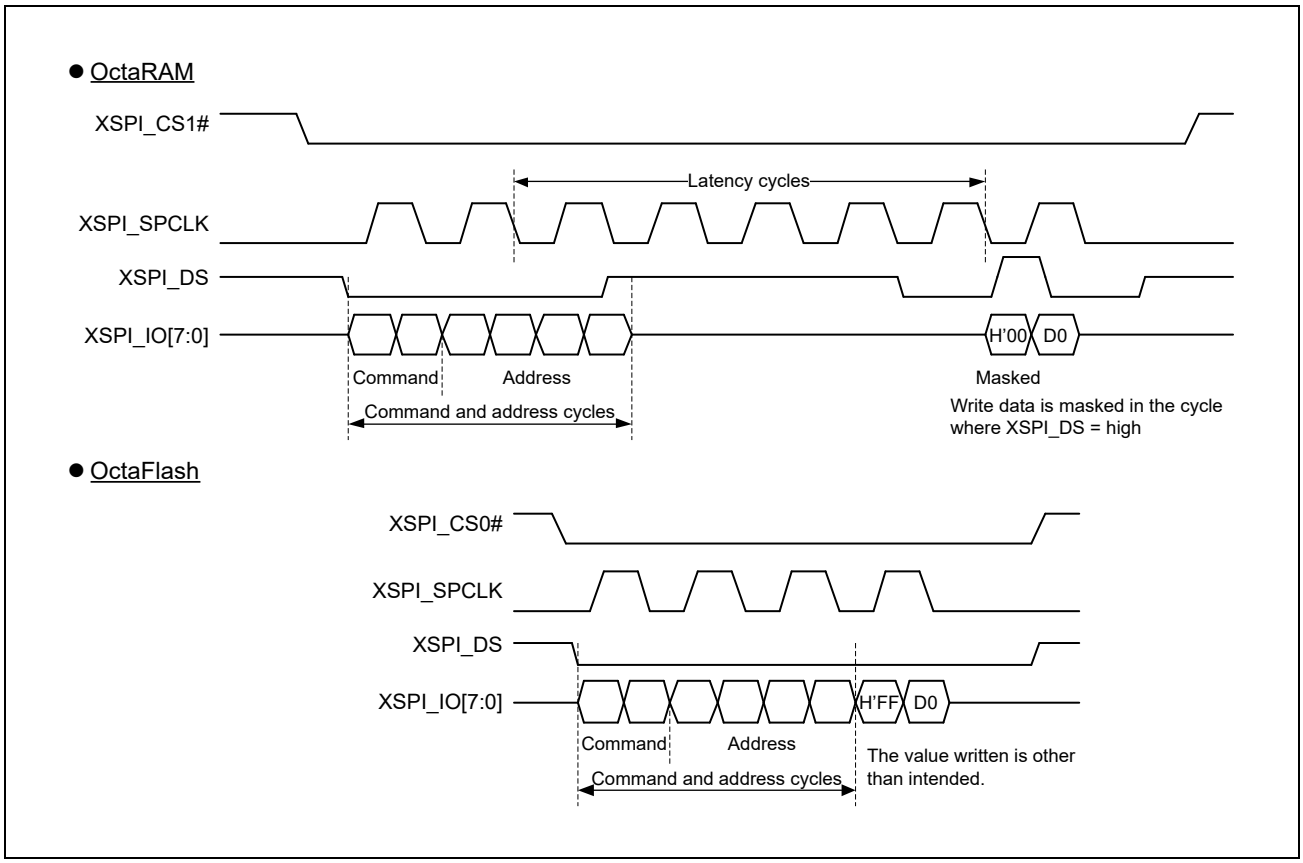

Figure 29.13 Waveforms in One-Byte Write Access in the DOPI Mode

29.5.6 Operation Flows

This section describes the flows of Octa memory controller operations for various purposes.

The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

The sample settings assume the following environment.

(1) Memory connections: CS0 (device 0) to OctaFlash and CS1 (device 1) to OctaRAM

(2) XSPI_SPCLK (Octa memory clock) frequency: 100 MHz

29.5.6.1 Initial Settings

The following shows an example of initial settings of the Octa memory controller.
Before access to the external memory, set up the SEL_SPI_OCTA bit in the xSPI/Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA) in the initial setting steps.

Table 29.6 Example of Initial Settings of the Octa Memory Controller

Step	Read/Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	DSR0	H'0800_0000	4	Specifies the type and size of device 0.
2	Write	DSR1	H'4080_0000	4	Specifies the type and size of device 1.
3	Write	MDTR	H'0740_A640	4	Adjusts the memory access timings.
4	Write	DRCSTR	H'2900_2900	4	Specifies the read timing for each device.
5	Write	DWCSTR	H'1A00_1A00	4	Specifies the write timing for each device.
6	Write	DCSTR	H'0000_2900	4	Specifies the timings of the chip select signals.
7	Write	CDSR	H'0000_000A	4	Sets up the controller functions. (1) Memory pre-cycle is enabled or disabled. (2) Transfer type is specified (SPI, SOPI, or DOPI).
8	Write	MDLR	H'0505_0E0E	4	Specifies number of dummy cycles (latency).
9	Write	MRWCR0	H'12ED_EE11	4	Specifies the read and write commands for device 0.
10	Write	MRWCR1	H'2000_A000	4	Specifies the read and write commands for device 1.
11	Write	MRWCSR	H'5454_5454	4	Sets up the memory-mapped reading and writing. (1) The length (bytes) of a command is specified. (2) The length (bytes) of an address is specified. (3) The order of bytes to be written is specified.

Note: Set up the SEL_SPI_OCTA bit in the xSPI/Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA).
For the SEL_SPI_OCTA bit, refer to **Section 45, General Purpose Input Output Port (GPIO)**.

29.5.6.2 Basic Operation Settings

This section describes the basic operations of OctaFlash and OctaRAM.

The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

(1) OctaFlash Operation Settings

Table 29.7 Write Enable Settings

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	H'0000_0006	4	H'0000_06F9	4	
2	Write	DCSR	H'0010_0000	4	H'0020_0000	4	
3	Write	CWNDR	Any value	4	Any value	4	

Table 29.8 Read Status Register

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	H'0000_0005	4	H'0000_05FA	4	
2	Write	DAR	—	—	H'0000_0000	4	
3	Write	DCSR	H'0010_0001	4	H'0C20_0401	4	
4	Read	CRR	H'0000_00xx	1	H'0000_00xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low order eight bits.

Table 29.9 Read Configuration Register

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	H'0000_0015	4	H'0000_15EA	4	
2	Write	DAR	—	—	H'0000_0001	4	
3	Write	DCSR	H'0010_0001	4	H'0C20_0401	4	
4	Read	CRR	H'0000_00xx	1	H'0000_00xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low order eight bits.

Table 29.10 Write Configuration Register

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	—	—	H'0000_01FE	4	
2	Write	DAR	—	—	H'0000_0001	4	
3	Write	DCSR	—	—	H'0420_0001	4	
4	Write	CWDR	—	—	H'0000_00xx	1	Set all the high-order 24 bits to 0s, and specify the write data in the low-order eight bits.

Table 29.11 Read Configuration Register 2

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	H'0000_0071	4	H'0000_718E	4	
2	Write	DAR	Address	4	Address	4	
3	Write	DCSR	H'0410_0001	4	H'0C20_0401	4	
4	Read	CWDR	H'0000_00xx	1	H'0000_00xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low order eight bits.

Table 29.12 Write Configuration Register 2

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	H'0000_0072	4	H'0000_728D	4	
2	Write	DAR	Address	4	Address	4	
3	Write	DCSR	H'0410_0001	4	H'0420_0001	4	
4	Write	CWDR	H'0000_00xx	1	H'0000_00xx	1	Set all the high-order 24 bits to 0s, and specify the write data in the low-order eight bits.

Table 29.16 Write Configuration Register

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	H'0000_4000	4	
2	Write	DAR	H'0004_0000	4	
3	Write	DCSR	H'04A8_0002	4	
4	Write	CWDR	H'0000_xxxx	2	Set all the high-order 16 bits to 0s, and specify the write data in the low-order 16 bits.

29.6 Delaying XSPI_DS and Auto-Calibration

29.6.1 Delaying XSPI_DS

Depending on the characteristics of the DOPI mode, the controller might not be able to latch data on the rising and falling edges of the XSPI_DS clock signal. XSPI_DS will then require a delay to allow the latching of data with sufficient margins for the setup and hold times. The DV1DEL[7:0] and DV0DEL[7:0] bits in the memory delay trimming register (MDTR) can be used to specify the amount of delay.

Figure 29.14 shows how a delayed XSPI_DS becomes asserted at a good time for latching of the data.

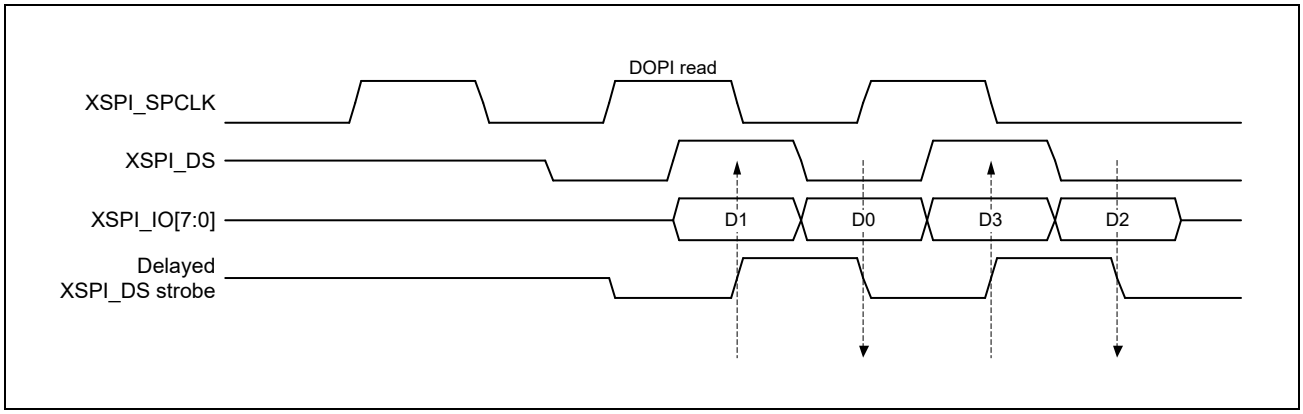

Figure 29.14 Example of Securing the Latching of Data by Delaying XSPI_DS

29.6.2 XSPI_DS Auto-Calibration

This LSI has an automatic calibration to prevent acquisition of wrong data due to the variation of voltage and temperature. When using the automatic calibration, set the following registers.

- Controller and device setting register (CDSR): Automatic calibration mode ACMODE[1:0] bits setting
- Auto-calibration timer register (ACTR): Automatic calibration cycle time setting
- Auto-calibration address registers 0 and 1 (ACAR0/ACAR1): Preamble pattern store address setting

Automatic calibration requires 16 bytes user area to store the preamble pattern. Store the preamble pattern to the setting address of ACAR0 and ACAR1.

Preamble pattern:

H’00F708F7_FF0000F7_0800FF00_FFFF0000
When MRWCSR.MRO1 or MRWCSR.MRO0 is 0,

H’00F708F7_FF0000F7_0800FF00_FFFF0000
When MRWCSR.MRO1 or MRWCSR.MRO0 is 1,

H’F700F708_00FFF700_000800FF_FFFF0000
store in the flash memory or RAM device.

The operation proceeds as follows when auto-calibration is enabled.

Once the time specified in ACTR has elapsed, the Octa memory controller varies the delay time for XSPI_DS and checks whether the preamble pattern can correctly be read from the address specified in ACAR0 or ACAR1.

The preamble pattern is read 48 times per auto-calibration.

The controller seeks the most appropriate timing of latching in this sequence of reading and updates the DV0DEL or DV1DEL bits in MDTR with the result. This re-starts the timer for auto-calibration.

Note that access to the OctaFlash memory or OctaRAM area by the CPU or other bus masters is held pending until reading of the preamble data for auto-calibration is completed.

Figure 29.15 describes the flow of automatic calibration settings for OctaFlash and OctaRAM devices.

Before starting settings, check that the Octa memory controller is selected in the SEL_SPI_OCTA bit in the xSPI/Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA).

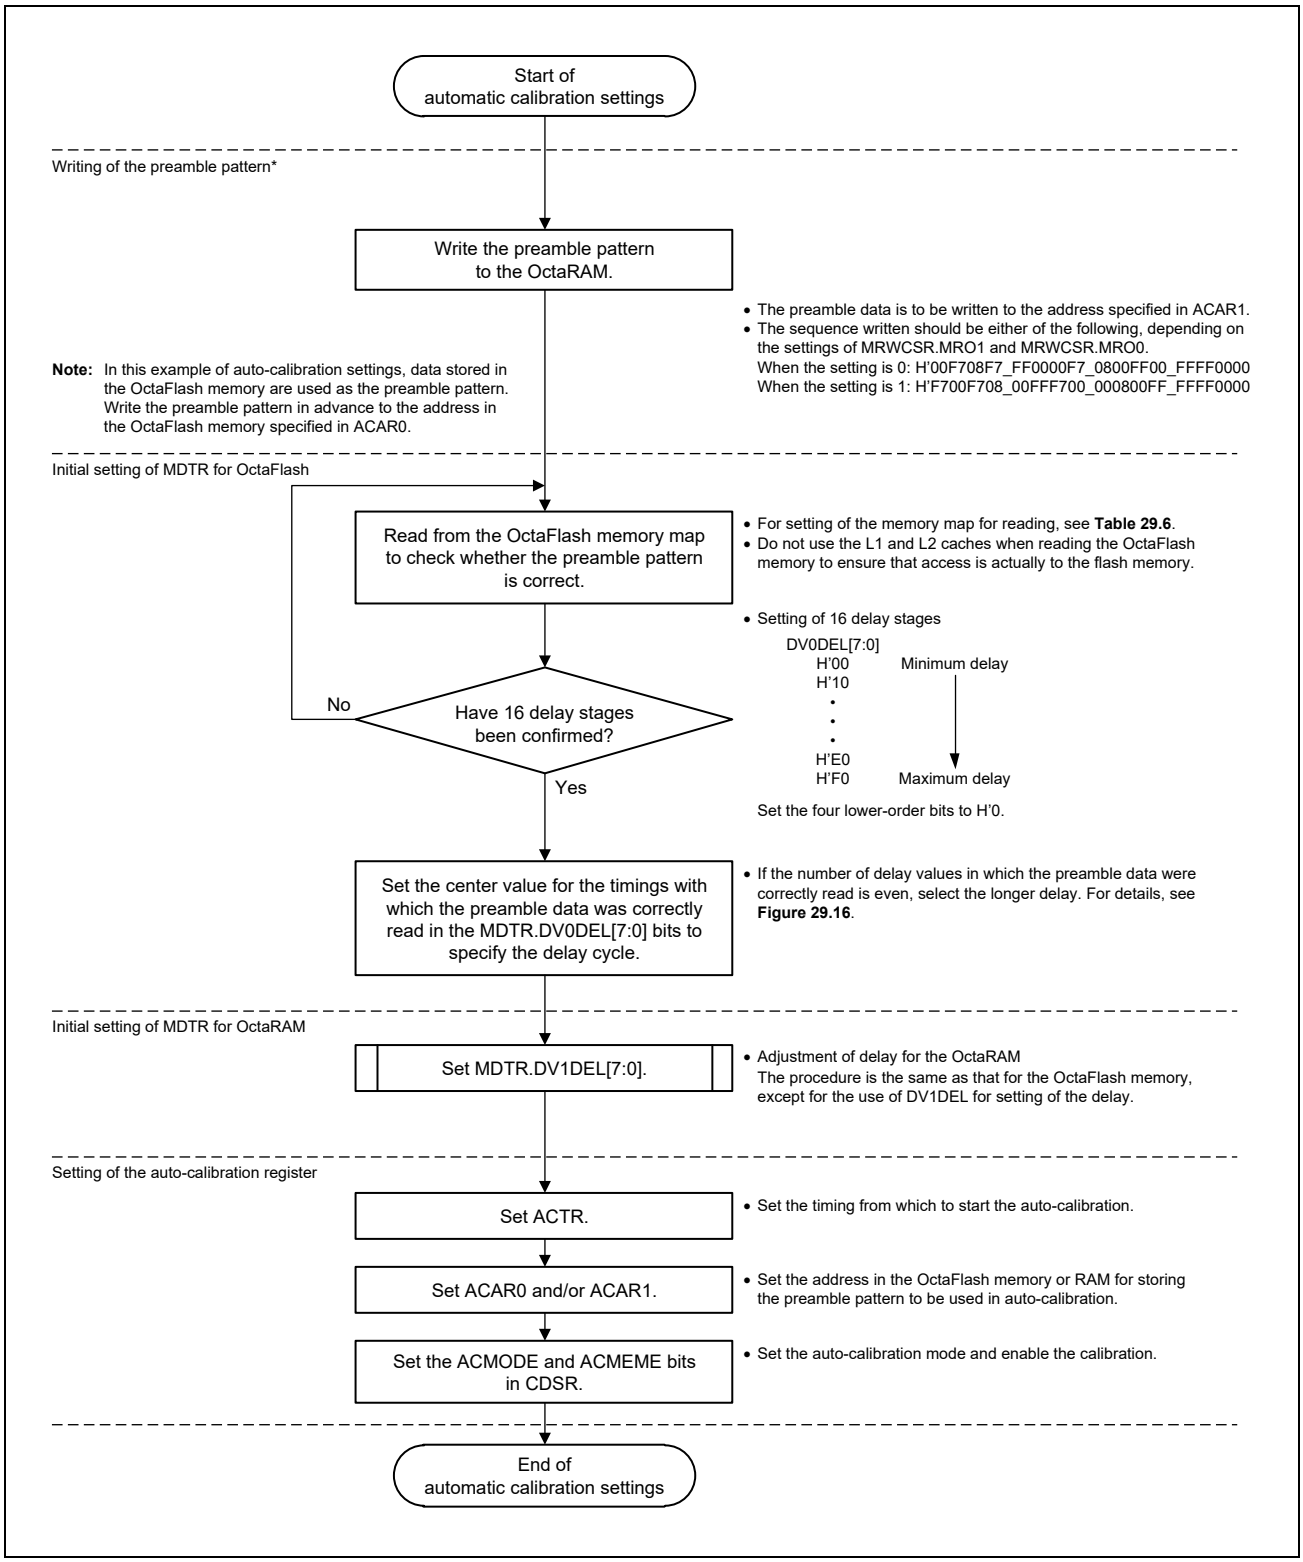

Figure 29.15 Flow of Settings for the Auto-Calibration Mode

Figure 29.16 shows an example of the initial setting of the DV0DEL or DV1DEL Bits in MDTR.

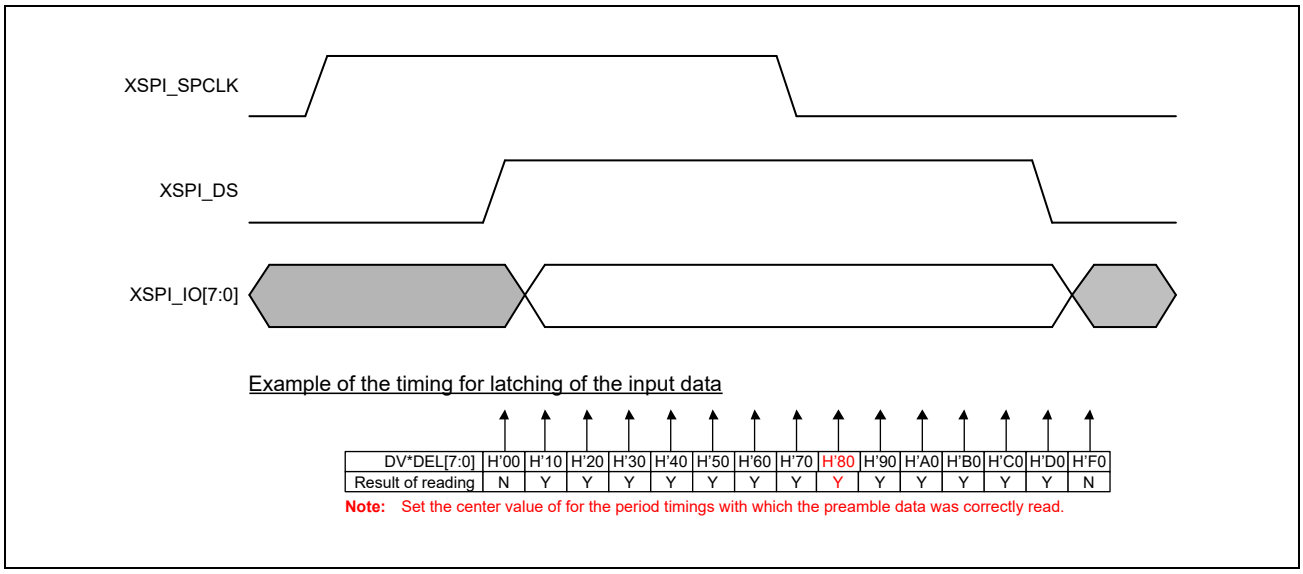

Figure 29.16 Example of the Initial Setting of the DV0DEL or DV1DEL Bits in MDTR

29.7 XSPI_DS Enable Counter

During read command operation, the XSPI_DS signal is used as the data latch clock by the controller. When the memory device is in the idle state, XSPI_DS maintains a high impedance (Hi-Z) state, and asserts low before data is output. This Hi-Z to low transition may latch wrong data by driving the XSPI_DS data latch logic of the controller.

Figure 29.15 shows the waveform when XSPI_DS maintains a high-impedance (Hi-Z) state and asserts low before data is output.

Avoiding such Hi-Z to low transitions, this controller can bypass wrong data with memory delay trim register (MDTR). (MDTR.DQSEDOPI[3:0] for Flash DOPI mode, MDTR.DQSESOPI[3:0] for Flash SOPI mode, and MDTR.DQSERAM[3:0] for RAM mode)

Each of the bit fields can be set within the range from 0 to 15.

XSPI_DS enable counter (MDTR) minimum value ≥ Number of the command cycles + number of the address cycles*1 + number of the stable XSPI_DS cycles*2 + number of the XSPI_DS delay cycles*3

XSPI_DS enable counter (MDTR) maximum value ≤ Number of the command cycles + number of the address cycles*1 + number of the memory dummy cycles (latency) + number of the XSPI_DS delay cycles*3 + pre-cycle setting*4

Note 1. Flash SOPI: Number of the command cycles + number of the address cycles = 2 + 4 = 6
Flash DOPI: Number of the command cycles + number of the address cycles = 1 + 2 = 3
RAM DOPI: number of command cycles + number of address cycles = 1 + 2 − 1 = 2 (start dummy (latency) calculation from the second cycle)

Note 2. Number of stable XSPI_DS cycles: Maximum value is 2 cycles of XSPI_SPCLK (Reference specification of OctaFlash/OctaRAM)

Note 3. Number of the XSPI_DS delay cycles: XSPI_DS clock delay due to external causes
When XSPI_DS delay ≤ 0.25 XSPI_SPCLK: XSPI_DS delay cycles = −1
When 0.25 XSPI_SPCLK < XSPI_DS delay ≤ 1.25 XSPI_SPCLK: XSPI_DS delay cycles = 0
When 1.25 XSPI_SPCLK < XSPI_DS delay ≤ 2.25 XSPI_SPCLK: XSPI_DS delay cycles = 1
In the flash SOPI mode, read 0.25 as 0.5, 1.25 as 1.5, and 2.25 as 2.5 in the above expressions.

Note 4. Pre-cycle setting: XSPI_DS pre-cycle on/off
XSPI_DS pre-cycle off: Pre-cycle setting = 0
XSPI_DS pre-cycle on: Pre-cycle setting = −1

Setting example: Flash DOPI mode, dummy cycles (latency) = 4, pre-cycle is off

Minimum value of XSPI_DS enable counter (MDTR) ≥ 1 + 2 + 2 + 0 = 5
Maximum value of XSPI_DS enable counter (MDTR) ≤ 1 + 2 + 4 + 0 = 7

From the above, setting MDTR .DQSEDOPI[3:0] from 5 to 7 can latch the correct data. If MDTR is too small, wrong data may be latched due to a transition from Hi-Z to Low. If MDTR is too large, no data is latched.

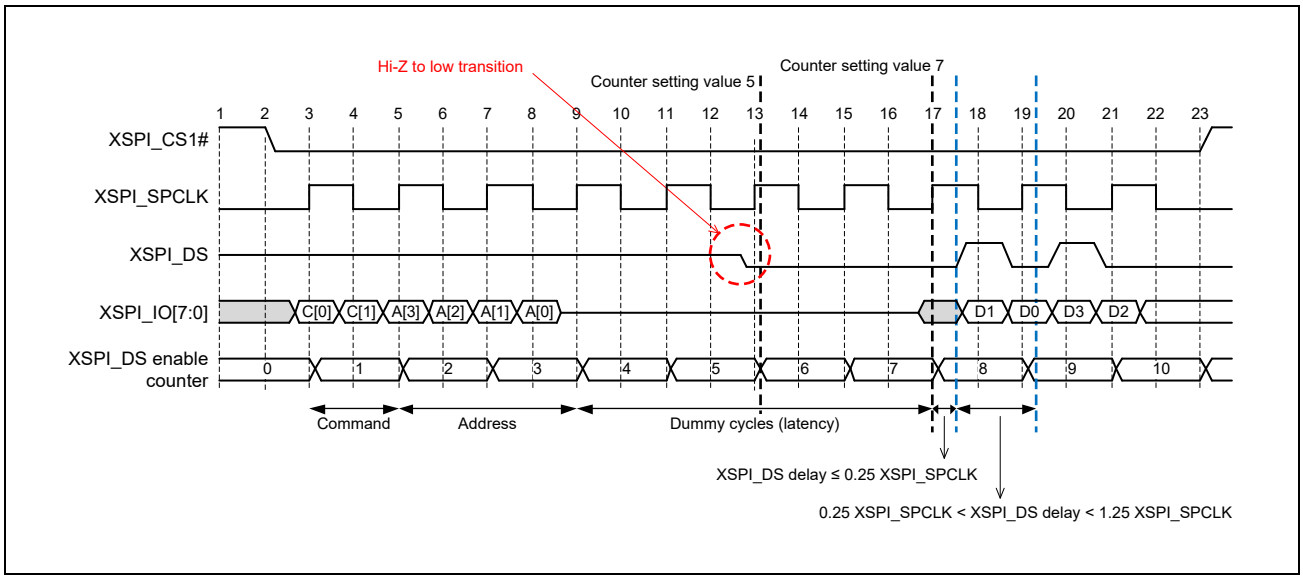

Figure 29.17 Timing of the XSPI_DS Enable Counter in DOPI Mode for the Flash Memory with 4 as the Number of Dummy Cycles (Latency), and XSPI_DS Pre-Cycle Off

30. CAN-FD Interface (CAN-FD)

30.1 Overview

The LSI has a 2-channel CAN-FD module (CAN-FD) that complies with ISO 11898-1 (2015) Standards. CAN-FD transmits and receives both formats of messages, namely the standard identifier (11 bits) (identifier is hereafter referred to as ID) and extended ID (29 bits). **Table 30.1** lists the specifications of the CAN-FD, **Figure 30.1** shows a block diagram of the CAN-FD, and **Table 30.2** lists the I/O pins.

Table 30.1 CAN-FD Specifications (1/2)

Parameter	Description
Number of channels	Two channels
Protocol	CAN-FD ISO 11898-1 (CD2015) compliant
Communication speed	• CAN-FD mode Nominal bit rate: Max. 1 Mbps Data bit rate: Max. 8 Mbps
Buffer	Total 192 buffers (when frame size is 76 bytes) • Individual buffers: 64 buffers (32 buffers × 2 channels) Transmit buffer: 32 buffers per channel Transmit queue: 4 queues per channel (shared with transmit buffer, up to 16 buffers allocatable) • Shared buffers: 128 buffers for all channels Receive buffers: Up to 32 RXMB Receive FIFO buffer: 8 FIFO Buffers Common FIFO buffer: Up to 6 FIFO Buffers individually configurable as RX FIFO/TX FIFO/ Gateway FIFO
Reception function	• Receives data frames and remote frames • Selects ID format (standard ID, extended ID, or both IDs) to be received • Sets interrupt enable/disable for each FIFO • Mirror function (reception of messages transmitted from the CAN node itself) • Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	• Selects receive message according to 128 receive rules • Sets the number of receive rules (0 to 128) for each channel • Acceptance filter processing: Sets ID and mask for each receive rule • DLC filter processing: Enables DLC filter check for each acceptance rule
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Label addition function Stores label information together with a message in a receive buffer and FIFO buffer
Transmission function	• Transmits data frames and remote frames • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer • Selects ID priority transmission or transmit buffer number priority transmission • Transmit request can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmit message at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority
Transmit history function	Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information
Gateway function	Transmits a received message automatically

Table 30.1 CAN-FD Specifications (2/2)

Parameter	Description
Bus off recovery mode selection	Selects the method for returning from bus-off state. • ISO 11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus-off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, from error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock) • Defects error status transitions (error warning, error passive, bus-off entry, and bus-off recovery) • Reads the error counter • Monitors DLC errors
Interrupt source	8 interrupt sources • Global interrupts (2 sources) RX FIFO interrupt Global error interrupt • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0, 1) – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) – CANm transmit history interrupt – CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt 10 DMA requests • 8 for RX FIFO • 2 for the first common FIFO (1 source/channel)
CAN clock source	Selects the PCLKM/2 (40 MHz) or the PCLKCAN (Less than 80 MHz)
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test (CRC error test enabled)
Power down function	Module start stop function for each CAN node (Channel & Global Sleep Mode)
Bus traffic measurement	CAN bus traffic measurement of each Channel is possible

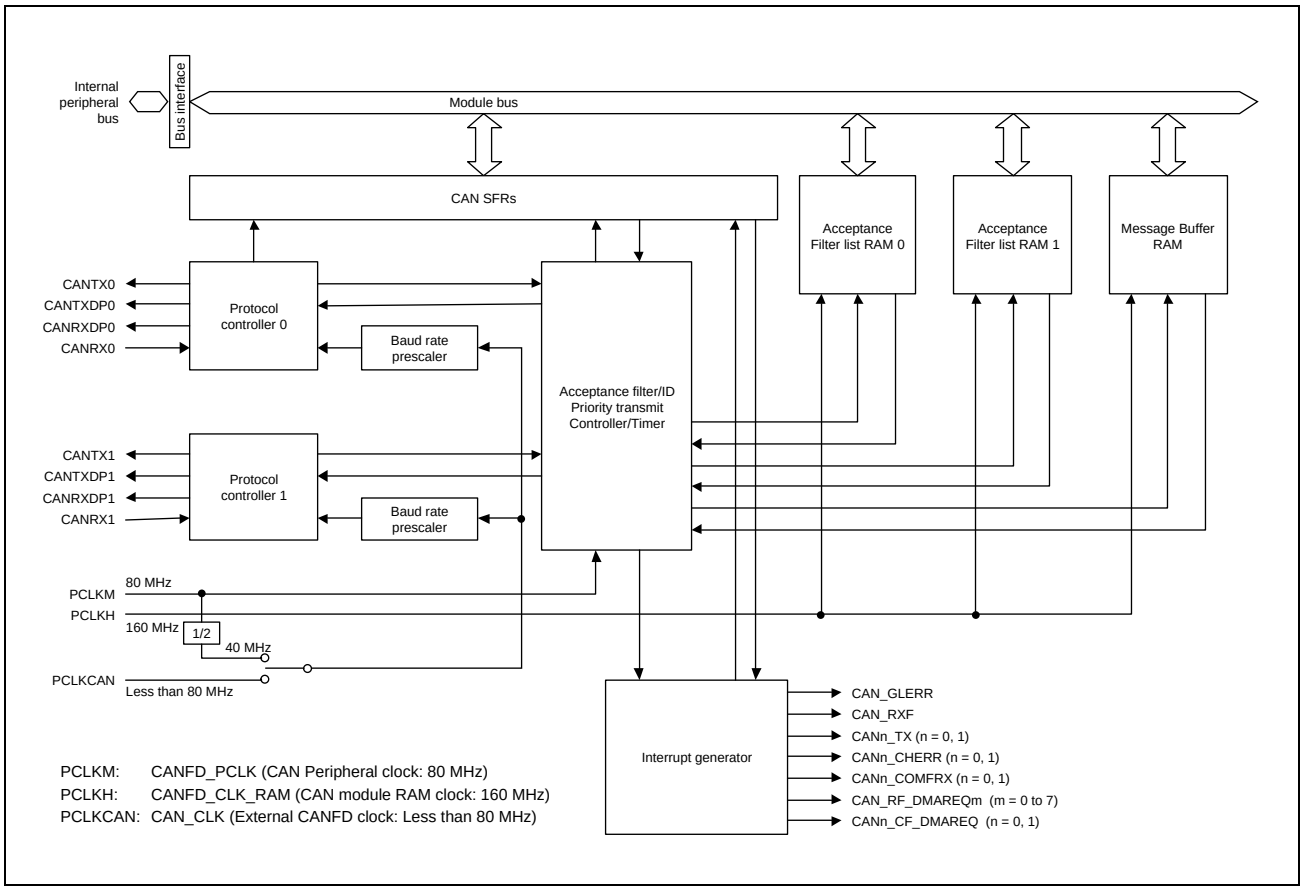

Figure 30.1 Block Diagram of CAN-FD

Table 30.2 lists the input/output pins of the CAN-FD module.

Table 30.2 Pin Configuration of CAN-FD

Channel	Pin Name	I/O	Function
CAN0	CAN0_RX	Input	CAN0 receive data input (CANRX0)
	CAN0_TX	Output	CAN0 transmit data output (CANTX0)
	CAN0_RX_DATARATE_EN	Output	CAN0 receive data phase output (CANRXDP0)
	CAN0_TX_DATARATE_EN	Output	CAN0 transmit data phase output (CANTXDP0)
CAN1	CAN1_RX	Input	CAN1 receive data input (CANRX1)
	CAN1_TX	Output	CAN1 transmit data output (CANTX1)
	CAN1_RX_DATARATE_EN	Output	CAN1 receive data phase output (CANRXDP1)
	CAN1_TX_DATARATE_EN	Output	CAN1 transmit data phase output (CANTXDP1)

Table 30.3 CAN-FD Interrupt Sources

Name	Interrupt Sources	Cortex-A55 Request	Cortex-M33/ Cortex-M33_ FPU Request	DMAC Activation
CAN_RXF	RX FIFO interrupt (INTRCANGRECC)	Possible	Possible	Not possible
CAN_GLERR	Global error interrupt (INTRCANGERR)	Possible	Possible	Not possible
CANn_TX	Channel n TX interrupt (INTRCANnTRX)	Possible	Possible	Not possible
CANn_CHERR	Channel n CAN error interrupt (INTRCANnREC)	Possible	Possible	Not possible
CANn_COMFRX	Channel n Common RX FIFO or TXQ interrupt (INTCANnERR)	Possible	Possible	Not possible
CAN_RF_DMAREQm	RX FIFO m DMA request (RXF_DMAm)	Not possible	Not possible	Possible
CANn_CF_DMAREQ	Channel n First common FIFO DMA request (COM_DMAn)	Not possible	Not possible	Possible

Note: m = 0 to 7, n = 0, 1

30.2 Register Descriptions

Table 30.4 shows the register configuration. The CAN-FD address space is offset from the base address. The base address of CAN-FD is as follows.

CAN-FD base address: H'0_100C_0000 (Overall Address Space)
CAN-FD base address: H'400C_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
CAN-FD base address: H'500C_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

For all repetitive registers and bits, a lowercase index is used to indicate which slice is being referenced. If an index is being used, it is defined and described below the Register Table it is being used in.

There is one global index used across all the registers and bits that need it.

Table 30.4 Register Configurations (1/4)

Register Name	Symbol	Value After Reset	Offset Address N/A (after)	Access Size
Channel n Nominal Bit Rate Configuration Register (n = 0, 1)	CFDCnNCFG	H'0000_0000	H'0000 + n × H'0010	8, 16, 32
Channel n Control Registers (n = 0, 1)	CFDCnCTR	H'0000_0005	H'0004 + n × H'0010	8, 16, 32
Channel n Status Registers (n = 0, 1)	CFDCnSTS	H'0000_0005	H'0008 + n × H'0010	8, 16, 32
Channel n Error Flag Registers (n = 0, 1)	CFDCnERFL	H'0000_0000	H'000C + n × H'0010	8, 16, 32

Note 1. The RAM area is initialized after HW reset, refer **Section 30.4.2, CAN Module Configuration after Hardware Reset**.

30.2.1 Channel n Nominal Bit Rate Configuration Register (CFDCnNCFG) (n = 0, 1)

The CFDCnNCFG register is used to configure the transmission/reception nominal bit rate parameters of the channels. Do not write this register in CH_OPERATION or CH_SLEEP mode. Set this register in CH_RESET or CH_HALT mode.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0000 + H'10 × n

9 to 0	NBRP[9:0]	All 0	R/W	Nominal Bit Rate Prescaler Nominal bit rate prescaler division ratio setting

NBRP[9:0] bits (Nominal Bit Rate Prescaler)

The NBRP[9:0] bits are used to define the peripheral bus clock periods contained in a time quantum.

NSJW[6:0] bits (Nominal Bit Rate Resynchronization Jump Width Control)

The NSJW[6:0] bits set the synchronization jump width. A value from 1 to 128 time quanta can be set.

NTSEG1[7:0] bits (Nominal Bit Rate Time Segment 1 Control)

The NTSEG1[7:0] bits set the segment TSEG1 to compensate for edges on the CAN bus with a positive phase error. These bits contain the propagation segment. Configure a Tq value only between 2 and 256, inclusive. See **Section 30.4.1.2, CAN Bit Timing** for more details.

NTSEG2[6:0] bits (Nominal Bit Rate Time Segment 2 Control)

The NTSEG2[6:0] bits set the segment TSEG2 to compensate for edges on the CAN bus with a negative phase error. Configure a Tq value only between 2 and 128, inclusive.

30.2.2 Channel n Control Register (CFDCnCTR) (n = 0, 1)

The CFDCnCTR register controls the modes of the related channel. It is used to enable generation of interrupts if errors are detected on the CAN bus connected to this channel. It is also used to configure the channel in test mode.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0004 + H'10 × n

1, 0	CHMDC[1:0]	01	R/W	Mode Select 00: Channel Communication mode 01: Channel Reset mode 10: Channel Halt mode 11: Setting prohibited

CHMDC[1:0] bits (Mode Select)

The CHMDC[1:0] bits can be used to configure modes of the CAN channel.

CAN mode transitions are described in more details in **Section 30.3.3, Channel Modes**.

Setting CHMDC[1:0] bits to 11b has no effect. When the CAN-FD module is in GL_HALT mode, these bits can only be set to 10b or 01b. These bits cannot be set in CH_SLEEP mode.

These bits can change automatically when transitioning to Halt mode by the CFDCnCTR.BOM settings.

If CPU write access to CFDCnCTR.CHMDC occurs at the same time when the CAN channel enters Halt mode (at the start of bus-off when CFDCnCTR.BOM[1:0] = 01b, or at the end of bus-off when CFDCnCTR.BOM[1:0] = 10b), then the CPU write access has the highest priority.

The CAN channel changes the value of CFDCnCTR.CHMDC within the Channel Control Registers for the specified cases only if the CFDCnCTR.CHMDC[1:0] value is 00b (Operation mode).

CSLPR bit (Channel Stop Mode)

When the CSLPR bit is 1, a Sleep mode request is generated for the corresponding CAN channel.

When this bit is 0, a request to exit Sleep mode is generated for the related CAN-FD channel.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

RTBO bit (Forcible Return from Bus-Off)

When the protocol controller of the CAN channel enters bus-off state, you can force a recovery from bus-off state by setting the RTBO bit in the Channel Control Register to 1.

The error state changes from bus-off state to integrating with a maximum delay of 1 CAN bit time.

When the RTBO bit is set to 1, the REC and TEC registers are initialized and the Bus-Off Status bit (Channel Bus-off Status, CFDCnSTS.BOSTS) is set to 0.

Registers other than the REC and TEC registers are not initialized by this command. Even if CFDCnCTR.BORIE is set, a bus-off recovery interrupt is not generated by this recovery from the bus-off state.

The RTBO bit cannot be set in CH_SLEEP mode. Setting this bit in any state other than bus-off state has no effect and the bit is cleared immediately. The read value is always 0.

Return from the Bus-Off command should be used only when CFDCnCTR.BOM[1:0] is set to 00b.

Only write to this bit when the related CAN-FD channel is in CH_OPERATION mode. This bit is automatically cleared when set by software.

BEIE bit (Bus Error Interrupt Enable)

When the BEIE and the CFDCnERFL.BEF bits are both 1, an error interrupt request is generated.

This bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

EWIE bit (Error Warning Interrupt Enable)

When the EWIE and the CFDCnERFL.EWF bits are both 1, an error interrupt request is generated.

The EWIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

EPIE bit (Error Passive Interrupt Enable)

An error interrupt request is generated when the EPIE bit and the CFDCnERFL.EPF are both 1.

The EPIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

BOEIE bit (Bus-Off Entry Interrupt Enable)

When the BOEIE and the CFDCnERFL.BOEF bits are both 1, an error interrupt request is generated.

The BOEIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

BORIE bit (Bus-Off Recovery Interrupt Enable)

When the BORIE and the CFDCnERFL.BORF bits are both 1, an error interrupt request is generated.

The BORIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

OLIE bit (Overload Interrupt Enable)

When the OLIE and the CFDCnERFL.OVLF bits are both 1, an error interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

BLIE bit (Bus Lock Interrupt Enable)

When the BLIE and the CFDCnERFL.BLF bits are both 1, an error interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

ALIE bit (Arbitration Lost Interrupt Enable)

When the ALIE and the CFDCnERFL.ALF bits are both 1, an error interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

TAIE bit (Transmission Abort Interrupt Enable)

When the TAIE bit is 1 and a transmission is successfully aborted from the transmit buffer, an interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

EOCOIE bit (Error Occurrence Counter Overflow Interrupt Enable)

When the EOCOIE bit is 1 and the CFDCnFDSTS.EOCO bit belonging to the corresponding CAN channel is 1, an error interrupt request is generated.

The EOCOIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

SOCOIE bit (Successful Occurrence Counter Overflow Interrupt Enable)

When the SOCOIE bit is 1 and the CFDCnFDSTS.SOCO bit belonging to the corresponding CAN channel is 1, an error interrupt request is generated.

The SOCOIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

TDCVFIE bit (Transceiver Delay Compensation Violation Interrupt Enable)

When the TDCVFIE bit is 1 and the CFDCnFDSTS.TDCVF bit belonging to the corresponding CAN channel is 1, an error interrupt request is generated.

The TDCVFIE bit cannot be set in CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

BOM[1:0] bits (Bus-Off Recovery Mode Select)

The BOM[1:0] bits control the timing of the recovery from Bus-Off mode of the CAN-FD Channel.

Do not write to these bits in CH_SLEEP mode. Only write to these bits when the related CAN-FD channel is in CH_RESET mode.

ERRD bit (Error Display Mode Select)

The ERRD bit controls the display mode of the error flag bits [14:8] in the Channel Error Flag Register (CFDCnERFL).

If the ERRD bit is 0 and more than one errors occur at the same time, the error flag bits are set for all the errors that occurred at the same time. No further errors are flagged until the error flag bits [14:8] are cleared.

Do not write to the ERRD bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

CTME bit (Communication Test Mode Enable)

The CTME bit enables the channel test modes.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_HALT mode.

CTMS[1:0] bits (Communication Test Mode Select)

The CTMS[1:0] bits are used to select the required test mode.

Do not write to these bits in CH_SLEEP or CH_RESET mode. Only write to these bits when the related CAN-FD channel is in CH_HALT mode.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

CRCT bit (CRC Error Test Enable)

The CRCT bit checks the internal CRC generator logic of the protocol controller.

This bit inverts the first bit (ID bit) of the CAN message data stream that is being received, so that the internal generated CRC result does not match the received CRC value of the frame. Refer to the bit stuffing rule when using this feature for the possibility of receiving a stuff error (due to the inversion) rather than a CRC error.

The internal generated CRC value is always observed in the following registers:

- CFDCnFDCRC.CRCREG (CAN-FD frames)

Some limitations exist when using this bit:

- It is not possible to use this feature with CAN nodes connected to the device externally, only with nodes connected to the internal CAN bus communication can be used
- One CAN node can send a reference message and the receiver node can invert one bit of the incoming bit stream

Note: The transmitter and receiver modes share the same CRC generator, therefore it is not necessary to consider the modes separately when testing this limitation.

The CRC Error Test mode is enabled if the CRCT (new control signal that inverts the first bit of the bit stream) and CTME bits are both 1.

Do not write to the CRCT bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_HALT mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

ROM bit (Restricted Operation Mode Enable)

When the ROM and CTME bits are both 1, the restricted operation mode is enabled. This mode should only be used in basic test mode (CFDCnCTR.CTMS[1:0] = 00b).

The ROM bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_HALT mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

30.2.3 Channel n Status Register (CFDCnSTS) (n = 0, 1)

The CFDCnSTS register shows the mode, error, and transmission/reception status of the related channel together with its reception and transmission error count values.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0008 + H'10 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	TEC[7:0]	H'00	R	Transmission Error Count The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	H'00	R	Reception Error Count The receive error counter (REC) can be read.
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
8	ESIF	0	R/W	Error State Indication Flag 0: No CAN-FD message whose ESI bit is recessive has been received 1: At least one CAN-FD message whose ESI bit is recessive has been received
7	COMSTS	0	R	Communication Status Flag 0: Communication is not ready 1: Communication is ready
6	RECSTS	0	R	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	0	R	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	0	R	Bus-Off Status Flag 0: Not in bus-off state 1: In bus-off state
3	EPSTS	0	R	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	1	R	Channel Stop Status Flag 0: Not in Channel Sleep mode 1: In Channel Sleep mode
1	CHLTSTS	0	R	Channel Halt Status Flag 0: Not in Channel Halt mode 1: In Channel Halt mode

Bit	Bit Name	Initial Value	R/W	Description
0	CRSTSTS	1	R	Channel Reset Status Flag 0: Not in Channel Reset mode 1: In Channel Reset mode

CRSTSTS bit (Channel Reset Status Flag)

The CRSTSTS bit indicates whether the related CAN channel is in Reset mode.

This bit is set automatically when the related CAN channel enters Channel Reset mode. When the mode is changed from Reset mode to Sleep mode, the CRSTSTS bit remains 1.

This bit is cleared automatically when the related CAN channel exits the Channel Reset mode, except when changing to Sleep mode.

CHLTSTS bit (Channel Halt Status Flag)

The CHLTSTS bit indicates whether the related CAN channel is in Halt mode.

This bit is set automatically when the related CAN module enters Halt mode, and is cleared automatically when the related CAN module exits Halt mode.

CSLPSTS bit (Channel Stop Status Flag)

The CSLPSTS bit indicates whether the related CAN channel is in Sleep mode.

This bit is set automatically when the related CAN-FD channel enters Sleep mode, and is cleared automatically when the related CAN-FD channel exits Sleep mode.

EPSTS bit (Error Passive Status Flag)

The EPSTS bit indicates whether the related CAN-FD channel has entered the error passive state.

This bit is set automatically when the value of the CAN Transmission or Reception Counter Register exceeds the value of H’7F.

This bit is cleared automatically when the related CAN-FD channel exits the error passive state or enters Reset mode.

BOSTS bit (Bus-Off Status Flag)

The BOSTS bit indicates whether the related CAN-FD channel has entered the error bus-off state.

This bit is set automatically when the value of the related CAN Transmission Error Count Register exceeds H’FF and the related CAN-FD channel is in the bus-off state (CAN Transmission Error Count Register > H’FF).

This bit is cleared automatically when the related CAN-FD channel exits bus-off state.

TRMSTS bit (Transmit Status Flag)

The TRMSTS bit indicates whether the related CAN-FD channel is transmitting a message.

This bit is set automatically when the related CAN-FD channel is operating as a transmitter node or is in the bus-off state.

This bit is cleared automatically when the related CAN-FD channel is in the bus-idle state or starts operating as a receiver node.

RECSTS bit (Receive Status Flag)

The RECSTS bit indicates whether the related CAN-FD channel is receiving a message.

This bit is set automatically when the related CAN-FD channel is operating as a receiver node.

This bit is cleared automatically when the related CAN-FD channel is in the bus-idle state or starts operating as a transmitter node.

COMSTS bit (Communication Status Flag)

The COMSTS bit indicates whether the related CAN-FD channel is ready for communication.

This bit is set automatically when the related CAN-FD channel is ready to perform communication following the detection of 11 consecutive recessive bits after exiting the Reset or Halt mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

Note: This bit is 1 during bus-off state.

ESIF bit (Error State Indication Flag)

The ESIF bit is set when the ESI bit is sampled recessive for a reception CAN message without any error. When in Loopback or Mirror mode, the self-transmitted messages are considered reception messages.

If a set from the CAN-FD channel occurs simultaneously with a clear by a write access, then the bit is set.

This bit is cleared by writing 0 to it. This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

REC[7:0] bits (Reception Error Count)

The REC[7:0] bits increment or decrement the counter value according to error status of the CAN-FD channel during reception, and display the value of the REC error counter.

The value in bus-off state is indeterminate.

These bits are cleared automatically when the CAN-FD module enters GL_RESET or the CAN-FD channel is in CH_RESET mode.

TEC[7:0] bits (Transmission Error Count)

The TEC[7:0] bits increment or decrement the counter value according to error status of the CAN-FD channel during transmission, and display the value of the TEC error counter.

Only write to these bits when in test mode and CAN-FD channel is in CH_HALT mode.

These bits are cleared automatically when CAN-FD module is in GL_RESET or CAN-FD channel is in CH_RESET mode.

30.2.4 Channel n Error Flag Register (CFDCnERFL) (n = 0, 1)

The CFDCnERFL register shows the status of various error conditions detectable regardless of the setting of the related CAN Channel Error Interrupt Enable Register. It also shows the status of the various bus errors detectable by the CAN channel. Refer to the CAN specification (ISO 11898-1) for a description of error occurrence conditions.

Only write to this register when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'000C + H'10 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3	BOEF	0	R/W*1	Bus-Off Entry Flag 0: Channel bus-off entry not detected 1: Channel bus-off entry detected
2	EPF	0	R/W*1	Error Passive Flag 0: Channel error passive not detected 1: Channel error passive detected
1	EWF	0	R/W*1	Error Warning Flag 0: Channel error warning not detected 1: Channel error warning detected
0	BEF	0	R/W*1	Bus Error Flag 0: Channel bus error not detected 1: Channel bus error detected

Note 1. To clear each flag of this register, software must write 0 to the corresponding bit. These flags cannot be set to 1 by software.

BEF bit (Bus Error Flag)

The BEF bit indicates a detection of a CAN channel bus error state, flagged by bits [14:8] in this register.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when a bus error is detected, and is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

EWF bit (Error Warning Flag)

The EWF bit indicates whether an error warning condition has been detected for the CAN channel.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when either TEC or REC exceeds H’5F.

The setting of this bit only occurs when the TEC or REC initially exceeds H’5F. Therefore, if the TEC or REC remains > H’5F and the EWF bit is cleared by software, it is not set again until both the TEC and REC go below H’60 and either TEC or REC crosses over again from a value H’5F to a value > H’5F.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

EPF bit (Error Passive Flag)

The EPF bit indicates a detection of a CAN channel error passive state.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when the CAN error state becomes error passive state.

The setting of this bit only occurs when the TEC or REC initially exceeds H’7F. Therefore, if the TEC or REC remains > H’7F and the bit is cleared by software, it is not set again until both the TEC and REC go below H’80 and either TEC or REC crosses over again from a value ≤ H’7F to a value > H’7F.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

BOEF bit (Bus-Off Entry Flag)

The BOEF bit indicates a detection of a CAN channel bus-off entry state.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when the CAN error state enters the bus-off state.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If a set condition occurs simultaneously with a clear condition, then the bit is set.

BORF bit (Bus-Off Recovery Flag)

The BORF bit indicates a detection of a CAN channel bus-off recovery state.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically if CAN channel recovers from bus-off state in the following conditions:

- When CFDCnCTR.BOM[1:0] is 00b and normal recovery (11 consecutive recessive bits × 128 times detected) occurs
- When CFDCnCTR.BOM[1:0] is 10b and normal recovery (11 consecutive recessive bits × 128 times detected) occurs
- When CFDCnCTR.BOM[1:0] is 11b and normal recovery (11 consecutive recessive bits × 128 times detected) occurs.

The bit is not set if CAN channel recovers from bus-off state in the following conditions:

- When CAN Reset mode is requested
- When CFDCnCTR.RTBO is set to 1 (the CAN channel returns to error active)
- When CFDCnCTR.BOM[1:0] is 01b
- When CFDCnCTR.BOM[1:0] is 11b and a halt request is asserted before the CAN channel reaches the end of the bus- off state.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If a set condition occurs simultaneously with a clear condition, the flag is set.

OVLF bit (Overload Flag)

The OVLF flag indicates a detection of a CAN channel overload state.

The OVLF bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when an overload condition is detected. If a set condition occurs simultaneously with a clear condition, then the bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

BLF bit (Bus Lock Flag)

The BLF bit indicates a detection of a CAN channel bus lock condition.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when 32 consecutive dominant bits are detected on the CAN bus while the CAN channel is in Operation mode.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

ALF bit (Arbitration Lost Flag)

The ALF bit indicates a detection of a CAN channel bus arbitration-lost condition.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

The bit is set automatically when an arbitration-lost condition is detected on the CAN bus while the CAN channel is in Operation mode.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

SERR bit (Stuff Error Flag)

The SERR bit indicates a detection of a CAN stuff error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a stuff error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000000b.

FERR bit (Form Error Flag)

The FERR bit indicates a detection of a CAN form error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a form error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000000b.

AERR bit (Acknowledge Error Flag)

The AERR bit indicates a detection of a CAN acknowledge error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when an acknowledge error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000000b.

CERR bit (CRC Error Flag)

The CERR bit indicates a detection of a CAN CRC error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a CRC error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000000b.

B1ERR bit (Recessive Bit Error Flag)

The B1ERR bit indicates a detection of a recessive bit error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a recessive bit error (expected recessive bit, sampled as dominant bit) is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000001b.

B0ERR bit (Dominant Bit Error Flag)

The B0ERR bit indicates a detection of a dominant bit error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a dominant bit error (expected dominant bit, sampled as recessive bit) is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000000b.

ADERR bit (Acknowledge Delimiter Error Flag)

The ADERR bit indicates a detection of an acknowledge delimiter bit error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a form error is detected during the acknowledge delimiter state of frame transmission. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at the error flag bits [14:8] in the CFDCnERFL register is already set. Otherwise, this bit is set if the error flag bits [14:8] in the CFDCnERFL register is 0000000b.

CRCREG[14:0] bits (CRC Calculation Data (CRC length: 15 bits))

The CRCREG[14:0] bits read the calculated CRC value when CFDCnCTR.CTME bit is 1 for the channel.

If CFDCnCTR.CTME bit is 0, then these bits are always read as 0.

These bits show the CAN2.0 CRC value calculated by the CAN-FD channel logic when the CTME bit is enabled.

The CFDCnERFL.CRCREG value is updated in the first bit of the CRC field of the CAN frame (reception and transmission).

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

30.2.5 Channel n Data Bit Rate Configuration Register (CFDCnDCFG) (n = 0, 1)

The CFDCnDCFG register configures the transmission/reception data bit rate parameters of the channels.

Do not write to this register in CH_OPERATION or CH_SLEEP mode. Only write to this register in CH_RESET or CH_HALT mode.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1400 + H'20 × n

7 to 0	DBRP[7:0]	H'00	R/W	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

DBRP[7:0] bits (Data Bit Rate Prescaler Division Ratio Setting)

The DBRP[7:0] bits define the peripheral bus clock periods contained in a time quantum.

DTSEG1[4:0] bits (Data Bit Rate Time Segment 1 Control)

The DTSEG1[4:0] bits set the segment TSEG1 to compensate for edges on the CAN bus with a positive phase error. A value from 2 to 32 time quanta can be set.

The DTSEG1[4:0] bits are also used to set the propagation segment.

Do not write any other value to these bits. See **Section 30.4.1.2, CAN Bit Timing** for more details.

DTSEG2[3:0] bits (Data Bit Rate Time Segment 2 Control)

The DTSEG2[3:0] bits set the segment TSEG2 to compensate for edges on the CAN bus with a negative phase error. A value from 2 to 16 time quanta can be set.

Do not write any other value to these bits.

DSJW[3:0] bits (Data Bit Rate Resynchronization Jump Width Control)

The DSJW[3:0] bits set the synchronization jump width. A value from 1 to 16 time quanta can be set.

30.2.6 Channel n CAN-FD Configuration Register (CFDCnFDCFG) (n = 0, 1)

The CFDCnFDCFG register configures which communication direction (transmitter/receiver) errors are counted.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1404 + H'20 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

EOCCFG[2:0] bits (Error Occurrence Counter Configuration)

The EOCCFG[2:0] bits select which type of CAN frame configuration and direction, including protocol errors are counted.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

TDCOC bit (Transmitter Delay Compensation Offset Configuration)

The TDCOC bit selects which offset is used when defining the position of the secondary sample point (SSP) for the CAN- FD channel. If the bit is set to 0, the position of the SSP is the measured transceiver delay plus the fixed offset. If the bit is 1, the position of the SSP is defined only by the offset.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

TDCE bit (Transceiver Delay Compensation Enable)

The TDCE bit enables the transceiver delay compensation for the CAN-FD channel.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

ESIC bit (Error State Indication Configuration)

Bus controllers that are used as CAN-to-CAN gateway support that in every forwarded CAN-FD message. The ESI flag does not change to reflect the status of the gateway, bridge, or router but instead the flag is sent as it was in the original message.

The ESIC bit controls the transmission of either the ESI flag information or the message of ESI flag information (CFDCFFDCSTSn.CFESI or CFDTMFDCTRn.TMESI).

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

TDCO[7:0] bits (Transceiver Delay Compensation Offset)

The TDCO[7:0] bits set the secondary sample point offset. How this value is used, depends on the CFDCnFDCFG.TDCOC setting.

If CFDCnFDCFG.TDCOC = 0, the transceiver delay compensation result is equal to the Trv_Delay (measured delay) + the value in CFDCnFDCFG.TDCO, rounded down to the nearest integer number of time quanta. Otherwise, the result is equal to the value in CFDCnFDCFG.TDCO. See **Section 30.4.1.5, Transmitter Delay Compensation** for details on how CFDCnFDCFG.TDCO is used.

The actual offset value is interpreted as TDCO + 1. For example, if 4 is set in TDCO, the offset is 5 clock cycles. Clock cycle is 1 cycle of CAN channel DLL clock.

Do not write to the TDCO[7:0] bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GWEN bit (CAN2.0, CAN-FD Multi-Gateway Enable)

When the GWEN bit is enabled, a multi gateway is enabled. Message received on one node can be routed to another node using the COM FIFO when they are configured as gateway FIFO (CFDCFCCn.CFM[1:0] = 10b). Furthermore, when TX Queue is set as Gateway mode, the message received on one node can be stored in TX Queue and can be sent to another node.

The FDF and BRS bits of the routed message can be changed by the configuration value of the CFDCnFDCFG.GWFDF and CFDCnFDCFG.GWBRS bits. By this, the transmitted value of these bits can be replaced.

[Example]

CFDCnFDCFG.GWEN = 1 on channel y
CFDCnFDCFG.GWFDF = 1

If a Classical CAN frame is received on channel x and routed to a gateway FIFO or TX Queue of channel y, then this CAN frame is sent on channel y as a CAN-FD frame because of the CFDCnFDCFG.GWFDF bit.

Table 30.5 shows how the message information is changed depending on the received and configured data.

Table 30.5 Modified Message Information by Received and Configured Data

Routed CAN Frame	Routed Received DLC	CAN BRS Bit	Configured CFDCnFDCFG.GWFDF Bit	Gateway Message DLC	Gateway Message BRS Bit	Gateway Message Frame Type
CAN2.0	≤ 8	N/A	1	≤ 8	Based on configuration of CFDCnFDCFG.GWBRS	CAN-FD
CAN2.0	> 8	N/A	1	= 8	Based on configuration of CFDCnFDCFG.GWBRS	CAN-FD
CAN-FD	≤ 8	None	1	≤ 8	Based on configuration of CFDCnFDCFG.GWBRS	CAN-FD
CAN-FD	> 8	None	1	> 8	Based on configuration of CFDCnFDCFG.GWBRS	CAN-FD
CAN2.0	≤ 8	N/A	0	≤ 8	N/A	CAN2.0
CAN2.0	> 8	N/A	0	> 8	N/A	CAN2.0
CAN-FD	≤ 8	None	0	≤ 8	N/A	CAN2.0
CAN-FD	> 8	None	0	= 8	N/A	CAN2.0

Note: This gateway is limited to an 8-byte data payload for different frame type. If routing and target frame type is the same, the data length code (DLC) value remains the same. If the source frame is a CAN-FD with more than 8 data bytes. Only the first 8 bytes of data perform gateway transmission.

Note: Transmission buffers other than the gateway FIFO are not affected by this feature.

Do not route remote frames through the gateway when CFDCnFDCFG.GWEN is set.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

GWFDF bit (Gateway FDF Configuration Bit)

When the GWEN bit is set to 1, the FDF bit of the transmitting gateway frame is replaced by the value of the GWFDF bit.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the CAN-FD module is in CH_RESET mode.

GWBRS bit (Gateway BRS Configuration Bit)

When the GWEN bit is set to 1, the BRS bit of the transmitting gateway frame is replaced by the value of CFDCnFDCFG.GWBRS.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

REFE bit (RX Edge Filter Enable)

The REFE bit enables the RX edge filter during the IDLE detection (bus integration). When the bit is enabled, two consecutive dominant time quanta are required to detect a synchronization edge.

The REFE bit cannot be written in CH_OPERATION, CH_HALT and CH_SLEEP mode.

30.2.7 Channel n CAN-FD Control Register (CFDCnFDCTR) (n = 0, 1)

The CFDCnFDCTR register (n = 0, 1) controls the error and successful occurrence counters.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1408 + H'20 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'00	W	Reserved These bits are read as 0. The write value should be always 0.
23 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
1	SOCCLR	0	R/W	Successful Occurrence Counter Clear 0: No successful occurrence counter clear 1: Clear successful occurrence counter
0	EOCCLR	0	R/W	Error Occurrence Counter Clear 0: No error occurrence counter clear 1: Clear error occurrence counter

EOCCLR bit (Error Occurrence Counter Clear)

The EOCCLR bit is used to clear the error occurrence counter.

Do not write to this bit in CH_SLEEP or CH_RESET mode. The read value is always 0.

This bit is cleared automatically by the CAN-FD logic and when the related CAN-FD channel is in CH_RESET mode.

SOCCLR bit (Successful Occurrence Counter Clear)

The SOCCLR bit is used to clear the successful occurrence counter.

Do not write to this bit in CH_SLEEP or CH_RESET mode. The read value is always 0.

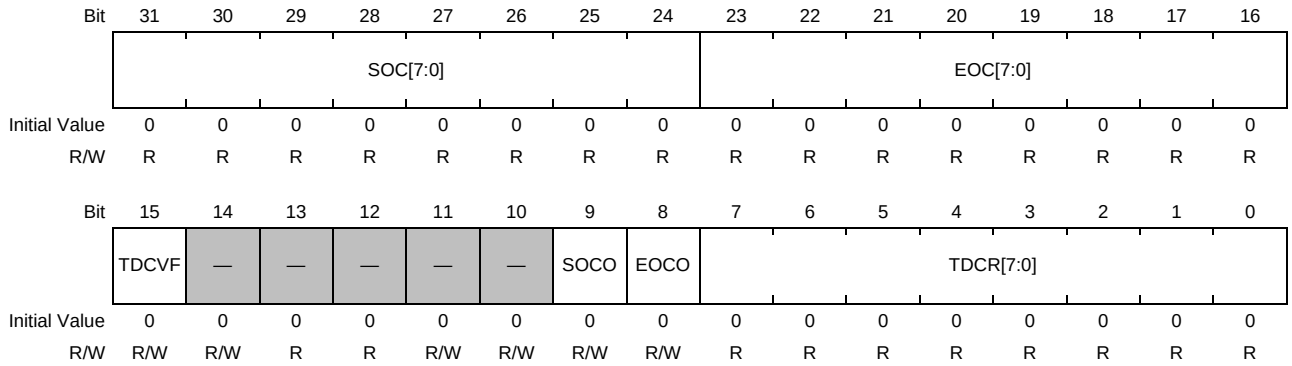
This bit is cleared automatically by the CAN-FD logic and when the related CAN-FD channel is in CH_RESET mode.

30.2.8 Channel n CAN-FD Status Register (CFDCnFDSTS) (n = 0, 1)

The CFDCnFDSTS register (n = 0, 1) indicates the transceiver compensation delay result and its related FIFO message lost status.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'140C + H'20 × n



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SOC[7:0]	H'00	R	Successful Occurrence Counter These bits show the successful occurrence counter value.
23 to 16	EOC[7:0]	H'00	R	Error Occurrence Counter These bits show the error occurrence counter value.
15	TDCVF	0	R/W	Transceiver Delay Compensation Violation Flag 0: Transceiver delay compensation violation has not occurred 1: Transceiver delay compensation violation has occurred
14	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
13, 12	—	00	R	Reserved These bits are read as 0.
11, 10	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.
9	SOCO	0	R/W	Successful Occurrence Counter Overflow Flag 0: Successful occurrence counter has not overflowed 1: Successful occurrence counter has overflowed
8	EOCO	0	R/W	Error Occurrence Counter Overflow Flag 0: Error occurrence counter has not overflowed 1: Error occurrence counter has overflowed
7 to 0	TDCR[7:0]	H'00	R	Transceiver Delay Compensation Result

TDCR[7:0] bits (Transceiver Delay Compensation Result)

The TDCR[7:0] bits are set when the transceiver delay has been measured.

The measured delay is a multiple of the CAN channel DLL clock. The result depends on the CFDCnFDCFG.TDCOC configuration and the offset value in CFDCnFDCFG.TDCO. See **Section 30.4.1.5, Transmitter Delay Compensation** for details on how this value is derived.

The TDCR[7:0] bits are updated at the falling edge between the FDF bit and the RES bit when CFDCnFDCFG.TDCOC = 0 and the transceiver delay compensation is enabled (CFDCnFDCFG.TDCE = 1).

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

EOCO bit (Error Occurrence Counter Overflow Flag)

The EOCO bit indicates whether the related CAN channel error occurrence counter has overflowed. This bit is cleared by writing 0 to it. Writing 1 has no effect.

This bit is set automatically when CFDCnFDSTS.EOC is H'FF and a CAN bus error is detected based on the configuration defined in CFDCnFDCFG.EOCCFG.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit.

SOCO bit (Successful Occurrence Counter Overflow Flag)

The SOCO bit indicates whether the related CAN channel successful occurrence counter has overflowed. This bit is cleared by writing 0 to it. Writing 1 has no effect.

This bit is set automatically when CFDCnFDSTS.SOC is H'FF and a successful message reception or successful message transmission occurs.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit.

TDCVF bit (Transceiver Delay Compensation Violation Flag)

The CAN-FD module captures internally the transmitted data bit-by-bit. This data is then compared against the received CAN bus level which is delayed by the transceiver loop delay.

The transceiver delay has some variations depending on the physical parameters such as temperature. The result bit CFDCnFDSTS.TDCR is updated by each message. However, temporary maximum delay violation could be missed. Therefore, the TDCVF bit captures this violation.

This bit is cleared by writing 0 to it. Writing 1 has no effect.

This bit is set automatically when the transceiver delay compensation is greater than the maximum delay compensation (6 data bit times - 2 clk_dlc) and the internal bit is overrun.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit.

EOC[7:0] bits (Error Occurrence Counter)

The EOC[7:0] bits are used together with the SOC[7:0] bits to support an option for host-controlled fall-back to payload bit rate identical to arbitration bit rate when messages utilizing the reduced payload bit length have significant higher error rates compared to other messages.

This higher error rate can be detected depending on the configuration of the CFDCnFDCFG.EOCCFG bits.

The EOC[7:0] bits are set only by CAN-FD module logic. These bits are cleared by writing 1 to CFDCnFDCTR.EOCCLR. Writing any other value has no effect.

These bits are updated when an error occurs, according to the configuration of the CFDCnFDCFG.EOCCFG bits. When the counter reaches the value of H'FF, the update stops.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

SOC[7:0] bits (Successful Occurrence Counter)

The SOC[7:0] bits are used together with the EOC[7:0] bits to support an option for host-controlled fall-back to payload bit rate identical to arbitration bit rate when messages utilizing the reduced payload bit length have significant higher error rates compared to other messages.

The SOC[7:0] bits are set only by CAN-FD module logic. Writing any other value has no effect.

These bits are updated when the occurrence of any error-free messages on the bus is detected through reception or transmission. When the counter reaches the value of H’FF, the update stops. In Loopback mode, the counter is incremented twice.

These bits are cleared by writing 1 to CFDCnFDCTR.SOCCLR.

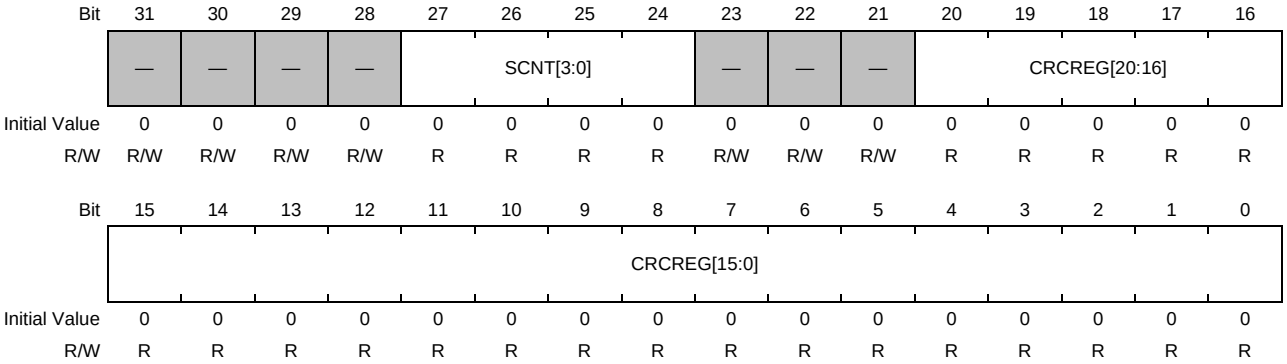
These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

30.2.9 Channel n CAN-FD CRC Register (CFDCnFDCRC) (n = 0, 1)

The CFDCnFDCRC register (n = 0, 1) holds the CRC value calculated for the CAN-FD frame.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1410 + H'20 × n



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
27 to 24	SCNT[3:0]	H'0	R	Stuff Bit Count These bits shows the stuff bit count (mod 8) for the CAN-FD frame.
23 to 21	—	000	R/W	Reserved These bits are read as 0. The write value should be always 0.
20 to 0	CRCREG [20:0]	All 0	R	CRC Register Value These bits show the CRC value calculated for the CAN-FD frame.

CRCREG[20:0] bits (CRC Register Value)

The CRCREG[20:0] bits contain the CRC value calculated by the CAN-FD channel logic when the CFDCnCTR.CTME bit is enabled.

The CFDCnFDCRC.CRCREG value is updated in the first bit of the CRC field of the CAN-FD frame (reception and transmission).

When the CFDCnCTR.CTME bit is 0, the CRCREG[20:0] bits are always read as 0.

When bit 17th of the CRC field is used, CRCREG[20:17] are always read as 0.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

SCNT[3:0] bits (Stuff Bit Count)

The SCNT[3:0] bits contain the stuff count value of the CAN-FD frame. These bits indicate the number of inserted stuff bits (modulo 8, Gray-coded) for a CAN-FD frame when the CFDCnCTR.CTME bit is enabled in CFDCnFDCRC.SCNT[3:1]. SCNT[0] is the parity bit.

When the CFDCnCTR.CTME bit is 0, the SCNT[3:0] bits are always read as 0.

The SCNT value is updated in the first bit of CRC field of the CAN-FD frame (reception and transmission).

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

30.2.10 Global IP Version Register (CFDGIPV)

The CFDGIPV register shows the release version of the CAN-FD module.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0080

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.
29 to 16	PSI[13:0]	11 0001 0010 0100	R	Parameter Status Information These bits show the IP configuration.
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9, 8	IPT[1:0]	0*1	R	IP Type These bits show the IP type used in the product. 00: CAN IP 01: CAN-FD IP 1x: Reserved
7 to 0	IPV[7:0]	H'43	R	IP Version These bits show the main release number.

Bits	Description
[29:27]	Number of channel (110b: 2 channels)
[26:24]	Number of TXMB (001b: 32/channel)
[23:21]	Number of AFL entry (001b: 128/channel)
[20:17]	Number of pool buffer (0010b: 64/channel)
[16]	Same ID overwrite function of TXQ (0b: Support)

Note 1. The value depends on product package type.

30.2.11 Global Configuration Register (CFDGCFG)

The CFDGCFG register is used to select the transmission priority to be used for all the TX message buffers and the clock source for the CAN protocol engine of all CAN channels. The CFDGCFG register is also used to select the source for the timestamp clock and to configure the frequency for the timestamp clock and interval timer reference clock.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0084

5	CMPOC	0	R/W	CAN-FD Message Payload Overflow Configuration 0: Message is rejected 1: Message payload is cut to fit to configured message size
4	DCS	0	R/W	Data Link Controller Clock Select 0: PCLKM 1: PCLKCAN
3	MME	0	R/W	Mirror Mode Enable 0: Mirror mode disabled 1: Mirror mode enabled

Bit	Bit Name	Initial Value	R/W	Description
2	DRE	0	R/W	DLC Replacement Enable 0: DLC replacement disabled 1: DLC replacement enabled
1	DCE	0	R/W	DLC Check Enable 0: DLC check disabled 1: DLC check enabled
0	TPRI	0	R/W	Transmission Priority 0: ID priority 1: Message buffer number priority

TPRI bit (Transmission Priority)

The TPRI bit selects the transmission priority for all CAN channels.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

Message buffer number priority should not be used together with TX queue transmission.

DCE bit (DLC Check Enable)

The DCE bit enables data length code (DLC) check for all CAN channels.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

DRE bit (DLC Replacement Enable)

When the DRE bit is 1 and the DCE is 1, the CAN-FD stores the configured value (CFDGAFLP0n.GAFLDLC) of the DLC in the destination RX message buffer or FIFO buffer if the DLC check passes. Otherwise, the DLC value in the destination RX message buffer or FIFO buffer is unchanged.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

MME bit (Mirror Mode Enable)

The MME bit enables the Mirror mode for all CAN channels.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

DCS bit (Data Link Controller Clock Select)

The DCS bit selects the clock source for CAN communication.

Do not write to this bit in GL_SLEEP or GL_OPERATION mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

CMPOC bit (CAN-FD Message Payload Overflow Configuration)

The CMPOC bit controls the message payload acceptance mechanism when the received payload is higher than the message buffer payload size CFDRMNB.RMPLS, CFDRFCCn.RFPLS, and CFDCFCCn.CFPLS. The received message payload is always compared with the available message payload size in the message buffer.

Do not write to this bit in GL_SLEEP or GL_OPERATION mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

When this bit is set and payload overflow occurs, the DLC value is stored in the RX message buffer or FIFO buffer unchanged.

TSP[3:0] bits (Timestamp Prescaler)

The value configured in the TSP[3:0] bits defines the period of the clock source used for the timestamp counter.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

TSSS bit (Timestamp Source Select)

The TSSS bit allows the selection of the clock source for the timestamp counter.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode. Additionally, do not set this bit to 1 when CAN-FD communication is used.

Note: The bit time clock varies depending on the nominal and data rate bit configuration.

TSBTCS[2:0] bits (Timestamp Bit Time Channel Select)

The TSBTCS[2:0] bits allow the selection of the bit time clock of a particular channel for the timestamp counter.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

ITRCP[15:0] bits (Interval Timer Reference Clock Prescaler)

The ITRCP[15:0] bits allow the definition of a reference clock for the FIFO interval timer source clock.

When these bits are H’0000, the timer is disabled.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

30.2.12 Global Control Register (CFDGCTR)

The CFDGCTR register controls the global mode of the CAN-FD module and the timestamp function. The register also enables and disables the global error interrupts.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0088

7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.

Bit	Bit Name	Initial Value	R/W	Description
2	GSLPR	1	R/W	Global Sleep Request 0: Global sleep request disabled 1: Global sleep request enabled
1, 0	GMDC[1:0]	01	R/W	Global Mode Control 00: Global operation mode request 01: Global reset mode request 10: Global halt mode request 11: Keep current value

GMDC[1:0] bits (Global Mode Control)

The GMDC[1:0] bits can be used to configure the modes for the CAN-FD module. Additionally, if CFDGCTR.GSLPR bit is 1 when the CAN-FD module is in Reset mode, the CAN-FD module transits to Global Sleep mode. Additionally, if CFDGCTR.GSLPR is 1 when the CAN-FD module is in Reset Mode, then the CAN-FD module transits to Global Sleep Mode.

Setting the GMDC[1:0] bits to 11b has no effect. Mode transition is described in detail in **Section 30.3.2, Global Modes**.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

GSLPR bit (Global Sleep Request)

The GSLPR bit globally selects the sleep request for CAN-FD module including all CAN channels. Channel sleep request is set automatically for all channels.

Only write to this bit when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

DEIE bit (DLC Check Interrupt Enable)

When the DEIE bit is 1, an interrupt is generated if a DLC error is detected in the received frames.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

MEIE bit (Message Lost Error Interrupt Enable)

When the MEIE bit is 1, an interrupt is generated if a message lost condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

THLEIE bit (TX History List Entry Lost Interrupt Enable)

When the THLEIE bit is 1, an interrupt is generated if a TX history list entry lost condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CMPOFIE bit (CAN-FD Message Payload Overflow Flag Interrupt Enable)

When the CMPOFIE bit is 1, an interrupt is generated when a CAN-FD message payload overflow condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

QOWEIE bit (TXQ Message Overwrite Error Interrupt Enable)

When the QOWEIE bit is 1, an interrupt is generated when a TXQ message overwrite condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

QMEIE bit (TXQ Message Lost Error Interrupt Enable)

When the QMEIE bit is 1, an interrupt is generated when a TXQ message lost condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

MOWEIE bit (GW FIFO Message Overwrite Error Interrupt Enable)

When the MOWEIE bit is 1, an interrupt is generated in GW mode and a GW FIFO message overwrite condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

TSRST bit (Timestamp Reset)

When the TSRST bit is 1, the Global Timestamp Register is reset to H’0000.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode.

Read value is always 0.

This bit is cleared automatically by the CAN-FD logic.

30.2.13 Global Status Register (CFDGSTS)

The CFDGSTS register indicates the global status of the CAN-FD module.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'008C

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	GHLTSTS	0	R	Global Halt Status 0: Not in Halt mode 1: In Halt mode
0	GRSTSTS	1	R	Global Reset Status 0: Not in Reset mode 1: In Reset mode

GRSTSTS bit (Global Reset Status)

The GRSTSTS bit indicates the status of Global CAN-FD module Reset mode.

This bit is set automatically when the CAN-FD module enters GL_RESET mode. When the mode changes from GL_RESET mode to GL_SLEEP mode, this bit remains set.

This bit is cleared automatically when the CAN-FD module exits the GL_RESET mode.

GHLTSTS bit (Global Halt Status)

The GHLTSTS bit indicates the status of Global CAN-FD module Halt mode.

This bit is set automatically when the CAN-FD module enters GL_HALT mode.

This bit is cleared automatically when the CAN-FD module exits the GL_HALT mode.

GSLPSTS bit (Global Sleep Status)

The GSLPSTS bit indicates the status of Global CAN-FD module Sleep mode.

This bit is set automatically when the CAN-FD module enters GL_SLEEP mode.

This bit is cleared automatically when the CAN-FD module exits the GL_SLEEP mode.

GRAMINIT bit (Global RAM Initialization)

The GRAMINIT bit indicates the status of Global CAN-FD module RAM initialization.

This bit is set automatically when the CAN-FD module enters GL_SLEEP mode after a hardware reset.

This bit is cleared automatically when the CAN-FD module completed RAM initialization.

30.2.14 Global Error Flag Register (CFDGERFL)

The CFDGERFL register indicates the detection of global errors.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0090

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
17	EEF1	0	R/W	ECC Error Flag for Channel 1 0: ECC error not detected during TX-SCAN 1: ECC error detected during TX-SCAN
16	EEF0	0	R/W	ECC Error Flag for Channel 0 0: ECC error not detected during TX-SCAN 1: ECC error detected during TX-SCAN
15 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7	MOWES	0	R	Message Overwrite Error Status 0: Message overwrite error not detected 1: Message overwrite error detected
6	QMES	0	R	TXQ Message Lost Error Status 0: TXQ message lost error not detected 1: TXQ message lost error detected
5	—	0	R	Reserved This bit is read as 0.
4	QOWES	0	R	TXQ Message Overwrite Error Status 0: TXQ message overwrite error not detected 1: TXQ message overwrite error detected
3	CMPOF	0	R/W	CAN-FD Message Payload Overflow Flag 0: CAN-FD message payload overflow not detected 1: CAN-FD message payload overflow detected
2	THLES	0	R	TX History List Entry Lost Error Status 0: TX history list entry lost error not detected 1: TX history list entry lost error detected
1	MES	0	R	Message Lost Error Status 0: Message lost error not detected 1: Message lost error detected
0	DEF	0	R/W	DLC Error Flag 0: DLC error not detected 1: DLC error detected

DEF bit (DLC Error Flag)

The DEF bit indicates the error status of the DLC.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when a DLC error is detected in a received frame.

The bit is cleared by writing 0 to it.

This bit is cleared automatically in GL_RESET mode.

MES bit (Message Lost Error Status)

The MES bit indicates status of the message lost error.

This bit is set automatically when a FIFO message lost error is detected.

This bit is cleared automatically when:

- All FIFO message lost flags are cleared
- The CAN-FD module is in GL_RESET mode.

THLES bit (TX History List Entry Lost Error Status)

The THLES bit indicates status of the TX history list entry lost error.

This bit is set automatically when a TX history list entry lost error is detected.

This bit is cleared automatically when:

- All TX history list entry lost flags are cleared
- The CAN-FD module is in GL_RESET mode.

CMPOF bit (CAN-FD Message Payload Overflow Flag)

The CMPOF bit is set automatically when a CAN-FD message payload overflow is detected on at least one channel.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode.

This bit is cleared by writing 0 to it. Writing 1 to this bit has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is cleared automatically in GL_RESET mode.

QOWES bit (TXQ Message Overwrite Error Status)

The QOWES bit is set automatically when a TXQ message overwrite error is detected.

This bit is cleared automatically when all TXQ message overwrite flags are cleared.

This bit is cleared automatically in GL_RESET mode.

QMES bit (TXQ Message Lost Error Status)

The QMES bit is set automatically when a TXQ message lost error is detected.

This bit is cleared automatically when all TXQ message lost flags are cleared.

This bit is cleared automatically in GL_RESET mode.

MOWES bit (Message Overwrite Error Status)

The MOWES bit is set automatically when GW mode and COMFIFO message overwrite error is detected.

This bit is cleared automatically when all COMFIFO Message Overwrite flags are cleared.

This bit is cleared automatically in GL_RESET mode.

EEF0 bit (ECC Error Flag for Channel 0)

The EEF0 bit specifies whether an ECC error has occurred on Channel 0.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode. Writing 1 to this bit has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The bit is cleared by writing 0 to it. This bit is cleared automatically in GL_RESET mode.

EEF1 bit (ECC Error Flag for Channel 1)

The EEF1 bit specifies whether an ECC error has occurred on Channel 1.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode. Writing 1 to this bit has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The bit is cleared by writing 0 to it. This bit is cleared automatically in GL_RESET mode.

30.2.15 Global TX Interrupt Status Register 0 (CFDGTINTSTS0)

The CFDGTINTSTS0 indicates the detection of transmit specific interrupts.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1300

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TSIFn bit (TX Successful Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.TSIFn bit is set to 1 when the TX Successful Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX MB Result Status bits are cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TAIFn bit (TX Abort Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.TAIFn bit is set to 1 when the TX Abort Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX MB Result Status bits are cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TQIFn bit (TX Queue Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.TQIFn bit is set to 1 when the TX Queue Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX Queue Interrupt flag is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

CFTIFn bit (COM FIFO in TX/GW Mode Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.CFTIFn bit is set to 1 when the related COM TX/GW FIFO Mode Interrupt flag (CFDCFSTSn.CFTXIF) is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related COM TX/GW FIFO Mode Interrupt flag (CFDCFSTSn.CFTXIF) is cleared (when the interrupt enable is disabled)

- When in GL_RESET or CH_RESET mode.

THIFn bit (TX History List Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.THIFn bit is set to 1 when the related TX History List Interrupt flag (CFDTHLSTSn.THLIF) is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX History List Interrupt flag (CFDTHLSTSn.THLIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TQOFIFn bit (TX Queue One Frame Transmission Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.TQOFIFn bit is set to 1 when the TX Queue One Frame Transmission Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX Queue One Frame Transmission Interrupt flag is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

CFOTIFn bit (COM FIFO One Frame Transmission Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.CFOTIFn bit is set to 1 when the related COM FIFO One Frame Transmission Interrupt flag (CFDCFSTSn.CFOFTXIF) is set (when the Interrupt is enabled).

This bit is cleared automatically:

- When the related COM FIFO One Frame Transmission Interrupt flag (CFDCFSTSn.CFOFTXIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

30.2.16 Global Timestamp Counter Register (CFDGTSC)

The CFDGTSC register stores the timestamp based on the selected configuration.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0094

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
15 to 0	TS[15:0]	All 0	R	Timestamp value

TS[15:0] bits (Timestamp value)

The proper incrementing of the Time Stamp counter cannot be guaranteed when moving to Halt state.

The Timestamp value is stored in the Global Timestamp Counter register based on the configuration of TSSS, TSBTCS, and TSP.

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

The TS[15:0] bits are cleared automatically in GL_RESET mode.

30.2.17 Global Acceptance Filter List Entry Control Register (CFDGAFLECTR)

The CFDGAFLECTR register is used to select the Global Acceptance Filter List page for reading or writing entries into the Global Acceptance Filter List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0098

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
8	AFLDAE	0	R/W	Acceptance Filter List Data Access Enable 0: Acceptance Filter List data access disabled 1: Acceptance Filter List data access enabled
7	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
6 to 0	AFLPN[6:0]	All 0	R/W	Acceptance Filter List Page Number Select an Acceptance Filter List page

AFLPN[6:0] bits (Acceptance Filter List Page Number)

The AFLPN[6:0] bits select the page number to access the desired RAM area of the Acceptance Filter List. One Acceptance Filter List page consists of 16 Acceptance Filter List entries.

Read/write accesses to the Acceptance Filter List can only be performed through a fixed window.

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode. Enter only the values between H'00 and H'0F, inclusive.

AFLDAE bit (Acceptance Filter List Data Access Enable)

The AFLDAE bit prevents write access to the Acceptance Filter List when cleared after configuration of the Acceptance Filter List.

Data can be read from the Acceptance Filter List independent of the status of this bit.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. Set this bit to enable write access for the Acceptance Filter List.

30.2.18 Global Acceptance Filter List Configuration Register 0 (CFDGAFLCFG0)

The CFDGAFLCFG0 register is used to define the number of rules for entries in the Acceptance Filter List, applicable for channels 0 to 1.

The total number of available entries in the Acceptance Filter List is 256 for 2 CAN channels. However, the filters can be allocated flexibly to the different channels depending on requirements as long as both of the following conditions are satisfied:

- The maximum number of acceptance filter per channel is 256
- The total number of rules defined for all channels is not exceeding the number of available entries in the Acceptance Filter List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'009C

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	RNC0[8:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
24 to 16	RNC0[8:0]	All 0	R/W	Rule Number for Channel 0 Number of rules dedicated to channel 0
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
8 to 0	RNC1[8:0]	All 0	R/W	Rule Number for Channel 1 Number of rules dedicated to channel 1

RNCn[8:0] bits (Rule Number for Channel n (n = 0, 1))

The RNCn[8:0] bits define the number of rules in the Acceptance Filter List for channel n.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

30.2.19 Global Acceptance Filter List ID Register n (CFDGAFLIDn) (n = 0 to 15)

The CFDGAFLIDn register (n = 0 to 15) is used to configure the ID field for the rules of entries in the Global Acceptance Filter List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1800 + H'10 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	GAFLIDE	0	R/W	Global Acceptance Filter List Entry IDE Field 0: Standard identifier of rule entry ID is valid for acceptance filtering 1: Extended identifier of rule entry ID is valid for acceptance filtering
30	GAFLRTR	0	R/W	Global Acceptance Filter List Entry RTR Field 0: Data frame 1: Remote frame
29	GAFLLB	0	R/W	Global Acceptance Filter List Entry Loopback Configuration 0: Global Acceptance Filter List entry ID for acceptance filtering with attribute RX 1: Global Acceptance Filter List entry ID for acceptance filtering with attribute TX
28 to 0	GAFLID[28:0]	All 0	R/W	Global Acceptance Filter List Entry ID Field ID part of the Global Acceptance Filter List entry

GAFLID[28:0] bits (Global Acceptance Filter List Entry ID Field)

The GAFLID[28:0] bits represent the CAN identifier (ID) field of each entry in the Global Acceptance Filter List.

The acceptance filter process compares this field against the ID of a received CAN message. For alignment of these bits in standard and extended frame formats, see **Section 30.2.89 Identifier Bits Alignment.**

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLLB bit (Global Acceptance Filter List Entry Loopback Configuration)

The GAFLLB bit selects whether entry in the Global Acceptance Filter List gets the attribute RX or TX.

This attribute determines the validity of the entry in Mirror mode, Loopback test mode, and during standard (non-loopback) reception. See **Section 30.5.5, Loopback Modes** for detailed description of the validity of the Global Acceptance Filter List entry depending on transmitter/receiver case, the type of loopback mode, and RX/TX attribute.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLRTR bit (Global Acceptance Filter List Entry RTR Field)

The GAFLRTR bit allows the configuration of the specified frame format (data frame or remote frame) for each entry of the Global Acceptance Filter List. For each rule entry in a CAN channel, the acceptance filter process compares this bit against the RTR bit of the received CAN message.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLIDE bit (Global Acceptance Filter List Entry IDE Field)

The GAFLIDE bit allows the configuration of the ID format (standard ID or extended ID) for each entry in the Global Acceptance Filter List. For each rule entry in a CAN channel, the acceptance filter process compares this bit against the IDE bit of the received CAN message.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

30.2.20 Global Acceptance Filter List Mask Register n (CFDGAFLMn) (n = 0 to 15)

The CFDGAFLMn register (n = 0 to 15) is used to configure the Mask field of each rule for entries in the Global Acceptance Filter List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1804 + H'10 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	GAFLIFL1	GAFLIDM[28:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAFLIDM[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GAFLIDEM	0	R/W	Global Acceptance Filter List IDE Mask 0: IDE bit is not used for ID matching 1: IDE bit is used for ID matching
30	GAFLRTRM	0	R/W	Global Acceptance Filter List Entry RTR Mask 0: RTR bit is not used for ID matching 1: RTR bit is used for ID matching
29	GAFLIFL1	0	R/W	Global Acceptance Filter List Information Label 1 Global Acceptance Filter List information label bit 1
28 to 0	GAFLIDM [28:0]	All 0	R/W	Global Acceptance Filter List ID Mask Field Global Acceptance Filter List Mask field bits for ID field

GAFLIDM[28:0] bits (Global Acceptance Filter List ID Mask Field)

GAFLIDM[28:0] bits are the filter mask bits for the related bits in the CAN Identifier field of each Global Acceptance Filter List entry.

0: Corresponding STD-ID/EXT-ID bit is not used for ID matching
1: Corresponding STD-ID/EXT-ID bit is used for ID matching

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.
Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLIFL1 bit (Global Acceptance Filter List Information Label 1)

The GAFLIFL1 bit allows the configuration of a 2-bit information label to be attached to a received message accepted by the associated entry in the Global Acceptance Filter List. This bit is a MSB bit of an information label.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

This bit is stored in the Information Label Field [1] (CFDRMFDSTS.RMIFL[1], CFDRFFDSTS.RFIFL[1], CFDCFFDCSTSn.CFIFL[1]) of the storage location of an incoming message.

Note: This bit is stored in CFDTHLACC1n.TIFL[1] when CFDTHLCCn.THLDGE = 1 is set up using Gateway function.

GAFLRTRM bit (Global Acceptance Filter List Entry RTR Mask)

The GAFLRTRM bit allows the configuration of the RTR mask bit for each entry in the Global Acceptance Filter List.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLIDEM bit (Global Acceptance Filter List IDE Mask)

The GAFLIDEM bit allows the configuration of the IDE mask bit for each entry in the Global Acceptance Filter List.

When the IDE mask bit is 0, the ID comparison depends on the received IDE bit.

If the received IDE bit is 0, the STD-ID comparison takes place.

If the received IDE bit is 1, the EXT-ID comparison takes place.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

30.2.21 Global Acceptance Filter List Pointer 0 Register n (CFDGAFLP0n) (n = 0 to 15)

The CFDGAFLP0n register (n = 0 to 15) is used to configure the data length code (DLC), software pointer, single message buffer select, and message buffer direction pointer for each rule entry in the Global Acceptance Filter List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1808 + H'10 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4	GAFLSRD0	0	R/W	Global Acceptance Filter List Select Routing Destination 0 0: Routing target is CFIFO0 1: Routing target is TX Queue 0 instead of CFIFO0
3 to 0	GAFLDLC [3:0]	H'0	R/W	Global Acceptance Filter List DLC Field Minimum number of data bytes in a data frame required for acceptance

GAFLDLC[3:0] bits (Global Acceptance Filter List DLC Field)

The GAFLDLC[3:0] bits allow the configuration of a minimum data length code (DLC) value for a message to be accepted by the associated entry in the Global Acceptance Filter List (automatic DLC filter function).

DLC filter process is only passed if the DLC value of the message accepted by an entry in the Global Acceptance Filter List is equal to or higher than the DLC value configured for this associated Global Acceptance Filter List entry. Automatic DLC filter function is disabled for the corresponding rule entry when this field is set to 0.

Table 30.6 shows DLC value that can be configured.

Table 30.6 Configuration of DLC Value

DLC[3:0]	Description
0000b	DLC of received message = 0 or more (DLC filter check is disabled)
0001b	DLC of received message = 1 or more
0010b	DLC of received message = 2 or more
0011b	DLC of received message = 3 or more
0100b	DLC of received message = 4 or more
0101b	DLC of received message = 5 or more
0110b	DLC of received message = 6 or more
0111b	DLC of received message = 7 or more
1000b	DLC of received message = 8 or more
1001b	DLC of received message = 12 or more
1010b	DLC of received message = 16 or more
1011b	DLC of received message = 20 or more
1100b	DLC of received message = 24 or more
1101b	DLC of received message = 32 or more
1110b	DLC of received message = 48 or more
1111b	DLC of received message = 64

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLSRD0 bit (Global Acceptance Filter List Select Routing Destination 0)

The GAFLSRD0 bit changes a copy destination to CFIFO0 or TXQ0 by routing.

If this bit is set as 1, the preset value of CFDGAFLP1n.GAFLFDP selects TXQ0.

If this bit is set to 0, the preset value of CFDGAFLP1n.GAFLFDP selects CFIFO0.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLSRD1 bit (Global Acceptance Filter List Select Routing Destination 1)

The GAFLSRD1 bit changes a copy destination to CFIFO1 or TXQ1 by routing.

If this bit is set to 1, the preset value of CFDGAFLP1n.GAFLFDP selects TXQ1.

If this bit is set to 0, the preset value of CFDGAFLP1n.GAFLFDP selects CFIFO1.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLSRD2 bit (Global Acceptance Filter List Select Routing Destination 2)

The GAFLSRD2 bit changes a copy destination to CFIFO2 or TXQ2 by routing.

If this bit is set to 1, the preset value of CFDGAFLP1n.GAFLFDP selects TXQ2.

If this bit is set to 0, the preset value of CFDGAFLP1n.GAFLFDP selects CFIFO2.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the CAN-FD module is in CH_RESET or CH_HALT mode.

GAFLIFL0 bit (Global Acceptance Filter List Information Label 0)

The GAFLIFL0 bit allows the configuration of a 2-bit information label that can be attached to a received message accepted by the related Global Acceptance Filter List entry. This bit is a LSB bit of an information label.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

This bit is stored in Information Label Field[0] (CFDRMFDSTS.RMIFL[0], CFDRFFDSTS.RFIFL[0], CFDCFFDCSTSn.CFIFL[0]) of the storage location of an incoming message.

This bit is stored in CFDTHLACC1n.TIFL[0] when CFDTHLCCn.THLDGE = 1 is set up using the gateway function.

GAFLRMDP[6:0] bits (Global Acceptance Filter List RX Message Buffer Direction Pointer)

The GAFLRMDP[6:0] bits allow the configuration of a single reception message buffer as the destination target for a received message that passes the acceptance check of the related Global Acceptance Filter List entry. The value entered is the single destination message buffer number.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

CFDRMNB.NRXMB[7:0] is the value entered in the RX Message Buffer Number Register to configure the number of RX message buffers. The value to be entered in CFDGAFLP0n.GAFLRMDP[6:0] bits should only be between H’00 and CFDRMNB.NRXMB[7:0] to 1 less.

If CFDRMNB.NRXMB[7:0] = H’00, the GAFLRMV bit should be configured as 0.

GAFLRMV bit (Global Acceptance Filter List RX Message Buffer Valid)

The GAFLRMV bit allows the enabling or disabling of a single reception message buffer as the target for a received message that passes the acceptance check of the related Global Acceptance Filter List entry.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLPTR[15:0] bits (Global Acceptance Filter List Pointer)

The GAFLPTR[15:0] bits allow the configuration of a 16-bit pointer to be attached to a received message accepted by the related Global Acceptance Filter List entry. The pointer is added during message storage in the Message Buffer area and can be used by the application as a support function. The pointer information can be used for example, to support PDU Identifier allocation for the received message in AUTOSAR systems.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

30.2.22 Global Acceptance Filter List Pointer 1 Register n (CFDGAFLP1n) (n = 0 to 15)

The CFDGAFLP1n register (n = 0 to 15) is used to configure the FIFO direction pointer fields in each Rule Entry of the Global Acceptance Filter List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'180C + H'10 × n

31 to 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
13 to 0	GAFLFDP [13:0]	All 0	R/W	Global Acceptance Filter List FIFO Direction Pointer FIFO direction pointer bits for received message storage

GAFLFDP[13:0] bits (Global Acceptance Filter List FIFO Direction Pointer)

The GAFLFDP[13:0] bits allow the configuration of FIFO buffers as the target for a received message that passes the acceptance check of the related Global Acceptance Filter List entry. Each bit of the CFDGAFLP1n.GAFLFDP[13:0] is configured as dedicated FIFO.

Table 30.7 Global Acceptance Filter List entry (1/2)

Bit	Value (binary)	Function
0	0	Disable RX FIFO 0 as target for reception
	1	Enable RX FIFO 0 as target for reception
1	0	Disable RX FIFO 1 as target for reception
	1	Enable RX FIFO 1 as target for reception
2	0	Disable RX FIFO 2 as target for reception
	1	Enable RX FIFO 2 as target for reception
3	0	Disable RX FIFO 3 as target for reception
	1	Enable RX FIFO 3 as target for reception
4	0	Disable RX FIFO 4 as target for reception
	1	Enable RX FIFO 4 as target for reception
5	0	Disable RX FIFO 5 as target for reception
	1	Enable RX FIFO 5 as target for reception
6	0	Disable RX FIFO 6 as target for reception
	1	Enable RX FIFO 6 as target for reception

Table 30.7 Global Acceptance Filter List entry (2/2)

Bit	Value (binary)	Function
7	0	Disable RX FIFO 7 as target for reception
	1	Enable RX FIFO 7 as target for reception
8	0	Disable Common FIFO 0 and Channel 0 TX Queue 0 as target for reception
	1	GAFLSRD0 = 0: Enable Common FIFO 0 as target for reception GAFLSRD0 = 1: Enable Channel 0 TX Queue 0 as target for reception
9	0	Disable Common FIFO 1 and Channel 0 TX Queue 1 as target for reception
	1	GAFLSRD1 = 0: Enable Common FIFO 1 as target for reception GAFLSRD1 = 1: Enable Channel 0 TX Queue 1 as target for reception
10	0	Disable Common FIFO 2 and Channel 0 TX Queue 2 as target for reception
	1	GAFLSRD2 = 0: Enable Common FIFO 2 as target for reception GAFLSRD2 = 1: Enable Channel 0 TX Queue 2 as target for reception
11	0	Disable Common FIFO 3 and Channel 1 TX Queue 0 as target for reception
	1	GAFLSRD0 = 0: Enable Common FIFO 3 as target for reception GAFLSRD0 = 1: Enable Channel 1 TX Queue 0 as target for reception
12	0	Disable Common FIFO 4 and Channel 1 TX Queue 1 as target for reception
	1	GAFLSRD1 = 0: Enable Common FIFO 4 as target for reception GAFLSRD1 = 1: Enable Channel 1 TX Queue 1 as target for reception
13	0	Disable Common FIFO 5 and Channel 1 TX Queue 2 as target for reception
	1	GAFLSRD2 = 0: Enable Common FIFO 5 as target for reception GAFLSRD2 = 1: Enable Channel 1 TX Queue 2 as target for reception

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0. Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

For storage in TX queue, TX queue buffers of a target that is in GW mode is possible.

Only one of the following configurations is valid:

- Up to 8 destination FIFO buffers
- 7 destination FIFO buffers plus one RX message buffer
- 8 destination TX queue buffers
- 7 destination TX queue buffers plus one RX message buffer
- A maximum of 8 destinations in all at FIFO buffer and TX queue buffer.

30.2.23 RX Message Buffer Number Register (CFDRMNB)

The CFDRMNB register is used to configure the total number of RX message buffers allocated to all channels.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'00AC

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

10 to 8	RMPLS[2:0]	000	R/W	Reception Message Buffer Payload Data Size 000: 8 bytes 001: 12 bytes 010: 16 bytes 011: 20 bytes 100: 24 bytes 101: 32 bytes 110: 48 bytes 111: 64 bytes
7 to 0	NRXMB[7:0]	H'00	R/W	Number of RX Message Buffers

NRXMB[7:0] bits (Number of RX Message Buffers)

The NRXMB[7:0] bits are used to configure the number of RX message buffers.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

Enter only values between 0 and 32 inclusive, with H'00 indicating that no RX message buffer is allocated.

RMPLS[2:0] bits (Reception Message Buffer Payload Data Size)

The RMPLS[2:0] bits are used to configure the message buffer payload data size.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

30.2.24 RX Message Buffer New Data Register 0 (CFDRMND0)

The CFDRMND0 specifies the new data storage status of the RX message buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'00B0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMNS[31:16]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RMNS[31:0]	All 0	R/W	RX Message Buffer New Data Status 0: New data not stored in corresponding RX message buffer 1: New data stored in corresponding RX message buffer

RMNS[31:0] bits (RX Message Buffer New Data Status)

The RMNSu[31:0] bits indicate the status of new data for the corresponding RX message buffer. RMNS bit [0] corresponds to RX message buffer [0] and so on.

no_of_channels = 2
no_of_CFDRMBCPs_per_channel = (number of RX message buffer components per channel) = 16
no_of_CFDRMBCPs = no_of_channels × no_of_CFDRMBCPs_per_channel (2 × 16 = 32)
no_of_bits_per_register = 32
no_of_CFDRMNDs (number of CFDRMND Registers) = no_of_CFDRMBCPs/no_of_bits_per_register (32/32 = 1)
t = [0 ... no_of_CFDRMNDs - 1]
u = [t × 32 ... (no_of_CFDRMBCPs − ((no_of_CFDRMNDs − 1 − t) × 32) − 1)]

The parameter t can be calculated from the target of the New Data Status flag (u) using the formula t = floor (u/32)

Bit position can be calculated using the formula (u − (t × 32))

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode. Writing 1 has no effect.

These bits cannot be cleared when message storage in the corresponding RX message buffer is in progress.

Do not use the bit clear instruction to clear these bits. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

These bits are set automatically when storage of new messages are in the corresponding RX message buffer. These bits are cleared by writing 0. These bits are cleared automatically when the CAN-FD module is in GL_RESET mode.

When CFDRMNB.RMPLS = 000b (maximum 8 bytes payload), the duration of message storage is 6 PCLKM cycles.

When CFDRMNB.RMPLS > 000b, the duration of message storage is 6 PCLKM cycles + 1 for each 4 bytes (maximum of 20 PCLKM cycles for 64 bytes).

30.2.25 RX FIFO Configuration/Control Register n (CFDRFCCn) (n = 0 to 7)

The CFDRFCCn registers (n = 0 to 7) are used to configure and control the eight RX FIFOs.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'00C0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	RFIE	0	R/W	RX FIFO Interrupt Enable 0: FIFO interrupt generation disabled 1: FIFO interrupt generation enabled
0	RFE	0	R/W	RX FIFO Enable 0: FIFO disabled 1: FIFO enabled

RFE bit (RX FIFO Enable)

The RFE bit enables the FIFO. When this bit is set to 0, the RX FIFO is cleared to empty.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

This bit can only be set if the configured FIFO depth is greater than 000b (CFDRFCCn.RFDC[2:0] > 000b).

Set the RFE bit with a separate write access to the CFDRFCCn register, after all the other bits in the CFDRFCCn register are set.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

RFIE bit (RX FIFO Interrupt Enable)

The RFIE bit enables generation of the FIFO interrupt.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

RFPLS[2:0] bits (Rx FIFO Payload Data Size Configuration)

The RFPLS[2:0] bits define the message data payload allocation in the RAM.

This is the maximum number of bytes which can be received by this FIFO.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

RFDC[2:0] bits (RX FIFO Depth Configuration)

The RFDC[2:0] bits select the depth of the FIFO in terms of the number of messages. If the FIFO depth is configured to 0 messages, the FIFO cannot be used.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

RFIM bit (RX FIFO Interrupt Mode)

The RFIM bit selects the interrupt generation condition for the FIFO.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

RFIGCV[2:0] bits (RX FIFO Interrupt Generation Counter Value)

The RFIGCV[2:0] bits select the counter value of the FIFO for generation of FIFO interrupts. These values represent fractions of the FIFO depth for which an interrupt is generated.

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode.

The setting of the RFIGCV[2:0] bits should be synchronized with the RFDC[2:0] bits.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

RFFIE bit (RX FIFO Full Interrupt Enable)

The RFFIE bit enables generation of the RX FIFO full interrupt. Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

The following content shows examples of interruptions:

- Interruption output in number of arbitrary stages (CFDRFCCn.RFIGCV)
- Interruption output in FIFO full state.

Note: Management of the receiving data of FIFO can be performed by these notices of interruption.

30.2.26 RX FIFO Status Register n (CFDRFSTSn) (n = 0 to 7)

The CFDRFSTSn register (n = 0 to 7) shows the status of messages stored in the corresponding FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'00E0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 29	—	000	R/W	Reserved These bits are read as 0. The write value should be always 0.
28	—	0	R	Reserved This bit is read as 0.
27 to 17	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
16	RFFIF	0	R/W	RX FIFO Full Interrupt Flag 0: FIFO full interrupt condition not satisfied 1: FIFO full interrupt condition satisfied
15 to 8	RFMC[7:0]	H'00	R	RX FIFO Message Count Number of messages stored in FIFO
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
3	RFIF	0	R/W	RX FIFO Interrupt Flag 0: FIFO interrupt condition not satisfied 1: FIFO interrupt condition satisfied
2	RFMLT	0	R/W	RX FIFO Message Lost 0: No message lost in FIFO 1: FIFO message lost
1	RFFLL	0	R	RX FIFO Full 0: FIFO not full 1: FIFO full
0	RFEMP	1	R	RX FIFO Empty 0: FIFO not empty 1: FIFO empty

RFEMP bit (RX FIFO Empty)

The RFEMP bit is set automatically when:

- The RFMC bit is 0
- RX FIFO is disabled by setting the CFDRFCCn.RFE bit to 0
- The CAN-FD module is in GL_RESET mode.

The RFEMP bit is cleared automatically when the first message is stored in the RX FIFO buffer.

RFFLL bit (RX FIFO Full)

The RFFLL bit is set automatically when the number of CAN messages stored in the FIFO buffer matches the configured FIFO depth.

The RFFLL is cleared automatically when:

- The number of CAN messages stored in the FIFO buffer is less than the configured FIFO depth
- RX FIFO is disabled by setting the CFDRFCCn.RFE bit to 0
- The CAN-FD module is in GL_RESET mode.

RFMLT bit (RX FIFO Message Lost)

Only write to the RFMLT bit when CAN-FD module is in GL_HALT or GL_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically whenever a message is lost due to attempted storage when the FIFO buffer is already full. If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode.

RFIF bit (RX FIFO Interrupt Flag)

The RFIF bit is set automatically when the configured interrupt condition is satisfied. This bit is not automatically cleared when the RX FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then this bit is set.

The bit is cleared by writing 0 to it. The bit is also cleared when CAN-FD module is in GL_RESET mode.

RFMC[7:0] bits (RX FIFO Message Count)

The RFMC[7:0] bits indicate the number of CAN messages stored in the RX FIFO buffer that can be read by the CPU.

These bits are cleared automatically when the FIFO is disabled and when the CAN-FD module is in GL_RESET mode.

RFFIF bit (RX FIFO Full Interrupt Flag)

The RFFIF bit is not cleared automatically when the RX FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the FIFO full interrupt condition is satisfied. If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The bit is cleared by writing 0 to it.

The bit is also cleared when the CAN-FD module is in GL_RESET mode.

30.2.27 RX FIFO Pointer Control Register n (CFDRFPCTRn) (n = 0 to 7)

The CFDRFPCTRn register (n = 0 to 7) can be used to increment the read pointer of the corresponding RX FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0100 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	RFPC[7:0]	H'00	W	RX FIFO Pointer Control Increments read pointer of the corresponding RX FIFO buffers

RFPC[7:0] bits (RX FIFO Pointer Control)

When the value H'FF is written to the RFPC bits, the pointer of the corresponding RX FIFO buffer is moved to the next FIFO entry. Only write H'FF to these registers when the corresponding RX FIFO buffer is enabled and not empty.

The read value from these bits is always H'00.

Only write to these bits when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

Do not write to the RX FIFO Pointer Control registers when DMA is enabled.

30.2.28 Common FIFO Configuration/Control Register n (CFDCFCCn) (n = 0 to 5)

The CFDCFCCn register (n = 0 to 5) is used to configure the Common FIFOs.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0120 + H'04 × n

1	CFRXIE	0	R/W	Common FIFO RX Interrupt Enable 0: FIFO interrupt generation disabled for Frame RX 1: FIFO interrupt generation enabled for Frame RX
0	CFE	0	R/W	Common FIFO Enable 0: FIFO disabled 1: FIFO enabled

CFE bit (Common FIFO Enable)

The CFE bit enables the FIFO when set. FIFO is disabled when this bit is cleared.

This bit can also be used, by clearing it, to abort transmission from Common FIFO when configured in TX mode or GW mode, or to stop reception into the Common FIFO in RX mode.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFOs configured as TX or GW FIFO.

This bit can only be set if the configured FIFO depth is greater than 0 (CFDC bit > 0).

Set the CFE bit with a separate write access to the CFDCFCCn register, after all the other bits in this register are set.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

This bit is also cleared automatically when the related channel is in CH_RESET mode if the FIFO is configured in TX or GW mode.

CFRXIE bit (Common FIFO RX Interrupt Enable)

The CFRXIE bit enables generation of FIFO interrupts when the interrupt flag is set after reception of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFTXIE bit (Common FIFO TX Interrupt Enable)

The CFTXIE bit enables generation of common FIFO interrupts when the interrupt flag is set after transmission of a frame from the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFPLS[2:0] bits (Common FIFO Payload Data Size Configuration)

The CFPLS[2:0] bits define the message data payload allocation in the RAM. This is the maximum number of bytes which can be received or transmitted by the FIFO buffer.

For details, see **Section 30.6, FIFO Buffers and Normal Message Buffer Configuration**.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

CFM[1:0] bits (Common FIFO Mode)

The CFM[1:0] bits select the mode of the FIFO. When a hardware reset is applied, all the Common FIFO buffers are configured in RX FIFO mode. Do not configure these bits to 11b.

Do not write to these bits in GL_OPERATION or GL_SLEEP mode.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

CFITSS bit (Common FIFO Interval Timer Source Select)

The CFITSS bit selects the basic clock source for the Interval Transmission Timer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. In addition, do not write to this bit when the CFE bit is set to 1.

Do not write 1 to this bit when CAN-FD communication is used.*[1]

Note: The bit time clock can vary depending on the nominal and data rate bit configuration.

CFITR bit (Common FIFO Interval Timer Resolution)

The CFITR bit selects the resolution of the reference clock for the Interval Transmission Timer (peripheral clock is the source for the reference clock).

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. Also, do not write to this bit when the CFE bit is set to 1.

CFIM bit (Common FIFO Interrupt Mode)

The CFIM bit selects the interrupt generation condition for the FIFO buffer.

Do not write to this bit in GL_SLEEP mode.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

CFIGCV[2:0] bits (Common FIFO Interrupt Generation Counter Value)

The CFIGCV[2:0] bits select the message counter value for the generation of FIFO interrupts. These values represent fractions of the FIFO depth at which the interrupt is to be generated.

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode.

The setting of these bits should be synchronized with the CFDC[2:0] bits.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

CFTML[4:0] bits (Common FIFO TX Message Buffer Link)

The CFTML[4:0] bits select the normal transmit message buffer position where the TX or GW FIFO is linked to, for transmission scanning.

Do not write to these bits in GL_OPERATION or GL_SLEEP mode.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

CFDC[2:0] bits (Common FIFO Depth Configuration)

The CFDC[2:0] bits select the depth of the common FIFO in terms of the number of messages. If the FIFO depth is configured to 0 message, the FIFO cannot be used.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

CFITT[7:0] bits (Common FIFO Interval Transmission Time)

The CFITT[7:0] bits select the delay in the start of transmission for all messages transmitted from this FIFO buffer when configured in TX or GW mode. The delay is a multiple of the basic interval timer clock source period (reference clock × 1, reference clock × 10, or bit time clock of the related CAN channel).

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode.

Do not write to these bits when the CFE bit is set to 1.

When CFDGCFG.ITRCP[15:0] = H’0000, set the CFITT[7:0] bits to H’00.

30.2.29 Common FIFO Configuration/Control Enhancement Register n (CFDCFCCEn) (n = 0 to 5)

The CFDCFCCEn register (n = 0 to 5) is used to configure the Common FIFOs.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0180 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
16	CFBME	0	R/W	Common FIFO Buffering Mode Enable 0: Transmission from Common FIFO 1: Transmission halt from Common FIFO
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
8	CFMOWM	0	R/W	Common FIFO Message Overwrite Mode 0: Message discarded mode 1: Message overwrite mode
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	CFOFTXIE	0	R/W	Common FIFO One Frame Transmission Interrupt Enable 0: One Frame TX interrupt generation disabled 1: One Frame TX interrupt generation enabled
1	CFOFRXIE	0	R/W	Common FIFO One Frame Reception Interrupt Enable 0: One Frame RX interrupt generation disabled 1: One Frame RX interrupt generation enabled
0	CFFIE	0	R/W	Common FIFO Full Interrupt Enable 0: FIFO Interrupt generation disabled 1: FIFO Interrupt generation enabled

CFFIE bit (Common FIFO Full Interrupt Enable)

The CFFIE bit enables generation of the FIFO full interrupt when the interrupt flag is set after reception of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

The following content shows examples of interruptions:

1. Interruption output in number of arbitrary stages (CFDCFCCn.CFIGCV).
2. Interruption output in FIFO full state.

Management of the receiving data of FIFO can be performed by these notices of interruption.

CFOFRXIE bit (Common FIFO One Frame Reception Interrupt Enable)

The CFOFRXIE bit enables generation of the one frame reception interrupt when the interrupt flag is set after reception of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFOFTXIE bit (Common FIFO One Frame Transmission Interrupt Enable)

The CFOFTXIE bit enables generation of the one frame transmission interrupt when the interrupt flag is set after transmission of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFMOWM bit (Common FIFO Message Overwrite Mode)

When the CFMOWM bit is 0, a receiving message is discarded and FIFO is full. When the CFMOWM bit is 1, a receiving message is overwritten and FIFO is full.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Only write 1 to this bit when the common FIFO is in GW mode.

Do not write 1 to this bit when the CFE bit is 1.

CFBME bit (Common FIFO Buffering Mode Enable)

When the CFBME bit is 0, messages are transmitted from FIFO. When the CFBME bit is 1, messages are not transmitted from FIFO.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. Additionally, do not write 1 to this bit when the CFE bit is 1.

30.2.30 Common FIFO Status Register n (CFDCFSTSn) (n = 0 to 5)

The CFDCFSTSn register (n = 0 to 5) shows the status of messages stored in the corresponding FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'01E0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
1	CFFLL	0	R	Common FIFO Full 0: FIFO not full 1: FIFO full
0	CFEMP	1	R	Common FIFO Empty 0: FIFO not empty 1: FIFO empty

CFEMP bit (Common FIFO Empty)

The CFEMP bit is set automatically when:

- The CPU has read all messages from the FIFO configured in RX mode
- All messages have been transmitted from the FIFO configured in TX or GW mode
- The FIFO is disabled by setting the CFE bit to 0
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET when FIFO configured in TX or GW mode.

The CFEMP bit is cleared automatically when:

- The first reception message is stored in the FIFO buffer when configured in RX mode
- The first message to be transmitted is stored in the FIFO buffer when configured in TX or GW mode.

CFFLL bit (Common FIFO Full)

The CFFLL bit is set automatically when the number of CAN messages stored in the FIFO matches the configured FIFO depth.

The CFFLL bit is cleared automatically when:

- The number of CAN messages stored in the FIFO is less than the configured FIFO depth
- The FIFO is disabled by setting the CFE bit to 0
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode when FIFO buffer is configured in TX or GW mode.

CFMLT bit (Common FIFO Message Lost)

The CFMLT bit is set automatically whenever a message is lost due to attempted storage of a new message when FIFO is already full in RX or GW mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then this bit is set.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The CFMLT bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFRXIF bit (Common RX FIFO Interrupt Flag)

The CFRXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the configured interrupt condition is satisfied for Common FIFO buffers when configured in GW mode or RX mode.

The CFRXIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in GW mode.

CFTXIF bit (Common TX FIFO Interrupt Flag)

The CFTXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO buffer configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the configured interrupt condition is satisfied for Common FIFO buffers configured in GW or TX mode.

The CFTXIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFMC[7:0] bits (Common FIFO Message Count)

The CFMC[7:0] bits indicate the following:

- Number of CAN messages stored by the CPU in the FIFO buffer configured in TX mode pending for transmission
- Number of CAN messages stored in the FIFO buffer configured in RX mode by CAN-FD to be read by the CPU
- Number of CAN messages stored by the CAN-FD in the GW FIFO pending for transmission.

The CFMC[7:0] bits are cleared automatically when:

- The FIFO is disabled
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFFIF bit (Common FIFO Full Interrupt Flag)

The CFFIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the FIFO Full Interrupt condition is satisfied for Common FIFO buffers when configured in GW or RX mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The CFFIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFOFRXIF bit (Common FIFO One Frame Reception Interrupt Flag)

The CFOFRXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for the FIFO buffer configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the One Frame Reception Interrupt condition is satisfied for the Common FIFO buffers when configured in GW or RX mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The CFOFRXIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.
- This bit is not influenced by the value of **CFDCFCCn.CFIM**.

CFOFTXIF bit (Common FIFO One Frame Transmission Interrupt Flag)

The CFOFTXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFOs configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the One Frame Transmission Interrupt condition is satisfied for Common FIFO buffers configured in GW mode or TX mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO is configured in TX or GW mode.
- This bit is not influenced by the value of **CFDCFCCn.CFIM**

CFMOW bit (Common FIFO Message Overwrite)

The CFMOW bit is set automatically whenever a message is an overwrite storage of a new message when CFDCFCCEn.CFMOWM = 1 and FIFO is already full in GW mode.

If the set from the CAN channel occurs simultaneously with the clear by a write access, the bit is set.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO buffer configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The CFMOW bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

30.2.31 Common FIFO Pointer Control Register n (CFDCFPCTRn) (n = 0 to 5)

The CFDCFPCTRn register (n = 0 to 5) can be used to increment the read or write pointer of the corresponding Common FIFO buffer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0240 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CFPC[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	CFPC[7:0]	H'00	W	Common FIFO Pointer Control Increments read or write pointer of the corresponding Common FIFO buffers depending on the mode configuration.

CFPC[7:0] bits (Common FIFO Pointer Control)

When the value H'FF is written into the CFPC[7:0] bits, the read pointer of the corresponding Common FIFO buffer (when configured in RX mode), or the write pointer of the corresponding Common FIFO buffer (when configured in TX mode) moves to the next FIFO entry.

The read value from these bits is always H'00.

Only write to these bits when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

Only write H'FF to this register when:

- The Common FIFO buffer is enabled and is not empty if configured in RX mode
- The Common FIFO buffer is enabled and is not full if configured in TX mode
- The Common FIFO buffer is enabled and is not configured in GW mode.

Do not write to the Common FIFO Pointer Control registers when DMA is enabled.

30.2.32 FIFO Empty Status Register (CFDFESTS)

The CFDFESTS register shows status of the empty bits of the FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02A0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

13 to 8	CFXEMP[5:0]	All 1	R	Common FIFO Empty Status 0: Corresponding FIFO not empty 1: Corresponding FIFO empty
7 to 0	RFXEMP[7:0]	All 1	R	RX FIFO Empty Status 0: Corresponding FIFO not empty 1: Corresponding FIFO empty

RFXEMP[7:0] bits (RX FIFO Empty Status)

Bit [7] (RFXEMP[7]) is associated with FIFO index 7 and bit [0] (RFXEMP[0]) is associated with FIFO index 0.

The RFXEMP[7:0] bits are set when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

CFXEMP[5:0] bits (Common FIFO Empty Status)

Bit [13] (CFXEMP[5]) is associated with common FIFO index 5 and bit [8] (CFXEMP[0]) is associated with common FIFO index 0.

The CFXEMP[5:0] bits are set when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

30.2.33 FIFO Full Status Register (CFDFFSTS)

The CFDFFSTS register shows status of the full bits of the FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02A4

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	CFXFLL[5:0]						RFXFLL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31:14	—	All 0	R	Reserved These bits are read as 0.
13:8	CFXFLL[5:0]	All 0	R	Common FIFO Full Status 0: Corresponding FIFO not full 1: Corresponding FIFO full
7:0	RFXFLL[7:0]	All 0	R	RX FIFO Full Status 0: Corresponding FIFO not full 1: Corresponding FIFO full

RFXFLL[7:0] bits (RX FIFO Full Status)

Bit [7] (RFXFLL[7]) is associated with FIFO index 7 and bit [0] (RFXFLL[0]) is associated with FIFO index 0.

The RFXFLL[7:0] bits are cleared when CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

CFXFLL[5:0] bits (Common FIFO Full Status)

Bit [13] (CFXFLL[5]) is associated with common FIFO index 5 and bit [8] (CFXFLL[0]) is associated with common FIFO index 0.

The CFXFLL[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

30.2.34 FIFO Message Lost Status Register (CFDFMSTS)

The CFDFMSTS register shows status of the message lost bits of the FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02A8

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CFXMLT[5:0]						RFXMLT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as 0.
13 to 8	CFXMLT[5:0]	All 0	R	Common FIFO Message Lost Status 0: Corresponding FIFO Message Lost flag not set 1: Corresponding FIFO Message Lost flag set
7 to 0	RFXMLT[7:0]	All 0	R	RX FIFO Message Lost Status 0: Corresponding FIFO Message Lost flag not set 1: Corresponding FIFO Message Lost flag set

RFXMLT[7:0] bits (RX FIFO Message Lost Status)

Bit [7] (RFXML[7]) is associated with FIFO index 7 and bit [0] (RFXML[0]) is associated with FIFO index 0.

The RFXMLT[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

CFXMLT[5:0] bits (Common FIFO Message Lost Status)

Bit [13] (CFXMLT[5]) is associated with common FIFO index 5 and bit [8] (CFXMLT[0]) is associated with common FIFO index 0.

The CFXMLT[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

30.2.35 RX FIFO Interrupt Flag Status Register (CFDRFISTS)

The CFDRFISTS register shows status of the interrupt flag bits of the RX FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02AC

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	RFXFFLL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RFXIF[7:0]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
23 to 16	RFXFFLL[7:0]	All 0	R	RX FIFO[x] Interrupt Full Flag Status 0: Corresponding RX FIFO Interrupt Full flag not set 1: Corresponding RX FIFO Interrupt Full flag set
15 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	RFXIF[7:0]	All 0	R	RX FIFO[x] Interrupt Flag Status 0: Corresponding RX FIFO Interrupt flag not set 1: Corresponding RX FIFO Interrupt flag set

RFXIF[7:0] bits (RX FIFO Interrupt Flag Status)

Bit [7] (RFXIF[7]) is associated with FIFO index 7 and bit [0] (RFXIF[0]) is associated with FIFO index 0.

Each bit is set automatically when the corresponding interrupt flag bit is set in the RX FIFO Status Registers.

The RFXIF[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding interrupt flag bit is cleared in the RX FIFO Status Registers.

RFXFFLL[7:0] bits (RX FIFO Interrupt Full Flag Status)

Bit [23] (RFXFFLL[7]) is associated with FIFO index 7 and bit [16] (RFXFFLL[0]) is associated with FIFO index 0.

Each bit is set automatically when the corresponding interrupt full flag bit is set in the RX FIFO Status Registers.

The RFXFFLL[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding interrupt full flag bit is cleared in the RX FIFO Status Registers.

30.2.36 Common FIFO RX Interrupt Flag Status Register (CFDCFRISTS)

The CFDCFRISTS register shows status of the interrupt flag bits of the Common FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02B0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
5 to 0	CFXRXIF[5:0]	All 0	R	Common FIFO RX Interrupt Flag Status 0: Corresponding Common FIFO RX Interrupt flag not set 1: Corresponding Common FIFO RX Interrupt flag set

CFXRXIF[5:0] bits (Common FIFO RX Interrupt Flag Status)

Bit [5] (CFXRXIF[5]) is associated with FIFO index 5 and bit [0] (CFXRXIF[0]) is associated with FIFO index 0.

Each bit is set automatically when the corresponding RX interrupt flag bit is set in the Common FIFO Status Registers.

The CFXRXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding RX interrupt flag bit is cleared in the Common FIFO Status Registers.

30.2.37 Common FIFO TX Interrupt Flag Status Register (CFDCFTISTS)

The CFDCFTISTS register shows status of the interrupt flag bits of the Common FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02B4

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CFXTXIF[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
5 to 0	CFXTXIF[5:0]	All 0	R	Common FIFO TX Interrupt Flag Status 0: Corresponding Common FIFO TX Interrupt flag not set 1: Corresponding Common FIFO TX Interrupt flag set

CFXTXIF[5:0] bits (Common FIFO TX Interrupt Flag Status)

Bit [5] (CFXTXIF[5]) is associated with FIFO index 5 and bit [0] (CFXTXIF[0]) is associated with FIFO index 0.

Each bit is set automatically when the corresponding TX interrupt flag bit is set in the Common FIFO Status Registers.

The CFXTXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding TX interrupt flag bit is cleared in the Common FIFO Status Registers.

30.2.38 FIFO FDC Full Status Register (CFDFFFSTS)

The CFDFFFSTS register shows status of the full interrupt flag bits of the FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02C4

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CFXFFLL[5:0]						RFXFFLL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as 0.
13 to 8	CFXFFLL[5:0]	All 0	R	COMMON FIFO FDC Level Full Status 0: Corresponding FIFO full interrupt not set 1: Corresponding FIFO full interrupt set
7 to 0	RFXFFLL[7:0]	All 0	R	RX FIFO FDC Level Full Status 0: Corresponding FIFO full interrupt not set 1: Corresponding FIFO full interrupt set

RFXFFLL[7:0] bits (RX FIFO FDC Level Full Status)

Bit [7] (RFXFFLL[7]) is associated with FIFO index 7 and bit [0] (RFXFFLL[0]) is associated with FIFO index 0.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

The RFXFFLL[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

CFXFFLL[5:0] bits (COMMON FIFO FDC Level Full Status)

Bit [13] (CFXFFLL[5]) is associated with common FIFO index 5 and bit [8] (CFXFFLL[0]) is associated with common FIFO index 0.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

The CFXFFLL[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

30.2.39 Common FIFO Message Overwrite Status Register (CFDCFMOWSTS)

The CFDCFMOWSTS register shows the status of the Interrupt Flag bits of the Common FIFO Buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02C0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CFXMOW[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
5 to 0	CFXMOW [5:0]	All 0	R	Common FIFO Massage Overwrite Status 0: Corresponding FIFO Overwrite flag not set 1: Corresponding FIFO Overwrite flag set

CFXMOW[5:0] bits (Common FIFO Massage Overwrite Status)

Bit [5] (CFXMOW[5]) is associated with common FIFO index 5 and bit [0] (CFXFMOW[0]) is associated with common FIFO index 0.

The CFXMOW[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode. This register is only valid in GW mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

30.2.40 Common FIFO One Frame RX Interrupt Flag Status Register (CFDCFOFRISTS)

The CFDCFOFRISTS register shows status of the interrupt flag bits of the Common FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02B8

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CFXOFRXIF[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are read as 0.
5 to 0	CFXOFRXIF [5:0]	All 0	R	Common FIFO One Frame RX Interrupt Flag Status 0: Corresponding Common FIFO One Frame RX Interrupt flag not set 1: Corresponding Common FIFO One Frame RX Interrupt flag set

CFXOFRXIF[5:0] bits (Common FIFO One Frame RX Interrupt Flag Status)

Bit [5] (CFXFRXIF[5]) is associated with common FIFO index 5 and bit [0] (CFXFRXIF[0]) is associated with common FIFO index 0.

Each bit is set automatically when the corresponding One Frame RX Interrupt flag bit is set in the Common FIFO Status Registers.

The CFXOFRXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding One Frame RX Interrupt flag bit is cleared in the Common FIFO Status Registers.

30.2.41 Common FIFO One Frame TX Interrupt Flag Status Register (CFDCFOFTISTS)

The CFDCFOFTISTS register shows status of the interrupt flag bits of the Common FIFO buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02BC

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	CFXOFTXIF[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are read as 0.
5 to 0	CFXOFTXIF [5:0]	All 0	R	Common FIFO One Frame TX Interrupt Flag Status 0: Corresponding Common FIFO One Frame TX Interrupt flag not set 1: Corresponding Common FIFO One Frame TX Interrupt flag set

CFXOFTXIF[5:0] bits (Common FIFO One Frame TX Interrupt Flag Status)

Bit [5] (CFXOFTXIF [5]) is associated with common FIFO index 5 and bit [0] (CFXOFTXIF[0]) is associated with common FIFO index 0.

Each bit is set automatically when the corresponding One Frame TX Interrupt flag bit is set in the Common FIFO Status Registers.

The CFXOFTXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding One Frame TX Interrupt flag bit is cleared in the Common FIFO Status Registers.

30.2.42 DMA Transfer Control Register (CFDCDTCT)

The CFDCDTCT register controls the start and stop of DMA transfer operation.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1330

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CFDMAE1	CFDMAE0	RFDMAE7	RFDMAE6	RFDMAE5	RFDMAE4	RFDMAE3	RFDMAE2	RFDMAE1	RFDMAE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9	CFDMAE1	0	R/W	DMA Transfer Enable for Common FIFO 0 of Channel 1 0: DMA transfer request disabled 1: DMA transfer request enabled
8	CFDMAE0	0	R/W	DMA Transfer Enable for Common FIFO 0 of Channel 0 0: DMA transfer request disabled 1: DMA transfer request enabled
7	RFDMAE7	0	R/W	DMA Transfer Enable for RX FIFO 7 0: DMA transfer request disabled 1: DMA transfer request enabled
6	RFDMAE6	0	R/W	DMA Transfer Enable for RX FIFO 6 0: DMA transfer request disabled 1: DMA transfer request enabled
5	RFDMAE5	0	R/W	DMA Transfer Enable for RX FIFO 5 0: DMA transfer request disabled 1: DMA transfer request enabled
4	RFDMAE4	0	R/W	DMA Transfer Enable for RX FIFO 4 0: DMA transfer request disabled 1: DMA transfer request enabled
3	RFDMAE3	0	R/W	DMA Transfer Enable for RX FIFO 3 0: DMA transfer request disabled 1: DMA transfer request enabled
2	RFDMAE2	0	R/W	DMA Transfer Enable for RX FIFO 2 0: DMA transfer request disabled 1: DMA transfer request enabled
1	RFDMAE1	0	R/W	DMA Transfer Enable for RX FIFO 1 0: DMA transfer request disabled 1: DMA transfer request enabled
0	RFDMAE0	0	R/W	DMA Transfer Enable for RX FIFO 0 0: DMA transfer request disabled 1: DMA transfer request enabled

RFDMAEn (n = 0 to 7) bit (DMA Transfer Enable for RX FIFOn)

Number of RX FIFOs = 8

The RFDMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

CFDMAEn (n = 0, 1) bit (DMA Transfer Enable for Common FIFO 0 of Channel 0, 1)

The CFDMAEn bit enables or disables DMA transfer request for common FIFO 0 of channel 0 or 1. Only Common FIFO 0 can be linked to a DMA channel with this bit. Common FIFO 1 cannot be linked to a DMA channel.

To link Common FIFO 2, see bit CFDCDTTCT.CFDMAEn in **Section 30.2.44, DMA TX Transfer Control Register (CFDCDTTCT)**.

The CFDMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

Do not enable a DMA transfer for a Common FIFO that is configured as TX or GW FIFO.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

30.2.43 DMA Transfer Status Register (CFDCDTSTS)

The CFDCDTSTS register shows the status of the DMA transfer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1334

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9	CFDMASTS1	0	R	DMA Transfer Status only for Common FIFO 0 of Channel 1 0: DMA transfer stopped 1: DMA transfer on going
8	CFDMASTS0	0	R	DMA Transfer Status only for Common FIFO 0 of Channel 0 0: DMA transfer stopped 1: DMA transfer on going
7	RFDMASTS7	0	R	DMA Transfer Status for RX FIFO 7 0: DMA transfer stopped 1: DMA transfer on going
6	RFDMASTS6	0	R	DMA Transfer Status for RX FIFO 6 0: DMA transfer stopped 1: DMA transfer on going
5	RFDMASTS5	0	R	DMA Transfer Status for RX FIFO 5 0: DMA transfer stopped 1: DMA transfer on going
4	RFDMASTS4	0	R	DMA Transfer Status for RX FIFO 4 0: DMA transfer stopped 1: DMA transfer on going
3	RFDMASTS3	0	R	DMA Transfer Status for RX FIFO 3 0: DMA transfer stopped 1: DMA transfer on going
2	RFDMASTS2	0	R	DMA Transfer Status for RX FIFO 2 0: DMA transfer stopped 1: DMA transfer on going
1	RFDMASTS1	0	R	DMA Transfer Status for RX FIFO 1 0: DMA transfer stopped 1: DMA transfer on going
0	RFDMASTS0	0	R	DMA Transfer Status for RX FIFO 0 0: DMA transfer stopped 1: DMA transfer on going

RFDMASTSn (n = 0 to 7) bit (DMA Transfer Status for RX FIFO n)

Number of RX FIFOs = 8

Each bit is set automatically when the corresponding DMA enable bit is set and the corresponding DMA FIFO is not empty.

Each bit is cleared automatically when the DMA transfer stops either because the DMA is disabled or the DMA FIFO is empty.

When CFDCDTCT.RFDMAEn (see CFDCDTCT.RFDMAEn bit in **Section 30.2.42, DMA Transfer Control Register (CFDCDTCT)**) is set to 0 while DMA transfer for the corresponding FIFO is ongoing, the RFDMASTSn bit becomes 0 when the DMA transfer is complete.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

CFDMASTSn (n = 0, 1) bit (DMA Transfer Status only for Common FIFO 0 of Channel 0, 1)

Each bit is set automatically when the corresponding DMA enable bit is set and the corresponding DMA FIFO is not empty.

Each bit is cleared automatically when the DMA transfer stops either because the DMA is disabled or the DMA FIFO is empty.

When CFDCDTCT.CFDMAEn (see CFDCDTCT.CFDMAEn bit in **Section 30.2.42, DMA Transfer Control Register (CFDCDTCT)**) is set to 0 while DMA transfer for the corresponding FIFO is ongoing, the CFDMASTSn bit becomes 0 when the DMA transfer is complete.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

30.2.44 DMA TX Transfer Control Register (CFDCDTTCT)

The CFDCDTTCT register controls the start and stop of DMA transfer operation.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1340

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
17	CFDMAE1	0	R/W	DMA TX Transfer Enable for Common FIFO 2 of Channel 1 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled
16	CFDMAE0	0	R/W	DMA TX Transfer Enable for Common FIFO 2 of Channel 0 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9	TQ3DMAE1	0	R/W	DMA TX Transfer Enable for TXQ 3 of Channel 1 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled
8	TQ3DMAE0	0	R/W	DMA TX Transfer Enable for TXQ 3 of Channel 0 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled
7 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
1	TQ0DMAE1	0	R/W	DMA TX Transfer Enable for TXQ 0 of Channel 1 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled
0	TQ0DMAE0	0	R/W	DMA TX Transfer Enable for TXQ 0 of Channel 0 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled

TQ0DMAEn (n = 0, 1) bit (DMA TX Transfer Enable for TXQ 0 of Channel n)

The TQ0DMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

TQ3DMAEn (n = 0, 1) bit (DMA TX Transfer Enable for TXQ 3 of Channel n)

The TQ3DMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

CFDMAEn (n = 0, 1) bit (DMA TX Transfer Enable for Common FIFO 2 of Channel n)

The CFDMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

Only common FIFO 2 can be linked to a DMA channel with this bit. Common FIFO 1 cannot be linked to a DMA channel. To link Common FIFO 0, see CFDCDTCT.CFDMAEn bit in **Section 30.2.42, DMA Transfer Control Register (CFDCDTCT)**.

Do not enable a DMA transfer for a Common FIFO that is configured as RX or GW FIFO.

The CFDMAEn bit is cleared when the CAN-FD module is in GL_RESET mode.

30.2.45 DMA TX Transfer Status Register (CFDCDTTSTS)

The CFDCDTTSTS register shows the status of the DMA TX transfer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1344

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8	TQ3DMASTS0	0	R	DMA TX Transfer Status for TXQ3 of Channel 0 0: DMA TX transfer stopped 1: DMA TX transfer enabled
7 to 2	—	All 0	R	Reserved These bits are read as 0.
1	TQ0DMASTS1	0	R	DMA TX Transfer Status for TXQ0 of Channel 1 0: DMA TX transfer stopped 1: DMA TX transfer enabled
0	TQ0DMASTS0	0	R	DMA TX Transfer Status for TXQ0 of Channel 0 0: DMA TX transfer stopped 1: DMA TX transfer enabled

TQ0DMASTSn (n = 0, 1) bit (DMA TX Transfer Status for TXQ 0 of Channel n)

The TQ0DMASTSn bit is set when the CFDCDTTCT.TQ0DMAEn bit in the corresponding CFDCDTTCT register is set (see **Section 30.2.44, DMA TX Transfer Control Register (CFDCDTTCT)**).

This bit is cleared when:

- The CFDCDTTCT.TQ0DMAEn bit in the corresponding CFDCDTTCT register is cleared
- The CAN-FD module is in GL_RESET mode.

TQ3DMASTSn (n = 0, 1) bit (DMA TX Transfer Status for TXQ 3 of Channel n)

The TQ3DMASTSn bit is set when the CFDCDTTCT.TQ3DMAEn bit in the corresponding CFDCDTTCT register is set (see **Section 30.2.44, DMA TX Transfer Control Register (CFDCDTTCT)**).

This bit is cleared when:

- The CFDCDTTCT.TQ3DMAEn bit in the corresponding CFDCDTTCT register is cleared
- The CAN-FD module is in GL_RESET mode.

CFDMASTSn (n = 0 ,1) bit (DMA TX Transfer Status only for Common FIFO 2 of Channel n)

The CFDMASTSn bit is set when the CFDCDTTCT.CFDMAEn bit in the corresponding CFDCDTTCT register is set (see **Section 30.2.44, DMA TX Transfer Control Register (CFDCDTTCT)**).

This bit is cleared when:

- The CFDCDTTCT.CFDMAEn bit in the corresponding CFDCDTTCT register is cleared
- The CAN-FD module is in GL_RESET mode.

30.2.46 Global RX Interrupt Status Register n (CFDGRINTSTSn) (n = 0, 1)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1350 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	QFIF[2:0]	000	R	TXQ Full Interrupt Flag Channel n (n = 0, 1) 0: Corresponding TXQ Full Interrupt flag is not set 1: Corresponding TXQ Full Interrupt flag is set

QFIF[2:0] bits (TXQ Full Interrupt Flag Channel n (n = 0, 1))

The QFIF[2:0] bits are set automatically when the TXQ Full Interrupt flag of the related channel is set when the interrupt is enabled.

The QFIF[2:0] bits are cleared automatically when:

- The related TXQ result status bits are cleared or the interrupt enable is disabled
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

BQFIF[1:0] bits (Borrowed TXQ Full Interrupt Flag Channel n (n = 0, 1))

The BQFIF[1:0] bits are set when a flexible transmission buffer assignment function is used and the borrowed TXQ is in full status. Operation is the same as CFDGRINTSTSn.QFIF.

The bit of the channel that lends TXMB is a reserved bit.

QOFRIF[2:0] bits (TXQ One Frame RX Interrupt Flag Channel n (n = 0, 1))

The QOFRIF[2:0] bits are set automatically when the TXQ One Frame RX Interrupt flag of the related channel is set when the interrupt is enabled.

The QOFRIF[2:0] bits are cleared automatically when:

- The related TXQ result status bits are cleared or the interrupt enable is disabled
- The CAN-FD module is in GL_RESET or CH_RESET mode.

BQOFRIF[1:0] bits (Borrowed TXQ One Frame RX Interrupt Flag Channel n (n = 0, 1))

The BQOFRIF[1:0] bits are set when a flexible transmission buffer assignment function is used and the borrowed TXQ receives one frame. Operation is the same as CFDGRINTSTSn.QOFRIF.

The bit of the channel that lends TXMB is a reserved bit.

CFRIF[2:0] bits (Common FIFO RX Interrupt Flag Channel n (n = 0, 1))

The CFRIF[2:0] bits are set automatically when the Common FIFO RX Interrupt flag of the related channel is set when the interrupt is enabled.

The CFRIF[2:0] bits are cleared automatically when:

- The related Common FIFO RX result status bits are cleared or the interrupt enable is disabled
- The CAN-FD module is in GL_RESET or CH_RESET mode.

CFRFIF[2:0] bits (Common FIFO FDC Level Full Interrupt Flag Channel n (n = 0, 1))

The CFRFIF[2:0] bits are set automatically when the Common FIFO Full Interrupt flag of the related channel is set when the interrupt is enabled.

The CFRFIF[2:0] bits are cleared automatically when:

- The related Common FIFO RX result status bits are cleared or the interrupt enable is disabled

- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

CFOFRIF[2:0] bits (Common FIFO One Frame RX Interrupt Flag Channel n (n = 0, 1))

The CFOFRIF[2:0] bits are set automatically when the Common FIFO One Frame RX Interrupt flag of the related channel is set when the interrupt is enabled.

The CFOFRIF[2:0] bits are cleared automatically when:

- The related Common FIFO RX result status bits are cleared or the interrupt enable is disabled
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

30.2.47 TX Message Buffer Control Register n (CFDTMCn) (n = 0 to 127)

The CFDTMCn register (n = 0 to 127) configures the TX message buffer functions.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'02D0 + H'01 × n

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	TMOM	0	R/W	TX Message Buffer One-shot Mode 0: TX message buffer not configured in one-shot mode 1: TX message buffer configured in one-shot mode
1	TMTAR	0	R/W	TX Message Buffer Transmission Abort Request 0: TX message buffer transmission request abort not requested 1: TX message buffer transmission request abort requested
0	TMTR	0	R/W	TX Message Buffer Transmission Request 0: TX Message buffer transmission not requested 1: TX message buffer transmission requested

TMTR bit (TX Message Buffer Transmission Request)

When the TMTR bit is set, the CAN-FD module logic tries to transmit the message stored in the corresponding message buffer.

Only write to this bit when the related CAN-FD module is in CH_HALT or CH_OPERATION mode.

Do not set this bit if the corresponding TX message buffer is linked to a COM FIFO in TX or GW mode or is a part of TX Queue.

This bit cannot be directly cleared by a CPU write access.

This bit can only be set when the Transmission Result flag bits (CFDTMSTSn.TMTRF[1:0]) in the CFDTMSTSn register corresponding to the message buffer are cleared to 00b.

The TMTR bit is automatically cleared by the:

- CAN-FD module logic at the end of a successful transmission
- CAN-FD module logic at the end of a transmission abort, requested by the corresponding CFDTMCn.TMTAR bit
- CAN-FD module logic when there is a detection of a CAN bus error or arbitration loss if CFDTMCn.TMOM bit is set for the message buffer
- CAN-FD module logic when the CAN-FD module is in GL_RESET mode or the related channel is in CH_RESET mode.

TMTAR bit (TX Message Buffer Transmission Abort Request)

When the TMTAR bit is set, the CAN-FD module logic tries to abort the transmission of the frame stored in the corresponding message buffer.

In most cases, transmission cannot be aborted if the internal scan for transmission is complete and the message buffer has already been selected for transmission. In this case, frame may be transmitted successfully from the message buffer. The message buffer selection is released by entering CH_HALT mode.

However, message buffer selected for transmission can be aborted by an abort request when the CAN node detects a new message on the bus (RX pin) before it starts transmission from the selected message buffer.

Only write to the TMTAR bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode. This bit can only be set when the related transmit request TMTR bit is set.

The TMTAR bit cannot be cleared by a CPU write access. Clearing of this bit by CAN-FD has priority over setting by a CPU write access.

The TMTAR bit is automatically cleared by:

- The CAN-FD module logic at the end of a successful transmission
- The CAN-FD module logic at the end of a transmission abort
- The CAN-FD module logic when there is detection of a CAN bus error or arbitration loss
- The CAN-FD module logic when the CAN-FD module is in GL_RESET mode or the related channel enters CH_RESET mode.

TMOM bit (TX Message Buffer One-shot Mode)

When the TMOM bit is set, the CAN-FD module logic tries to transmit the message only once.

If the transmission is successful, the CFDTMSTSn.TMTRF[1:0] bits are set to 10b or 11b. Otherwise, the transmission is automatically aborted and CFDTMSTSn.TMTRF[1:0] bits are set to 01b due to a bus error or a bus arbitration lost.

The TMOM bit remains set if the transmission has completed successfully or aborted due to an error or a loss of arbitration.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Set this bit at the same time as the TMTR bit. Clear this bit with a write access.

If a message has already been requested for transmission, do not write to this bit until the message has been successfully transmitted or transmission has been aborted.

The TMOM bit is automatically cleared by the CAN-FD module logic when the CAN-FD module is in GL_RESET mode or the related channel is in CH_RESET mode.

30.2.48 TX Message Buffer Status Register n (CFDTMSTSn) (n = 0 to 127)

The CFDTMSTSn register (n = 0 to 127) shows status of the transmission and transmission abort for the corresponding message buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'07D0 + H'01 × n

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	000	R/W	Reserved These bits are read as 0. The write value should be always 0.
4	TMTARM	0	R	TX Message Buffer Transmission Abort Request Mirrored 0: TX message buffer transmission request abort not requested 1: TX message buffer transmission request abort requested
3	TMTRM	0	R	TX Message Buffer Transmission Request Mirrored 0: TX message buffer transmission not requested 1: TX message buffer transmission requested
2, 1	TMTRF[1:0]	00	R/W	TX Message Buffer Transmission Result Flag 00: No result 01: Transmission aborted from the TX message buffer 10: Transmission successful from the TX message buffer and transmission abort was not requested 11: Transmission successful from the TX message buffer and transmission abort was requested
0	TMTSTS	0	R	TX Message Buffer Transmission Status 0: No on-going transmission 1: On-going transmission

TMTSTS bit (TX Message Buffer Transmission Status)

The TMTSTS bit is set automatically at the start of the transmission from the corresponding TX message buffer.

This bit is cleared automatically when:

- Transmission stops
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

TMTRF[1:0] bits (TX Message Buffer Transmission Result Flag)

The TMTRF[1:0] bits show the result for the corresponding TX message buffer. The status is as follows:

- 00b: Transmission in progress or has not been requested
- 01b: Transmission has been aborted from the corresponding TX message buffer
- 10b: Transmission was successful from the corresponding TX message buffer and the CFDTMCn.TMTAR bit was not set for this TX message buffer

- 11b: Transmission was successful from the corresponding TX message buffer, but the CFDTMCn.TMTAR bit was set for this TX message buffer.

Only write to these bits when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

The TMTRF[1:0] bits are cleared automatically when the CAN-FD module is in GL_RESET mode or the related channel is in CH_RESET mode.

TMTRM bit (TX Message Buffer Transmission Request Mirrored)

The TMTRM bit is set when the CFDTMCn.TMTR bit in the corresponding CFDTMCn register is set.

This bit is cleared when the CFDTMCn.TMTR bit in the corresponding CFDTMCn register is cleared.

TMTARM bit (TX Message Buffer Transmission Abort Request Mirrored)

The TMTARM bit is set when the CFDTMCn.TMTAR bit in the corresponding CFDTMCn register is set.

This bit is cleared when the CFDTMCn.TMTAR bit in the corresponding CFDTMCn register is cleared.

30.2.49 TX Message Buffer Transmission Request Status Register n (CFDTMTRSTSn) (n = 0 to 3)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0CD0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0.
15 to 0	TMTRSTS [15:0]	All 0	R	TX Message Buffer Transmission Request Status 0: Transmission not requested for corresponding TX message buffer 1: Transmission requested for corresponding TX message buffer

TMTRSTS[15:0] bits (TX Message Buffer Transmission Request Status)

The TMTRSTS[15:0] bits show status of the CFDTMCn.TMTR bits of the TX Message Buffer Control Registers.

Alignment of the TMTRSTS[15:0] bits is shown in **Table 30.8**.

Table 30.8 Alignment of TMTRSTS[15:0] Mirror Bits

Bit Position	TX Message Buffer Number
n × 64 − fmin × 32	n × 64 + 0
n × 64 + 1 − fmin × 32	n × 64 + 1
⋮	⋮
n × 64 + 31 − fmin × 32	n × 64 + 31
n × 64 + 32 − fmax × 32	n × 64 + 32
n × 64 + 33 − fmax × 32	n × 64 + 33
⋮	⋮
n ×64 + 62 − fmax × 32	n × 64 + 62
n × 64 + 63 − fmax × 32	n × 64 + 63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

Each bit is set automatically when the corresponding bit is set in the TX Message Buffer Control Registers (CFDTMCn), and only when the message buffer does not belong to a TX Queue.

Each bit is cleared automatically when:

- The corresponding bit is cleared in the TX Message Buffer Control Registers

- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

30.2.50 TX Message Buffer Transmission Abort Request Status Register n (CFDTMTARSTSn) (n = 0 to 3)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0D70 + H'04 × n

n × 64 + 33 − fmax × 32	n × 64 + 33
⋮	⋮
n × 64 + 62 − fmax × 32	n × 64 + 62
n × 64 + 63 − fmax × 32	n × 64 + 63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

Each bit is set automatically when the corresponding bit is set in the TX Message Buffer Control Registers, and when the message buffer belongs to a TX Queue.

Each bit is cleared automatically when:

- The corresponding bit is cleared in the TX Message Buffer Control Registers

- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

30.2.51 TX Message Buffer Transmission Completion Status Register n (CFDTMTCSTSn) (n = 0 to 3)

Base address: H'0_100C_0000

Offset address: H'0E10 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMTCSTS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0.
15 to 0	TMTCSTS [15:0]	All 0	R	TX Message Buffer Transmission Completion Status 0: Transmission not completed for corresponding TX message buffer 1: Transmission completed for corresponding TX message buffer

TMTCSTS[15:0] bits (TX Message Buffer Transmission Completion Status)

The TMTCSTS[15:0] bits show status of successful completion of the TX Message Buffer Status Registers.

Alignment of the TMTCSTS[15:0] bits is shown in **Table 30.10**.

Table 30.10 Alignment of TMTCSTS[15:0] Mirror Bits

Bit Position	TX Message Buffer Number
n × 64 − fmin × 32	n × 64 + 0
n × 64 + 1 − fmin × 32	n × 64 + 1
⋮	⋮
n × 64 + 31 − fmin × 32	n × 64 + 31
n × 64 + 32 − fmax × 32	n × 64 + 32
n × 64 + 33 − fmax × 32	n × 64 + 33
⋮	⋮
n × 64 + 62 − fmax × 32	n × 64 + 62
n × 64 + 63 − fmax × 32	n × 64 + 63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1,fmin = 2, fmax = 3

Each bit is set automatically when the corresponding bit is set in the TX Message Buffer Status Registers.

Each bit is cleared automatically when:

- The corresponding bit is cleared in the TX Message Buffer Status Registers
- The CAN-FD module is in GL_RESET mode

- The related CAN-FD channel is in CH_RESET mode.

If a CAN channel enters CH_RESET mode, then the bits related to that channel are cleared.

30.2.52 TX Message Buffer Transmission Abort Status Register n (CFDTMTASTSn) (n = 0 to 3)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0EB0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0.
15 to 0	TMTASTS [15:0]	All 0	R	TX Message Buffer Transmission Abort Status 0: Transmission not aborted for corresponding TX message buffer 1: Transmission aborted for corresponding TX message buffer

TMTASTS[15:0] bits (TX Message Buffer Transmission Abort Status)

The TMTASTS[15:0] bits show status of the successful transmission abort of the corresponding TX message buffer.

Alignment of the TMTASTS[15:0] bits is shown in **Table 30.11**.

Table 30.11 Alignment of TMTASTS[15:0] Mirror Bits

Bit Position	TX Message Buffer Number
n × 64 − fmin × 32	n × 64 + 0
n × 64 + 1 − fmin × 32	n × 64 + 1
⋮	⋮
n × 64 + 31 − fmin × 32	n × 64 + 31
n × 64 + 32 − fmax × 32	n × 64 + 32
n × 64 + 33 − fmax × 32	n × 64 + 33
⋮	⋮
n × 64 + 62 − fmax × 32	n × 64 + 62
n × 64 + 63 − fmax × 32	n × 64 + 63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

Each bit is set automatically when the CFDTMSTSn.TMTRF[1:0] bits are set to 01b in the corresponding TX Message Buffer Status Register.

Each bit is cleared automatically when:

- The CFDTMSTSn.TMTRF[1:0] bits are cleared in the corresponding TX Message Buffer Status Register

- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

30.2.53 TX Message Buffer Transmission Interrupt Enable Register n (CFDTMIECn) (n = 0 to 3)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'0F50 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMIE[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
15 to 0	TMIE[15:0]	All 0	R/W	TX Message Buffer Interrupt Enable 0: TX message buffer interrupt disabled for corresponding TX message buffer 1: TX message buffer interrupt enabled for corresponding TX message buffer

TMIE[15:0] bits (TX Message Buffer Interrupt Enable)

If the TMIE[15:0] bits are set, an interrupt is generated at the end of a successful transmission from the corresponding message buffer.

See **Section 30.7, Interrupt and DMA** for TX Message Buffer Interrupt specification.

Alignment of the TMIE[15:0] bits is shown in **Table 30.12**.

Table 30.12 Alignment of TMIE[15:0] bits

Bit Position	TX Message Buffer Number
n × 64 − fmin × 32	n × 64 + 0
n × 64 + 1 − fmin × 32	n × 64 + 1
⋮	⋮
n × 64 + 31 − fmin × 32	n × 64 + 31
n × 64 + 32 − fmax × 32	n × 64 + 32
n × 64 + 33 − fmax × 32	n × 64 + 33
⋮	⋮
n × 64 + 62 − fmax × 32	n × 64 + 62
n × 64 + 63 − fmax × 32	n × 64 + 63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

Do not write to the TMIE[15:0] bits when:

- The CAN-FD module is in GL_SLEEP mode

- The related CAN-FD channel is in CH_SLEEP mode
- The corresponding TX message buffer is part of a TX Queue
- The corresponding TX message buffer is linked to a Common FIFO with the CFDCFCCn.CFTML[4:0] bits.

30.2.54 TX Queue Configuration/Control Register 0n (CFDTXQCC0n) (n = 0, 1)

The CFDTXQCC0n register (n = 0, 1) is used to configure the TX Queue transmission.

TXQ0 is composed of TXMB0 to TXMB31 (at the maximum) when TXQE is enabled.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1000 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5	TXQTXIE	0	R/W	TX Queue TX Interrupt Enable 0: TX Queue TX interrupt disabled 1: TX Queue TX interrupt enabled
4, 3	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.

Bit	Bit Name	Initial Value	R/W	Description
2	TXQOWE	0	R/W	TX Queue Overwrite Mode Enable 0: TX Queue OW mode disabled 1: TX Queue OW mode enabled
1	TXQGWE	0	R/W	TX Queue Gateway Mode Enable 0: TX Queue GW mode disabled 1: TX Queue GW mode enabled
0	TXQE	0	R/W	TX Queue Enable 0: TX Queue disabled 1: TX Queue enabled

TXQE bit (TX Queue Enable)

The TXQE bit cannot be set if the configured TX Queue depth is H'00 (CFDTXQCC0n.TXQDC[4:0] = H'00).

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

The TXQE bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQGWE bit (TX Queue Gateway Mode Enable)

When the TXQGWE bit is set, the TX Queue is in TX Queue GW mode.

When this bit is set, CPU must not access the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQOWE bit (TX Queue Overwrite Mode Enable)

When the TXQOWE bit is set, the TX Queue is in TX Queue Overwrite mode.

An overwrite function is valid when the same ID such as ID of the data written in from the gateway or CPU is in TX Queue. For example, when a frame is received and is stored into the TX Queue, if a message with the same ID is stored in the TX Queue, the old message is overwritten by the new message.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

When using the function in GW mode, the depth of TXQ (CFDTXQCC0n.TXQDC) should be configured to the value which is the various number of ID that is used in the TX Queue plus 3.

The function is valid for the standard ID frame but is invalid for the extended ID frame.

Do not modify this bit when the CFDTXQCC0n.TXQE bit is 1.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[4:0] bits (TX Queue Depth Configuration)

The TXQDC[4:0] bits select the depth of the transmission queue. The message buffer selection starts from MB[0] up to MB[31] depending on the configured depth.

When using TXQ1 and TXQ0 simultaneously, the total depth of TXQ1 and TXQ0 should be 32 or less.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQFIE bit (TXQ Full Interrupt Enable)

When the TXQFIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS0n.TXQFIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit in Gateway mode (CFDTXQCC0n.TXQGWE = 1).

TXQOFRXIE bit (TXQ One Frame Reception Interrupt Enable)

When the TXQOFRXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS0n.TXQOFRXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit in GW mode (CFDTXQCC0n.TXQGWE = 1).

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS0n.TXQOFTXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

30.2.55 TX Queue Configuration/Control Register 1n (CFDTXQCC1n) (n = 0, 1)

The CFDTXQCC1n register (n = 0, 1) is used to configure the TX Queue transmission.

TXQ1 is composed of TXMB31 to TXMB0 (at the maximum) when TXQE is enabled.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1060 + H'04 × n

4, 3	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.

Bit	Bit Name	Initial Value	R/W	Description
2	TXQOWE	0	R/W	TX Queue Overwrite Mode Enable 0: TX Queue OW mode disabled 1: TX Queue OW mode enabled
1	TXQGWE	0	R/W	TX Queue Gateway Mode Enable 0: TX Queue GW mode disabled 1: TX Queue GW mode enabled
0	TXQE	0	R/W	TX Queue Enable 0: TX Queue disabled 1: TX Queue enabled

TXQE bit (TX Queue Enable)

The TXQE bit cannot be set if the configured TX Queue depth is H'00 (CFDTXQCC1n.TXQDC[4:0] = H'00).

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQGWE bit (TX Queue Gateway Mode Enable)

When the TXQGWE bit is set, the TX Queue is in TX Queue Gateway mode.

When this bit is set, CPU must not access the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQOWE bit (TX Queue Overwrite Mode Enable)

When the TXQOWE bit is set, the TX Queue is in TX Queue Overwrite mode.

An overwrite function is valid when the same ID such as ID of the data written in from the gateway or CPU is in TX Queue. For example, when a frame is received and is stored into the TX Queue, if a message with the same ID is stored in the TX Queue, the old message is overwritten by the new message.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

When using the function in GW mode, the depth of TXQ (CFDTXQCC1n.TXQDC) should be configured to the value which is the various number of ID that is used in the TX Queue plus 3.

The function is valid for the standard ID frame but is invalid for the extended ID frame.

Do not modify this bit when the CFDTXQCC1n.TXQE bit is 1.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[4:0] bits (TX Queue Depth Configuration)

The TXQDC[4:0] bits select the depth of the transmission queue. The message buffer selection starts from MB[31] down to MB[0] depending on the configured depth.

When using TXQ1 and TXQ0 simultaneously, the total depth of TXQ1 and TXQ0 should be 32 or less.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQFIE bit (TXQ Full Interrupt Enable)

When the TXQFIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS1n.TXQFIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in Gateway mode (CFDTXQCC1n.TXQGWE = 1).

TXQOFRXIE bit (TXQ One Frame Reception Interrupt Enable)

When the TXQOFRXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS1n.TXQOFRXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in Gateway mode (CFDTXQCC1n.TXQGWE = 1).

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS1n.TXQOFTXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

30.2.56 TX Queue Configuration/Control Register 2n (CFDTXQCC2n) (n = 0, 1)

The CFDTXQCC2n register (n = 0, 1) is used to configure the TX Queue transmission.

TXQ2 is composed of TXMB32 to TXMB63 (at the maximum) when TXQE is enabled.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'10C0 + H'04 × n

5	TXQTXIE	0	R/W	TX Queue TX Interrupt Enable 0: TX Queue TX interrupt disabled 1: TX Queue TX interrupt enabled
4, 3	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.

Bit	Bit Name	Initial Value	R/W	Description
2	TXQOWE	0	R/W	TX Queue Overwrite Mode Enable 0: TX Queue OW mode disabled 1: TX Queue OW mode enabled
1	TXQGWE	0	R/W	TX Queue Gateway Mode Enable 0: TX Queue GW mode disabled 1: TX Queue GW mode enabled
0	TXQE	0	R/W	TX Queue Enable 0: TX Queue disabled 1: TX Queue enabled

TXQE bit (TX Queue Enable)

The TXQE bit cannot be set if the configured TX Queue depth is H'00 (CFDTXQCC2n.TXQDC[4:0] = H'00).

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

TXQGWE bit (TX Queue Gateway Mode Enable)

When the TXQGWE bit is set, the TX Queue is in TX Queue Gateway mode. When this bit is set, CPU must not access the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQOWE bit (TX Queue Overwrite Mode Enable)

When the TXQOWE bit is set, the TX Queue is in TX Queue Overwrite mode.

An overwrite function is valid when the same ID such as ID of the data written in from the gateway or CPU is in TX Queue. For example, when a frame is received and is stored into the TX Queue, if a message with the same ID is stored in the TX Queue, the old message is overwritten by the new message.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

When using the function in GW mode, the depth of TXQ (CFDTXQCC2n.TXQDC) should be configured to the value which is the various number of ID that is used in the TX Queue plus 3.

The function is valid for the standard ID frame but is invalid for the extended ID frame.

Do not modify this bit when the CFDTXQCC2n.TXQE bit is 1.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[4:0] bits (TX Queue Depth Configuration)

The TXQDC[4:0] bits select the depth of the transmission queue. The message buffer selection starts from MB[32] up to MB[63] depending on the configured depth.

When using TXQ3 and TXQ2 simultaneously, the total depth of TXQ3 and TXQ2 should be 32 or less.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION

TXQFIE bit (TXQ Full Interrupt Enable)

When the TXQFIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS2n.TXQFIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in GW mode (CFDTXQCC2n.TXQGWE = 1).

TXQOFRXIE bit (TXQ One Frame Reception Interrupt Enable)

When the TXQOFRXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS2n.TXQOFRXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in GW mode (CFDTXQCC2n.TXQGWE = 1).

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS2n.TXQOFTXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

30.2.57 TX Queue Configuration/Control Register 3n (CFDTXQCC3n) (n = 0, 1)

The CFDTXQCC3n register (n = 0, 1) is used to configure the TX Queue transmission.

TXQ3 is composed of TXMB63 to TXMB32 (at the maximum) when TXQE is enabled.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1120 + H'04 × n

Bit	Bit Name	Initial Value	R/W	Description
0	TXQE	0	R/W	TX Queue Enable 0: TX Queue disabled 1: TX Queue enabled

TXQE bit (TX Queue Enable)

The TXQE bit cannot be set if the configured TX Queue depth is H'00 (CFDTXQCC3n.TXQDC[4:0] = H'00).

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

TXQOWE bit (TX Queue Overwrite Mode Enable)

When the TXQOWE bit is set, the TX Queue is in TX Queue Overwrite mode.

An overwrite function is valid when the same ID such as ID of the data written in from the gateway or CPU is in TX Queue. For example, when a frame is received and is stored into the TX Queue, if a message with the same ID is stored in the TX Queue, the old message is overwritten by the new message.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

When using the function in GW mode, the depth of TXQ (CFDTXQCC3n.TXQDC) should be configured to the value which is the various number of ID that is used in the TX Queue plus 3.

The function is valid for the standard ID frame but is invalid for the extended ID frame.

Do not modify this bit when the CFDTXQCC3n.TXQE bit is 1.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[4:0] bits (TX Queue Depth Configuration)

The TXQDC[4:0] bits select the depth of the transmission queue. The message buffer selection starts from MB[63] down to MB[32] depending on the configured depth.

When using TXQ3 and TXQ2 simultaneously, the total depth of TXQ3 and TXQ2 should be 32 or less.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS3n.TXQOFTXIF bit.

Cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

30.2.58 TX Queue Status Register 0n (CFDTXQSTS0n) (n = 0, 1)

The CFDTXQSTS0n register (n = 0, 1) shows the status of the TX Queue of corresponding CAN Channel.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1020 + H'04 × n

Bit	Bit Name	Initial Value	R/W	Description
0	TXQEMP	1	R	TX Queue Empty 0: TX Queue not empty 1: TX Queue empty

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is set automatically when the TX Queue is disabled or no messages are stored in the TX Queue.

This bit is set automatically when:

- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

This bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth.

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[5:0] bits (TX Queue Message Count)

The TXQMC[5:0] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQFIF bit (TXQ Full Interrupt Flag)

The TXQFIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Only in Gateway mode (CFDTXQCC0n.TXQGWE = 1) that this bit is set automatically when the TX Queue transits to a buffer full status.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFRXIF bit (TXQ One Frame Reception Interrupt Flag)

The TXQOFRXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When receiving data is stored in the TX Queue in Gateway mode, this bit is set automatically.

This function can only be used in Gateway mode of the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When transmission is successful in the TX Queue, this bit is set automatically.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMLT bit (TXQ Message Lost)

The TXQMLT bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When a message lost occurs in Gateway mode of the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMOW bit (TXQ Message Overwrite)

The TXQMOW bit is not cleared automatically if the TX Queue is disabled.

When stopping TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.

When CFDTXQCC0n.TXQOWE = 1 and message overwrite occurs in TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

30.2.59 TX Queue Status Register 1n (CFDTXQSTS1n) (n = 0, 1)

The CFDTXQSTS1n register (n = 0, 1) shows the status of the TX Queue of corresponding CAN Channel.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1080 + H'04 × n

16	TXQFIF	0	R/W	TXQ Full Interrupt Flag When TXQ is in full status, an interrupt is set.
15, 14	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.
13 to 8	TXQMC[5:0]	All 0	R	TX Queue Message Count Number of messages in the TX Queue
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	TXQTXIF	0	R/W	TX Queue TX Interrupt Flag 0: TX Queue interrupt condition not satisfied after a frame TX 1: TX Queue interrupt condition satisfied after a frame TX
1	TXQFLL	0	R	TX Queue Full 0: TX Queue not full 1: TX Queue full
0	TXQEMP	1	R	TX Queue Empty 0: TX Queue not empty 1: TX Queue empty

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is set automatically when the TX Queue is disabled or no messages are stored in the TX Queue.

This bit is set automatically when:

- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

This bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth.

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[5:0] bits (TX Queue Message Count)

The TXQMC[5:0] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQFIF bit (TXQ Full Interrupt Flag)

The TXQFIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Only in Gateway mode (CFDTXQCC1n.TXQGWE = 1) that this bit is set automatically when the TX Queue transits to a buffer full status.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFRXIF bit (TXQ One Frame Reception Interrupt Flag)

The TXQOFRXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When receiving data is stored in the TX Queue in Gateway mode, this bit is set automatically.

This function can only be used in Gateway mode of the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When transmission is successful in the TX Queue, this bit is set automatically.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMLT bit (TXQ Message Lost)

The TXQMLT bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When a message lost occurs in Gateway mode of the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode

TXQMOW bit (TXQ Message Overwrite)

The TXQMOW bit is not cleared automatically if the TX Queue is disabled.

When stopping TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.

When CFDTXQCC1n.TXQOWE = 1 and message overwrite occurs in TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

30.2.60 TX Queue Status Register 2n (CFDTXQSTS2n) (n = 0, 1)

The CFDTXQSTS2n register (n = 0, 1) shows the status of the TX Queue of corresponding CAN Channel.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'10E0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17	TXQOFRXIF	0	R/W	TXQ One Frame Reception Interrupt Flag When TXQ receives one frame, an interrupt is set.
16	TXQFIF	0	R/W	TXQ Full Interrupt Flag When TXQ is in full status, an interrupt is set.
15, 14	—	00	R/W	Reserved These bits are read as 0. The write value should be always 0.
13 to 8	TXQMC[5:0]	All 0	R	TX Queue Message Count Number of messages in the TX Queue.
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	TXQTXIF	0	R/W	TX Queue TX Interrupt Flag 0: TX Queue interrupt condition not satisfied after a frame TX 1: TX Queue interrupt condition satisfied after a frame TX
1	TXQFLL	0	R	TX Queue Full 0: TX Queue not full 1: TX Queue full
0	TXQEMP	1	R	TX Queue Empty 0: TX Queue not empty 1: TX Queue empty

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is set automatically when the TX Queue is disabled or no messages are stored in the TX Queue.

This bit is set automatically when:

- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

This bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth.

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[5:0] bits (TX Queue Message Count)

The TXQMC[5:0] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQFIF bit (TXQ Full Interrupt Flag)

The TXQFIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Only in Gateway mode (CFDTXQCC2n.TXQGWE = 1) that this bit is set automatically when the TX Queue transits to a buffer full status.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFRXIF bit (TXQ One Frame Reception Interrupt Flag)

The TXQOFRXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When receiving data is stored in the TX Queue in Gateway mode, this bit is set automatically.

This function can only be used in Gateway mode of the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When transmission is successful in the TX Queue, this bit is set automatically.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMLT bit (TXQ Message Lost)

The TXQMLT bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When a message lost occurs in Gateway mode of the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMOW bit (TXQ Message Overwrite)

The TXQMOW bit is not cleared automatically if the TX Queue is disabled.

When stopping TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.

When CFDTXQCC2n.TXQOWE = 1 and message overwrite occurs in TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

30.2.61 TX Queue Status Register 3n (CFDTXQSTS3n) (n = 0, 1)

The CFDTXQSTS3n register (n = 0, 1) shows the status of the TX Queue of corresponding CAN Channel.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1140 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000	R/W	Reserved These bits are read as 0. The write value should be always 0.
28	—	0	R	Reserved These bits are read as 0.
27 to 21	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
20	TXQMOW	0	R/W	TXQ Message Overwrite 0: No message overwrite in TXQ 1: Message overwrite in TXQ
19	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
18	TXQOFTXIF	0	R/W	TXQ One Frame Transmission Interrupt Flag When one frame transmits from TXQ, an interrupt is set.
17 to 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
13 to 8	TXQMC[5:0]	All 0	R	TX Queue Message Count Number of messages in the TX Queue.
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	TXQTXIF	0	R/W	TX Queue TX Interrupt Flag 0: TX Queue interrupt condition not satisfied after a frame TX 1: TX Queue interrupt condition satisfied after a frame TX
1	TXQFLL	0	R	TX Queue Full 0: TX Queue not full 1: TX Queue full
0	TXQEMP	1	R	TX Queue Empty 0: TX Queue not empty 1: TX Queue empty

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is set automatically when the TX Queue is disabled or no messages are stored in the TX Queue.

This bit is set automatically when:

- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

This bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth.

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[5:0] bits (TX Queue Message Count)

The TXQMC[5:0] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When transmission is successful in the TX Queue, this bit is set automatically.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMOW bit (TXQ Message Overwrite)

The TXQMOW bit is not cleared automatically if the TX Queue is disabled.

When stopping TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.

When CFDTXQCC3n.TXQOWE = 1 and message overwrite occurs in TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

Cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

30.2.62 TX Queue Pointer Control Register 0n (CFDTXQPCTR0n) (n = 0, 1)

The CFDTXQPCTR0n register (n = 0, 1) is used to confirm storage of a full message in the corresponding TX Queue buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1040 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	TXQPC[7:0]	H'00	W	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value H'FF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always H'00. Do not write to the FIFO control registers when DMA is enabled.

Cannot write to these bits when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Only write H'FF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in GW mode.

30.2.63 TX Queue Pointer Control Register 1n (CFDTXQPCTR1n) (n = 0, 1)

The CFDTXQPCTR1n register (n = 0, 1) is used to confirm storage of a full message in the corresponding TX Queue buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'10A0 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7 to 0	TXQPC[7:0]	H'00	W	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value H'FF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always H'00. Cannot write to the FIFO control registers when DMA is enabled.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Only write H'FF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in GW mode.

30.2.64 TX Queue Pointer Control Register 2n (CFDTXQPCTR2n) (n = 0, 1)

The CFDTXQPCTR2n register (n = 0, 1) is used to confirm storage of a full message in the corresponding TX Queue buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1100 + H'04 × n

31 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	TXQPC[7:0]	H'00	W	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value H'FF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always H'00. Cannot write to the FIFO control registers when DMA is enabled.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Only write H'FF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in GW mode.

30.2.65 TX Queue Pointer Control Register 3n (CFDTXQPCTR3n) (n = 0, 1)

The CFDTXQPCTR3n register (n = 0, 1) is used to confirm storage of a full message in the corresponding TX Queue buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1160 + H'04 × n

31 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	TXQPC[7:0]	H'00	W	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value H'FF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always H'00. Do not write to the FIFO control registers when DMA is enabled.

Cannot write to these bits when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Only write H'FF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in Gateway mode.

30.2.66 TX Queue Empty Status Register (CFDTXQESTS)

The CFDTXQESTS register shows the status of the empty bits of the TXQ buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1180

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

7 to 0	TXQxEMP [7:0]	H'FF	R	TXQ Empty Status 0: TXQ not empty 1: TXQ empty

TXQxEMP[7:0] bits (TXQ Empty Status)

Each bit is set automatically when the corresponding bit is set in the TX Queue Empty Status Register.

Each bit is cleared automatically when the corresponding bit is cleared in the TX Queue Empty Status Register.

This bit is set when the CAN-FD module is in GL_RESET mode.

Bit Position	Corresponding TX Queue
0	Channel 0 TX Queue 0
1	Channel 0 TX Queue 1
2	Channel 0 TX Queue 2
3	Channel 0 TX Queue 3
4	Channel 1 TX Queue 0
5	Channel 1 TX Queue 1
6	Channel 1 TX Queue 2
7	Channel 1 TX Queue 3
31:8	Reserved

30.2.67 TX Queue Full Interrupt Status Register (CFDTXQFISTS)

The CFDTXQFISTS register shows the status of the full interrupt bits of the TXQ buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1184

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
6 to 4	TXQ1FULL [2:0]	000	R	TXQ Full Interrupt Status Flag for Channel 1 0: TXQ full interrupt not set 1: TXQ full interrupt set
3	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
2 to 0	TXQ0FULL [2:0]	000	R	TXQ Full Interrupt Status Flag for Channel 0 0: TXQ full interrupt not set 1: TXQ full interrupt set

TXQnFULL[2:0] (n = 0 ,1) bits (TXQ Full Interrupt Status Flag)

Each bit is set automatically when the corresponding bit is set in the TX Queue Full Interrupt Status Register.

Each bit is cleared automatically when the corresponding bit is cleared in the TX Queue Full Interrupt Status Register.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

Bit Position	Corresponding TX Queue
0	Channel 0 TX Queue 0
1	Channel 0 TX Queue 1
2	Channel 0 TX Queue 2
3	Reserved
4	Channel 1 TX Queue 0
5	Channel 1 TX Queue 1
6	Channel 1 TX Queue 2
31:7	Reserved

30.2.68 TX Queue Message Lost Status Register (CFDTXQMSTS)

The CFDTXQMSTS register shows the status of the message lost bits of the TXQ buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1188

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
6 to 4	TXQ1ML[2:0]	000	R	TXQ Message Lost Status Flag for Channel 1 0: TXQ message lost flag not set 1: TXQ message lost flag set
3	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
2 to 0	TXQ0ML[2:0]	000	R	TXQ Message Lost Status Flag for Channel 0 0: TXQ message lost flag not set 1: TXQ message lost flag set

TXQnML[2:0] (n = 0, 1) bits (TXQ Message Lost Status Flag)

Each bit is set automatically when the corresponding bit is set in the TX Queue Message Lost Status Register.

Each bit is cleared automatically when the corresponding bit is cleared in the TX Queue Message Lost Status Register.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

Bit Position	Corresponding TX Queue
0	Channel 0 TX Queue 0
1	Channel 0 TX Queue 1
2	Channel 0 TX Queue 2
3	Reserved
4	Channel 1 TX Queue 0
5	Channel 1 TX Queue 1
6	Channel 1 TX Queue 2
31:7	Reserved

30.2.69 TX Queue Message Overwrite Status Register (CFDTXQOWSTS)

The CFDTXQMSTS register shows the status of the message lost bits of the TXQ buffers.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'118C

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

10	THLDTE	0	R/W	TX History List Dedicated TX Enable 0: TX FIFO + TX Queue 1: Flat TX MB + TX FIFO + TX Queue
9	THLIM	0	R/W	TX History List Interrupt Mode 0: Interrupt generated if TX History List level reaches ¾ of the TX History List depth 1: Interrupt generated for every successfully stored entry
8	THLIE	0	R/W	TX History List Interrupt Enable 0: TX History List Interrupt disabled 1: TX History List Interrupt enabled
7 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
0	THLE	0	R/W	TX History List Enable 0: TX History List disabled 1: TX History List enabled

THLE bit (TX History List Enable)

The THLE bit enables the TX History List buffer when it is set.

Do not write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

THLIE bit (TX History List Interrupt Enable)

The THLIE bit enables the generation of the TX History List interrupt when it is set.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

THLIM bit (TX History List Interrupt Mode)

The THLIM bit selects the interrupt generation condition for the FIFO.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

THLDTE bit (TX History List Dedicated TX Enable)

The THLDTE bit selects the condition for storing an entry in the TX History List after successful transmission.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

THLDGE bit (TX History List Dedicated Gateway Enable)

The THLDGE bit selects the condition for storing an entry in the TX History List after successful transmission.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

30.2.75 TX History List Status Register n (CFDTHLSTSn) (n = 0, 1)

The CFDTHLSTSn register (n = 0, 1) shows the status of data stored in the TX History List buffer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1220 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
13 to 8	THLMC[5:0]	All 0	R	TX History List Message Count Number of messages stored in TX History List
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
3	THLIF	0	R/W	TX History List Interrupt Flag 0: TX History List interrupt condition not satisfied 1: TX History List interrupt condition satisfied
2	THLELT	0	R/W	TX History List Entry Lost 0: No entry lost in TX History List 1: TX History List entry Lost
1	THLFLL	0	R	TX History List Full 0: TX History List not full 1: TX History List full
0	THLEMP	1	R	TX History List Empty 0: TX History List not empty 1: TX History List empty

THLEMP bit (TX History List Empty)

The THLEMP bit is set automatically when the CPU has read all the entries from the TX History List buffer.

This bit is cleared automatically when the first entry is stored to the TX History List.

This bit is set automatically when:

- TX History List is disabled
- The related CAN-FD channel is in CH_RESET mode.

THLFLL bit (TX History List Full)

The THLFLL bit is set automatically when the number of entries in the TX History List buffer matches the TX History List depth.

Each TX History List can store up to 32 entries (each channel has a dedicated TX History List).

This bit is cleared automatically when:

- The number of entries in the TX History List buffer is less than the TX History List depth
- The TX History List is disabled
- The related CAN-FD channel is in CH_RESET mode.

THLELT bit (TX History List Entry Lost)

The THLELT bit is set when a new entry cannot be stored because the related TX History List buffer is already full.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

THLIF bit (TX History List Interrupt Flag)

The THLIF bit is set when the configured interrupt condition is satisfied.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

THLMC[5:0] bits (TX History List Message Count)

The THLMC[5:0] bits show the number of transmitted messages stored in the TX History List.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

30.2.76 Channel n TX History List Access Register 0 (CFDTHLACC0n) (n = 0, 1)

The CFDTHLACC0n register (n = 0, 1) provides access to the entry in the TX History List based on the read timestamp value.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'8000 + H'08 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTS[15:0]	All 0	R	Transmit Timestamp Transmit timestamp value for software drivers.
15	TGW	0	R	Transmit Gateway Buffer Indication 0: No transmission from gateway 1: Transmission from gateway
14 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9 to 3	BN[6:0]	All 0	R	Buffer Number Number of the message buffer
2 to 0	BT[2:0]	000	R	Buffer Type 001: Flat TX message buffer 010: TX FIFO message buffer number and gateway FIFO message number 100: TX Queue message buffer number Others: Setting prohibited

BT[2:0] bits (Buffer Type)

The BT[2:0] bits indicate whether data has been stored following a transmission from a FIFO buffer, a TX Queue or a TX message buffer.

BN[6:0] bits (Buffer Number)

The BN[6:0] bits show the message buffer from which transmission was successfully completed. If a message from a Common FIFO is transmitted, then these bits show the message buffer that is linked to the Common FIFO for transmission.

TGW bit (Transmit Gateway Buffer Indication)

The TGW bit is automatically set to 1 when transmission is completed in GW mode.

TMTS[15:0] bits (Transmit Timestamp)

The TMTS[15:0] bits indicate the timestamp for use by software drivers.

In the case of can_race_ts_en=1, the information as which CFDTHLACC0n.TMTS is inputted from can_race_ts is reflected.

See **Section 30.8.1.3 Timestamp** for the timestamp in detail.

30.2.77 Channel n TX History List Access Register 1 (CFDTHLACC1n) (n = 0, 1)

The CFDTHLACC1n register (n = 0, 1) provides access to entry in the TX History List based on the read pointer value.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'8004 + H'08 × n

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be aways 0.
17, 16	TIFL[1:0]	00	R	Transmit Information Label These bits indicate that message buffer information label, TX FIFO information label, or AFL information label is stored for software drivers.
15 to 0	TID[15:0]	All 0	R	Transmit ID These bits indicate that message buffer reference ID, TX FIFO reference ID, or AFL pointer field is stored for software drivers.

TID[15:0] bits (Transmit ID)

The TID[15:0] bits indicate whether the message buffer reference ID (CFDTMFDCTRn.TMPTR) or the TX FIFO reference ID (CFDCFFDCSTSn.CFPTR) is for use by software drivers.

When transmission in Gateway mode, these bits indicate the AFL pointer field (CFDGAFLP0n.GAFLPTR) instead of the message buffer reference ID (CFDTMFDCTRn.TMPTR).

TIFL[1:0] bits (Transmit Information Label)

The TIFL[1:0] bits indicate whether the message buffer information label (CFDTMFDCTRn.TMIFL) or the TX FIFO information label (CFDCFFDCSTSn.CFIFL) is for use by software drivers.

When transmission in Gateway mode, these bits indicate the AFL pointer field (CFDGAFLMn.GAFLIFL1 and CFDGAFLP0n.GAFLIFL0) instead of the MB information label (CFDTMFDCTRn.TMIFL).

30.2.78 TX History List Pointer Control Register n (CFDTHLPCTRn) (n = 0, 1)

The CFDTHLPCTRn register (n = 0, 1) is used to increment the read pointer of the TX History List.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1240 + H'04 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
7 to 0	THLPC[7:0]	H'00	W	TX History List Pointer Control Increments the write pointer to the TX History List in the corresponding channel

THLPC[7:0] bits (TX History List Pointer Control)

When H'FF is written to the THLPC[7:0] bits, the read pointer of the TX History List is moved to the next TX History List entry address.

The read value from these bits is always H'00. Only write to these bits when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Only write H'FF to these registers when the corresponding TX History List is enabled and not empty.

30.2.79 Global Reset Control Register (CFDGRSTC)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1380

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
15 to 8	KEY[7:0]	H'00	W	Key Code These bits control the validity of rewriting of the SRST bit.
7 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
0	SRST	0	R/W	Software Reset 0: Normal state 1: Software reset state

SRST bit (Software Reset)

When the SRST bit is set, the CAN-FD module is in the same state as hardware reset. When a reset is required, write 1 then write 0 to this bit.

This bit is cleared when the CAN-FD module is in GL_SLEEP mode.

When this bit is cleared, the RAM initialization sequence does not operate. The configuration of RAM is performed by software.

The RAM is not initialized when software reset is performed during the initialization of RAM. Software must perform the initialization of RAM.

KEY[7:0] bits (Key Code)

When H'C4 is written in the KEY[7:0] bits, a write to the SRST bit is valid.

The read value from these bits is always H'00.

Write a SRST bit and the KEY bits simultaneously.

30.2.80 Global Flexible CAN Mode Configuration Register (CFDGFCMC)

Flexible CAN mode configured in the CFDGFCMC register and Flexible transmission buffer assignment configured in the CFDGFTBAC register should not be used simultaneously.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1384

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	FLXC0	0	R/W	Flexible CAN Mode between Channel 0 and Channel 1 0: Normal mode 1: Flexible CAN mode

FLXC0 bit (Flexible CAN Mode between Channel 0 and Channel 1)

When the FLXC0 bit is set, Channel 0 and Channel 1 of a CAN-FD module are in Flexible CAN mode.

Channel 1 uses TX/RX terminal of Channel 0. The TX/RX terminal of Channel 1 cannot be used.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

30.2.81 Global Flexible Transmission Buffer Assignment Configuration Register (CFDGFTBAC)

Flexible transmission buffer assignment configured in the CFDGFTBAC register and Flexible CAN mode configured in the CFDGFCMC register should not be used simultaneously.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'138C

3 to 0	FLXMB0[3:0]	H'0	R/W	Flexible Transmission Buffer Assignment between Channel 0 and Channel 1 By setting these bits, the even channel can use the configured number of TX mailboxes of the odd channel H'0: 0 H'1: 4 H'2: 8 H'3: 12 H'4: 16 H'5: 20 H'6: 24 H'7: 28 H'8: 32 Others: Setting prohibited

FLXMB0[3:0] bits (Flexible Transmission Buffer Assignment between Channel 0 and Channel 1)

Channel 0 can use the number TXMB of channel 1 from 0 to 32 by the configuration of these bits.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

30.2.82 Global Test Configuration Register (CFDGTSTCFG)

The CFDGTSTCFG register is used to configure the CAN channels joining the internal CAN bus communication test mode and the RAM test mode page.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1308

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
25 to 16	RTMPS[9:0]	All 0	R/W	RAM Test Mode Page Select Select a RAM test mode page
15 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
1	C1ICBCE	0	R/W	Channel 1 Internal CAN Bus Communication Test Mode Enable 0: Channel 1 internal CAN bus communication disabled 1: Channel 1 internal CAN bus communication enabled
0	C0ICBCE	0	R/W	Channel 0 Internal CAN Bus Communication Test Mode Enable 0: Channel 0 internal CAN bus communication disabled 1: Channel 0 internal CAN bus communication enabled

CnICBCE (n = 0, 1) bits (Channel n Internal CAN Bus Communication Test Mode Enable)

When the C0ICBCE and C1ICBCE bits are set and CAN-FD module is configured in the internal CAN bus communication test mode, then CAN channel n joins the internal CAN bus communication test mode operation.

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

Only write to these bits when the CAN-FD module is in GL_HALT mode.

These bits are cleared automatically when the CAN-FD module is in GL_RESET mode.

RTMPS[9:0] bits (RAM Test Mode Page Select)

The RTMPS[9:0] bits select the RAM page mode for CPU read/write access when the CAN-FD module is configured in RAM test mode.

See **Section 30.9.2.1, RAM Test Mode** for the RAM test mode specification.

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

Only enter values from 0 to 15 (H'00F) for the AFL RAM and 16 to 76 (H'04C) for the message buffer RAM.

The setting range of these bits depends on the combination of parameters.

Only write to these bits when the CAN-FD module is in GL_HALT mode.

These bits are cleared automatically when the related CAN-FD channel is in GL_RESET mode.

30.2.83 Global Test Control Register (CFDGTSTCTR)

The CFDGTSTCTR register is used to control the global test modes of the CAN-FD module.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'130C

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
0	ICBCTME	0	R/W	Internal CAN Bus Communication Test Mode Enable 0: Internal CAN Bus Communication test mode disabled 1: Internal CAN Bus Communication test mode enabled

ICBCTME bit (Internal CAN Bus Communication Test Mode Enable)

When the ICBCTME bit is set, internal CAN bus communication is enabled for the CAN channels that are configured for internal CAN bus communication participation. See **Section 30.9.2.2, Internal CAN Bus Communication Mode** for the specification of internal CAN bus communication test mode.

Only write to this bit when the CAN-FD module is in GL_HALT mode.

Clear this bit when the CAN-FD module is in GL_HALT mode.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

RTME bit (RAM Test Mode Enable)

When the RTME bit is set, the CAN-FD module is configured in RAM test mode. See **Section 30.9.2.1, RAM Test Mode** for RAM test mode specification.

Only write to this bit when the CAN-FD module is in GL_HALT mode.

Clear this bit when the CAN-FD module is in GL_HALT mode.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

30.2.84 Global FD Configuration Register (CFDGFDCFG)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1314

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9, 8	TSCCFG[1:0]	00	R/W	Timestamp Capture Configuration 00: Timestamp capture at the sample point of SOF (start of frame) 01: Timestamp capture at frame valid indication 10: Timestamp capture at the sample point of RES bit 11: Reserved
7 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
0	RPED	0	R/W	RES Bit Protocol Exception Disable 0: Protocol exception event detection enabled 1: Protocol exception event detection disabled

RPED bit (RES Bit Protocol Exception Disable)

The RPED bit configures the protocol exception event handling according to ISO 11898-1.

When this bit is enabled, the protocol exception event detection is disabled, and the protocol controller transmits an error frame when the protocol exception event is detected (RES bit is sampled recessive).

Only write to this bit when the CAN-FD module is in GL_RESET mode.

TSCCFG[1:0] bits (Timestamp Capture Configuration)

The TSCCFG[1:0] bits configure the different capture points of the timestamp for transmission and reception.

When CFDGFDCFG.TSCCFG[1:0] = 10b, the timestamp capture is performed for CAN-FD frames at RES bit and for Classical frames at the start of frame.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

Set 01b to these bits when can_race_ts_en is 1.

See **Section 30.8.1.3 Timestamp** for the timestamp in detail.

30.2.85 Global Lock Key Register (CFDGLOCKK)

The CFDGLOCKK register is a write-only register that is used to unlock the protection for special test bits. See **Section 30.9.2, Global Test Modes** for Lock key specification.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'131C

15 to 0	LOCK[15:0]	H'0000	W	Lock Key Key bits for unlocking the protection of test modes

LOCK[15:0] bits (Lock Key)

The unlock key sequence must be written in the LOCK[15:0] bits to configure the CAN-FD module in RAM test modes.

The read value from these bits is always H'0000.

Cannot write to these bits when the CAN-FD module is in GL_SLEEP or GL_RESET mode.

Do not write to these bits when the CAN-FD module is in GL_OPERATION mode.

30.2.86 RAM Test Page Access Register n (CFDRPGACCn) (n = 0 to 63)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'8400 + H'04 × n

RDTA[31:0] bits (RAM Data Test Access)

Data can be read from or written into the RDTA[31:0] bits when the CAN-FD module is configured in RAM test mode.

Only write to this bit when the CAN-FD module is in GL_HALT mode and RAM test mode is enabled.

If data is read when RAM test mode is not enabled, then it is always read as H'0000_0000.

Software data should be read/written in the RAM Test Page Access registers during RAM test mode.

30.2.87 Channel n Bus Load Control Register (CFDCnBLCT) (n = 0, 1)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1418 + H'20 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
8	BLCLD	0	W	Bus Load Counter Load When CFDCnBLCT.BLCLD is set, it is reset after a bus load counter value is loaded.
7 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
0	BLCE	0	R/W	Bus Load Counter Enable 0: Bus load counter disabled 1: Bus load counter enabled

BLCE bit (Bus Load Counter Enable)

The BLCE bit indicates the enabling signal of a bus load counter. Write to this bit after setting up the CFDCnNCFG register.

When this bit is 0, the bus load counter stops but the counter is not clear.

The bit is cleared when the related CAN-FD channel is in CH_RESET mode.

Do not write to this bit in CH_SLEEP mode.

BLCLD bit (Bus Load Counter Load)

When the BLCLD bit is set, the bus load counter value is loaded into CFDCnBLSTS.BLC and the bus load counter is reset.

The read value is always 0.

30.2.88 Channel n Bus Load Status Register (CFDCnBLSTS) (n = 0, 1)

Base address: CAN-FD = H'0_100C_0000

Offset address: H'141C + H'20 × n

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	BLC[28:0]	All 0	R	Bus Load Counter Status These bits indicate the bus load counter value.
2 to 0	—	000	R/W	Reserved These bits are read as 0. The write value should be always 0.

BLC[28:0] bits (Bus Load Counter Status)

The bus load counter increases by PCLKM/2 period while CAN bus is in an idle state.

When the CFDCnBLCT.BLCLD bit is set, the bus load counter value is loaded to BLC[28:0] bits and the bus load counter is reset.

These bits are set only by the CAN-FD module. Writing any value has no effect.

30.2.89 Identifier Bits Alignment

Standard Identifier (11 bits) format: ID28 to ID18 is aligned to b10 to b0, b11 to b28 should be 0.

Extended Identifier (29 bits) format: ID28 to ID0 is aligned to b28 to b0

For Standard Identifier format bits 11 to 28 (b11 to b28) should be all 0.

Table 30.13 Standard Identifier (11-Bit Format)

30.2.90 Message Buffer Component Structure

30.2.90.1 Start Addresses

The start address for each of the Message Buffer component is calculated using the number of related Message Buffer components and the number of channels.

Table 30.15 Channel Components Features

number_of_channels	i	2
number_of_RMBCPs_per_channel	b	16
number_of_RFMBCPs	b	8
number_of_CFMBCPs_per_channel	b	3
number_of_TMBCPs_per_channel	b	64

The start addresses for each register in the Message Buffer component are depicted in **Table 30.16**.

Table 30.16 Message Buffer Component Register Start Addresses

b = Message Buffer Component Index	MBCP	Register	p	Start Address n = 0, 1
0 to number_of_RMBCPs_per_channel - 1	RMBCPb[i]	RMID	—	H’2000 + b × H’0080 + n × H’800

		RFDFp	0 to 15	H’600C + p × H’0004 + b × H’0080
0 to number_of_CFMBCPs_per_channel - 1	CFMBCPb[i]	CFID	—	H’6400 + b × H’0080 + n × H’180
		CFPTR	—	H’6404 + b × H’0080 + n × H’180
		CFFDCSTS	—	H’6408 + b × H’0080 + n × H’180
		CFDFp	0 to 15	H’640C + p × H’0004 + b × H’0080 + n × H’180
0 to number_of_TMBCPs_per_channel - 1	TMBCPb[i]	TMID	—	H’1_0000 + b × H’0080 + n × H’2000
		TMPTR	—	H’1_0004 + b × H’0080 + n × H’2000
		TMFDCTR	—	H’1_0008 + b × H’0080 + n × H’2000
		TMDFp	0 to 15	H’1_000C + p × H’0004 + b × H’0080 + n × H’2000

The message buffer configuration consists of four types of Message Buffer components:

- RX Message Buffer Component (CFDRMBCPb[i])
- RX FIFO Access Message Buffer Component (CFDRFMBCPb[i])
- Common FIFO Access Message Buffer Component (CFDCFMBCPb[i])
- TX Message Buffer Component (CFDTMBCPb[i]).

Where b = the Message Buffer component index having a range that varies based on the type of Message Buffer component and i = channel index that has a range from 0 to n.

For a summary of this configuration, see **Figure 30.28, Message Buffer Configuration**. For a detailed description of the number of and the different types of message buffers, see **Section 30.6, FIFO Buffers and Normal Message Buffer Configuration**.

As described in **Section 30.2, Register Descriptions**, each Message Buffer component consists of the following registers:

- Identifier (ID)
- Pointer (PTR)
- Data Field (DFp).

p is the Data Field register index having a range that varies based on the type of Message Buffer component.

Rc is the Message Buffer Component register where c = Message Buffer Component register index having a range that varies based on the type of Message Buffer component.

A description of the registers, their associated bits and their accessibility are shown below the summary and detailed figures of each component.

In each of the figures, a cell that contains '-' means reserved and has the same behavior as reserved bits for registers in **Section 30.2 Register Descriptions**.

30.2.90.2 RX Message Buffer Component b (CFDRMBCPb[i])

Base address: CAN-FD = H'0_100C_0000

Offset address: RMID: H'2000 + H'0080 × b + H'800 × n
RMPTR: H'2004 + H'0080 × b + H'800 × n
RMFDSTS: H'2008 + H'0080 × b + H'800 × n
RMDFp: H'200C + H'0004 × p + H'080 × b + H'800 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 0	Rc	All 0	R	RX Message Buffer Component c Refer to **Table 30.17**, **Table 30.18** and the descriptions that follow for a detailed description of each register and its related bits, contained within this message buffer component.

(no_of_channels = 2)

(i = 0 .. no_of_channels – 1)

(b = RX Message Buffer Component index = [0…no_of_CFDRMBCPs_per_channel-1])

(no_of_CFDRMBCPs_per_channel = No. of RX Message Buffer Components per Channel = 16)

Where the total number of CFDRMBCPs = no_of_CFDRMBCPs_per_channel × no_of_channels = 16 × 2 = 32 as shown in **Figure 30.28 Message Buffer Configuration**.

(c = RX Message Buffer Component Register index = [0…no_of_REGs_per_CFDRMBCP-1])

no_of_REGs_per_CFDRMBCP = No. of Registers per RX Message Buffer Component = 19

Rc bit (RX Message Buffer Component c)

The RX Message Buffer Component is made up of the following registers: **CFDRMID**, **CFDRMPTR**, **CFDRMFDSTS**, and **CFDRMDFp**. Refer to **Table 30.18, RX Message Buffer Component Detailed** for details of how to interpret the structure of this buffer component and how to access the respective registers.

Table 30.17 RX Message Buffer Component Summary

RX Message Buffer Component (RMBCP)

30.2.90.3 RX Message Buffer ID Register n (CFDRMIDn) (n = 0 to 31)

The CFDRMIDn register (n = 0 to 31) stores the ID field, IDE bit, and RTR bit of the received message.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'2000 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

30	RMRTR	0	R	RX Message Buffer RTR Bit 0: Data frame 1: Remote frame
29	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
28 to 0	RMID[28:0]	All 0	R	RX Message Buffer ID Field STD-ID/EXT-ID fields

RMID[28:0] bits (RX Message Buffer ID Field)

The RMID[28:0] are the bits of the STD-ID/EXT-ID fields of the message stored in the RX message buffer.

For alignment of these bits in standard and extended frame format, see **Section 30.2.89, Identifier Bits Alignment**.

See **Section 30.2.90.1, Start Addresses** for details on how to interpret the structure of this buffer component.

RMRTR bit (RX Message Buffer RTR Bit)

The RMRTR bit shows whether a data frame or a remote frame was stored in the RX message buffer.

Note: There are no remote frames in CAN-FD format. When a CAN-FD frame is received, the register reflects the state of the received value (the RRS bit in FD frame format).

RMIDE bit (RX Message Buffer IDE Bit)

The RMIDE bit shows whether message with Standard Identifier or Extended Identifier was stored in the RX message buffer.

30.2.90.4 RX Message Buffer Pointer Register n (CFDRMPTRn) (n = 0 to 31)

The CFDRMPTRn register (n = 0 to 31) stores the DLC and Timestamp fields for the received message.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'2004 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMDLC[3:0]				—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RMTS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	RMDLC[3:0]	H'0	R	RX Message Buffer DLC Field Number of data bytes received in a CAN frame.
27 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
15 to 0	RMTS[15:0]	H'0000	R	RX Message Buffer Timestamp Field Timestamp value stored for the message in the RX message buffer

RMTS[15:0] bits (RX Message Buffer Timestamp Field)

The RMTS[15:0] bits store the timestamp value taken at the capture point as configured by CFDGFDCFG.TSCCFG of the received message.

In the case of can_race_ts_en=1, the information as which CFDRMPTR.RMTS is inputted from can_race_ts is reflected. See **Section 30.8.1.3 Timestamp** for the timestamp in detail.

RMDLC[3:0] bits (RX Message Buffer DLC Field)

The RMDLC[3:0] bits store the number of data bytes that were received in the RX message buffer.

See *Table 5 in ISO 11898-1 (2015) Specification* for details in defining the number of data bytes that were received.

Note: The maximum capacity of the buffer belongs to CFDRMNB.RMPLS.

30.2.90.5 RX Message Buffer CAN-FD Status Register n (CFDRMFDSTSn) (n = 0 to 31)

The CFDRMFDSTSn register (n = 0 to 31) shows the status of the FDF, BRS, and ESI bits, and pointer of the received CAN-FD frame.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'2008 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMPTR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RMIFL[1:0]		—	—	—	—	—	RMFDF	RMBRS	RMESI
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RMPTR[15:0]	H'0000	R	RX Message Buffer Pointer Field
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9, 8	RMIFL[1:0]	00	R	RX Message Buffer Information Label Field
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	RMFDF	0	R	CAN-FD Format bit 0: Non CAN-FD frame received 1: CAN-FD frame received
1	RMBRS	0	R	Bit Rate Switch bit 0: CAN-FD frame received with no bit rate switch 1: CAN-FD frame received with bit rate switch
0	RMESI	0	R	Error State Indicator bit 0: CAN-FD frame received from error active node 1: CAN-FD frame received from error passive node

RMESI bit (Error State Indicator bit)

The RMESI bit has the same value as the ESI bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

RMBRS bit (Bit Rate Switch bit)

The RMBRS bit has the same value as the BRS bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

RMFDF bit (CAN-FD Format bit)

The RMFDF bit has the same value as the FDF bit of the received CAN-FD frame.

RMIFL[1:0] bits (RX Message Buffer Information Label Field)

The RMIFL[1:0] bits store the information label value from the related Global Acceptance Filter List entry.

RMPTR[15:0] bits (RX Message Buffer Pointer Field)

The RMPTR[15:0] bits store the pointer value from the related Global Acceptance Filter List entry.

30.2.90.6 RX Message Buffer Data Field p Register n (CFDRMDFp_n) (p = 0 to 15, n = 0 to 31)

The CFDRMDFp_n register (p = 0 to 15, n = 0 to 31) stores the data bytes (4 × p) to data bytes (4 × p + 3) of the received message.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'200C + H'004 × p + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMDB_HH[7:0]								RMDB_HL[7:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RMDB_HH [7:0]	H'00	R	RX Message Buffer Data Byte (4 × p + 3)
23 to 16	RMDB_HL [7:0]	H'00	R	RX Message Buffer Data Byte (4 × p + 2)
15 to 8	RMDB_LH [7:0]	H'00	R	RX Message Buffer Data Byte (4 × p + 1)
7 to 0	RMDB_LL [7:0]	H'00	R	RX Message Buffer Data Byte (4 × p)

RMDB_LL[7:0] bits (RX Message Buffer Data Byte (4 × p))

The RMDB_LL[7:0] bits store data bytes (4 × p) of the message in the RX message buffer. Unused data bytes are filled with H'00.

RMDB_LH[7:0] bits (RX Message Buffer Data Byte (4 × p + 1))

The RMDB_LH[7:0] bits store data bytes (4 × p + 1) of the message in the RX message buffer. Unused Data Bytes are filled with H'00.

RMDB_HL[7:0] bits (RX Message Buffer Data Byte (4 × p + 2))

The RMDB_HL[7:0] bits store data bytes (4 × p + 2) of the message in the RX message buffer. Unused data bytes are filled with H'00.

RMDB_HH[7:0] bits (RX Message Buffer Data Byte (4 × p + 3))

The RMDB_HH[7:0] bits store data bytes (4 × p + 3) of the message in the RX message buffer. Unused data bytes are filled with H'00.

30.2.90.7 RX FIFO Access Message Buffer Component b (CFDRFMBCPb[i])

Base address: CAN-FD = H'0_100C_0000

Offset address: RFID: H'6000 + H'0080 × b
RFPTR: H'6004 + H'0080 × b

30.2.90.8 RX FIFO Access ID Register n (CFDRFIDn) (n = 0 to 7)

The CFDRFIDn register (n = 0 to 7) stores the ID field, IDE bit, and RTR bit of the message.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'6000 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFIDE	RFRTR	—	RFID[28:16]

30	RFRTR	0	R	RX FIFO Buffer RTR bit 0: Data frame 1: Remote frame
29	—	0	R/W	Reserved This bit is read as 0. The write value should be always 0.
28 to 0	RFID[28:0]	All 0	R	RX FIFO Buffer ID Field STD-ID/EXT-ID fields

RFID[28:0] bits (RX FIFO Buffer ID Field)

The RFID[28:0] bits are the bits of the STD-ID/EXT-ID fields of the message in the FIFO buffer.

For alignment of these bits in standard and extended frame format, see **Section 30.2.89, Identifier Bits Alignment**.

RFRTR bit (RX FIFO Buffer RTR bit)

The RFRTR bit shows whether a data frame or a remote frame was stored in the FIFO buffer.

Note: There are no remote frames in CAN-FD format. When a CAN-FD frame was received, the register reflects the state of the received value (RRS bit in FD frame format).

RFIDE bit (RX FIFO Buffer IDE bit)

The RFIDE bit shows whether message with the Standard Identifier or Extended Identifier was received in the FIFO buffer.

30.2.90.9 RX FIFO Access Pointer Register n (CFDRFPTRn) (n = 0 to 7)

The CFDRFPTRn register (n = 0 to 7) stores the DLC and Timestamp fields for the received message.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'6004 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFDLC[3:0]				—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	RFDLC[3:0]	H'0	R	RX FIFO Buffer DLC Field Number of data bytes received in a CAN frame
27 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
15 to 0	RFTS[15:0]	H'0000	R	RX FIFO Timestamp Value Timestamp value of the received CAN frame

RFTS[15:0] bits (RX FIFO Timestamp Value)

The RFTS[15:0] bits store the timestamp value taken at the capture point as configured by the CFDGFDCFG.TSCCFG bit of the received message.

In the case of can_race_ts_en=1, the information as which CFDRFPTR.RFTS is inputted from can_race_ts is reflected.

See **Section 30.8.1.3 Timestamp** for the timestamp in detail.

RFDLC[3:0] bits (RX FIFO Buffer DLC Field)

The RFDLC[3:0] bits store the number of data bytes that were received in the RX FIFO buffer.

See *Table 5 in ISO 11898-1 (2015) Specification* for details in defining the number of data bytes that were received.

30.2.90.10 RX FIFO Access CAN-FD Status Register n (CFDRFFDSTSn) (n = 0 to 7)

The CFDRFFDSTSn register (n = 0 to 7) shows the status of the FDF, BRS, and ESI bits, including the pointer of the received CAN-FD frame.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'6008 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFDRFPTR[15:0]

	—	—	—	—	—	—	RFIFL[1:0]		—	—	—	—	—	RFFDF	RFBRS	RFESI
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CFDRFPTR [15:0]	H'0000	R	RX FIFO Buffer Pointer Field
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9, 8	RFIFL[1:0]	00	R	RX FIFO Buffer Information Label Field
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	RFFDF	0	R	CAN-FD Format bit 0: Non CAN-FD frame received 1: CAN-FD frame received
1	RFBRS	0	R	Bit Rate Switch bit 0: CAN-FD frame received with no bit rate switch 1: CAN-FD frame received with bit rate switch
0	RFESI	0	R	Error State Indicator bit 0: CAN-FD frame received from error active node 1: CAN-FD frame received from error passive node

RFESI bit (Error State Indicator bit)

The RFESI bit has the same value as the ESI bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

RFBRS bit (Bit Rate Switch bit)

The RFBRS bit has the same value as the BRS bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

RFFDF bit (CAN-FD Format bit)

The RFFDF bit has the same value as the FDF bit of the received CAN-FD frame.

RFIFL[1:0] bits (RX FIFO Buffer Information Label Field)

The RFIFL[1:0] bits store the information label value from the related Global Acceptance Filter List entry.

CFDRFPTR[15:0] bits (RX FIFO Buffer Pointer Field)

The CFDRFPTR[15:0] bits store the pointer value from the related Global Acceptance Filter List entry.

30.2.90.11 RX FIFO Access Data Field p Register n (CFDRFDFp_n) (p = 0 to 15, n = 0 to 7)

The CFDRFDFpn register (p = 0 to 15, n = 0 to 7) stores data bytes (4 × p) to data bytes (4 × p + 3) of the received message.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'600C + H'004 × p + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RFDB_HH [7:0]	H'00	R	RX FIFO Buffer Data Byte (4 × p + 3)
23 to 16	RFDB_HL [7:0]	H'00	R	RX FIFO Buffer Data Byte (4 × p + 2)
15 to 8	RFDB_LH [7:0]	H'00	R	RX FIFO Buffer Data Byte (4 × p + 1)
7 to 0	RFDB_LL[7:0]	H'00	R	RX FIFO Buffer Data Byte (4 × p)

RFDB_LL[7:0] bits (RX FIFO Buffer Data Byte (4 × p))

The RFDB_LL[7:0] bits store data bytes (4 × p) of the message present in the FIFO buffer. Unused data bytes are filled with H'00 according to the configured data payload size CFDRFCCn.RFPLS.

RFDB_LH[7:0] bits (RX FIFO Buffer Data Byte (4 × p + 1))

The RFDB_LH[7:0] bits store data bytes (4 × p + 1) of the message present in the FIFO buffer. Unused data bytes are filled with H'00.

RFDB_HL[7:0] bits (RX FIFO Buffer Data Byte (4 × p + 2))

The RFDB_HL[7:0] bits store data bytes (4 × p + 2) of the message present in the FIFO buffer. Unused data bytes are filled with H'00.

RFDB_HH[7:0] bits (RX FIFO Buffer Data Byte (4 × p + 3))

The RFDB_HH[7:0] bits store data bytes (4 × p + 3) of the message present in the FIFO buffer. Unused data bytes are filled with H'00.

30.2.90.12 Common FIFO Access Message Buffer Component b (CFDCFMBCPb[i])

Base address: CAN-FD = H'0_100C_0000

Offset address: CFID: H'6400 + H'0080 × b + H'180 × n
CFPTR: H'6404 + H'0080 × b + H'180 × n
CFFDSTS: H'6408 + H'0080 × b + H'180 × n
CFDFp: H'640C + H'0004 × p + H'080 × b + H'180 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(no_of_channels = 2)

(i = 0 .. no_of_channels – 1)

(b = Common FIFO Access Message Buffer Component index = [0…no_of_CFDCFMBCPs_per_channel-1])

(no_of_CFDCFMBCPs_per_channel = No. of Common FIFO Access Message Buffer Components per Channel = 3)
Where the total number of CFDCFMBCPs = no_of_CFDCFMBCPs_per_chennel × no_of_channels = 3 × 2 = 6 as shown in **Figure 30.28 Message Buffer Configuration**.

(c = Common FIFO Access Message Buffer Component Register index = [0…no_of_REGs_per_CFDCFMBCP-1])

no_of_REGs_per_CFDCFMBCP = No. of Registers per Common FIFO Access Message Buffer Component = 19

Rc bit (Common FIFO Access Message Buffer Component c)

The Common FIFO Access Message Buffer Component is made up of the following registers: **CFDCFID**, **CFDCFPTR, CFDCFFDCSTS**, and **CFDCFDFp**. Refer to **Table 30.22, Common FIFO Access Message Buffer Component Detailed** for details of how to interpret the structure of this buffer component and how to access the respective registers.

Table 30.21 Common FIFO Access Message Buffer Component Summary

30.2.90.13 Common FIFO Access ID Register n (CFDCFIDn) (n = 0 to 5)

The CFDCFIDn register (n = 0 to 5) stores the ID field, IDE bit, and RTR bit of the message.

In TX mode, you can read data from the FIFO, only for the current entry based on the write pointer value, and not for the other entries.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'6400 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29	THLEN	0	R/W	THL Entry Enable TX FIFO mode: 0: Entry is not to be stored in THL after successful TX 1: Entry is to be stored in THL after successful TX RX FIFO mode: Reserved, this bit is read as 0.
28 to 0	CFID[28:0]	All 0	R/W	Common FIFO Buffer ID Field STD-ID/EXT-ID fields

CFID[28:0] bits (Common FIFO Buffer ID Field)

The CFID[28:0] bits are the bits of the STD-ID/EXT-ID fields of the message in the FIFO buffer.

For alignment of these bits in standard and extended frame format, see **Section 30.2.89, Identifier Bits Alignment**.

In TX mode, you can write and read data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

THLEN bit (THL Entry Enable)

The THLEN bit controls the storage of an entry corresponding to the transmitted message in the TX History list at the end of a successful transmission.

In TX mode, you can write and read data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

CFRTR bit (Common FIFO Buffer RTR bit)

The CFRTR bit selects whether a data frame or a remote frame is to be transmitted from or was received in the FIFO buffer.

Note: There are no remote frames in CAN-FD format. When a CAN-FD frame is received (RX mode), the register reflects the state of the received value (RRS bit in FD frame format). When CAN-FD transmission (TX or GW mode CFDCFID.CFFDF = 1), the bit is always transmitted dominant (data frame).

In TX mode, you can write and read data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

CFIDE bit (Common FIFO Buffer IDE bit)

The CFIDE bit selects whether a message with EXT-ID or STD-ID is to be transmitted from or was received in the FIFO buffer.

In TX mode, you can write and read data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

30.2.90.14 Common FIFO Access Pointer Register n (CFDCFPTRn) (n = 0 to 5)

The CFDCFPTRn register (n = 0 to 5) stores the DLC and Timestamp fields.

In TX mode, you can read data from the FIFO buffer, only for the current entry based on the write pointer value, and not for the other entries.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'6404 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFTS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	CFDLC[3:0]	H'0	R/W	Common FIFO Buffer DLC Field Number of data bytes received in a CAN frame, or transmitted in a CAN frame.
27 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
15 to 0	CFTS[15:0]	H'0000	R/W	Common FIFO Timestamp Value Timestamp value of the received CAN frame (FIFO in RX mode).

CFTS[15:0] bits (Common FIFO Timestamp Value)

The CFTS[15:0] bits store the timestamp value taken at the capture point as configured by the CFDGFDCFG.TSCCFG bit of the received message (if FIFO is configured in RX mode).

In TX mode, you can read and write data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In the case of can_race_ts_en=1, the information as which CFDCFPTR.CFTS is inputted from can_race_ts

is reflected. See **Section 30.8.1.3 Timestamp** for the timestamp in detail.

CFDLC[3:0] bits (Common FIFO Buffer DLC Field)

The CFDLC[3:0] bits store the number of data bytes that were received in the FIFO buffer or are to be transmitted.

See *Table 5 in ISO 11898-1 (2015) Specification* for details in defining the number of data bytes.

In TX mode, you can read and write data from the FIFO buffers. Do not read data for the other entries in the FIFO when configured in TX mode.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

30.2.90.15 Common FIFO Access CAN-FD Control/Status Register n (CFDCFFDCSTSn) (n = 0 to 5)

The CFDCFFDCSTSn register (n = 0 to 5) shows the status of the FDF, BRS, and ESI bits, including the pointer of the received CAN-FD frame or the CAN-FD frame to transmit.

In TX mode, you can read data from the FIFO, only for the current entry based on the write pointer value, and not for the other entries.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'6408 + H'080 × n

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CFPTR[15:0]	H'0000	R/W	Common FIFO Buffer Pointer Field
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9, 8	CFIFL[1:0]	00	R/W	COMMON FIFO Buffer Information Label Field
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	CFFDF	0	R/W	CAN-FD Format bit 0: Non CAN-FD frame received or to transmit 1: CAN-FD frame received or to transmit
1	CFBRS	0	R/W	Bit Rate Switch bit 0: CAN-FD frame received or to transmit with no bit rate switch 1: CAN-FD frame received or to transmit with bit rate switch
0	CFESI	0	R/W	Error State Indicator bit 0: CAN-FD frame received or to transmit by error active node 1: CAN-FD frame received or to transmit by error passive node

CFESI bit (Error State Indicator bit)

In TX mode, you can read and write data from FIFO buffers. In this mode, when the CAN-FD module is not in error passive, the CFESI bit equals the write value. Otherwise, it is a don't care and the bit is transmitted as 1 on the CAN bus, indicating this is an error passive node.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, the CFESI bit is updated with the ESI bit value of the CAN-FD frame when it has been received, indicating the error state of the transmitting node. In RX or GW mode, 0 is stored to this bit when the received FDF bit is 0, this means a CAN 2.0 frame is received.

CFBRS bit (Bit Rate Switch bit)

In TX mode, you can read and write data from FIFO buffers. In this mode, the CAN-FD module either transmits a 0 to indicate no bit rate switch in the frame to be transmitted or a 1 to indicate a bit rate switch in the frame to be transmitted.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, the CFBRS bit is updated with the BRS bit value of the CAN-FD frame when it has been received, indicating whether there is a bit rate switch (1) or (0) on the CAN-FD frame.

In RX or GW mode, 0 is stored to the CFBRS bit when the received FDF bit is 0, this means a CAN 2.0 frame is received.

CFFDF bit (CAN-FD Format bit)

In TX mode, you can read and write data from FIFO buffers. In this mode, the CAN-FD module either transmits a 0 to indicate a CAN 2.0 frame is to be transmitted or a 1 to indicate a CAN-FD frame is to be transmitted.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, the CFFDF bit is updated with the FDF bit value of the CAN frame when it has been received, indicating whether it is a CAN 2.0 frame (0) or a CAN-FD frame (1).

CFIFL[1:0] bits (COMMON FIFO Buffer Information Label Field)

If the Common FIFO is configured in TX mode, the value programmed in CFDCFFDCSTSn.CFIFL[1:0] is stored together with additional message information, to the TX History List after successful transmission of the message.

The information label value from the related Global Acceptance Filter List entry is stored in these bits (if FIFO is configured in either RX or GW mode).

In TX mode, you can read and write data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

CFPTR[15:0] bits (Common FIFO Buffer Pointer Field)

If the Common FIFO is configured in TX mode, the value programmed in CFDCFFDCSTSn.CFPTR[15:0] is stored together with additional message information, to the TX History List after successful transmission of the message.

The pointer value from the related Global Acceptance Filter List entry is stored in these bits (if FIFO is configured in either RX or GW mode).

In TX mode, you can read and write data from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

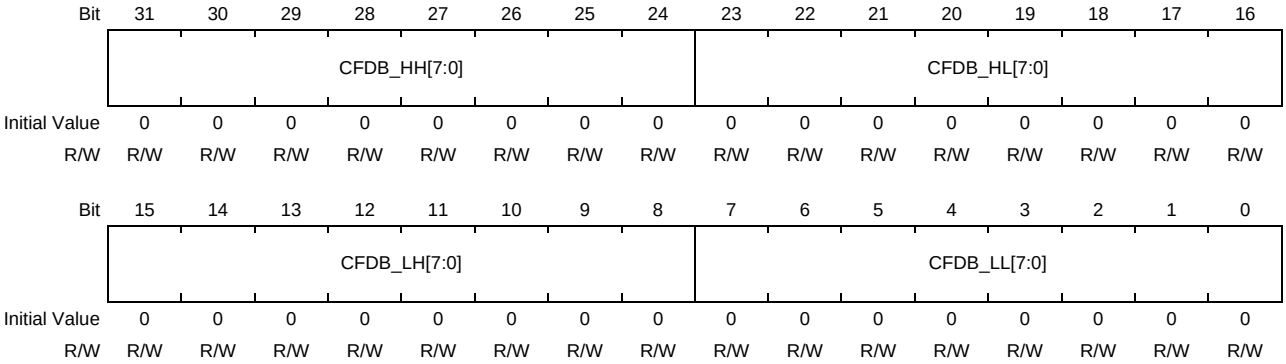
30.2.90.16 Common FIFO Access Data Field p Register n (CFDCFDFp_n) (p = 0 to 15, n = 0 to 5)

The CFDCFDFpn register (p = 0 to 15, n = 0 to 5) stores data bytes (4 × p) to data bytes (4 × p + 3) of the message.

In TX mode, you can read data from the FIFO, only for the current entry based on the write pointer value, and not for the other entries.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'640C + H'004 × p + H'080 × n



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CFDB_HH [7:0]	H'00	R/W	Common FIFO Buffer Data Byte (4 × p + 3)
23 to 16	CFDB_HL [7:0]	H'00	R/W	Common FIFO Buffer Data Byte (4 × p + 2)
15 to 8	CFDB_LH [7:0]	H'00	R/W	Common FIFO Buffer Data Byte (4 × p + 1)
7 to 0	CFDB_LL[7:0]	H'00	R/W	Common FIFO Buffer Data Byte (4 × p)

CFDB_LL[7:0] bits (Common FIFO Buffer Data Byte (4 × p))

The CFDB_LL[7:0] bits store data bytes (4 × p) of the message present in the FIFO buffer.

In TX mode, you can read and write data from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with H'00, according to their configured data payload size CFDCFCCn.CFPLS.

CFDB_LH[7:0] bits (Common FIFO Buffer Data Byte (4 × p + 1))

The CFDB_LH[7:0] bits store data bytes (4 × p + 1) of the message present in the FIFO buffer.

In TX mode, you can read and write data from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with H'00, according to their configured data payload size CFDCFCCn.CFPLS.

CFDB_HL[7:0] bits (Common FIFO Buffer Data Byte (4 × p + 2))

The CFDB_HL[7:0] bits store data bytes (4 × p + 2) of the message present in the FIFO buffer.

In TX mode, you can read and write data from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with H’00, according to their configured data payload size CFDCFCCn.CFPLS.

CFDB_HH[7:0] bits (Common FIFO Buffer Data Byte (4 × p + 3))

The CFDB_HH[7:0] bits store data bytes (4 × p + 3) of the message present in the FIFO buffer.

In TX mode, you can read and write data from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, Cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with H’00, according to their configured data payload size CFDCFCCn.CFPLS.

30.2.90.17 TX Message Buffer Component b (CFDTMBCPb[i])

Base address: CAN-FD = H'0_100C_0000

Offset address: TMID: H'1_0000 + H'0080 × b + H'2000 × n
TMPTR: H'1_0004 + H'0080 × b + H'2000 × n
TMFDSTS: H'1_0008 + H'0080 × b + H'2000 × n
TMDFp: H'1_000C + H'0004 × p + H'0080 × b + H'2000 × n

31:0	Rc	All 0	R	TX Message Buffer Component c Refer to **Table 30.23**, **Table 30.24** and the descriptions that follow for a detailed description of each register and its related bits, contained within this message buffer component.

(no_of_channels = 2)

(i = 0 .. no_of_channels – 1)

(b = TX Message Buffer Component index = [0…no_of_CFDTMBCPs_per_channel-1])

(no_of_CFDTMBCPs_per_channel = No. of TX Message Buffer Components per Channel = 64)

Where the total number of CFDTMBCPs = no_of_CFDTMBCPs_per_channel × no_of_channels = 64 × 2 = 128 as shown in **Figure 30.28 Message Buffer Configuration**.

(c = TX Message Buffer Component Register index = [0…no_of_REGs_per_CFDTMBCP-1])

no_of_REGs_per_CFDTMBCP = No. of Registers per TX Message Buffer Component = 19

Rc bit (TX Message Buffer Component c)

The TX Message Buffer Component is made up of the following registers: **CFDTMID**, **CFDTMPTR**, **CFDTMFDCTR**, and **CFDTMDFp**. Refer to **Table 30.24, TX Message Buffer Component Detailed** for details of how to interpret the structure of this buffer component and how to access the respective registers.

30.2.90.18 TX Message Buffer ID Register n (CFDTMIDn) (n = 0 to 127)

The CFDTMIDn register (n = 0 to 127) stores the ID, IDE, RTR fields and history configuration of the message to be transmitted from the associated buffer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1_0000 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

28:0	TMID[28:0]	All 0	R/W	TX Message Buffer ID Field STD-ID/EXT-ID fields

TMID[28:0] bits (TX Message Buffer ID Field)

The TMID[28:0] bits are bits of the STD-ID/EXT-ID fields of the message stored in this TX message buffer.

For alignment of these bits in standard and extended frame format, see **Section 30.2.89, Identifier Bits Alignment**.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

THLEN bit (Tx History List Entry)

The THLEN bit controls the storage of an entry corresponding to the transmitted message in the TX History list at the end of a successful transmission.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMRTR bit (TX Message Buffer RTR bit)

The TMRTR bit selects whether a data frame or remote frame is to be transmitted from this TX message buffer.

Note: There are no remote frames in CAN-FD format. For a CAN-FD transmission (CFDTMFDCTR.CFFDF = 1), this bit is always transmitted dominant (data frame).

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMIDE bit (TX Message Buffer IDE bit)

The TMIDE bit selects whether a message with EXT-ID or STD-ID is to be transmitted from this TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

30.2.90.19 TX Message Buffer Pointer Register n (CFDTMPTRn) (n = 0 to 127)

The CFDTMPTRn register (n = 0 to 127) stores the DLC fields of the message to transmit from the associated buffer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1_0004 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMDLC[3:0]				—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	TMDLC[3:0]	H'0	R/W	TX Message Buffer DLC Field Number of data bytes to be transmitted in a CAN frame.
27 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.

TMDLC[3:0] bits (TX Message Buffer DLC Field)

The TMDLC[3:0] bits select the number of data bytes to be transmitted from this TX message buffer when the corresponding TMRTR bit is configured as 0.

See *Table 5 in ISO 11898-1 (2015) Specification* for details in defining the number of data bytes to be transmitted.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

30.2.90.20 TX Message Buffer CAN-FD Control Register n (CFDTMFDCTRn) (n = 0 to 127)

The CFDTMFDCTRn register (n = 0 to 127) shows the status of the FDF, BRS, and ESI bits, including the pointer fields of the CAN-FD frame to be transmitted.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1_0008 + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMPTR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMPTR[15:0]	H'0000	R/W	TX Message Buffer Pointer Field
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
9, 8	TMIFL[1:0]	00	R/W	TX Message Buffer Information Label Field
7 to 3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be always 0.
2	TMFDF	0	R/W	CAN-FD Format bit 0: Non CAN-FD frame to transmit 1: CAN-FD frame to transmit
1	TMBRS	0	R/W	Bit Rate Switch bit 0: CAN-FD frame to transmit with no bit rate switch 1: CAN-FD frame to transmit with bit rate switch
0	TMESI	0	R/W	Error State Indicator bit 0: CAN-FD frame to transmit by error active node 1: CAN-FD frame to transmit by error passive node

TMESI bit (Error State Indicator bit)

If the channel is not in error passive, then the TMESI bit equals the write value, otherwise it is a don't care and the bit is transmitted as 1 on the CAN bus, indicating this is an error passive node.

Do not write to the TMESI bit when the related CAN-FD channel is in CH_SLEEP mode.

TMBRS bit (Bit Rate Switch bit)

Do not write to the TMBRS bit when the related CAN-FD channel is in CH_SLEEP mode.

TMFDF bit (CAN-FD Format bit)

Do not write to the TMFDF bit when the related CAN-FD channel is in CH_SLEEP mode.

TMIFL[1:0] bits (TX Message Buffer Information Label Field)

The TMIFL[1:0] bits store the information label value to be copied, together with additional message information, in the TX History List after successful transmission of the message.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMPTR[15:0] bits (TX Message Buffer Pointer Field)

The TMPTR[15:0] bits store the pointer value to be copied, together with additional message information in the TX History List after successful transmission of the message.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

30.2.90.21 TX Message Buffer Data Field p Register n (CFDTMDFp_n) (p = 0 to 15, n = 0 to 127)

The CFDTMDFp_n register (p = 0 to 15, n = 0 to 127) stores data bytes (4 × p) to data bytes (4 × p + 3) of the message to transmit from the associated buffer.

Base address: CAN-FD = H'0_100C_0000

Offset address: H'1_000C + H'004 × p + H'080 × n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	TMDB_HH [7:0]	H'00	R/W	TX Message Buffer Data Byte (4 × p + 3)
23 to 16	TMDB_HL [7:0]	H'00	R/W	TX Message Buffer Data Byte (4 × p + 2)
15 to 8	TMDB_LH [7:0]	H'00	R/W	TX Message Buffer Data Byte (4 × p + 1)
7 to 0	TMDB_LL [7:0]	H'00	R/W	TX Message Buffer Data Byte (4 × p)

TMDB_LL[7:0] bits (TX Message Buffer Data Byte (4 × p))

Data bytes (4 × p)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMDB_LH[7:0] bits (TX Message Buffer Data Byte (4 × p + 1))

Data bytes (4 × p + 1)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMDB_HL[7:0] bits (TX Message Buffer Data Byte (4 × p + 2))

Data bytes (4 × p + 2)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMDB_HH[7:0] bits (TX Message Buffer Data Byte (4 × p + 3))

Data bytes (4 × p + 3)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

30.3 Operation

30.3.1 Overview

The modes of the CAN-FD module can be classified into 2 groups:

- Global modes
- Channel modes

30.3.2 Global Modes

Global modes are applicable for the complete CAN-FD module. The global modes of the CAN-FD module are:

- Global Sleep
- Global Reset
- Global Halt
- Global Operation

Figure 30.2 shows the possible transitions between the Global modes.

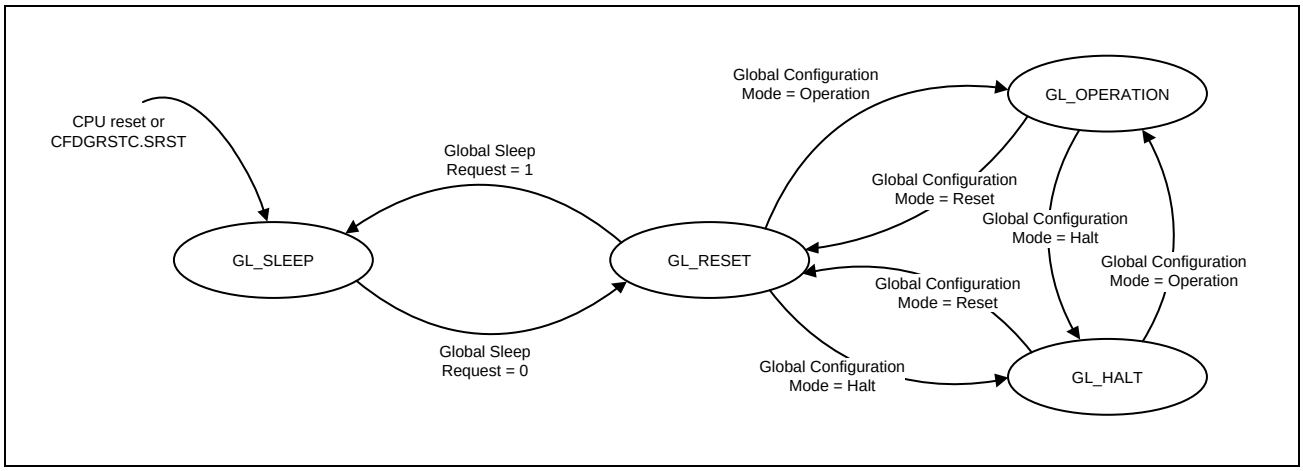

Figure 30.2 Transition between CAN-FD Global Modes

Changes in the Global mode can affect the Channel mode. **Table 30.25** shows the effect of a Global mode transition on a Channel mode.

Table 30.25 Possible CAN-FD Channel Modes and Global Modes

	Target Global Mode			
Current Global Mode	Sleep	Reset	Halt	Operation
Sleep	—	Ch-Sleep: Keep Ch-Reset: N/A Ch-Halt: N/A Ch-Oper: N/A	—	—
Reset	Ch-Sleep: Keep Ch-Reset: → Ch-Sleep Ch-Halt: N/A Ch-Oper: N/A	—	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: N/A Ch-Oper: N/A	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: N/A Ch-Oper: N/A
Halt	—	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: → Ch-Reset Ch-Oper: N/A	—	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: Keep Ch-Oper: N/A
Operation	—	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: → Ch-Reset Ch-Oper: → Ch-Reset	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: Keep Ch-Oper: → Ch-Halt	—

30.3.2.1 Global Sleep Mode

After the release of a hardware reset or after setting and clearing the CFDGRSTC.SRST bit, the CAN-FD module automatically enters Global Sleep mode.

The CAN-FD module also enters the Global Sleep mode when the Global Sleep Request bit is set while it is in Global Reset mode. This control bit cannot be set in Global Halt mode or Global Operation mode.

Setting the Global Sleep Request bit sets all Channel Sleep Request bits and forces all channels into the Channel Sleep mode. Sleep mode is used for power saving purpose. When CAN-FD module is in Global Sleep mode, only the clock for CPU write access to the Global Sleep Mode Request bit is active. All other clocks are stopped and all other functions of the CAN-FD module are suspended.

Read access from all registers is still possible and all register values are preserved.

In Global Sleep mode, RAM access is prohibited because the logic which generates a RAM address does not operate.

After setting the Global Sleep Request bit, it is necessary to confirm that the Global Sleep status has been updated, indicating successful transition to Global Sleep mode before the Global Sleep Request bit can be cleared again.

Figure 30.3 shows the procedure for entering Global Sleep mode and **Figure 30.4** shows the procedure for exiting Global Sleep mode.

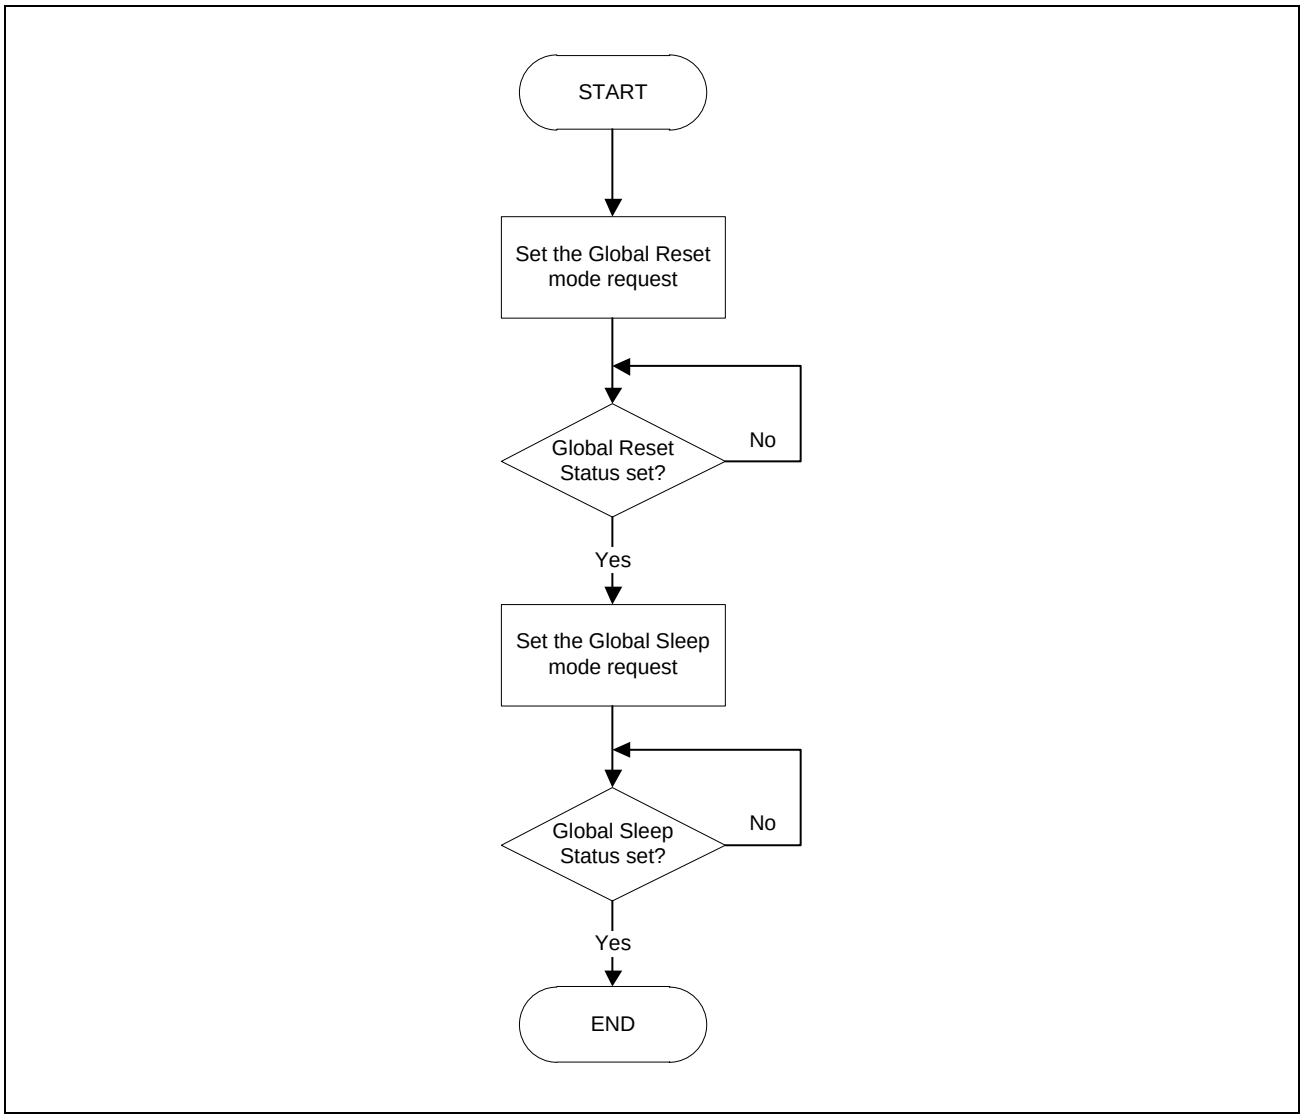

Figure 30.3 Procedure for Entering Global Sleep Mode

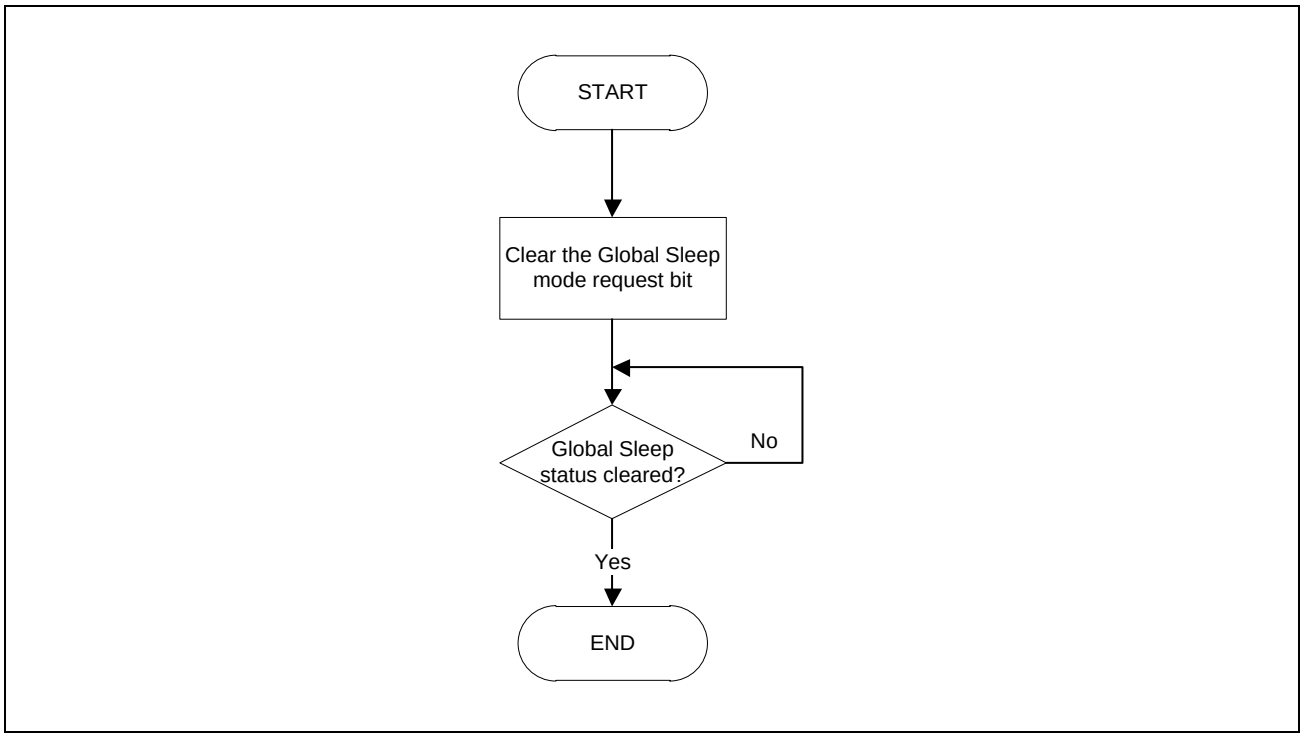

Figure 30.4 Procedure for Exiting Global Sleep Mode

30.3.2.2 Global Reset Mode

The CAN-FD module enters the Global Reset mode in the following ways:

- Global Mode Control bits CFDGCTR.GMDC[1:0] in the Global Control Register is configured for Global Reset mode while the CAN-FD module is in Global Halt or Global Operation mode.
- Global Sleep Mode Request bit is cleared while CAN-FD module is in Global Sleep mode.

In Global Reset mode, all CAN-FD module functions are suspended and all status and flag registers are initialized.

Additionally all FIFOs and all channel TX Queues are disabled and transmission control bits are cleared.

Configuration registers (except the test mode registers) are not initialized in this mode to their device reset values and the CAN-FD module can be configured.

See **Section 30.3.4, Global Mode and Channel Mode Transition Interactions** for a detailed description of the behavior of all registers when transition to Global Reset mode.

Setting the Global mode to Reset by setting the Global Mode Control bits CFDGCTR.GMDC[1:0] in the Global Control Register to 01b sets all Channel Mode Control bits CFDCnCTR.CHMDC[1:0] in the Channel Control Registers to 01b and forces all channels into the Channel Reset mode.

For channels that are already in Channel Reset mode or Channel Sleep mode, this automatic transition is not performed (CFDCnCTR.CHMDC[1:0] of related channel already set to 01b).

After setting Global Mode Control bits CFDGCTR.GMDC[1:0] to Reset mode, it is necessary to confirm that the Reset Mode Status bit CFDGSTS.GRSTSTS in the Global Status Register has been updated, indicating successful transition to Global Reset mode before CFDGCTR.GMDC can be changed again.

Figure 30.5 shows the procedure for entering Global Reset mode and **Figure 30.6** shows the procedure for exiting Global Reset mode.

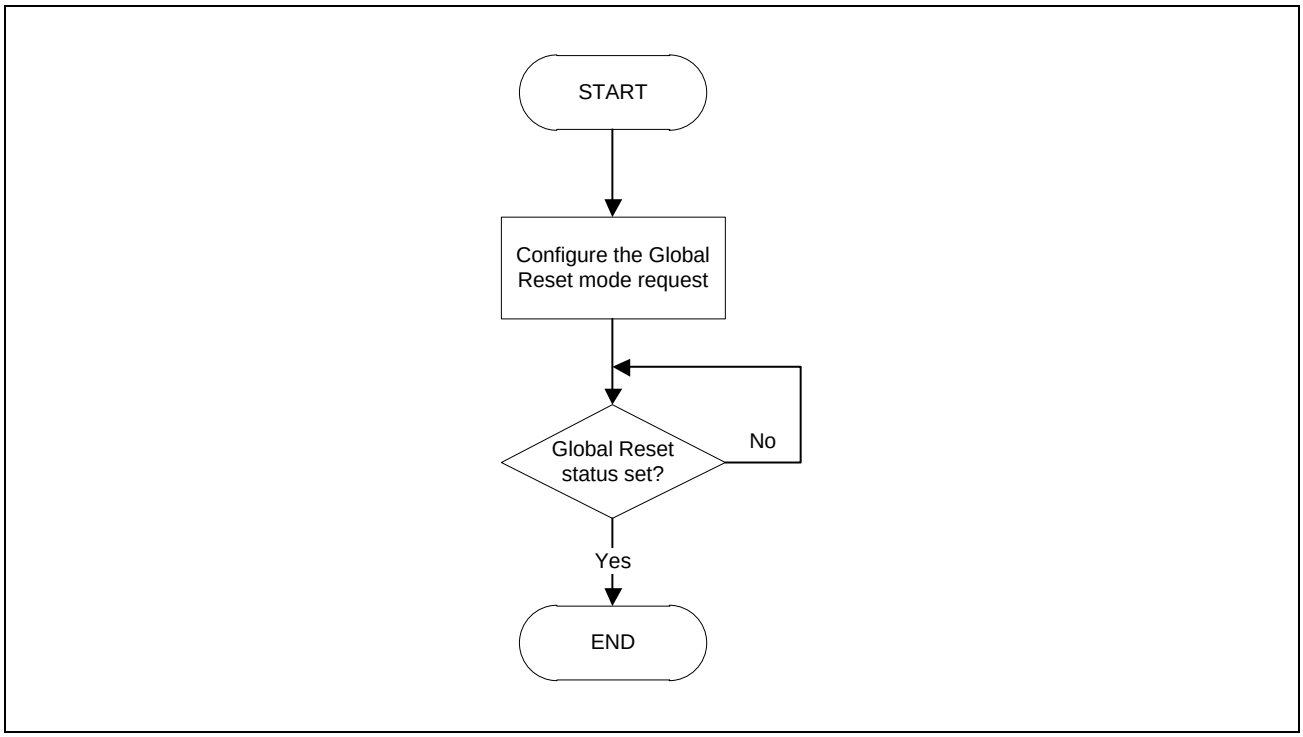

Figure 30.5 Procedure for Entering Global Reset Mode

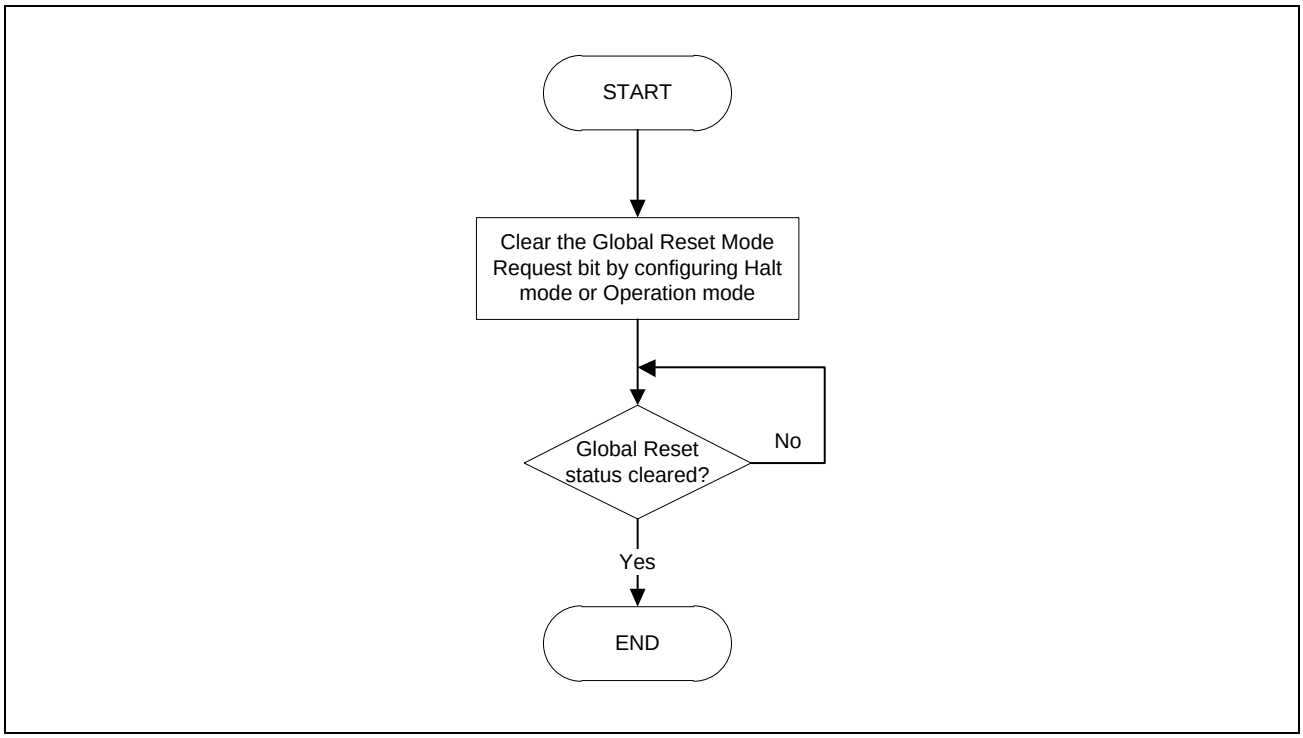

Figure 30.6 Procedure for Exiting Global Reset Mode

30.3.2.3 Global Halt Mode

The CAN-FD module enters the Global Halt mode in the following ways:

- Global Mode Control bits CFDGCTR.GMDC[1:0] in the Global Control Register is configured for Global Halt mode while the CAN-FD module is in Global Reset mode:
  - The channel is in either Channel Reset or Channel Sleep mode and remains in this mode.
- Global Mode Control bits CFDGCTR.GMDC[1:0] in the Global Control Register is configured for Global Halt mode while the CAN-FD module is in Global Operation mode:
  - All channels in Channel Reset, Channel Halt, or Channel Sleep mode remain in this mode
  - All channels in Channel Operation mode transit to Channel Halt mode
  - Global Halt Mode Status bit is set when all channels have left Channel Operation mode.

If a transmission or reception is ongoing for a channel, the transition to Channel Halt mode is delayed until completion of the communication.

Similarly, if a channel is in bus-off state, the full bus-off recovery sequence may be delayed depending on the channel configuration.

In Global Halt mode, all communications are suspended and CAN-FD logic does not cause any change to the Status and Flag registers (only when a channel is in the bus-off state that its REC and TEC values are cleared). Additionally, the test mode configuration and control registers are not initialized in this mode.

The Global Halt mode should be used to configure global module test modes.

See **Section 30.3.4, Global Mode and Channel Mode Transition Interactions** for a detailed description of the behavior of all registers when transition to Global Halt mode is performed.

Setting the Global mode to Halt mode by setting the Global Mode Control bits CFDGCTR.GMDC[1:0] in the Global Control Register to 10b sets all Channel Mode Control bits CFDCnCTR.CHMDC[1:0] in the Channel Control Registers to 10b for the channels that are in Channel Operation mode and forces these channels into the Channel Halt mode.

For channels that are already in Channel Reset, Channel Halt, or Channel Sleep mode, this automatic transition is not performed.

Therefore, the Global Halt mode request can be used to shut down all CAN-FD channel communications without loss of messages and disruption on the related CAN bus (no interruption of reception/transmission processes on the channels).

After setting the Global Mode Control bits CFDGCTR.GMDC[1:0] to Halt mode, it is necessary to confirm that the Halt Mode Status bit CFDGSTS.GHLTSTS in the Global Status Register has been updated to indicate a successful transition to Global Halt mode. Do not specify any other SFR setting until confirming CFDGSTS.GHLTSTS is set.

Figure 30.7 shows the procedure for entering Global Halt mode and **Figure 30.8** shows the procedure for exiting Global Halt mode.

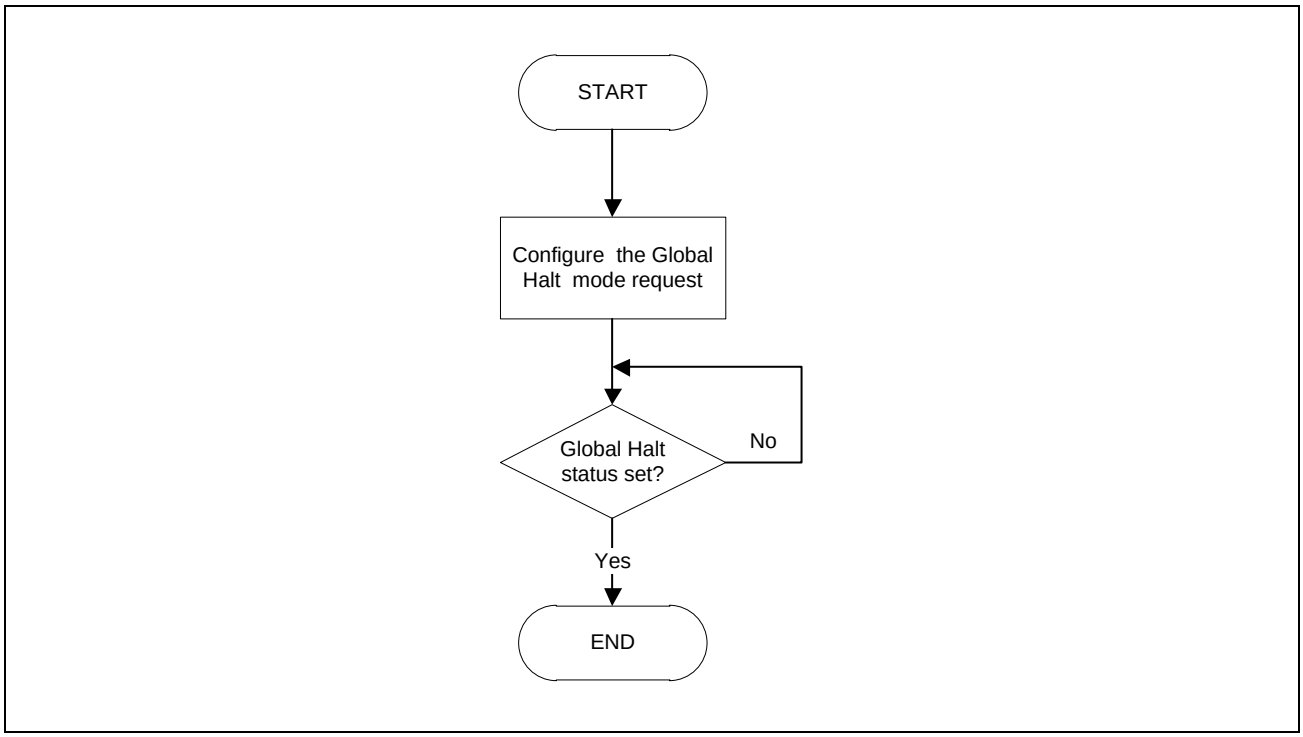

Figure 30.7 Procedure for Entering Global Halt Mode

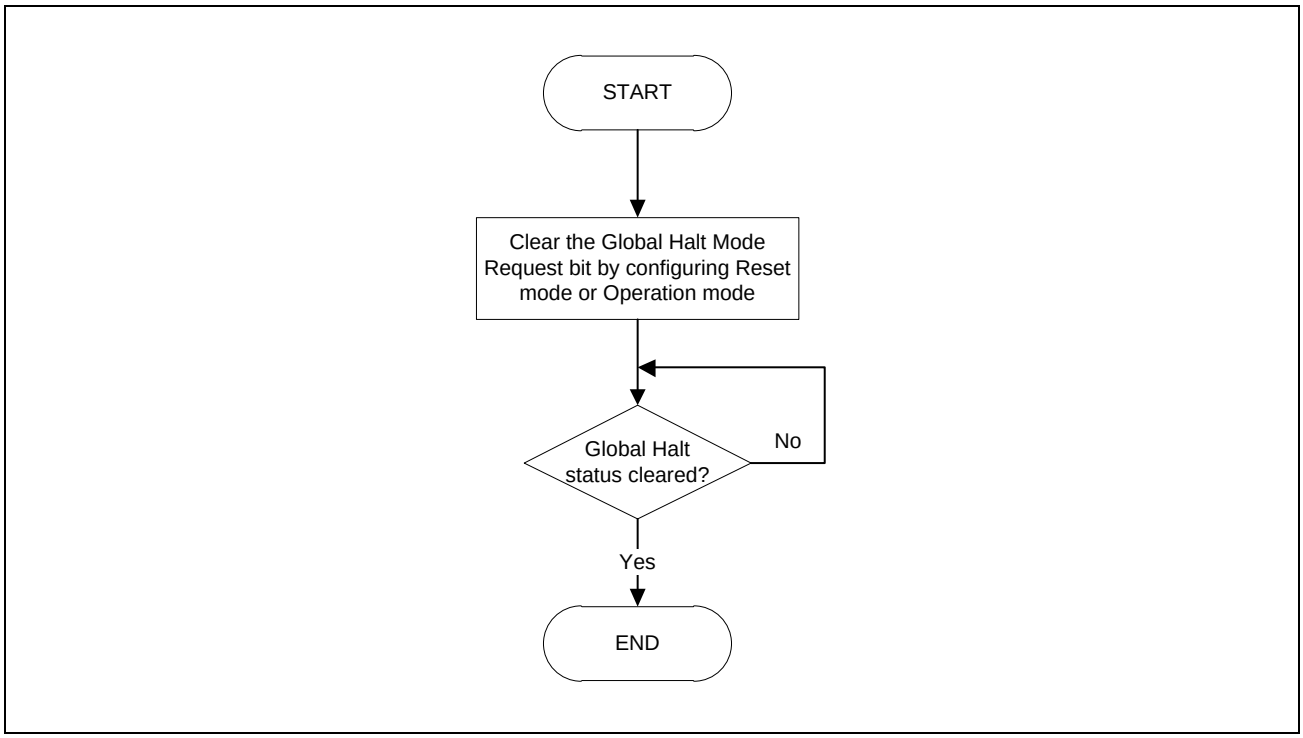

Figure 30.8 Procedure for Exiting Global Halt Mode

30.3.2.4 Global Operation Mode

The CAN-FD module enters the Global Operation mode when the Global Mode Configuration bits are set to Global Operation mode.

The CAN-FD channels can only be set to Channel Operation mode and start CAN communication when CAN-FD is in Global Operation mode.

After setting the Global Mode Control bits CFDGCTR.GMDC[1:0] to Global Operation mode, it is necessary to confirm that the Global Reset Mode Status bit CFDGSTS.GRSTSTS and the Global Halt Mode Status bit CFDGSTS.GHLTSTS in the Global Status Register have been cleared to indicate a successful transition to Global Operation mode before CFDGCTR.GMDC can be modified again.

Figure 30.9 shows the procedure for entering Global Operation mode and **Figure 30.10** shows the procedure for exiting Global Operation mode.

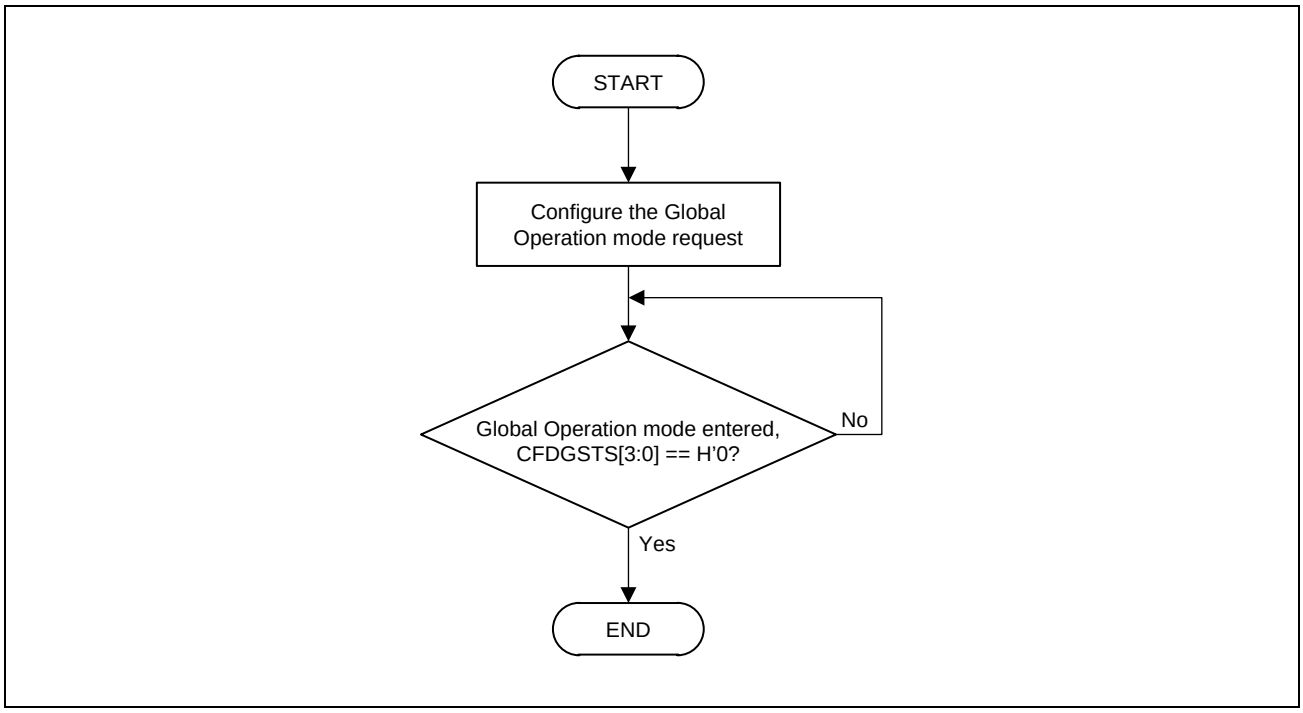

Figure 30.9 Procedure for Entering Global Operation Mode

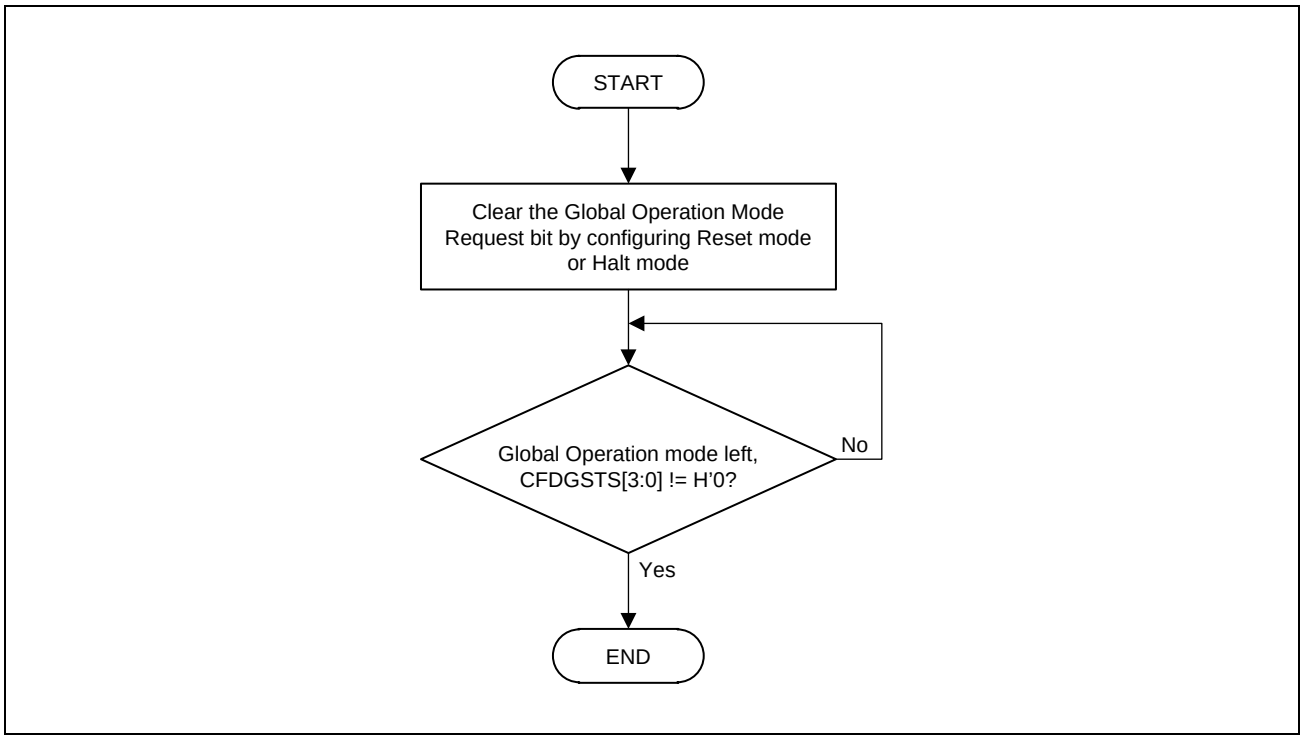

Figure 30.10 Procedure for Exiting Global Operation Mode

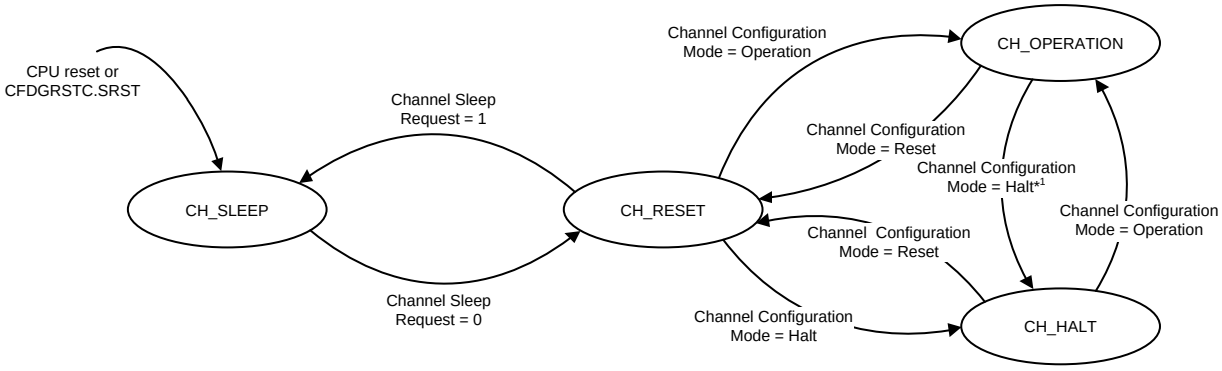
30.3.3 Channel Modes

Each CAN channel can be in one of the following four channel modes:

- Reset
- Halt
- Operation
- Sleep

Figure 30.11 shows possible transitions between the channel modes.



Note 1. The transition timing depends on BOM[1:0] setting in the Channel Control Register (CFDCnCTR):
When BOM[1:0] = 01b, the state transition timing is immediate after entering bus-off state
When BOM[1:0] = 10b, the state transition timing is at the end of bus-off state
When BOM[1:0] = 11b, the state transition timing is matching with the setting of CHMDC to HALT mode

Figure 30.11 Transition between CAN Channel Modes

30.3.3.1 CAN Channel Sleep Mode

After the release of a hardware reset or after setting and clearing the CFDGRSTC.SRST bit, each CAN channel of the CAN- FD module automatically enters Channel Sleep mode.

Each CAN channel also enters Channel Sleep mode when the related Channel Sleep Mode Request bit is set while the CAN channel is in Channel Reset mode. Do not set this control bit in Channel Halt mode or Channel Operation mode.

Entering the CAN Channel Sleep mode instantly stops the clock supplied to the CAN channel unit and therefore reduces power consumption.

After setting the Channel Sleep Mode Request bit, it is necessary to confirm that the Channel Sleep mode status has been updated to indicate a successful transition to Channel Sleep mode before the Channel Sleep Mode Request bit can be cleared again.

During Channel Sleep mode, do not write to channel related registers. Read operation is still possible.

30.3.3.2 CAN Channel Reset Mode

A CAN-FD CAN channel enters the CAN Channel Reset mode in the following ways:

- Channel Mode Control bits CFDCnCTR.CHMDC[1:0] in the Channel Control Registers is configured for Channel Reset mode while the related CAN channel is in Channel Halt mode or Channel Operation mode
- Channel Sleep Mode Request bit is cleared while the related CAN channel is in Channel Sleep mode
- Global Mode Control bits CFDGCTR.GMDC[1:0] is set to Global Reset mode and CAN channel is not in Channel Sleep mode or Channel Reset mode.

In Channel Reset mode, all CAN channel status and flag registers are initialized.

Additionally all channel-related transmission control bits are cleared and the channel-related TX Queue is disabled.

Configuration registers (except the Channel Test Mode registers) are not initialized in this mode and the CAN channel can be configured for communication.

See **Section 30.3.4, Global Mode and Channel Mode Transition Interactions** for a detailed description of the behavior of all registers when transition to Channel Reset mode is performed.

After setting the Channel Mode Control bits CFDCnCTR.CHMDC[1:0] to Channel Reset mode, it is necessary to confirm that the Reset Mode Status bit CFDCnSTS.CRSTSTS in the related Channel Status Registers has been updated to indicate a successful transition to Channel Reset mode before the related CFDCnCTR.CHMDC[1:0] bits can be modified again.

See **Table 30.26** for the behavior of transitioning to Channel Reset mode while CAN communication is ongoing.

Table 30.26 Transition Behavior in CAN Reset Mode and Halt Mode

	State		
Mode	Receiver	Transmitter	Bus-Off
CAN Channel Reset mode (CFDCnCTR.CHMDC[1:0] = 01b)	The CAN channel transits to Channel Reset mode without waiting for the completion of the ongoing reception.*1	The CAN channel transits to Channel Reset mode without waiting for the completion of the ongoing transmission.*1	The CAN channel transits to Channel Reset mode without waiting for the completion of the bus-off recovery.
CAN Channel Halt Mode (CFDCnCTR.CHMDC[1:0] = 10b)	The CAN channel transits to Channel Halt mode at the end of the ongoing reception or error.*2	The CAN channel transits to Channel Halt mode after completion of the ongoing transmission.	When CFDCnCTR.BOM[1:0] is set to 00b, a Channel Halt mode request is accepted only after the completion of the full bus-off recovery sequence. When CFDCnCTR.BOM[1:0] is set to 10b, the CAN channel transits automatically to Channel Halt mode after waiting for the completion of the bus-off recovery. When CFDCnCTR.BOM[1:0] is set to 01b, the CAN channel transits automatically to Channel Halt mode without waiting for the completion of the bus-off recovery. When CFDCnCTR.BOM[1:0] is set to 11b, the CAN channel transits to Channel Halt mode as soon as Channel Halt mode is requested (without waiting for the completion of the bus-off recovery).

Note 1. If the entry to Channel Reset is required only at the end of an ongoing communication, then Channel Halt mode can be requested first to prevent interruption of CAN communication by direct transition to Channel Reset mode. After the CAN channel enters Channel Halt mode, the Channel Reset mode can be requested.

Note 2. If CAN communication is locked at a dominant level after an error flag, software can detect this situation by monitoring the channel related Bus Lock flag and resolve the lock condition by setting the CAN channel to Channel Reset mode.

30.3.3.3 CAN Channel Halt Mode

A CAN-FD CAN channel enters the CAN Channel Halt mode in the following ways:

- Channel Mode Control bits CFDCnCTR.CHMDC[1:0] in the Channel Control Registers are configured for Channel Halt mode while the related CAN channel is in Channel Reset mode or Channel Operation mode
- Global Mode Control bits CFDGCTR.GMDC[1:0] are set to Global Halt mode and CAN channel is in Channel Operation mode.

In Channel Halt mode, all channel CAN communication is suspended but all status and flag registers remain unchanged during Channel Halt mode entry (except for the bus-off case where REC and TEC values are cleared for the channel).

In addition, the Channel Test Mode Configuration and Control registers are not initialized in this mode.

The Channel Halt mode should be used to configure Channel Test modes.

See **Section 30.3.4, Global Mode and Channel Mode Transition Interactions** for a detailed description of the behavior of all registers when transition to Channel Halt mode is performed.

After setting the Channel Mode Control bits CFDCnCTR.CHMDC[1:0] to Channel Halt mode, it is necessary to confirm that the Halt Mode Status bit CFDCnSTS.CHLTSTS in the related Channel Status Register is updated to indicate a successful transition to Channel Halt mode before the related CFDCnCTR.CHMDC[1:0] bits can be modified again.

See **Table 30.26** for the behavior of transitioning to Channel Halt mode while CAN communication is ongoing.

30.3.3.4 CAN Channel Operation Mode

The Channel Operation mode is activated by setting the CFDCnCTR.CHMDC[1:0] bits to 00b. If 11 consecutive recessive bits are detected after entering CAN Channel Operation mode, the CFDCnSTS.COMSTS bit is set and the CAN channel:

- Enables the functions of the channel communication by allowing the channel to become an active node on the CAN network
- Releases the internal fault confinement logic including receive and transmit error counters

At this point, the CAN channel can start transmission and reception of CAN messages.

Within the CAN Channel Operation mode, the channel may be in four different sub-modes, depending on which type of communication functions are performed (see **Figure 30.12**):

- Channel idle: The CAN channel is neither receiving nor transmitting
- Channel receives: The channel is receiving a CAN message sent by another CAN node
- Channel transmits: The channel is transmitting a CAN message

  Note: The channel may receive its own message simultaneously when Self-Test mode is enabled.
- Channel is in bus-off state: The CAN channel is cut-off from CAN bus communication.

After setting the Channel Mode Control bits CFDCnCTR.CHMDC[1:0] to Channel Operation mode, it is necessary to confirm that the Channel Reset Mode Status bit CFDCnSTS.CRSTSTS and the Channel Halt Mode Status bit CFDCnSTS.CHLTSTS in the Channel Status Register have been updated to indicate a successful transition to Channel Operation mode before the related CFDCnCTR.CHMDC[1:0] bits can be changed again.

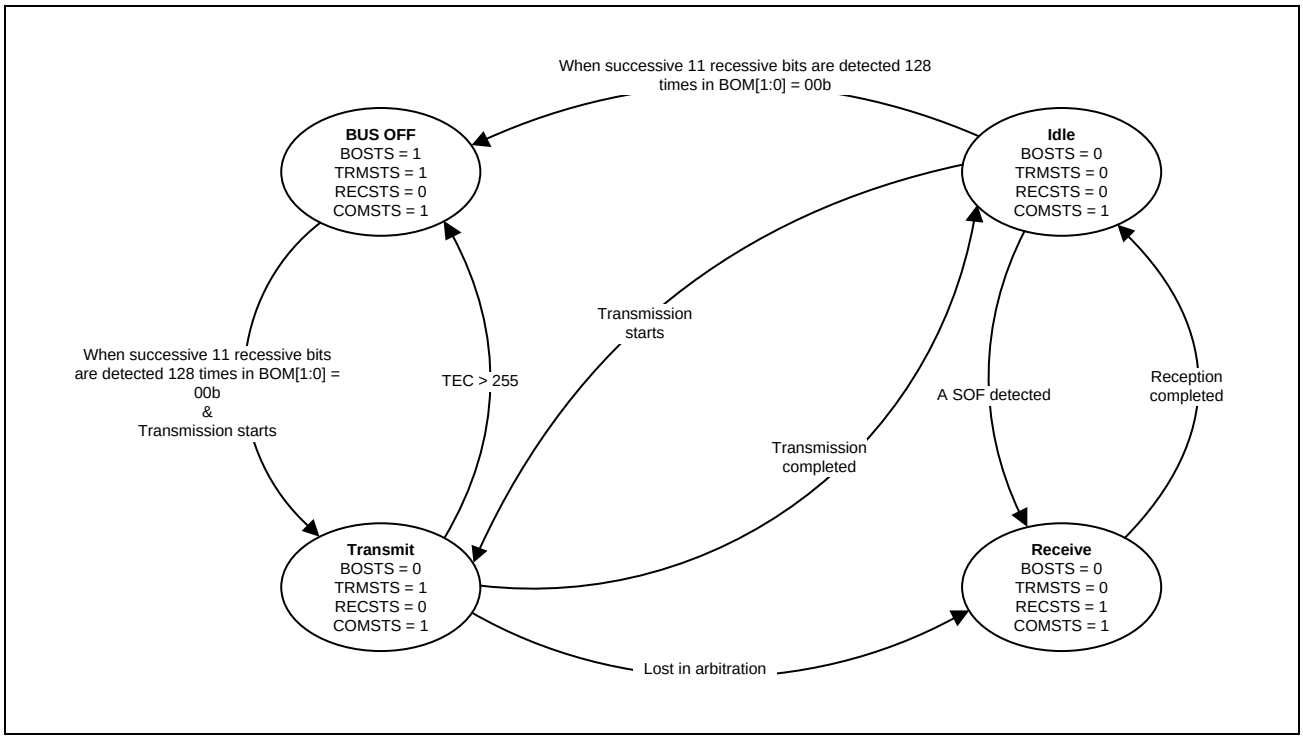


Figure 30.12 Sub-Modes of CAN Channel Operation Mode (Only when BOM[1:0] = 00b)

30.3.3.5 CAN Channel Bus-Off State

The CAN channel bus-off state is entered according to the fault confinement rules of the CAN specification. The following modes can be configured for returning to the CAN Channel Operation mode from the bus-off state:

- CFDCnCTR.BOM[1:0] = 00b:
  Bus-Off recovery is compliant to ISO 11898-1, namely the CAN channel re-enters CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. TEC and REC counters are initialized to 0. The Bus-Off Recovery Flag CFDCnERFL.BORF is set in this case.
- CFDCnCTR.BOM[1:0] = 01b:
  The CAN channel changes the value of the CFDCnCTR.CHMDC[1:0] bits within the CAN Channel Control Register to 10b and switches immediately to Channel Halt mode automatically after entering bus-off state. TEC and REC counters are initialized to 0 and the Bus-Off Recovery Flag CFDCnERFL.BORF is not set in this case.
- CFDCnCTR.BOM[1:0] = 10b:
  The CAN channel changes the value of the CFDCnCTR.CHMDC[1:0] bits within the CAN Channel Control Register to 10b as soon as it reaches bus-off state and enters Channel Halt mode automatically after the CAN channel has completed the bus-off recovery sequence (after 11 consecutive recessive bits are detected 128 times). TEC and REC counters are initialized to 0 and the Bus-Off Recovery Flag CFDCnERFL.BORF is set in this case.
- CFDCnCTR.BOM[1:0] = 11b:
  Bus-off recovery is initiated but CAN channel can immediately enter Channel Halt mode when still in bus-off state if a request is made to enter Channel Halt mode.
  TEC and REC counters are initialized to 0 and the Bus-Off Recovery Flag CFDCnERFL.BORF is not set. Without setting CFDCnCTR.CHMDC[1:0] = 10b and when 11 recessive bits is detected 128 times continuously, transition conditions become the same as CFDCnCTR.BOM[1:0] = 00b.

Note: If the recovery from bus-off occurs normally in Channel Halt mode (after waiting for 128 sequences of 11 consecutive recessive bits), and no halt request has been generated during this period, then the Bus-Off Recovery flag CFDCnERFL.BORF is set.

When software writes to the CFDCnCTR.CHMDC[1:0] bit at the same time as the CAN channel enters Halt mode (at the start of bus-off when CFDCnCTR.BOM[1:0] = 01b, or at the end of bus-off when CFDCnCTR.BOM[1:0] = 10b), the software request has the highest priority.

Note: In the above case, the automatic setting of the CFDCnCTR.CHMDC[1:0] bits to Channel Halt mode request is performed when the CFDCnCTR.CHMDC[1:0] bits value is previously 00b (Channel Operation mode).

Additionally, it is possible to force the CAN channel to recover from the bus-off state by setting CFDCnCTR.RTBO to 1. The error state changes from bus-off state to integrating state with a maximum delay of 1 CAN bit time, and the CAN communication becomes possible again after 11 consecutive recessive bits are detected. The Bus-Off Recovery Flag is not set in this case, and the TEC and REC counters are initialized to 0.

Before setting CFDCnCTR.RTBO to 1, all pending transmissions from the TX message buffers, TX Queues and/or Common FIFO in TX or GW mode should be disabled.

The disable of the pending transmission message buffer, TX Queue or FIFO must be confirmed by the corresponding acknowledge flags.

For the TX message buffer, the acknowledge flags are the Transmission Result Flags (CFDTMSTSn.TMTRF[1:0]). For the TX Queue, it is the TX Queue Empty flag (CFDTXQSTSn.TXQEMP). For the FIFO, it is the FIFO Empty flag (CFDCFSTSn.CFEMP).

The CFDCnCTR.RTBO bit should be used for bus-off recovery only when CFDCnCTR.BOM[1:0] is set to 00b.

Setting this bit in any state other than bus-off has no effect and the bit is cleared immediately.

Table 30.27 shows the settings for the Bus-Off Entry flag CFDCnERFL.BOEF and the Bus-Off Recovery flag CFDCnERFL.BORF for the different configurations of CFDCnCTR.BOM[1:0].

Table 30.27 Behavior of Bus-off Entry and Recovery Flags

BOM[1:0]	BOEF Bit Setting	BORF Bit Setting
00b	Always (on entry to bus-off)	Always (on exit from bus-off)
00b CFDCnCTR.RTBO set to 1	Always (on entry to bus-off)	Only if normal bus-off recovery occurs before software sets CFDCnCTR.RTBO to 1
01b	Always (on entry to bus-off)	Never
10b	Always (on entry to bus-off)	Always (on exit from bus-off)
11b	Always (on entry to bus-off)	Only if normal bus-off recovery occurs before software issues a Halt request

For an efficient software procedure, it is not necessary to wait for the bus-off recovery sequence to end.

It is possible to perform a transmission re-initialization during bus-off recovery. To do this, follow the recommended software flow in **Figure 30.13**.

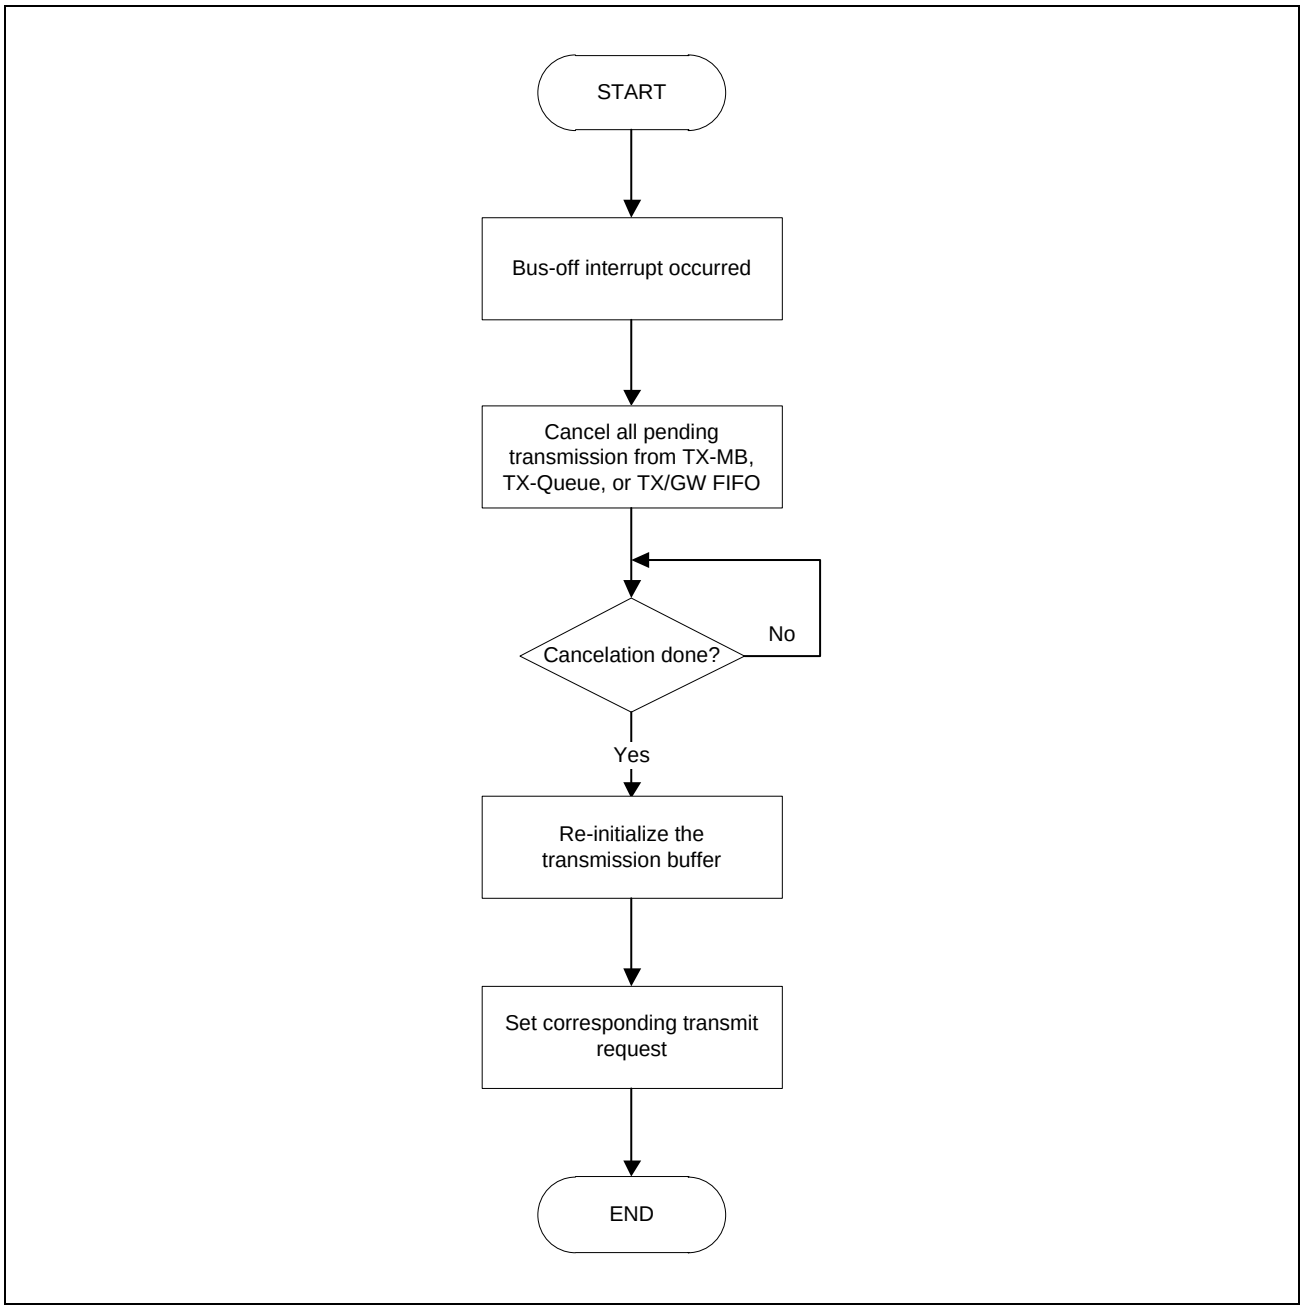

Figure 30.13 Transmission Re-Initialization during Bus-Off State

30.3.4 Global Mode and Channel Mode Transition Interactions

The interaction between Global mode setting and Channel mode setting is as follows:

- Changing the Channel Mode Control bits CFDCnCTR.CHMDC[1:0] in the Channel Control Registers does not affect the Global Mode Control bits CFDGCTR.GMDC[1:0].
- Changing the Global Mode Control bits CFDGCTR.GMDC[1:0] affects the channel mode control as described in **Table 30.28**.

Table 30.28 Instruction between Global and Channel Mode Transition

Global Mode Change	Channel Mode	Channel Mode Transition Action
Sleep → Reset	Sleep	Channel remains in Sleep mode
Sleep → Halt	— (Global mode change not possible)	
Sleep → Operation	— (Global mode change not possible)	
Reset → Sleep	Sleep	Channel remains in Sleep mode
	Reset	Channel Sleep request bit is set automatically, channel transits to Sleep mode
Reset → Halt	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
Reset → Operation	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
Halt → Sleep	— (Global mode change not possible)	
Halt → Reset	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel mode control is set to Reset mode, channel transits to Reset mode
Halt → Operation	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel remains in Halt mode
Operation → Sleep	— (Global mode change not possible)	
Operation → Reset	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel mode control is set to Reset mode, channel transits to Reset mode
	Operation	Channel mode control is set to Reset mode, channel transits to Reset mode
Operation → Halt	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel remains in Halt mode
	Operation	Channel mode control is set to Halt mode, channel transits to Halt mode after communication finished

30.3.4.1 Timing of Global Mode Change

The transition time for the Global mode changes are shown in the following table.

From	To	Maximum Transition Time
GL_SLEEP	GL_RESET	3 peripheral clock cycles*2
GL_RESET	GL_SLEEP	3 peripheral clock cycles
GL_RESET	GL_HALT	10 peripheral clock cycles
GL_RESET	GL_OPERATION	10 peripheral clock cycles
GL_HALT	GL_RESET	2 CAN bit times
GL_HALT	GL_OPERATION	3 peripheral clock cycles
GL_OPERATION	GL_RESET	2 CAN bit times
GL_OPERATION	GL_HALT	3 CAN frames*1,*3

Note 1. The given transition time is the time without any errors on the bus. In case of an error condition, the transition time can lengthen to an uncalculated result. The transition time can also come to a stuck condition for locked RX lines or continued error conditions.

Note 2. Exit GL_SLEEP mode only when CFDGSTS.GRAMINIT is cleared.

Note 3. TQ, CAN frame, and CAN bits are related to the individual channels. For maximum transition time, the channel with the lowest baud rate must be used.

30.3.4.2 Timing of Channel Mode Change

The transition time for the Channel mode changes are shown in the following table.

From	To	Maximum transition time
CH_SLEEP	CH_RESET	3 peripheral clock cycles
CH_RESET	CH_SLEEP	3 peripheral clock cycles
CH_RESET	CH_HALT	3 CAN bit times
CH_RESET	CH_OPERATION	4 CAN bit times
CH_HALT	CH_RESET	2 CAN bit times
CH_HALT	CH_OPERATION	4 CAN bit times*2
CH_OPERATION	CH_RESET	2 CAN bit times
CH_OPERATION	CH_HALT	2 CAN frames*1,*3

Note 1. The time specified for this transition does not include the case where channel enters bus-off state. For bus-off, the timing depends on the configuration of the CFDCnCTR.BOM[1:0] bits.

Note 2. The given transition time is the time without any errors on the bus. In case of an error condition, the transition time can lengthen to an uncalculated result. The transition time can also come to a stuck condition for locked RX lines or continued error conditions.

Note 3. In general, if the baud rate prescaler value CFDCnNCFG.NBRP is changed in CH_HALT mode, the transition time can deviate. The internal prescaler is a free running down counter that creates the TQ clock, and new BRP value is captured when the counter reaches the value 0.

30.4 Initialization

Before joining CAN communications, configure the following settings:

- Clock setting
- Bit timing setting (nominal and data rate)
- Baud rate setting (nominal and data rate)
- CAN-FD setting
- Acceptance filter setting (configuration of Global Acceptance Filter List)
- Reception, Transmission and GW-FIFO setting
- CAN Operation mode setting

30.4.1 Initialization of CAN Clock, Bit Timing and Baud Rate

30.4.1.1 Bit Timing Conditions

The following lines describe the composition of each segment and the limitations that apply to the segment setting.

1. Each segment setting SS = Fixed to 1 TQ
   TSEG1 = Refer to (CFDCnNCFG) and (CFDCnDCFG)
   TSEG2 = Refer to (CFDCnNCFG) and (CFDCnDCFG)
   SJW = Refer to (CFDCnNCFG) and (CFDCnDCFG)
   SS + TSEG1 + TSEG2 = 5 to 49 TQs for data bit rate and 8 to 385 for nominal bit rate

2. Limitations on TSEG1, TSEG2 and SJW
   TSEG1 (N) > TSEG2 (N) ≥ SJW (N)
   TSEG1 (D) ≥ TSEG2 (D) ≥ SJW (D)
   Table 30.29 shows an example of how to set the bit timing to achieve the required Sample Point settings.

Table 30.29 Transition Behavior in CAN Reset Mode and Halt Mode

	Set Value (TQ)				
1 Bit	SS	TSEG1	TSEG2	SJW	Sample Point*1 (%)
5 TQ	1	2	2	1	60.00
8 TQ	1	4	3	1	62.50
	1	5	2	1	75.00
10 TQ	1	6	3	1	70.00
	1	7	2	1	80.00
12 TQ	1	8	3	1	75.00
	1	9	2	1	83.33
15 TQ	1	10	4	1	73.33
	1	11	3	1	80.00
16 TQ	1	10	5	1	68.75
	1	11	4	1	75.00
20 TQ	1	12	7	1	65.00
	1	13	6	1	70.00
24 TQ	1	15	8	1	66.66
	1	16	7	1	70.83
50 TQ	1	39	10	4	80.00

Note 1. Sample Point (in Case of 75%)

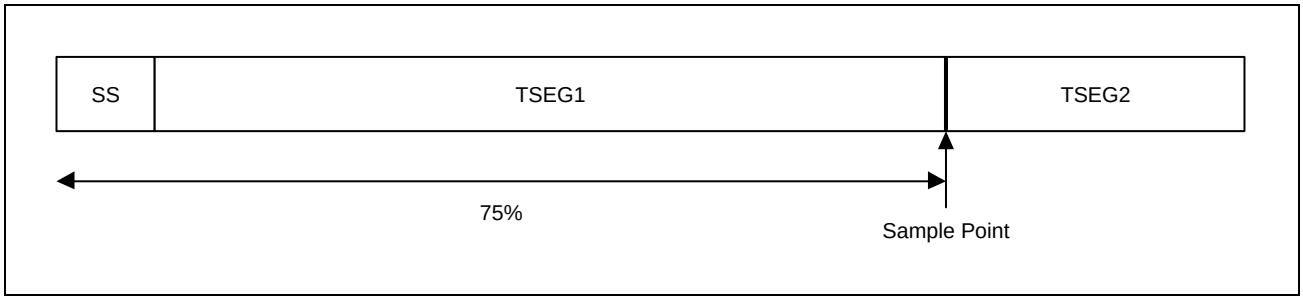

Figure 30.14 Sample Point (in Case of 75%)

30.4.1.2 CAN Bit Timing

In the CAN protocol, each bit in a communication frame is composed of three segments that can be configured individually for each channel using the related CFDCnNCFG and CFDCnDCFG registers.

Figure 30.15 shows the segment composition of a bit and the sample point in it.

Of these segments, the Time Segment 1 (TSEG1) and Time Segment 2 (TSEG2) are used to specify the position of the sample point, so that the timing at which each bit on the CAN bus is sampled can be altered by changing the values of these segments.

The minimum resolution for this timing is referred to as Time Quantum (TQ), which is determined by the clock frequency supplied to the CAN channel and the divide-by-N value of the baud rate prescaler (nominal and data rate).

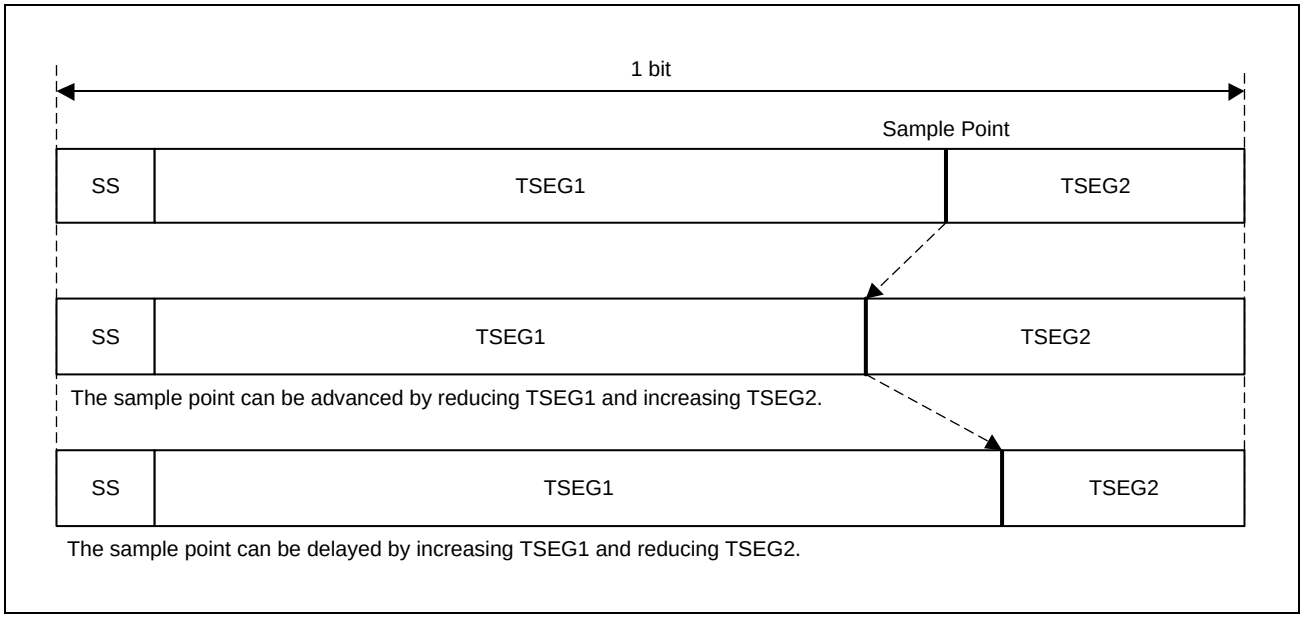

Figure 30.15 Segment Composition of a Bit and the Sample Point

1. SS: Synchronization Segment
   This segment is used to synchronize bits by monitoring a recessive-to-dominant edge during the interframe space. This comprises of intermission, suspend transmission, bus idle, during bus idle, and all nodes that can start transmission.
2. TSEG1: Time Segment 1
   This segment absorbs physical delays on the CAN network. A physical delay on the network is two times the total sum of a bus delay, input comparator delay, and output driver delay. It can be lengthened by SJW.
3. TSEG2: Time Segment 2
   This segment is used to correct a phase error by performing resynchronization. It can be shortened by SJW. While sending or receiving a message, communication frames between some nodes may get out of sync due to a drift in the oscillator frequency or a delay in the transmission path. This is referred to as a phase error.
4. SJW: Resynchronization Jump Width
   This is the maximum width by which bits that have become out of sync due to a phase error may be corrected.

Figure 30.15 shows only one symbolic sample point.

30.4.1.3 Baud Rate

Either PCLKM or PCLKCAN can be selected globally for all CAN channels as CAN communication clock.

The transfer speed is determined by the DLL clock, the divide-by-N value of the baud rate prescaler, and the number of TQs in one bit.

$$\text{Baud rate} = \frac{\text{DLL\_Clock}}{(\text{number\_of\_time\_quanta\_per\_bit}) \times (\text{BRP} + 1)}$$

Figure 30.16 shows a block diagram of the circuit that generates the CAN channel system clock, **Table 30.30** and **Table 30.31** show baud rate examples.

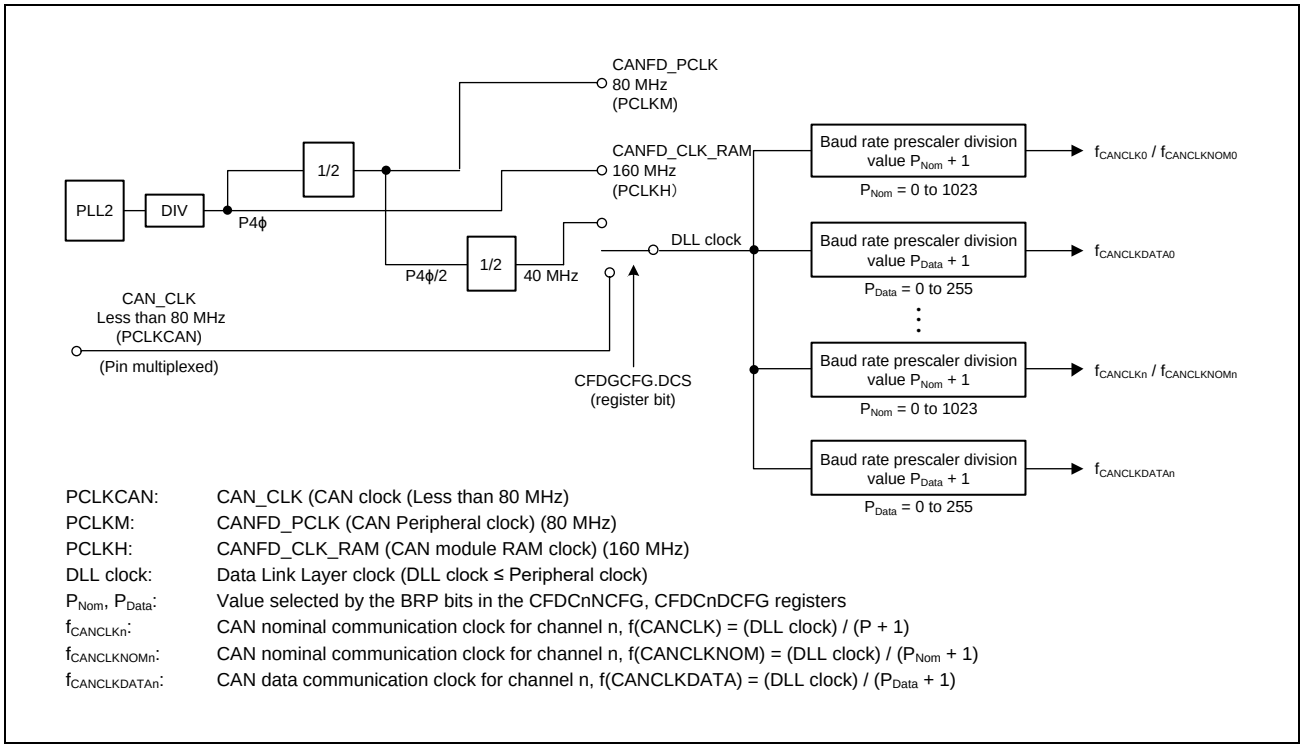

Figure 30.16 Block Diagram of the Circuit that Generates the CAN Channel Communication Clock

Table 30.30 Nominal Baud Rate Calculation Formula and Example CAN Communication Configurations

Baud rate calculation Formula	(DLL Clock) (Baud Rate Prescaler Divide-By-N Value*1) × (Number of TQs in One Bit)								
	80 MHz	40 MHz	32 MHz	30 MHz	24 MHz	20 MHz	16 MHz	10 MHz	8 MHz*2

Note: Shown in ( ) are the baud rate prescaler divided-by-N values.

Note 1. Baud rate prescaler divide-by-N value = P + 1 (P = 0 to 1023), P: value selected by the BRP bits in the Channel Configuration Registers.

Note 2. Minimum Frequency to achieve maximum. Nominal Baud Rate of 1Mbps.

Table 30.31 Baud Rate Calculation Example for Nominal and Data Bit Rate CAN Communication Configurations

Baud rate calculation formula	(DLL Clock) (Baud Rate Prescaler Divide-By-N Value*1) × (Number of TQs in One Bit)		
	80 MHz	40 MHz	20 MHz
Normal 1 Mbps Data 8 Mbps	80 TQ (1)	40 TQ (1)	20 TQ (1)
	10 TQ (1)	5 TQ (1)	Not possible
Normal 1 Mbps Data 5 Mbps	80 TQ (1)	40 TQ (1)	20 TQ (1)
	16 TQ (1)	8 TQ (1)	Not possible
Normal 500 Kbps Data 2 Mbps	160 TQ (1)	80 TQ (1)	40 TQ (1)
	40 TQ (1)	20 TQ (1)	10 TQ (1)

Note: Shown in ( ) are the baud rate prescaler divided-by-N values.

Note 1. Baud rate prescaler divide-by-N value = P + 1 (P = 0 to 1023), P: value selected by the BRP bits in the Channel Configuration Registers.

For optimum clock tolerance in networks using the FD frame format, the length of the time quantum should be the same in nominal bit time and in data bit time. This means CFDCnNCFG.NBRP = CFDCnDCFG.DBRP.

Additionally, if transceiver delay compensation is used, do not program the CFDCnDCFG.DBRP[7:0] bits to be greater than 1, as 1 means divide by 2.

30.4.1.4 Setting of CAN Clock, Bit Timing and Baud Rate

Figure 30.17 shows the procedure for setting the CAN clock and the baud rate for each channel.

These settings should be performed during Channel Reset mode (Configuration mode) for the CAN channels.

Before going to channel communication state, the baud rate must be configured, otherwise the mode does not switch correctly.

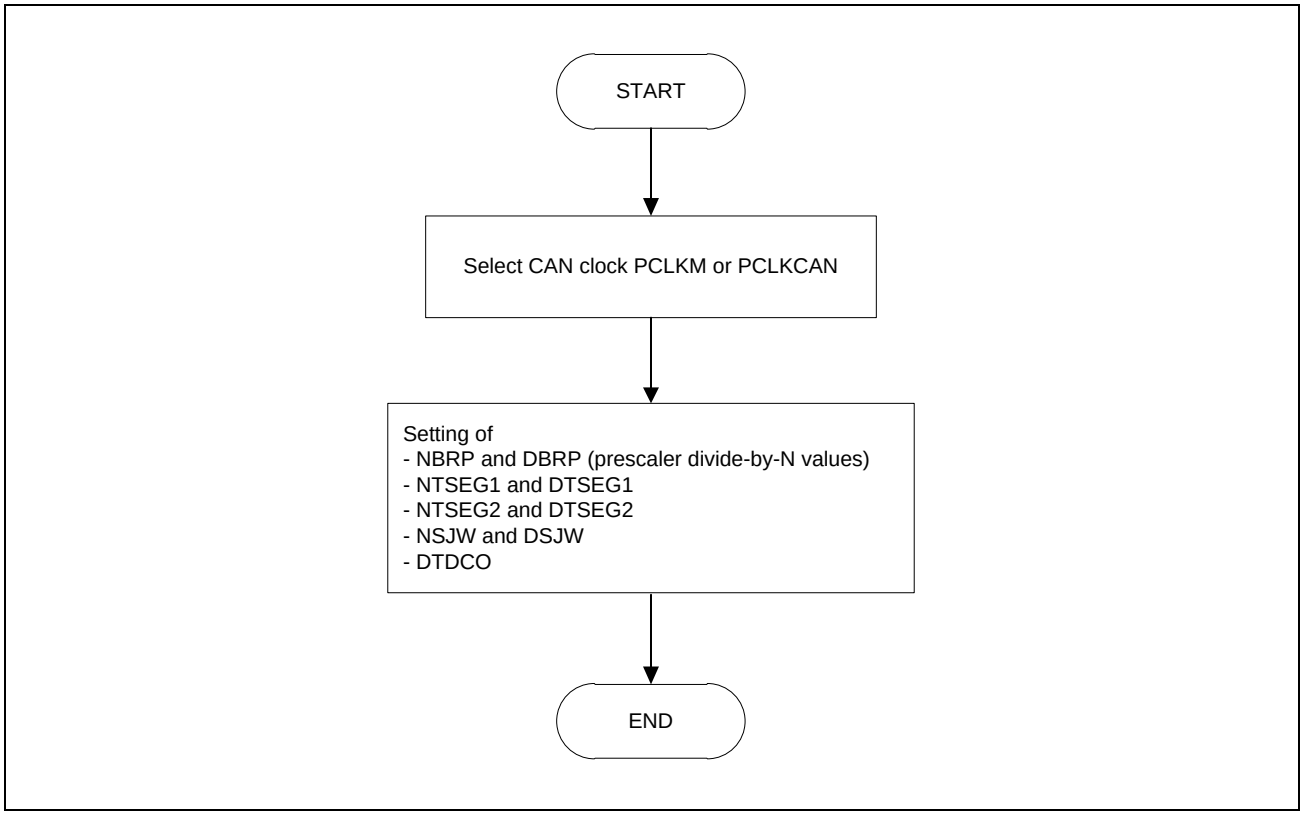

Figure 30.17 Procedure for Setting the CAN Bit Timing and Baud Rate

30.4.1.5 Transmitter Delay Compensation

When a high baud rate is used such as 5 to 8 Mbps for the data phase, the transmitter delay can become greater than TSEG1. In this case, the transmitter always detects a bit-error in the data phase of the CAN-FD frame. The TDC compensates for the inability of the transmitter to receive its own transmitted bit at the sample point of that bit.

There is another symbolic sample point known as the Secondary Sample Point (SSP) that is used only during the data phase of CAN-FD frames. This is derived from the Transceiver Delay Compensation Result bit (CFDCnFDSTS.TDCR) as shown in **Figure 30.18**.

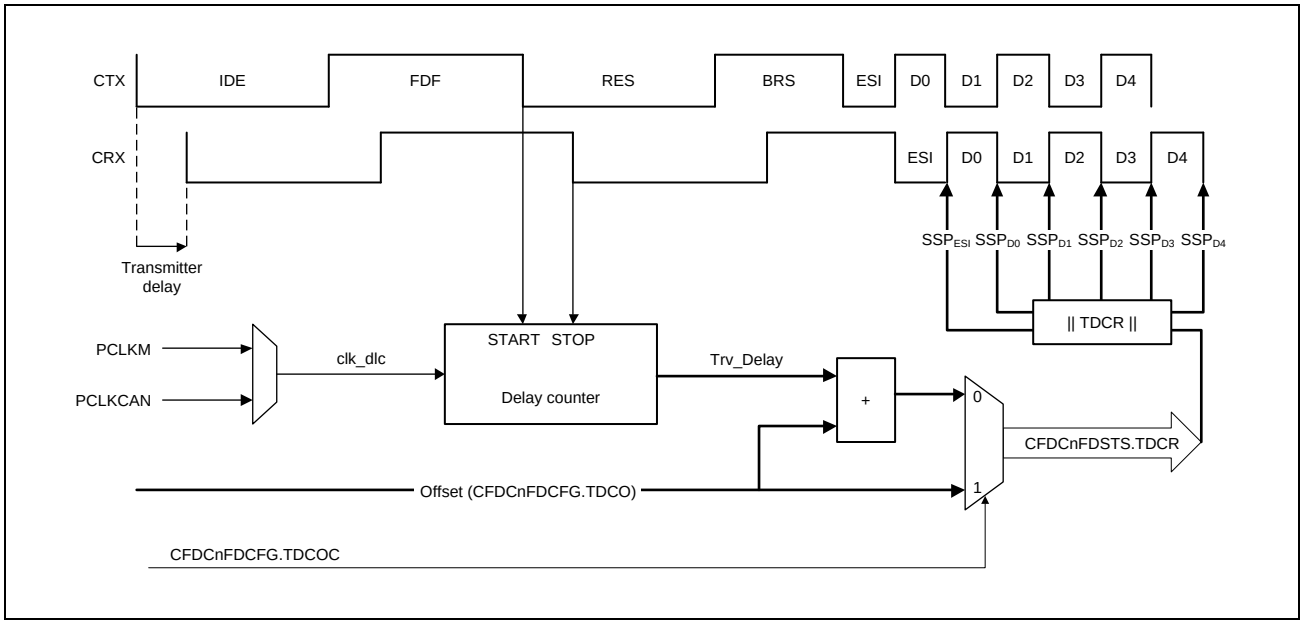

Figure 30.18 Transmitter Delay Compensation

The measured Trv_Delay is based on the number of clk_dlc clock cycles. The delay is counted up by 1 for each started clock until the dominant value is seen on CAN_RX. **Figure 30.19** shows the measured result. Trv_Delay counted to maximum 127 with a clk_dlc clock.

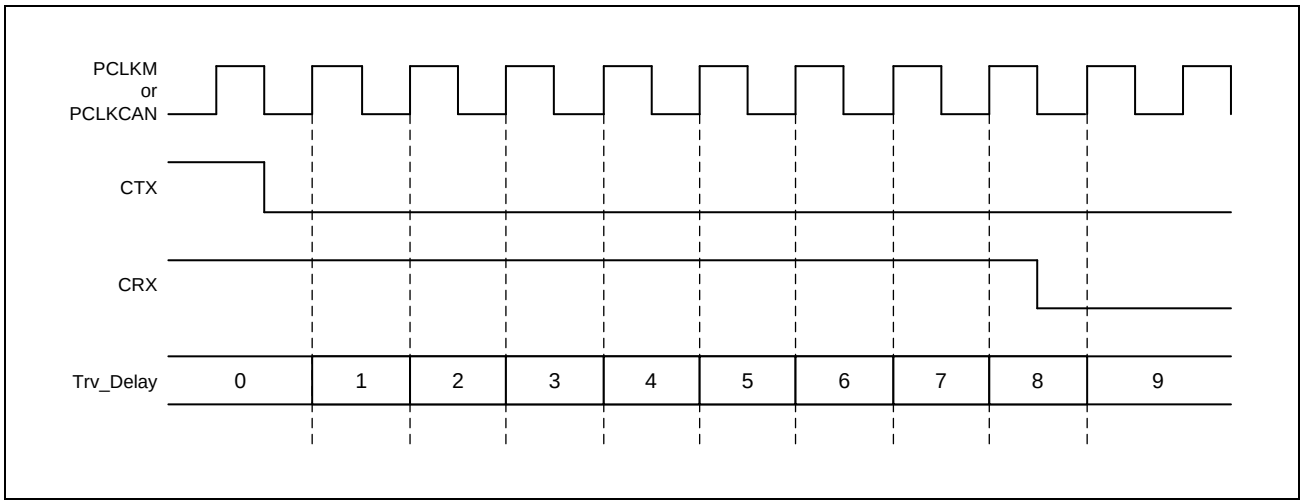

Figure 30.19 Trv_Delay Measurement Example

The SSP is calculated by taking the result from CFDCnFDSTS.TDCR and rounding the value down to the nearest integer number of data time quanta.

Figure 30.20 shows the positioning of the secondary sample point. When CFDCnFDCFG.TDCOC is equal to 0, the SSP is equal to the Trv_Delay (measured delay) + CFDCnFDCFG.TDCO, rounded down to the nearest integer number of time quanta. Usually, the TDCO value should have the size of (Sync Segment data + TSEG1 data) to position the SSP to a theoretical location of the sample point.

If the CFDCnFDCFG.TDCOC is equal to 1, the SSP is defined by CFDCnFDCFG.TDCO. If CFDCnDCFG.DBRP[7:0] is greater than 0, the value is also rounded down to the nearest integer number of time quanta.

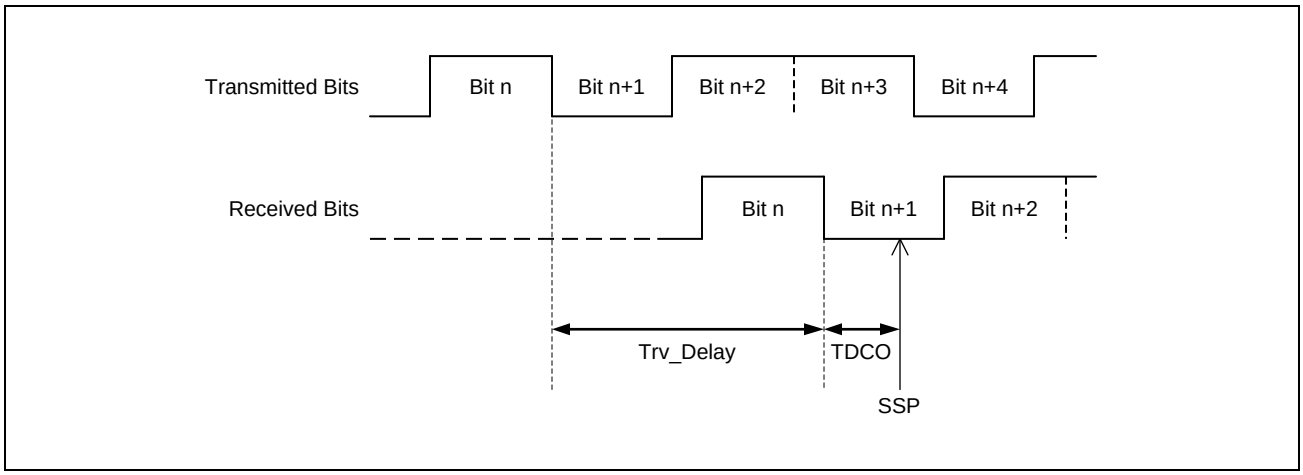

Figure 30.20 Position of the Secondary Sample Point

The maximum delay (Trv_Delay + TDCO) which can be compensated by the CAN-FD module is (6 data bits - 2clk_dlc).

The ISO 11898-1 allows you to set different values for BRP_data and BRP_nom.

If different values are used for CFDCnNCFG.NBRP and CFDCnDCFG.DBRP, then two CAN nodes may be out of synchronization at the point when the bit rate changes from nominal bit rate to data bit rate after sample point of the BRS bit. This condition is shown in **Figure 30.21**.

The length of the time quantum should be the same in the nominal bit time and in the data bit time. This means CFDCnNCFG.NBRP = CFDCnDCFG.DBRP.

Different bit rates can be achieved by selecting different configuration values for the Time Segments. The nominal bit rate can be configured from 8 to 385 TQs and the data bit rate from 5 to 49 TQs.

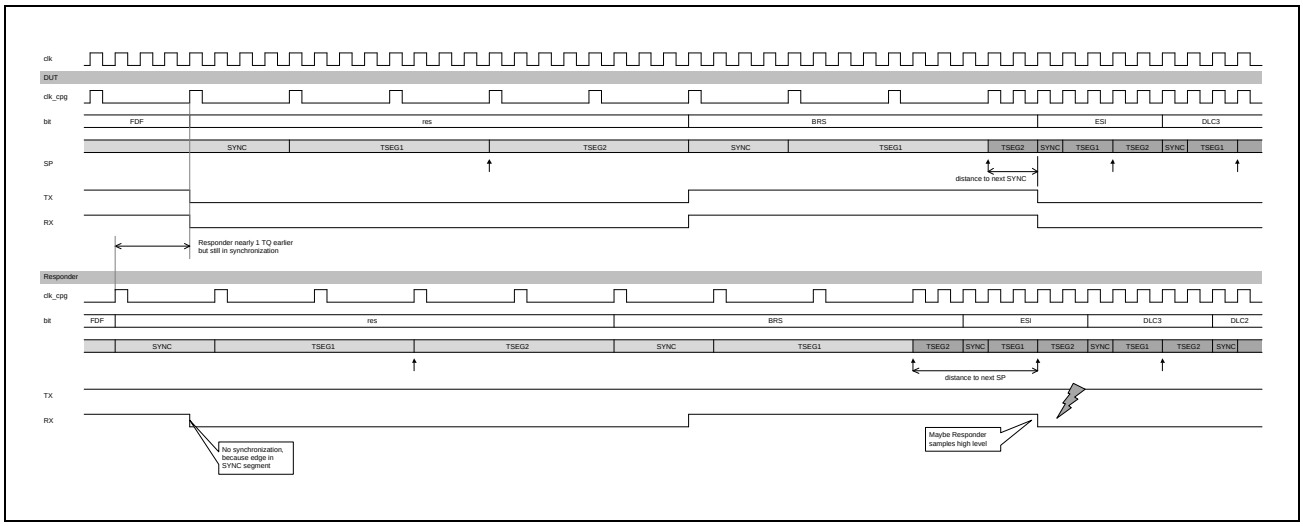

Figure 30.21 Loss of Synchronization between 2 CAN Nodes

The transmitter delay compensation measurement result is updated at the falling edge from FDF bit to RES bit when configured accordingly (CFDCnFDCFG.TDCE = 1, CFDCnFDCFG.TDCOC = 0).

Figure 30.22 shows the read flow to get the measured transmitter delay compensation result.

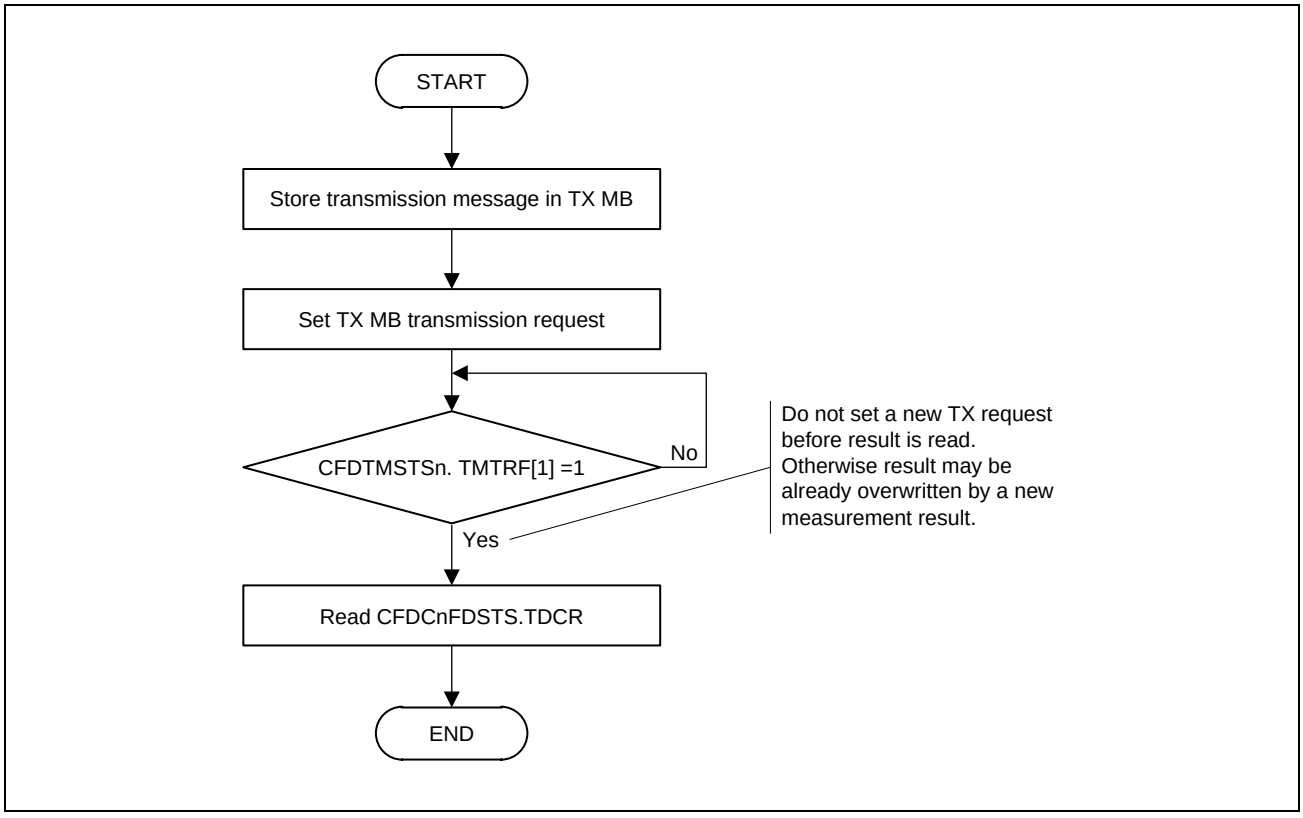

Figure 30.22 TDC Result Read Flow

30.4.2 CAN Module Configuration after Hardware Reset

After a hardware reset (power on reset) or after setting and clearing the CFDGRSTC.SRST bit, the CAN-FD module enters Global Sleep mode automatically.

To enable configuration of the CAN-FD module, you must exit Sleep mode by clearing the Global Sleep Request bit CFDGCTR.GSLPR to 0.

After a hardware reset, the module starts RAM initialization, the CFDGSTS.GRAMINIT bit in the Global Status Register is set automatically to indicate that the CAN-FD logic is initializing the RAM.

After RAM initialization is complete, this bit is cleared automatically.

RAM initialization is necessary to avoid setting of false ECC error flag after hardware resets the random data presented in the RAM.

Do not access registers of the CAN-FD in either read or write until RAM initialization is complete and the CFDGSTS.GRAMINIT bit is cleared.

Before going to communication mode, the Global Acceptance Filter List and message FIFO buffers must be configured. In addition, each required CAN channel must be configured such as CAN bit timing. For this configuration, all required CAN channels must be released from Channel Sleep mode and must be configured for communication in Channel Reset mode (Configuration mode).

For this, all required CAN channels must be released from Channel Sleep mode and must be configured for communication in Channel Reset mode (Configuration mode).

Figure 30.23 shows the configuration procedure. For details about each step, see **Section 30.5, Acceptance Filtering Function using Global Acceptance Filter List (AFL)**, **Section 30.6, FIFO Buffers and Normal Message Buffer Configuration**, **Section 30.7, Interrupt and DMA**, and **Section 30.4.1.3, Baud Rate**.

The CAN-FD module does not perform RAM initialization sequence after executing a software reset by setting CFDGRSTC.SRST.

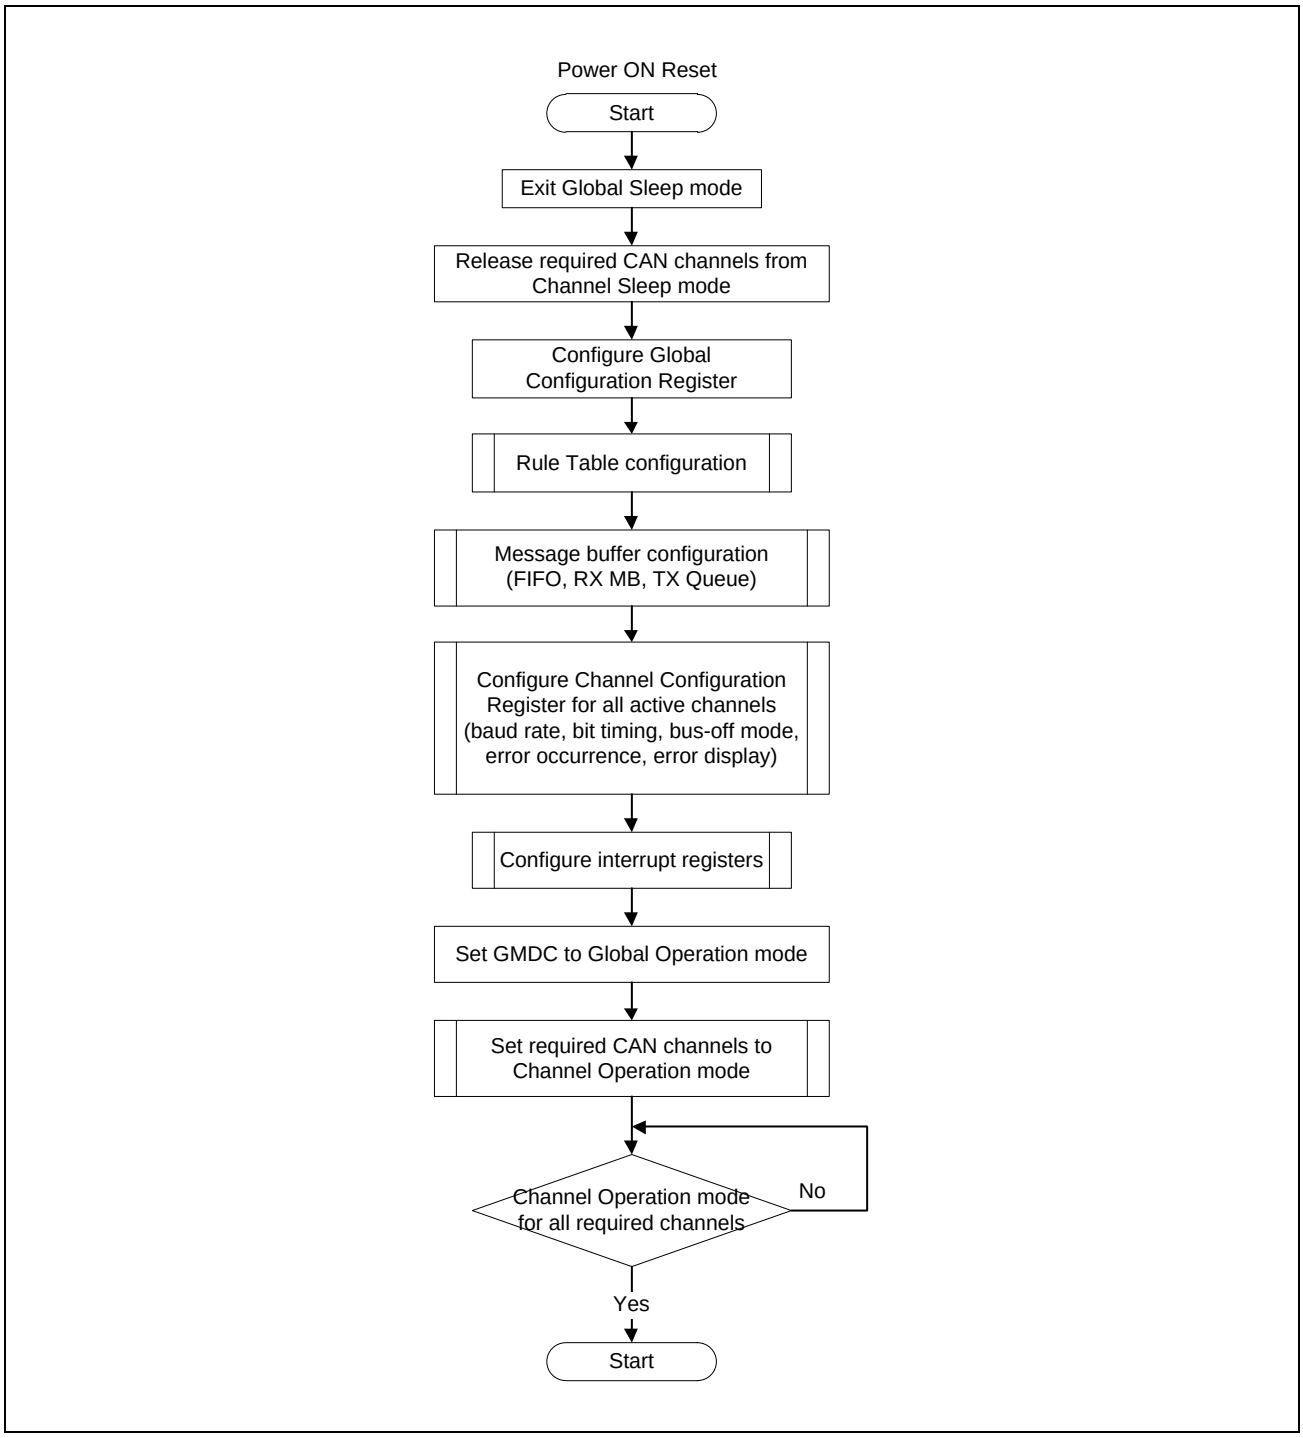

Figure 30.23 Configuration Procedure after a Hardware Reset

30.5 Acceptance Filtering Function using Global Acceptance Filter List (AFL)

30.5.1 Overview

The CAN-FD module can handle message acceptance filtering for all channels with a global Acceptance Filter List (AFL). Each element of the AFL defines a filter rule for messages received on a specific channel.

The following actions are performed based on the AFL entries:

- Acceptance filtering based on received CAN identifier and masking
- DLC filtering based on received DLC value
- Message data payload according to the CFDGCFG.CMPOC bit
- Storage of accepted messages in the message buffer objects defined in the related AFL entry
- Attaching a 16-bit pointer to the stored messages defined in the related AFL entry, for example to support AUTOSAR applications
- Attaching a 2-bit information label to the stored messages defined in the related AFL entry

The 2-channel CAN-FD module allows a maximum of 256 AFL entries across all channels with a maximum of 256 AFL entries per channel.

During the acceptance filtering process, each AFL entry in a channel is checked against the received message by the acceptance filter unit. The check starts from the lowest AFL entry number for this channel.

The AFL search stops when a match of the received identifier with a configured identifier/mask combination occurs or when the received identifier has been compared against all AFL entries defined for the related channel. If no match occurs, then the received message is rejected. No notification is given to the application in this case.

Additionally, an automatic DLC filtering is performed for each accepted message if DLC check is globally enabled. If the DLC value of the received message is equal to or higher than the configured DLC value in the matching AFL entry, the DLC check is passed.

If DLC replacement (CFDGCFG.DRE bit) is enabled, DLC value configured in the matching AFL entry is greater than H’0 and DLC check passes, then the configured value of DLC in the matching AFL entry is stored in the destination RXMB or FIFO Buffer.

If the received value of DLC is greater than the configured DLC value in the matching AFL entry, then the additional data bytes received on the CAN bus are not stored in the destination RXMB or FIFO Buffer. These additional data bytes are stored as H’00 in the destination RXMB or FIFO Buffer.

If DLC replacement is enabled and DLC value of matching AFL entry is H’0, then the received value of DLC is stored in the destination RX MB or FIFO Buffer.

If DLC replacement (the CFDGCFG.DRE bit) is disabled and DLC check passes, then the received value of DLC on the CAN bus is stored in the destination RXMB or FIFO buffer.

If the received value of DLC is greater than the configured DLC value in the matching AFL entry, then the additional data bytes received from the CAN bus are also stored in the destination RXMB or FIFO buffer.

If DLC value of the received message is less than the configured DLC value in the matching AFL entry, then DLC check fails. In this case, the received message is rejected and is not stored in any RXMB or FIFO buffer.

Additionally, DLC check failure is flagged by the DLC Error Flag in the Global Error Flag Register. If configured, an error interrupt is also generated. The DLC replacement configuration has no impact if the DLC check fails.

If a message has passed both acceptance filtering and DLC filtering, it is stored in a single reception message buffer and/or in FIFO buffers configured for reception or gateway function.

This message storage target information is also defined in the same AFL entry. Do not set a target at the AFL entry which is not configured.

Each accepted received message can be stored into a maximum of 8 different target destinations (single reception message buffer and/or FIFO buffers).

The programming of more than eight target destinations is not allowed. When more destinations are programmed then internal timing, a race condition can occur and received message may not be stored to the message RAM. Correct configuration of the numbers of target destination is the responsibility of the application.

Additional protection mechanism is made for the case when a received message contains more data payload bytes than possible to store in the target destination (CFDRMNB.RMPLS[2:0], CFDRFCCn.RFPLS[2:0] or CFDCFCCn.CFPLS[2:0]).

If CFDGCFG.CMPOC = 0, the message is completely rejected and is stored in the target destination. When CFDGCFG.CMPOC = 0 and RX or Common FIFO full including the received message contains more data payload bytes than possible to store in the target destination (CFDRMNB.RMPLS[2:0], CFDRFCCn.RFPLS[2:0] or CFDCFCCn.CFPLS[2:0]), the corresponding CFDFMSTS.RFXMLT[7:0] or CFDFMSTS.CFXMLT[5:0] bits are not set to 1, respectively.

When CFDGCFG.CMPOC = 1, the received data bytes greater than CFDRMNB.RMPLS is rejected. When CFDGCFG.CMPOC = 1 and RX or Common FIFO full including the received message contains more data payload bytes than possible to store in the target destination (CFDRMNB.RMPLS[2:0], CFDRFCCn.RFPLS[2:0] or CFDCFCCn.CFPLS[2:0]), the corresponding CFDFMSTS.RFXMLT[7:0] or CFDFMSTS.CFXMLT[5:0] bits are set to 1, respectively.

Depending on the CFDGCFG.DRE bit, the original received DLC or the DLC value configured at the AFL entry is stored.

Regardless of the CFDGCFG.CMPOC bit setting, CFDGERFL.CMPOF is set to 1 if a payload overflow condition is detected.

The DLC filtering is performed before the payload overflow function. So for one reception frame, only one flag can be set at the same time with CFDGERFL.DEF or CFDGERFL.CMPOF.

30.5.2 Allocation of AFL Entries to Each CAN Channel

The number of AFL entries per channel can be configured using the dedicated field in the related Global Acceptance Filter Configuration Registers (see **Figure 30.24**).

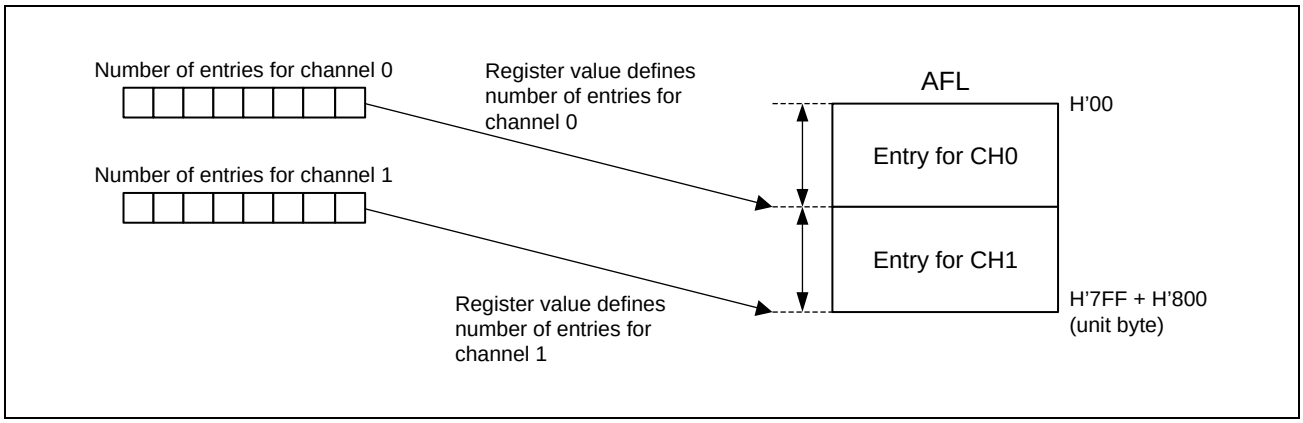

Figure 30.24 Configuration of AFL for Each Channel

The minimum number of entries for one channel is 0 (no entries defined for the channel) and the maximum number of entries for one channel is 256. The total number of entries for all channels should not exceed the maximum limit of (n + 1) × 128.

All entries are unique for a channel and overlapping or sharing of entries is not supported. Correct configuration of the AFL is the responsibility of the application.

The CAN-FD module does not flag errors related to the configuration of the AFL.

30.5.3 AFL Entry Description

Each AFL entry consists of 16 bytes. The fields in all entries are identical.

Each entry contains the following information for acceptance filtering and DLC filtering:

- Identifier (11 bits for Standard Frame format, 29 bits for Extended Frame format):
  Acceptance filter unit checks the identifier field of the received message against the identifier field of each AFL entry (full 29 bits masking of identifier bits is possible, see information that follows).
- IDE bit:
  Acceptance filter unit checks the IDE bit of the received message against this bit and selects the relevant part of the identifier field for acceptance filtering (masking of IDE bit is possible, see the information that follows).
- RTR bit:
  Acceptance filter unit only accepts data frames (RTR = 0) or remote frames (RTR = 1) according to the setting of this bit (masking of RTR bit is possible, see the information that follows).
- Loopback Configuration bit:
  This bit can enable or disable the AFL entry depending on the Loopback Configuration or Mirror mode condition.
- Mask for Identifier bits (29 bits):
  Each bit in the identifier mask can mask the corresponding identifier bit in the AFL entry during acceptance filtering, see **Figure 30.25**.
- Mask for IDE bit:
  If this Mask bit masks the IDE bit of the AFL entry in both Standard Identifier and Extended Identifier format, messages can be accepted by this AFL entry. The identifier of the received message is compared against the Standard Identifier part of the AFL entry for Standard Identifier format messages and against the Extended Identifier part of the AFL entry for Extended Identifier format messages.
- Mask for RTR bit:
  If this Mask bit masks the RTR bit of the AFL entry in both frame formats, data frame and remote frame formats are accepted by this AFL entry.
- Pointer information (16 bits):
  This 16-bit pointer is attached to a received message accepted by the related AFL entry. The pointer is added during message storage in the message buffer area and can be used by application as support function. The pointer information can be used for example to support PDU identifier allocation for the received message in AUTOSAR systems.
- Information label (2 bits):
  This 2-bit label is attached to a received message accepted by the related AFL entry. The label is added during message storage in the message buffer area and can be used by application as support function.
- DLC value for automatic DLC filtering:
  If the DLC value of the received message is equal or higher than the configured DLC value, the DLC check is passed. If the DLC value in this AFL entry is configured to 0, DLC filtering is effectively disabled for this entry (all accepted messages pass DLC filtering).

Each AFL entry contains the following information for the handling of received messages:

- Message buffer number of one single reception message buffer as target for received message storage
- Single reception message buffer enable bit to configure the single reception message buffer number to be valid or invalid, as target for received message storage
- FIFO direction pointer - each bit of the FIFO direction pointer configures a dedicated FIFO as possible target for a received message

Note: A message received on channel A can be routed to Common FIFO buffer of another channel. If this Common FIFO buffer is configured in Gateway mode, then the message stored in this Common FIFO Buffer is transmitted on that channel because Common FIFO buffer is associated with channel.

There is no hardware protection against such storage of message. Therefore, the FIFO direction pointer must be configured carefully.

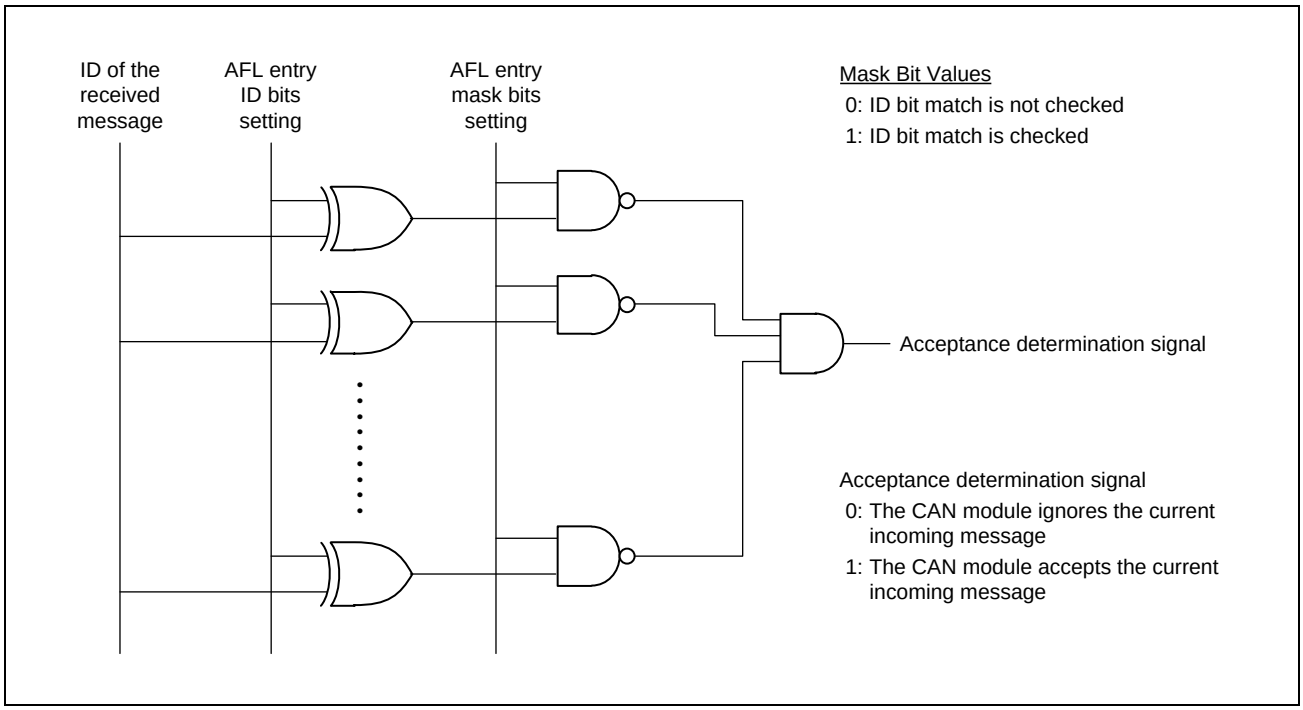

Figure 30.25 Acceptance Function

30.5.4 Entering Entries in the AFL

Application software can enter one full entry into the AFL using the following registers:

- Global AFL ID Entry Register: Part 1 of the AFL entry
- Global AFL Mask Entry Register: Part 2 of the AFL entry
- Global AFL Pointer 0 Entry Register: Part 3 of the AFL entry
- Global AFL Pointer 1 Entry Register: Part 4 of the AFL entry

16 sets of these registers form a group of AFL entries. Each group can be accessed through a page mechanism. For the CAN-FD module, 2-channel version, 16 of these pages exist to allow access to the whole AFL range. The AFL should only be configured in CH_RESET or CH_HALT mode. Pages are linked to the AFL entries in the following way:

Table 30.32 Mapping between Pages and AFL Entries

Page 0	Entry 0 - 15
Page 1	Entry 16 - 31
Page 2	Entry 32 - 47
Page 3	Entry 48 - 63
Page 4	Entry 64 - 79
Page 5	Entry 78 - 95
Page 6	Entry 96 - 111
Page 7	Entry 112 - 127
Page 8	Entry 128 - 143
Page 9	Entry 144 - 159
Page 10	Entry 160 - 175
Page 11	Entry 176 - 191
Page 12	Entry 192 - 207
Page 13	Entry 208 - 223
Page 14	Entry 224 - 239
Page 15	Entry 240 - 255

The selection of the AFL access page is done using the Global Acceptance Filter List Entry Control Register (CFDGAFLECTR) (see **Figure 30.26**). This register has the following fields:

- 4 bits to select the AFL page number
- 1 bit to enable or disable the AFL data access to prevent unwanted write access to the AFL

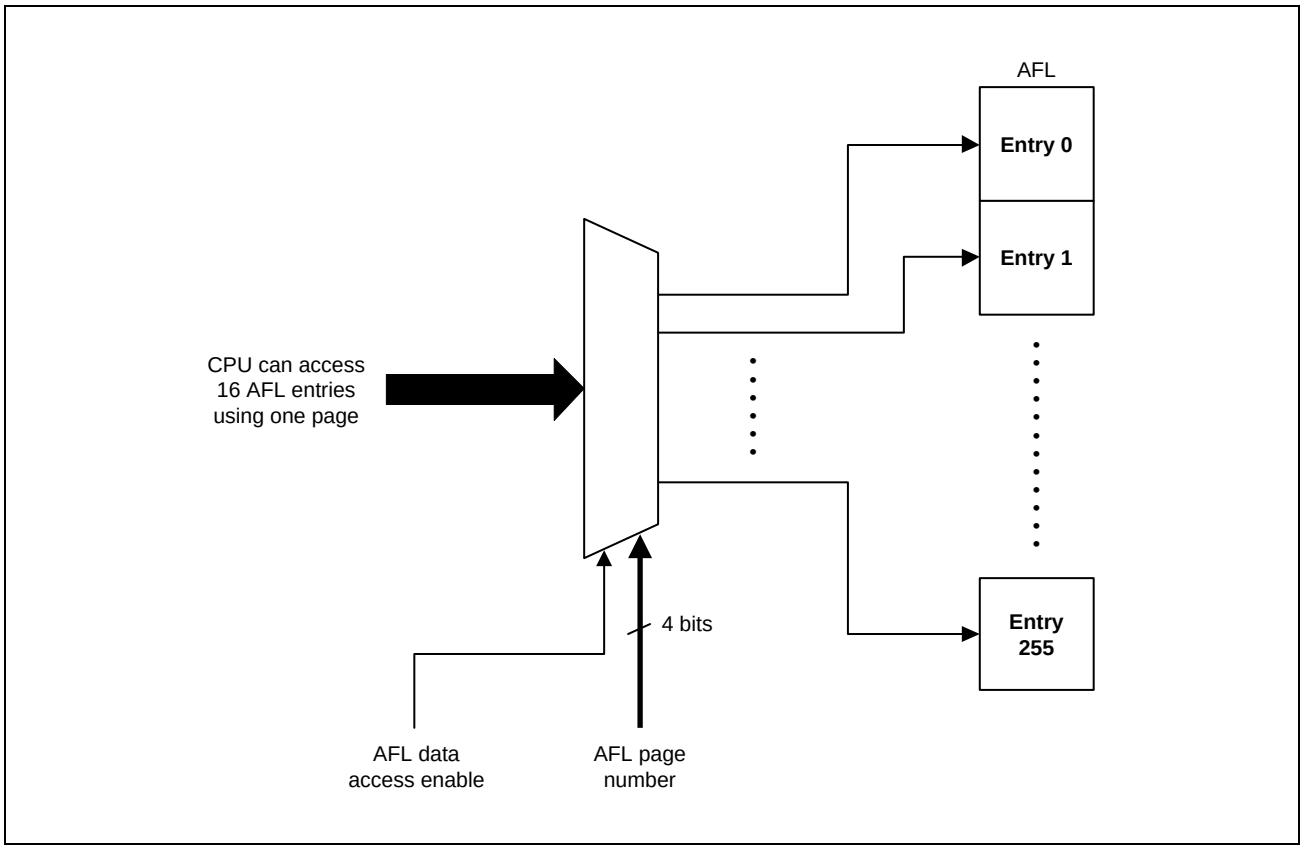

Figure 30.26 AFL Page Access

Application software should not write numbers higher than H’F for the AFL page number.

Follow the configuration shown in **Figure 30.27** to program the AFL.

After entering all entries in Configuration mode, locking of the AFL access should be performed to protect unwanted write access to the AFL.

Write protection is active during all Global modes (GL_RESET, GL_HALT, and GL_OPERATION) if the lock bit is set.

Read access to AFL is still possible during all Global modes even when AFL data access is disabled (consistency check of AFL contents is possible during run time).

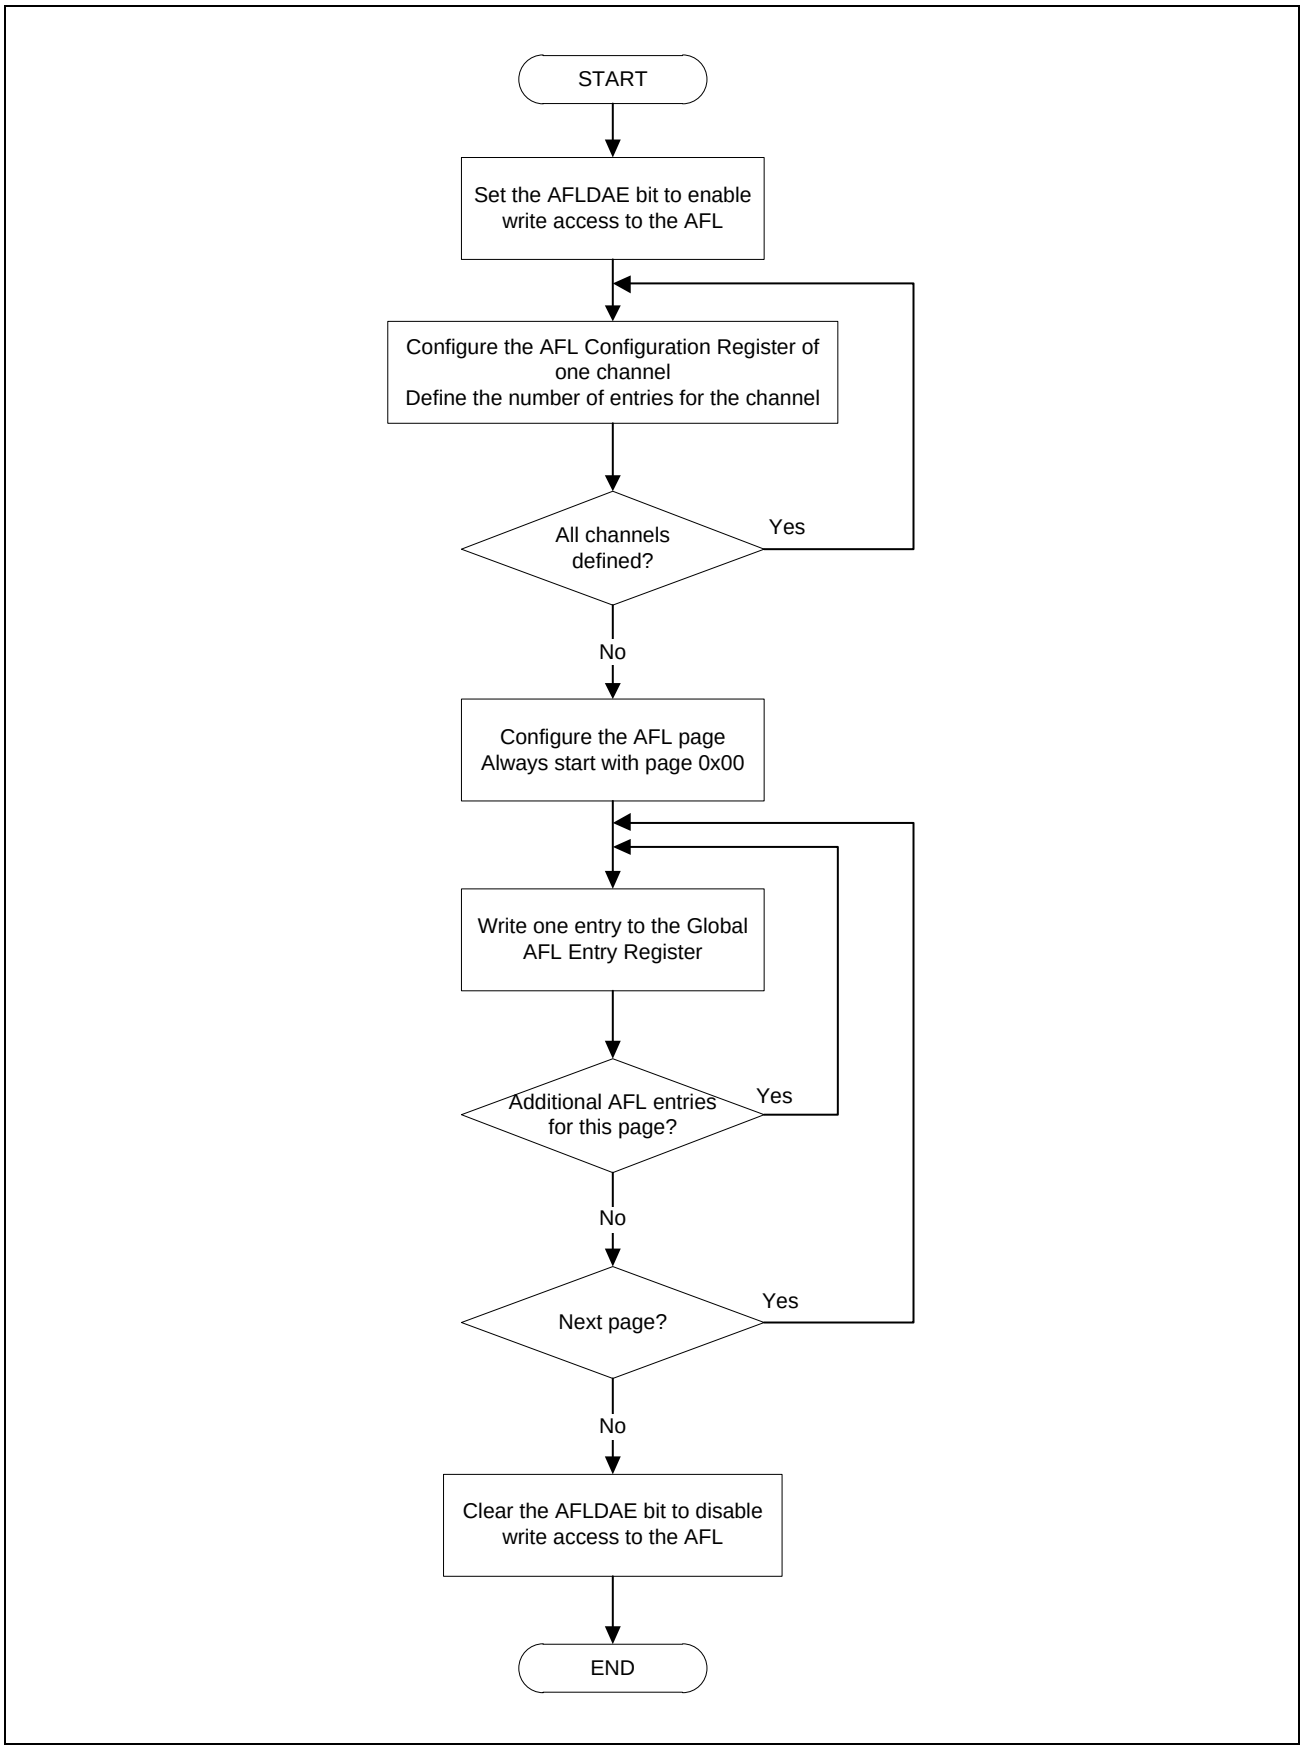

Figure 30.27 AFL Configuration Flow

30.5.5 Loopback Modes

If the Loopback Configuration bit is set, the AFL entry is only valid in loopback test mode (Self-test mode 0 or Self-test mode 1) or in mirror mode when receiving messages that were transmitted by the respective CAN channel itself.

The AFL entry is not valid for received messages in loopback mode transmitted by other CAN nodes on the bus. The expression valid or invalid for the related entry means that this AFL entry is or is not compared against the received message ID respectively.

If the Loopback Configuration bit is 0, the AFL entry is only valid for:

- Received messages transmitted by other CAN nodes on the bus in normal (non-loopback mode) and mirror modes
- Received messages transmitted by other CAN nodes or the CAN channel itself in loopback test mode.

The mirror mode can be enabled with the CFDGCFG.MME bit in the Global Configuration Register. If CFDGCFG.MME bit is set, then a successfully transmitted message can be stored back in an RX message buffer or FIFO buffer if a matching entry is configured in the AFL for that channel.

The Loopback Configuration bit in the matching AFL entry must be set to store this frame.

If mirror mode and loopback test mode are configured at the same time, the loopback test mode behavior applies.

Table 30.33 shows the behavior of the acceptance filter unit depending on the setting of the related input signals.

Table 30.33 Behavior of Acceptance Filter Based on the Loopback Configuration Setting in AFL Entry

Mirror Mode Enable (MME Configuration Bit)	Loopback in Test Mode (Self-test mode 0 or Self-test mode 1)	Channel Mode	Loopback Configuration Bit in AFL Entry	AFL Entry
0	0	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Invalid
			1	Invalid
	1	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Valid
			1	Valid
1	0	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Invalid
			1	Valid
	1	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Valid
			1	Valid

Note: The expression valid or invalid for the related entry means that this AFL entry is or is not compared against the received message ID, respectively.

30.5.6 IDE Masking

When the GAFLIDEM bit is 0 in an AFL entry, the IDE bit configured in the AFL entry is not used for ID matching. In this case, the use of ID[10:0] or ID[28:0] matching is based on the received IDE bit.

Consider the following example:

- The ID and Mask fields of an AFL entry x is configured as follows:
  - CFDGAFLID [x] = H’C055_3A20 → IDE = 1, RTR = 1, LLB = 0, ID[10:0] = H’220/ID[28:0] = H’055_3A20
  - CFDGAFLMn = H’0000_FFFF → IDEM = 0, RTRM = 0, IDM[10:0] = H’7FF/IDM[28:0] = H’0000_FFFF
- The comparison result for the four different received IDs with AFL entry x is described as follows:
  - If a frame with IDE = 0 and ID = H’220 is received, this is considered as a match
  - If a frame with IDE = 0 and ID = H’320 is received, this is not a match
  - If a frame with IDE = 1 and ID = H’1FFF_3A20 is received, this is considered as a match
  - If a frame with IDE = 1 and ID = H’0880_3220 is received, this is not a match.

30.6 FIFO Buffers and Normal Message Buffer Configuration

This section describes the process for configuring the number of RX message buffers, the FIFO buffers, and the flat TX message buffers in the CAN-FD module. The message buffers are mapped as shown in **Figure 30.28**.

The RX message buffers can be accessed with the RX Message Buffer Registers.

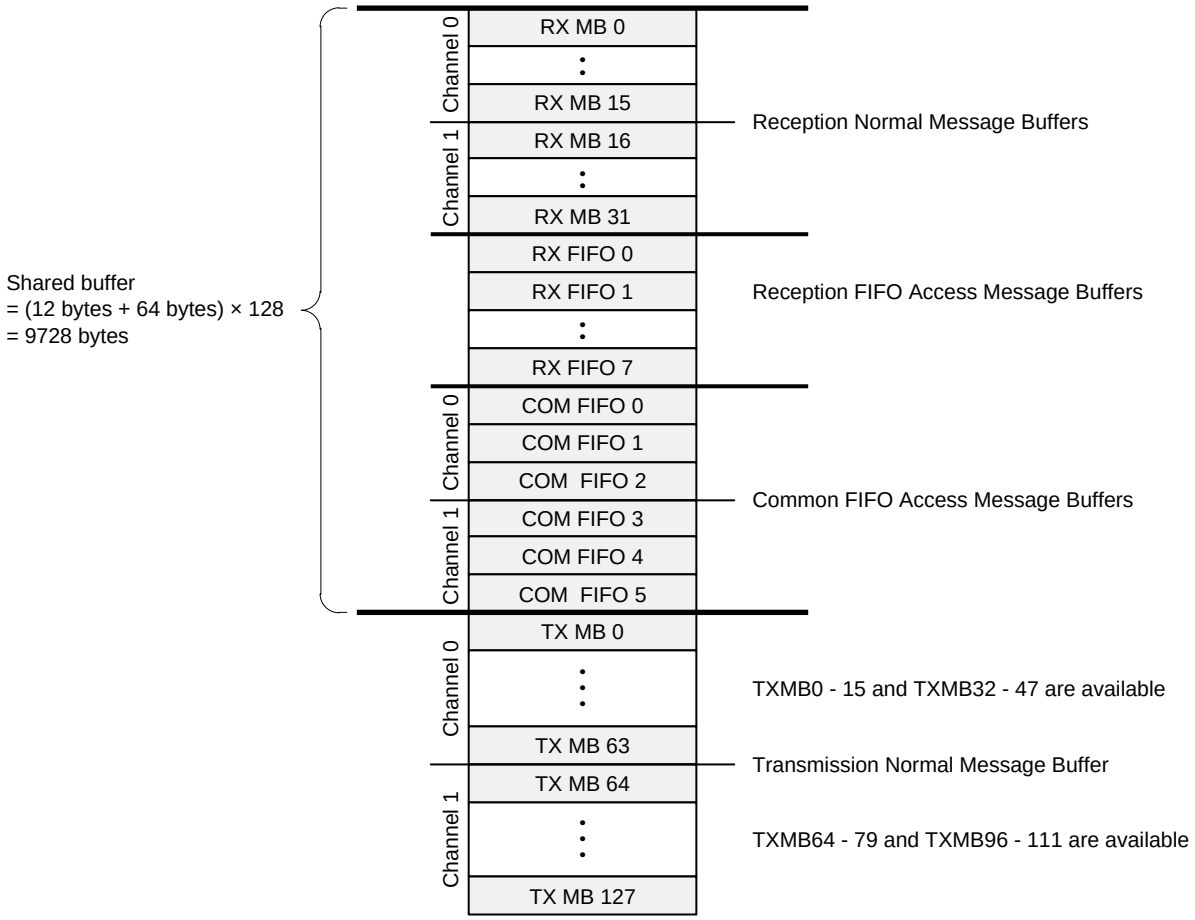
The RX FIFO buffers and the common FIFO buffers configured in RX mode, TX mode, or GW mode can only be accessed with the FIFO Access Registers.

If the common FIFO is configured in TX mode, you can only write data into the FIFO buffer using the FIFO Access registers.

If the common FIFO is configured in GW mode or RX mode, you can only read data from the FIFO Access Registers.

The TX message buffers can be accessed with the TX Message Buffer Registers.

If unused message buffer locations are read, the message buffer locations are read as unknown values.



Note: The total number of bytes in RXMB_cfg, RXFIFO_cfg, and CFIFO_cfg are less than or equal to 9728 bytes.
RXMB_cfg = (12 bytes + CFDRMND.RMPLS) × CFDRMNB.NRXMB
RXFIFO_cfg = SUM ((12 bytes + CFDRFCCn.RFPLS) × CFDRFCCn.RFDC)
CFIFO_cfg = SUM ((12 bytes + CFDCFCCn.CFPLS) × CFDCFCCn.CFDC)

Figure 30.28 Message Buffer Configuration

30.6.1 Normal RX Message Buffers

In CAN-FD module, the frames received by various channels can be stored in normal RX message buffers based on the configuration of the AFL entries.

Additionally, the number of normal RX message buffers required in the system can be chosen up to a fixed maximum limit.

30.6.1.1 Normal RX Message Buffer Configuration

In CAN-FD module, the number of normal RX message buffers can be configured by writing to the RX Message Buffer Number Register.

The limiting values for the configuration of number of message buffers are:

- Minimum value = H’00 (no normal RX MB)
- Maximum value = (16 × number of CAN channels) = 16 × 2 = 32 = H’20 (32 flat RX MBs for 2 channels)

Do not use values outside these limits.

The AFL entries for routing the received messages to normal RX message buffers must be configured to match the requirements of the system.

The AFL entries must also be configured properly, and an AFL entry for normal RX message buffers should not exceed the number of message buffers configured in the RX Message Buffer Number Register.

Note: There is no internal check procedure provided in CAN-FD module against incorrect configuration of the AFL.

The data field size of the RX message buffer can be configured with the CFDRMNB.RMPLS[2:0] bits. The default size is 8 bytes and the maximum data payload size is 64 bytes.

When the receiving frame exceeds the data field size, then the acceptance depends on the configuration of CFDGCFG.CMPOC (message rejecting or data payload cut).

30.6.2 FIFO Buffer

The CAN-FD module provides a fixed number of FIFO buffers to support storage of frames for reception, transmission and gateway functions for various CAN channels.

The number of reception-only FIFO buffers is fixed to 8. However, 3 common FIFO buffers per channel can be configured to store messages for transmission, reception, or gateway function.

These FIFO buffers can be enabled or disabled, and the following parameters can be configured to match the system requirements:

- Size
- Interrupt structure
- Message lost mechanism
- Message overwrite mechanism of the FIFO buffers
- Location of the TX FIFO or GW FIFO

When the receiving frame exceeds the data field size, the acceptance depends on the configuration of the CFDGCFG.CMPOC bit (message rejecting or data payload cut).

30.6.2.1 FIFO Buffers Configuration

In CAN-FD module, the FIFO buffers can be configured to match the system requirements.

The total number of FIFO buffers = 8 RX FIFO buffers + 6 common FIFO buffers = 14 FIFO buffers for 2 channels and message overwrite mechanism.

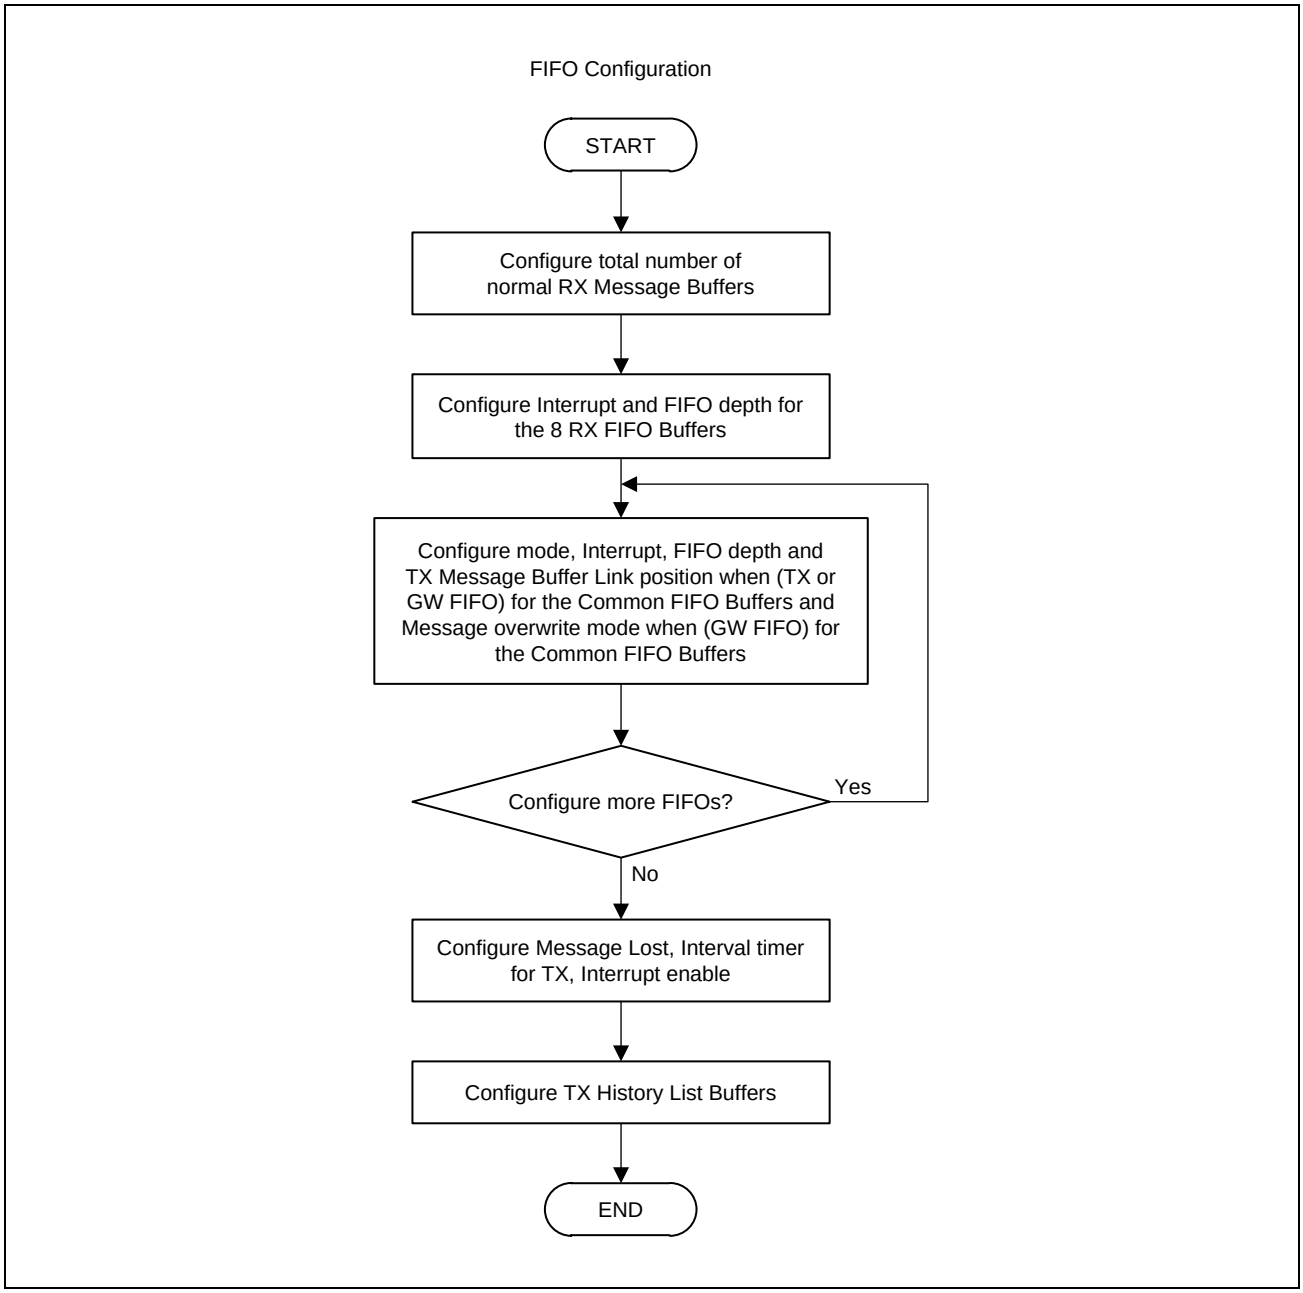


Figure 30.29 FIFO Buffer Configuration Flow in CAN-FD Module

As shown in **Figure 30.29**, the various FIFO buffers can be configured by writing to the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers.

For the 8 RX FIFO buffers, the following parameters can be configured:

- Interrupts
- FIFO depth

- FIFO payload data size

For the common FIFO buffers, the following parameters can be configured:

- Mode
- Interrupts FIFO depth
- FIFO payload data size
- FIFO TX link position

(1) FIFO Mode Configuration of Common FIFO Buffers

The mode of the common FIFO buffers can be configured by writing to the CFDCFCCn.CFM[1:0] bits in the Common FIFO Configuration/Control Registers. The possible modes of configuration for Common FIFO buffers are:

- 00b: RX mode (default mode after hardware reset)
- 01b: TX mode
- 10b: GW mode
- 11b: Reserved (do not write this value to the register bits)

Messages can only be read from the RX FIFO buffers and the Common FIFO buffers configured in RX mode. Messages are stored by the CAN module in these FIFO buffers based on the AFL entries.

Messages can be read and written into the Common FIFO buffers configured in TX mode. These messages are transmitted on the appropriate CAN channel.

Messages can only be read from the Common FIFO buffers configured in GW mode. However, the CPU read access has no impact on the read or write pointers. The pointers can only be incremented when a new message is stored in the FIFO buffer and decremented when a message is transmitted on the corresponding CAN channel by the CAN-FD module.

After a hardware reset, all the Common FIFO buffers are configured in RX mode by default. Only enable the FIFO buffers after configuring the Common FIFO buffers in the required modes.

In GW mode, when a transmit/receive FIFO buffer is trying to receive a new message while the transmit/receive FIFO buffer is already full of data, the oldest data of the buffer is overwritten with the message received or the message is discarded. The behavior is determined by setting the CFDCFCCEn.CFMOWM bit.

- When CFDCFCCEn.CFMOWM = 0:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the received message is discarded, and CFDCFSTSn.CFMLT bit is set to 1.
- When CFDCFCCEn.CFMOWM = 1:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the oldest data in the buffer is overwritten with the received message. The read pointer of the transmit/receive FIFO buffer simultaneously moves to the next oldest message. The CFDCFSTSn.CFMOW bit is then set to 1, which notifies that the oldest message has been overwritten with the received message.
  In addition, when a CAN bus error or arbitration-lost for the transmitting message occurs in the transmit/receive FIFO buffer full, the transmitting message is lost and retransmission for the message is not performed. The read point is then moves to the next message automatically. Do not write to this bit when the CFDCFCCn.CFE bit is 1.

(2) FIFO TX Message Buffer Link Configuration

When the common FIFO is configured as TX or GW FIFO, the FIFO buffer must be linked to a normal TX message buffer to participate in the transmission scan of a CAN channel.

The link to a normal TX message buffer must be unique, for example the same TX message buffer cannot be shared between 2 or more common FIFO buffers.

Do not write data into a TX message buffer that is linked to a Common FIFO buffer. Also, the TX message buffer linked to a Common FIFO buffer should not be a part of the TX Queue.

The TX message buffer link of each Common FIFO buffer can be configured by writing to the CFDCFCCn.CFTML[4:0] bits in the Common FIFO Configuration/Control Registers. Available options for TX message buffer link configuration are:

- H’00: TX Message Buffer 32
- H’01: TX Message Buffer 33
  ⋮
- H’1F: TX Message Buffer 63

(3) FIFO Depth Configuration

The depth of each FIFO buffer can be configured by writing to the CFDRFCCn.RFDC[2:0] bits and CFDCFCCn.CFDC[2:0] bits in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/ Control Registers. The 8 available options for depth configuration are:

- 000b: 0 Messages (FIFO buffer cannot be enabled)
- 001b: 4 Messages
- 010b: 8 Messages
- 011b: 16 Messages
- 100b: 32 Messages
- 101b: 48 Messages
- 110b: 64 Messages
- 111b: 128 Messages

The RAM allocation for RX message buffers along with FIFO buffers is limited to (n + 1) × 256 messages. Configuration of the RX message buffers, along with FIFO buffers, that exceeds this maximum limit should not be done.

CAN-FD module logic does not check the validity of the configuration.

Note: If the FIFO depth of a common FIFO is 4 messages or more (CFDCFCCn.CFDC[2:0] > 000b), then the Common FIFO TX message buffer link is valid when the FIFO is disabled or enabled.

Note: If FIFO depth is 0 messages, then the Common FIFO TX message buffer link is not valid when the FIFO is disabled or enabled.

(4) FIFO Payload Size Configuration

The data size of each FIFO buffer can be configured by writing to the CFDRFCCn.RFPLS[2:0] bits and CFDCFCCn.CFPLS[2:0] bits in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/ Control Registers. The eight available options for depth configuration are:

- 000b: 8 bytes

- 001b: 12 bytes
- 010b: 16 bytes
- 011b: 20 bytes
- 100b: 24 bytes
- 101b: 32 bytes
- 110b: 48 bytes
- 111b: 64 bytes

(5) FIFO Interrupt Configuration

The interrupt generation conditions for the FIFO buffers can be configured by writing to the CFDRFCCn.RFIM bit and the CFDCFCCn.CFIM bit in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers. The two available options are:

- 0:
  - RX FIFO mode: Interrupt generated when the Common FIFO counter reaches CFDRFCCn.RFIGCV/ CFDCFCCn.CFIGCV value
  - TX FIFO mode: Interrupt generated when the Common FIFO transmits the last message successfully
  - GW FIFO mode
    Frame RX: Interrupt generated when message counter increments and reaches the interrupt threshold value
    Frame TX: Interrupt generated when the last message is transmitted successfully from FIFO
- 1:
  - RX FIFO mode: Interrupt generated at the end of storage of every received message
  - TX FIFO mode: Interrupt generated for every successfully transmitted message
  - GW FIFO mode
    Frame RX: Interrupt generated when message is stored in the FIFO
    Frame TX: Interrupt generated when message is successfully transmitted from the FIFO

If the Interrupt Mode bit is 0 for a RX FIFO, then interrupt is generated based on the configuration of the CFDRFCCn.RFIGCV[2:0] bits.

Similarly, if the Interrupt Mode bit is 0 for a Common FIFO configured in RX mode, then interrupt is generated based on the configuration of CFDCFCCn.CFIGCV[2:0] bits.

The eight available options for configuring the FIFO counter value for generation of an interrupt are:

- 000b: Interrupt generated when FIFO is 1/8th Full
- 001b: Interrupt generated when FIFO is 1/4th Full
- 010b: Interrupt generated when FIFO is 3/8th Full
- 011b: Interrupt generated when FIFO is 1/2 Full
- 100b: Interrupt generated when FIFO is 5/8th Full
- 101b: Interrupt generated when FIFO is 3/4th Full
- 110b: Interrupt generated when FIFO is 7/8th Full
- 111b: Interrupt generated when FIFO is Full

In this case, an interrupt is generated when the message count matches the configured value.

However, there are some limitations on the configuration of the CFDRFCCn.RFIGCV[2:0] and CFDCFCCn.CFIGCV[2:0] bits depending on the FDC[2:0] bits (FIFO Depth Configuration), see **Table 30.34**.

Table 30.34 FIFO Interrupt Generation Counter and FIFO Depth Configuration

RFDC[2:0] (FDC[2:0])	RFIGCV[2:0] (CFGCV[2:0])							
	111b	110b	101b	100b	011b	010b	001b	000b
000b	Don't care (FIFO cannot be enabled)							
001b	Allowed	Not allowed	Allowed	Not allowed	Allowed	Not allowed	Allowed	Not allowed
010b	Allowed							
011b	Allowed							
100b	Allowed							
101b	Allowed							
110b	Allowed							
111b	Allowed							

Common FIFO buffer can set an interrupt output at the completion time of transmitting one frame, or the completion of reception. In addition, Common FIFO and RX FIFO can set an interrupt output, when stored to the setup number (CFDC/ RFDC) of FIFO stages.

30.6.2.2 FIFO Buffers Control

The FIFO interrupt must be enabled by setting any one of the following bits in the RX FIFO Configuration/Control Registers:

- CFDRFCCn.RFIE
- CFDRFCCn.RFFIE

In addition, the FIFO interrupt must be enabled by setting any one of the following bits in the Common FIFO Configuration/Control Registers:

- CFDCFCCn.CFRXIE
- CFDCFCCn.CFTXIE
- CFDCFCCEn.CFFIE
- CFDCFCCEn.CFOFRXIE
- CFDCFCCEn.CFOFTXIE

After configuration is complete, each FIFO can be enabled by setting the CFDRFCCn.RFE and CFDCFCCn.CFE bits in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers to allow transmission and reception of messages.

When CFDCFCCEn.CFBME = 1, it becomes FIFO buffering mode, send data is stored in the Common FIFO, and transmission is stopped. Transmission starts when CFDCFCCEn.CFBME = 0.

Do not write 1 from 0 for this bit when the CFDCFCCn.CFE bit is 1.

30.7 Interrupt and DMA

30.7.1 Interrupts

The CAN-FD module generates several interrupts. The interrupt output, which is connected to the Interrupt Controller Unit (ICU), can be controlled by the corresponding interrupt enable bit.

The status flag is set independent from this enable bit.

The channel transmission interrupt has an additional Status Flag register. These status bits are only set when the corresponding interrupt enables are set.

The Status Flag register supports the identification of the interrupt source for the channel transmission, as this interrupt is driven by several trigger sources.

The interrupts in the CAN-FD module can be classified into 2 groups, global interrupts and channel interrupts:

- Global interrupts

The CAN-FD module can generate 2 global interrupts:

1. One Global interrupt for successful reception into the 8 RX FIFO buffers
2. One Global error interrupt

- Channel interrupts:

Each channel of the CAN-FD module can generate 3 channel interrupts:

1. Channel transmission
   Transmission completed from channel
   Transmission abort from channel
   Transmission from TX Queue for a channel
   Channel THL Interrupt
   Successful transmission from a Common FIFO in TX or GW mode for a channel
2. Channel error interrupt
3. Successful reception in a Common FIFO in RX or GW mode for a channel or successful routing in a TXQ

The interrupts are cleared when the corresponding flag bits are cleared or interrupt enable bits are cleared.

Table 30.35 provides an overview of interrupt.

Table 30.35 Overview of Interrupt Source

Parameter	Interrupt	Interrupt Source	Interrupt Clearing
Global Interrupts	Successful reception into at least one RX FIFO	Interrupt flag of corresponding RX FIFO for which interrupt is enabled	Clear the interrupt flag of corresponding RX FIFO buffer for which interrupt is enabled
	FIFO full into at least one RX FIFO	FIFO Full Interrupt flag of corresponding RX FIFO for which interrupt is enabled	Clear the FIFO Full Interrupt flags of corresponding RX FIFO buffer for which interrupt is enabled
	Global error	Any of the following: • DLC Error flag • Message Lost Status bit • Message Overwrite Status bit • TXQ Message Lost Status bit • TXQ Message Overwrite Status bit • TX History Entry Lost Status bit • CAN-FD Message Payload overflow flag	Clear all of: • DLC Error flag • Message Lost flags in all of the FIFO Status Registers • Message Overwrite flags in all of the Common FIFO Status Registers • Message Lost flags in all of the TXQ Status Registers • Message Overwrite Flags in all of the TXQ Status Registers • TX History List Entry Lost flag • CAN-FD Message Payload Overflow flag
Channel Transmission Interrupts	Channel n successful transmission	Any channel related TX MB Successful flag when interrupt is enabled Separate interrupts are provided for common FIFO buffers and TX Queue*1	Clear all channel related TX MB Result Status bits for which the interrupt is enabled
	Channel n abort	Any channel related TX MB Abort flag when interrupt is enabled Separate interrupts are provided for common FIFO buffers and TX Queue*1	Clear all channel related TX MB Result Status bits for which the interrupt is enabled globally
	Channel n transmission from TX Queue	Related channel TX Queue Interrupt flag	Clear related channel TX Queue Interrupt flag
	Channel n THL Interrupt	Channel n THL Interrupt Status flag	Clear the relevant THL Interrupt Status flag
	Channel n COM FIFO TX Interrupt	Interrupt flag for Common FIFOs in TX or GW mode belonging to the related channel	Clear the interrupt flags of Common FIFOs in TX or GW mode belonging to the related channel
	Channel n COM FIFO One Frame TX Interrupt	One Frame Transmission Interrupt flag for Common FIFOs belonging to the related channel	Clear the One Frame Transmission Interrupt flags of Common FIFOs belonging to the related channel
	Channel n TXQ One Frame TX Interrupt	One Frame Transmission Interrupt flag for TXQs belonging to the related channel	Clear the One Frame Transmission Interrupt flags of TXQs belonging to the related channel
Channel COM RX FIFO Interrupt	Channel n COM FIFO RX Interrupt	Interrupt flag for Common FIFOs in RX or GW mode belonging to the related channel	Clear the interrupt flags of Common FIFOs in RX or GW mode belonging to the related channel
	Channel n COM FIFO One Frame RX Interrupt	One Frame Reception Interrupt flag for Common FIFOs belonging to the related channel	Clear the One Frame Reception Interrupt flags of Common FIFOs belonging to the related channel
	Channel n COM FIFO Full Interrupt	FIFO Full Interrupt flag for Common FIFOs in RX or GW mode belonging to the related channel	Clear the FIFO Full Interrupt flags of Common FIFOs in RX or GW mode belonging to the related channel
	Channel n TXQ One Frame Routing Interrupt	One Frame Routing Interrupt flag for TXQs in GW mode belonging to the related channel	Clear the One Frame Routing Interrupt flags of TXQs in GW mode belonging to the related channel
	Channel n TXQ Full Interrupt	TXQ Full Interrupt flag for TXQs in GW mode belonging to the related channel	Clear the FIFO Full Interrupt flags of TXQs in GW mode belonging to the related channel
Channel Error Interrupt	Channel n Error	Any channel related error flag in the Channel Error Flag Register for which interrupt is enabled in the Channel Error Interrupt Enable Register	Clear all channel related error flags in the Channel Error Flag Register for which interrupt is enabled in the Channel Error Interrupt Enable Register

Note 1. These interrupts are only set for TX Message Buffers that do not belong to an enabled TX Queue and are not pointing to a common FIFO.

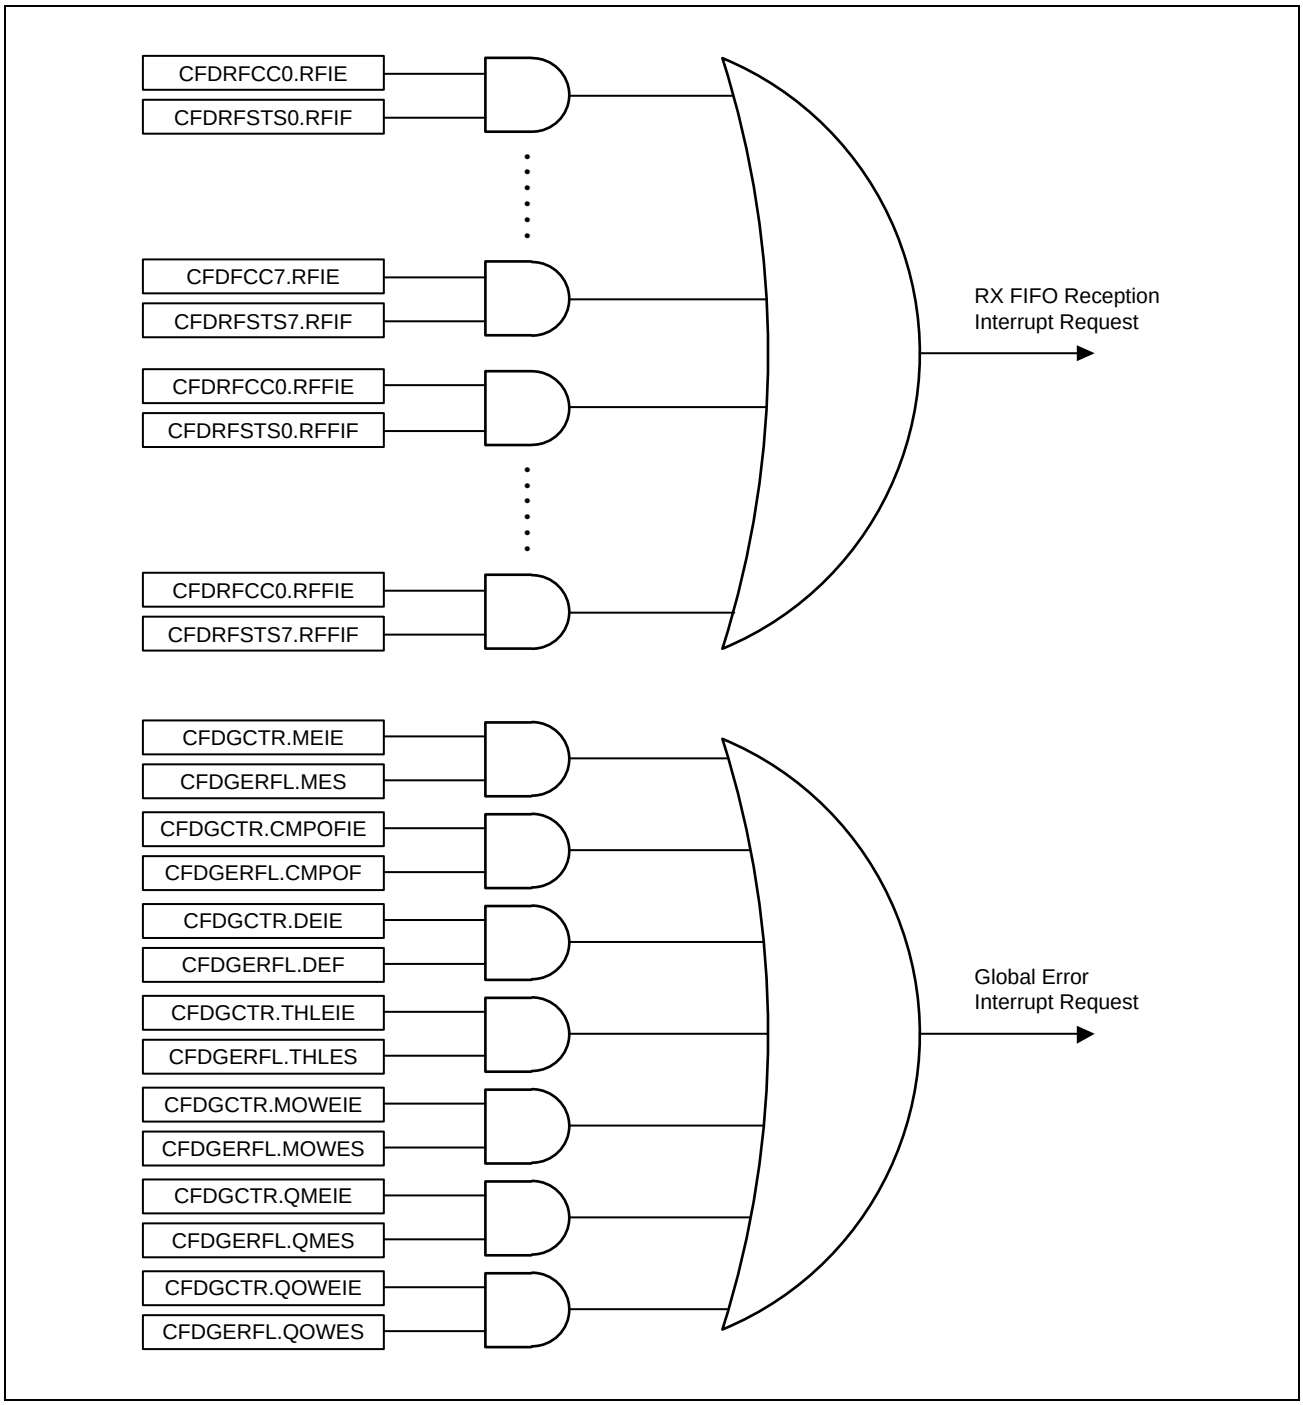

Figure 30.30 Block Diagram of Global Interrupt

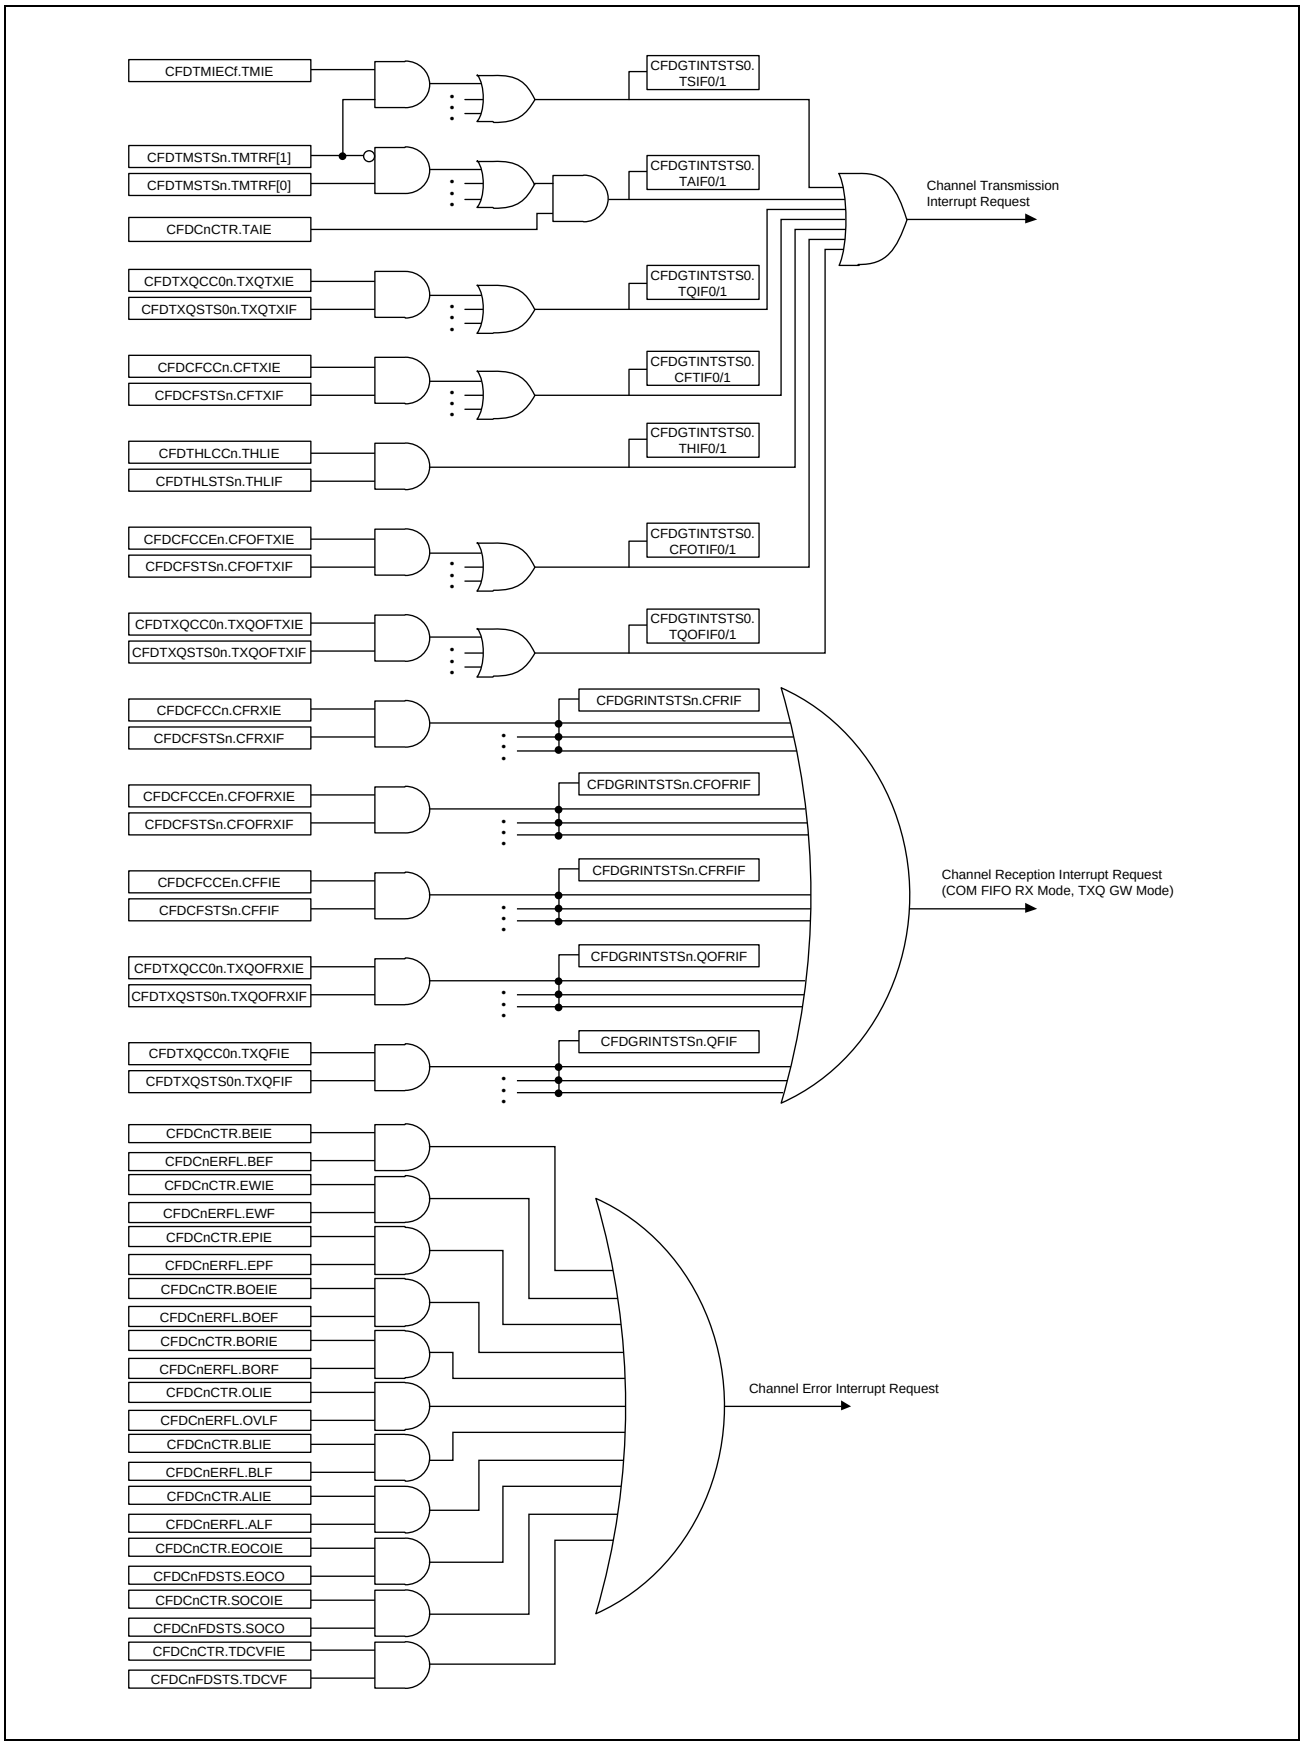

Figure 30.31 Block Diagram of Channel Interrupt

30.7.2 DMA Transfer

The CAN-FD module has some message buffer which can be associated with a DMA channel:

- Reception DMA
  - 8 RX FIFO Message Buffers
  - 2 Common FIFO Message Buffers
- Transmission DMA
  - 16 TXQ Message Buffers (TXQ0, TXQ3)
  - 2 Common FIFO Message Buffer

Figure 30.32 shows the potential DMA channels.

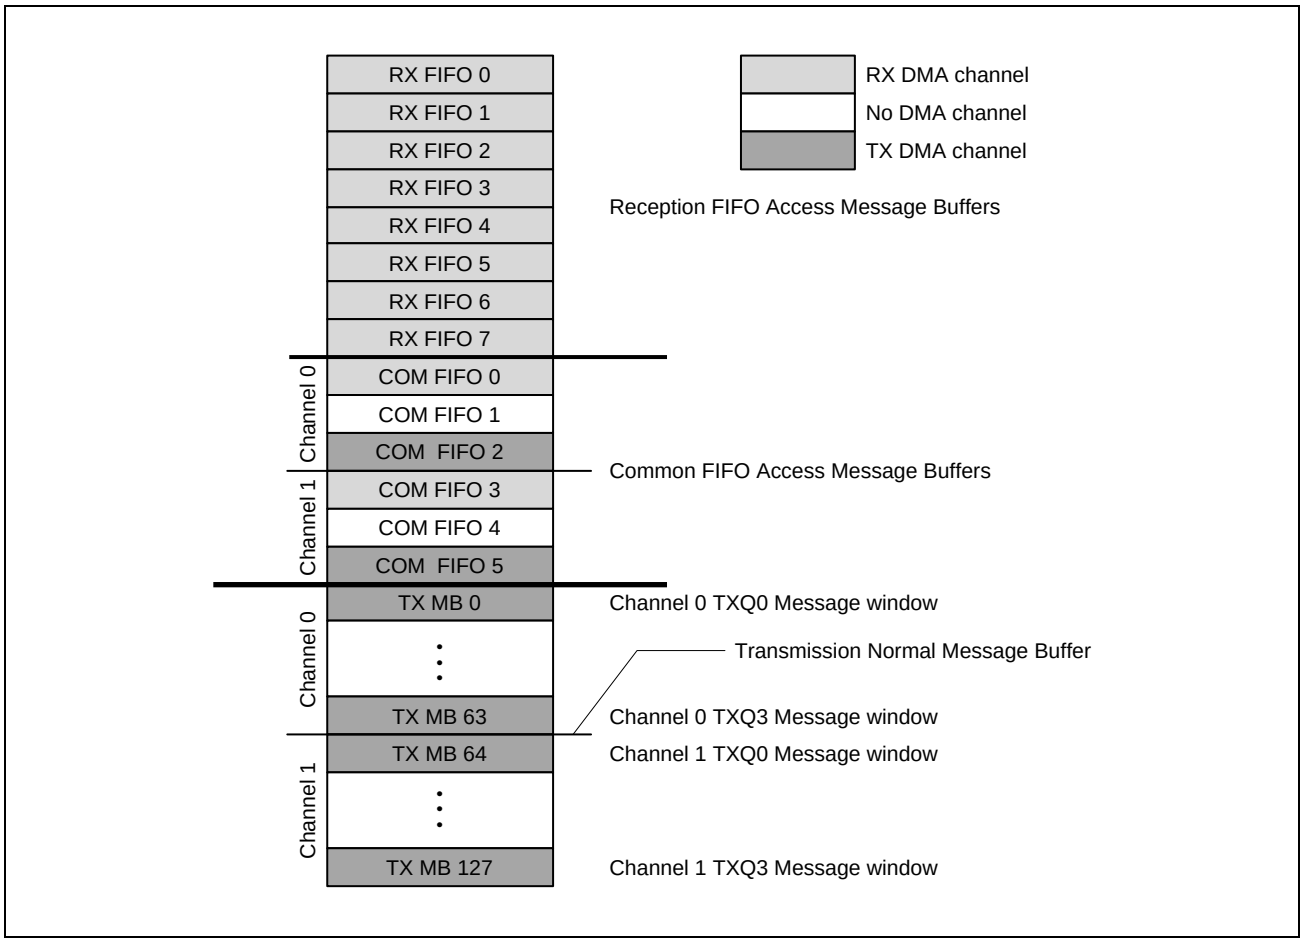

Figure 30.32 Message Buffer Connectable to DMA Channel

A DMA channel transfer request is generated for each FIFO entry to the DMAC when the related CFDCDTCT.RFDMAE or CFDCDTCT.CFDMAE is set to 1 and the belonging FIFO is not empty.

Reception FIFO interrupt should be disabled for this particular FIFO (CFDRFCCn.RFIE or CFDCFCCn.CFRXIE).

Use the regular start address for the DMA access window address and add H’8000 to the regular start address for the debugger access window. See **Table 30.36**.

Table 30.36 DMA Channel Access Window Address

b = Message Buffer Component Index	MBCP	Register	p	Start Address n = 0, 1
0 to number_of_RFMBCPs - 1	RFMBCPb	RFID	x	H'6000 + b × H'0080
		RFPTR	x	H'6004 + b × H'0080
		RFFDSTS	x	H'6008 + b × H'0080
		RFDFp	0 to 15	H'600C + p × H'0004 + b × H'0080
0 to number_of_CFMBCPs_per_channel - 1	CFMBCPb	CFID	x	H'6400 + b × H'0080 + n × H'0180
		CFPTR	x	H'6404 + b × H'0080 + n × H'0180
		CFFDCSTS	x	H'6408 + b × H'0080 + n × H'0180
		CFDFp	0 to 15	H'640C + p × H'0004 + b × H'0080 + n × H'0180

DMA FIFO pointer decrement is done automatically by reading the last configured data payload byte (CFDRFCCn.RFPLS or CFDCFCCn.CFPLS).

Note: The DMA must read the exact length of the configured data payload size (CFDRFCCn.RFPLS or CFDCFCCn.CFPLS).

The software debugger must access outside of the regular SFR address range from H'E000 to H'EFFF.

Do not write to the FIFO and TXQ control registers when DMA is enabled.

The DMA enable of the particular DMA FIFO (CFDCDTCT.RFDMAE or CFDCDTCT.CFDMAE) can be set at any time, the procedure in this section is a configuration flow for an initial setup.

When CFDCDTTCT.TQ0DMAE or CFDCDTTCT.TQ3DMAE or CFDCDTTCT.CFDMAE is set, the messages of the corresponding TXQ or Common FIFO can be handled by DMA controller.

Use the following procedure when the TXQ or the Common FIFO can be handled by DMA controller.

1. CPU checks the TXQ or the Common FIFO is not full.
2. When transmit data can be used, CPU sets this data to Common FIFO or TXQ.
   When using Common FIFO, transmit data is write in CFDCFIDn, CFDCFPTRn, CFDCFFDCSTSn, and CFDTMBCPb[i] registers.
   When using TXQ, transmit data is write in CFDTMIDn, CFDTMPTRn, CFDTMFDCTRn, and CFDTMDFp_n registers.
3. For Common FIFO, the common FIFO pointer is incremented automatically when DMA controller writes the last data payload byte configured by CFDCFCCn.CFPLS.
   For TXQ, if the data of 64 data payload is written, a TXQ pointer increases automatically. When payload data is less than 64 bytes, dummy data must be written in and 64 data payload size must be done.

Note: Only 32-bit write-access can be possible on the DMA message handling.

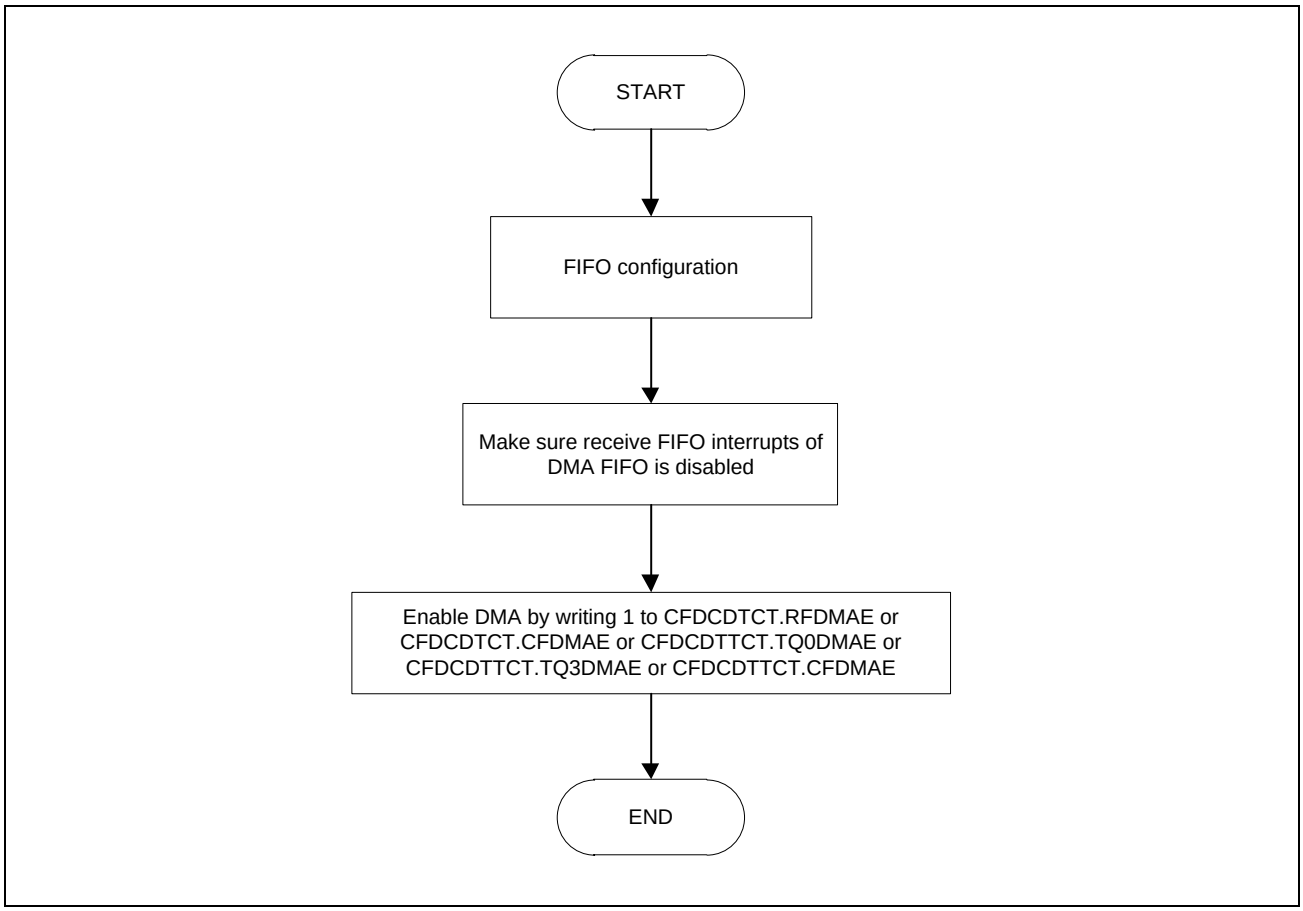

Figure 30.33 DMA Enable Flow

To disable a DMA transfer requested, disable the particular DMA enable bit (CFDCDTCT.RFDMAE or CFDCDTCT.CFDMAE). If the disable is made during an ongoing transfer, then this must be completed first before further action can be taken. The transfer status can be identified by the CFDCDTSTS.RFDMASTS or CFDCDTSTS.CFDMASTS. For reference, see the flow in **Figure 30.34**. When the DMA is disabled, then consider what to do with the remaining or new incoming messages to this particular FIFO reception.

When the FIFO is not disabled, reception to the FIFO continues.

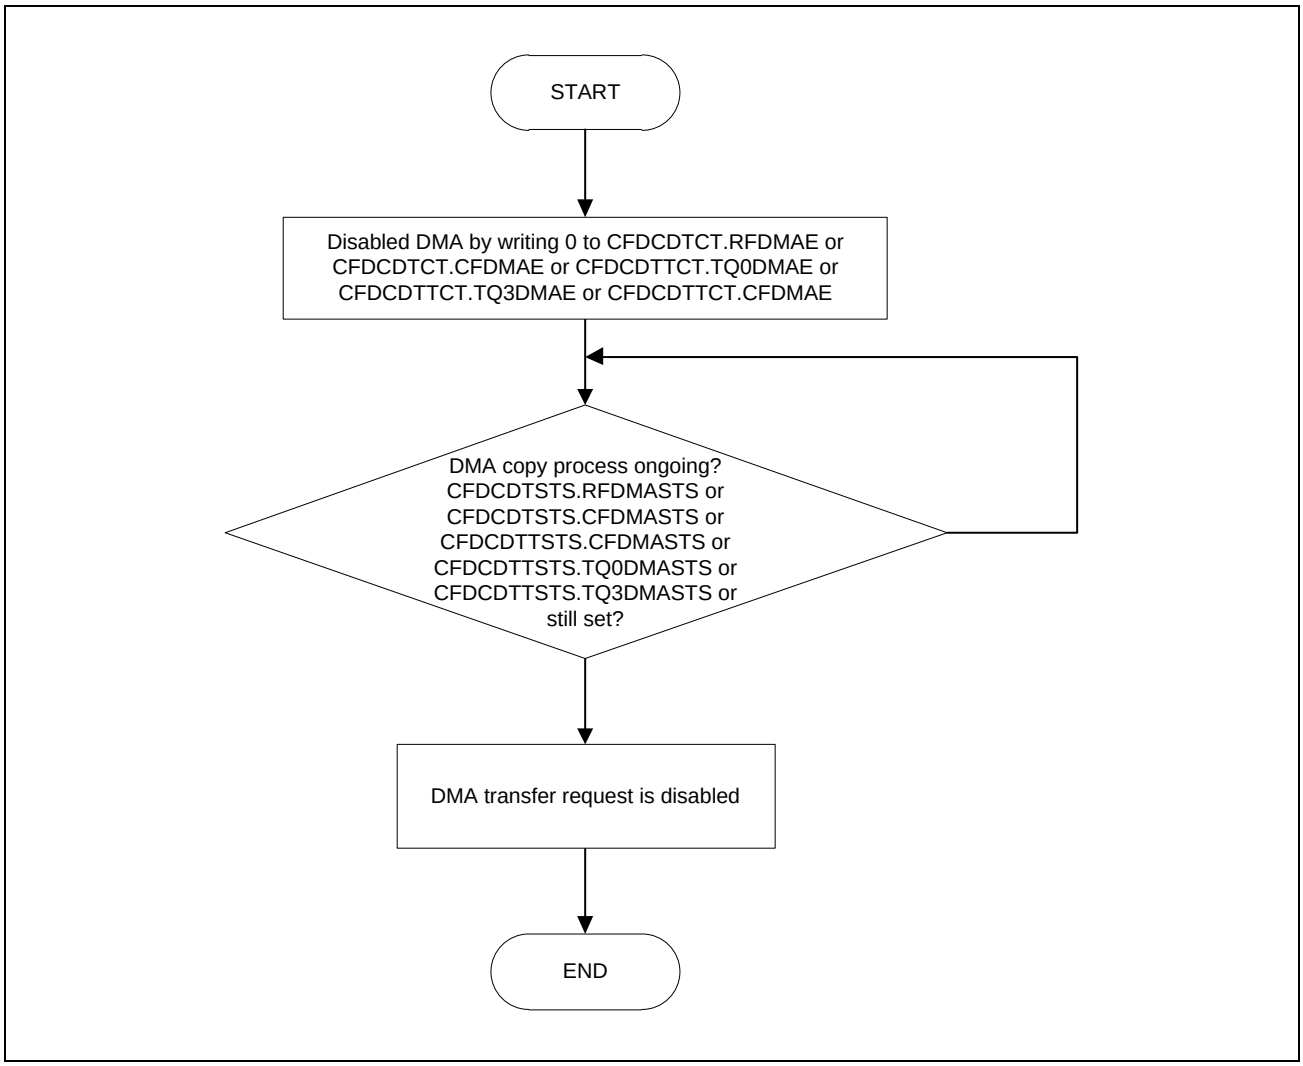

Figure 30.34 DMA Disable Flow

30.8 Reception and Transmission

30.8.1 Reception

FIFO buffers or Common FIFO buffers configured in RX mode or GW mode depending on the Acceptance Filter List entries are as follows:

- Up to 32 RX Message Buffers can be configured
- 8 RX FIFO buffers available
- Up to 6 Common FIFO buffers can be configured in RX mode or GW mode
- Up to 4 TX Queues can be configured in GW mode

30.8.1.1 Message Storage in RX Message Buffers

When a message is successfully received and stored in a RX Message Buffer, the corresponding New Data flag is set in the RX Message Buffer New Data Register.

The CAN message can be read from the corresponding RX Message Buffer.

If a new message is stored into a RX Message Buffer before the previous message in this message buffer can be read, then the original message is overwritten. There is no mechanism for preventing a new message from overwriting the current message in the RX Message Buffer. If such a loss of messages is not acceptable, then RX FIFO should be used to store related messages.

Note: Interrupts are not provided for the RX Message Buffers in the CAN-FD module and so the RX Message Buffer New Data Register should be accessed periodically to check if a new message has been stored in the RX Message Buffers.

Note: Unused data bytes are filled with H'00 depending on the DLC value.

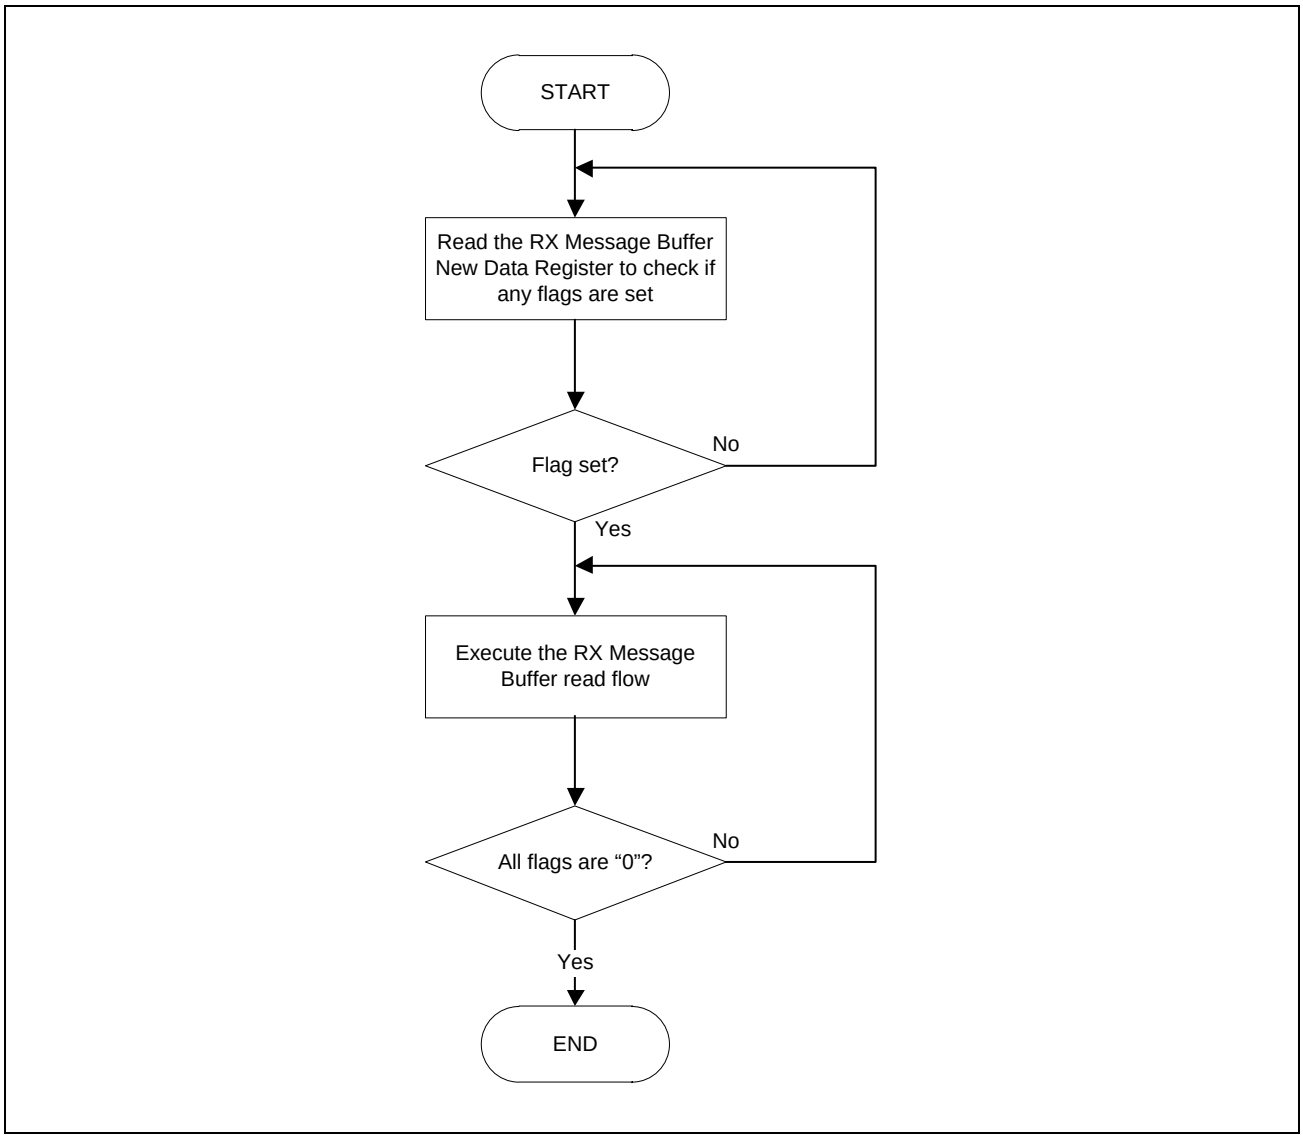

Figure 30.35 RX Message Buffer Message Access Flow

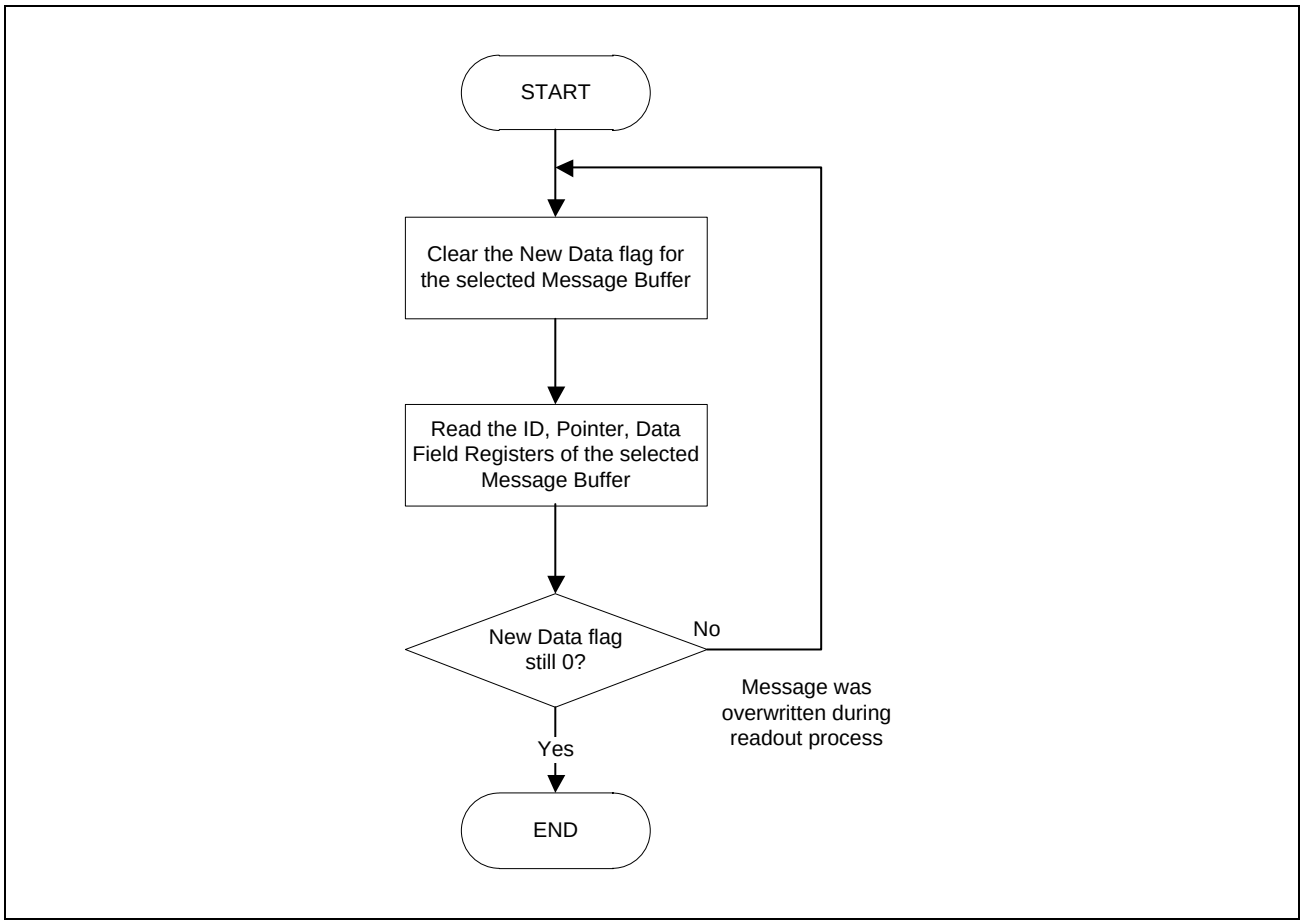

Figure 30.36 RX Message Buffer Read Flow

30.8.1.2 Message Storage in FIFO Buffers

The AFL entries for routing the received messages to RX FIFO buffers or Common FIFO buffers configured in RX or GW mode should be configured based on system requirements.

The CFDGAFLP1n.GAFLFDP[31:0] field in the matching AFL entry selects the FIFO buffers to which the related reception message is stored.

When the received message is stored in one or more RX FIFO buffers or Common FIFO buffers configured in RX mode or GW mode, the message counter value is incremented in the corresponding RX FIFO Status Registers or Common FIFO Status Registers.

Depending on the configuration of the FIFO buffers, an interrupt may also be generated.

The message can be read from the corresponding FIFO Access registers.

Note: Because many messages can be stored in the FIFO buffers, reading more than one message may be required to read the latest message stored in a FIFO buffer.

If the message count value matches the FIFO depth, the FIFO Full flag is set.

When the value H'FF is written to the corresponding FIFO Pointer Control Register, the message count is decremented by 1.

Only write H'FF to the FIFO Pointer Control register after reading the complete message from the FIFO Access registers of the corresponding FIFO.

When all the messages stored in the FIFO are read, the FIFO Empty flag is set.

If a new message is stored into the FIFO when the FIFO message count matches the FIFO depth (FIFO Full condition), the FIFO Message Lost flag is set and the new message is lost (no overwrite of already stored messages takes place).

An appropriate value can be configured as warning level to generate an interrupt before the FIFO full condition occurs to avoid loss of a message due to overrun condition.

In GW mode, when a transmit/receive FIFO buffer is trying to receive a new message while the transmit/receive FIFO buffer is already full of data, the oldest data of the buffer is overwritten with the message received or the message is discarded. The behavior is determined by setting CFDCFCCEn.CFMOWM bit.

- When CFDCFCCEn.CFMOWM = 0:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the received message is discarded and CFDCFSTSn.CFMLT bit is set to 1.
- When CFDCFCCEn.CFMOWM = 1:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the oldest data in the buffer is overwritten with the received message.
  The read pointer of the transmit/receive FIFO buffer simultaneously moves to the next oldest message.
  The CFDCFSTSn.CFMOW bit is then set to 1, which notifies that the oldest message has been overwritten with the received message.
  In addition, if a CAN bus error or arbitration-lost for the transmitting message occurs in the transmit/receive FIFO buffer full, the transmitting message is lost and retransmission of the message is not performed. The read point moves to the next message automatically.

Do not write change for this bit when the CFDCFCCn.CFE bit is 1. Common FIFO can set interrupt when:

- CAN frame reception is completed
- FIFO is in full status in RX mode or GW mode

Note: The message lost can be set only in RX or GW mode by CAN, the flag is not set when the CPU is overloading the FIFO buffers.

Note: When CFDGAFLP0n.GAFLSRDi (i = 0 to 2) is set and CFDTXQCCin.TXQGWE (i = 0 to 2, n = 0, 1) is also set, a receiving frame is stored in the target TXQ as send data by routing.

The RX FIFO Buffers and the Common FIFO Buffers configured in RX or GW mode can be disabled at any time by clearing the CFDRFCCn.RFE or CFDCFCCn.CFE bit in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers.

When the CFDRFCCn.RFE or CFDCFCCn.CFE bit is cleared, the message read and write pointers of the FIFO are cleared and are no longer active. Therefore, all messages in the FIFO Buffers are lost and no further messages can be stored into the FIFO.

When the RX FIFO Buffers or Common FIFO Buffers configured in RX mode are assigned as DMA channel, software should not access the FIFO Access Register of this FIFO buffer or write H’FF to the FIFO Pointer Control Register (CFDCFPCTRn.CFPC or CFDRFPCTRn.RFPC), because this could lead to unintended FIFO message decrement. The DMA channel controls the FIFO decrement automatically.

Note: If the interrupt flag is set for a FIFO Buffer and then the FIFO is disabled, the interrupt flag is not automatically cleared. The interrupt flag should be cleared before disabling the FIFO.

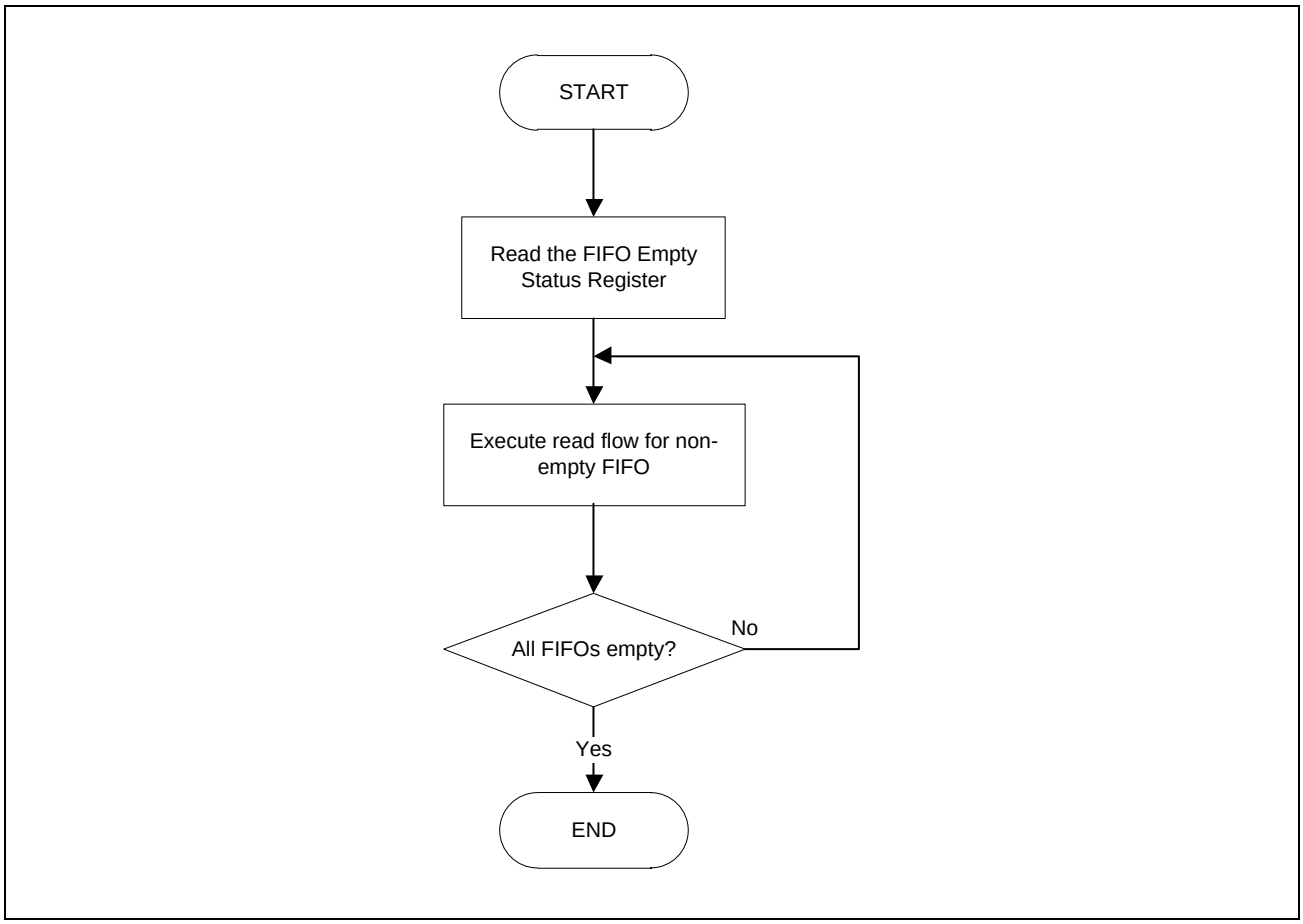

Figure 30.37 FIFO Buffer Message Access Flow (Example for Polling Case)

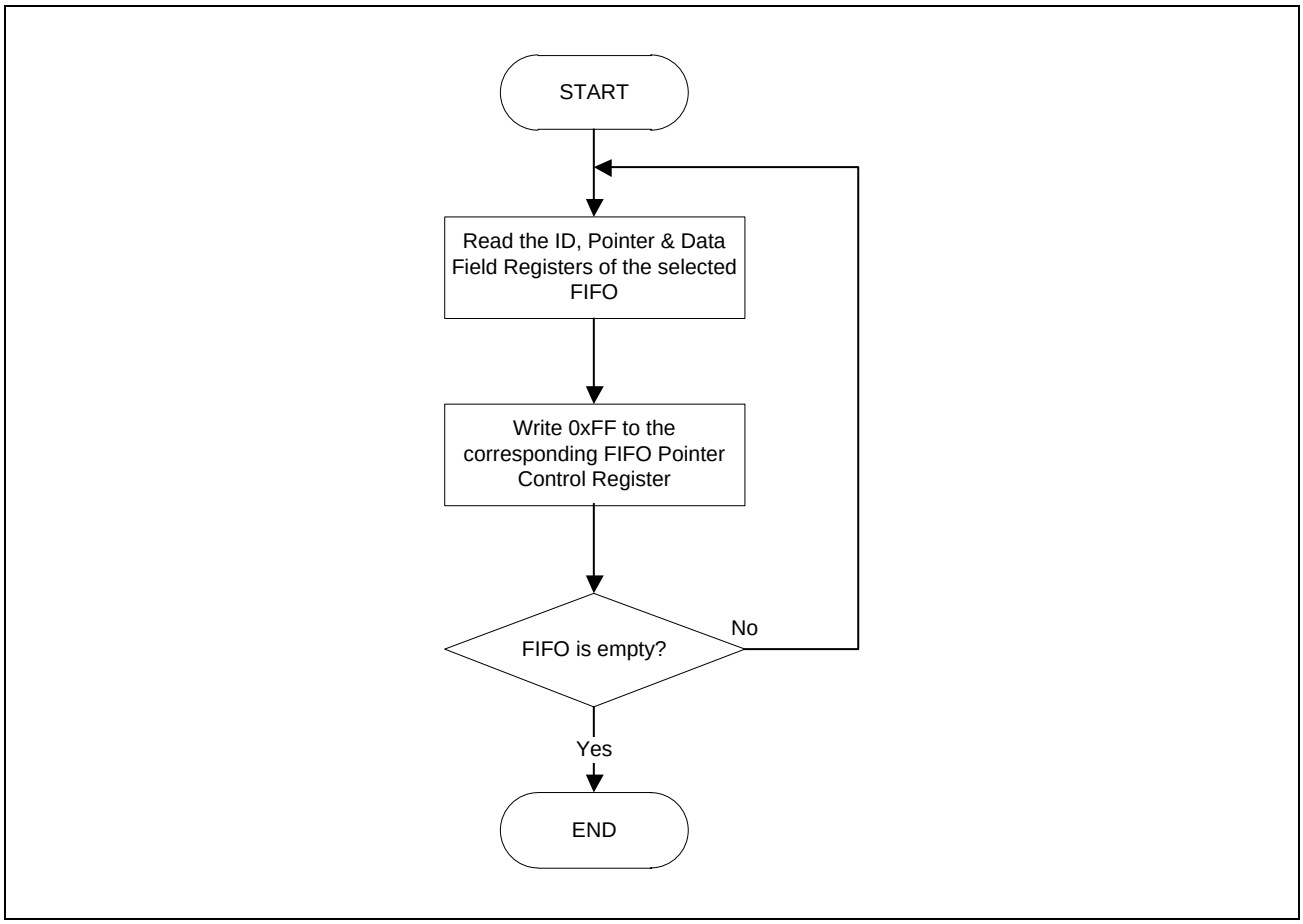

Figure 30.38 RX FIFO Buffer Read Flow (Example for Polling Case)

Note: When the next frame is received before clearing the completion interrupt flag of reception, the completion interrupt of reception is not set again.

Even if it clears an interruption flag after the completion processing of reception, the already received interrupt flag is not set.

It is necessary to perform the completion processing of reception even before the next completion of frame reception, and to clear an interruption flag.

When processing does not meet the deadline, after checking that receiving data is empty, interrupt flag is cleared and it checks that receiving data is empty again.

30.8.1.3 Timestamp

The Timestamp counter is a free-running counter that can be used to check reception time of an incoming message or transmission time of successful transmitted messages. The Timestamp counter value is captured based on the CFDGFDCFG.TSCCFG[1:0] configuration (at the sample point of start of frame, point in time when the frame is valid, or for CAN-FD frames also at the sample point of the RES bit). For reception, it is stored together with the message ID and Data into the target RX Message Buffer or RX/GW FIFO.

For transmit message, the Timestamp counter value is stored as part of the TX History List entry.

The counter can be clocked with the peripheral clock or with the CAN channel bit timing clock. The counter source clock can be configured with the CFDGCFG.TSSS bit of the Global Configuration Register. If it is 0, the peripheral clock is used. If it is 1, the selected CAN channel bit time clock is used.

The channel selection is done with the CFDGCFG.TSBTCS bit of the Global Configuration Register.

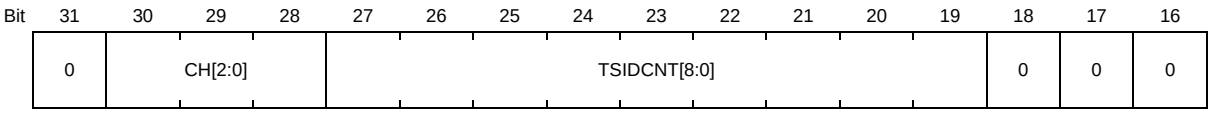
Care must be taken when using selected CAN channel bit time clock as the clock source. When entering Channel Halt mode or Channel Reset mode for this channel, the Timestamp counter is stopped. Therefore, for other CAN channels, the Timestamp counter value is also not updated.

If peripheral clock is selected as the Timestamp counter clock source, Channel modes do not influence the Timestamp counter function.

The source clock for the Timestamp counter can be divided by a factor defined by the CFDGCFG.TSP bits (Timestamp Prescaler) in the Global Configuration Register.

The Timestamp counter can be reset to H’0000 with the CFDGCTR.TSRST bit (Timestamp Reset).

The Timestamp counter filed format is described below.



30.8.2 Transmission

There are several possible transmission configurations for each channel:

- Normal transmission
- FIFO transmission
- Gateway transmission
- TX Queue transmission
  A fixed number of transmission message buffers (64 TX message buffers) are dedicated for each channel. These message buffers are only used for transmission and cannot be configured for reception.
  Additionally transmission from TX Queue and/or Common FIFO in TX or GW mode can be configured in the following way (see **Figure 30.39**):
  - TX Queue: Up to 32 transmission message buffers for one channel can be grouped to form a TX Queue with a common access window.
    Upper transmission message buffers are used to form the TXQ1 or TXQ3. Lower transmission message buffers are used to form the TXQ0 or TXQ2.
    Transmission control and status registers of these transmission message buffers should not be used. One channel has four TX Queues. Each TXQ has an access window:
    - TXQ0 is transmission Message Buffer 0 of each channel
    - TXQ1 is transmission Message Buffer 31 of each channel
    - TXQ2 is transmission Message Buffer 32 of each channel
    - TXQ3 is transmission Message Buffer 63 of each channel

    When using TXQ1 and TXQ0 simultaneously, the sum of the depths of TXQ1 and TXQ0 should not exceed 32.
    When using TXQ3 and TXQ2 simultaneously, the sum of the depths of TXQ3 and TXQ2 should not exceed 32.
- Common FIFO (TX/GW mode): Each Common FIFO in TX or GW mode is linked to a dedicated channel.
  Each channel has a fixed number of three Common FIFOs assigned to it. Within the channel, a Common FIFO configured in TX or GW mode, can be freely linked (assigned) between 32 and 39 transmission message buffers (only one FIFO to one transmission message buffer).
  The Common FIFO buffer then replaces the transmission message buffer linked to it.
  Transmission control and status registers of these transmission message buffers should not be used.

See **Figure 30.28** for information on Common FIFO buffer assignment to related channels.

Note: Common FIFO buffers should not be linked to TX message buffers that are already part of a TX Queue.

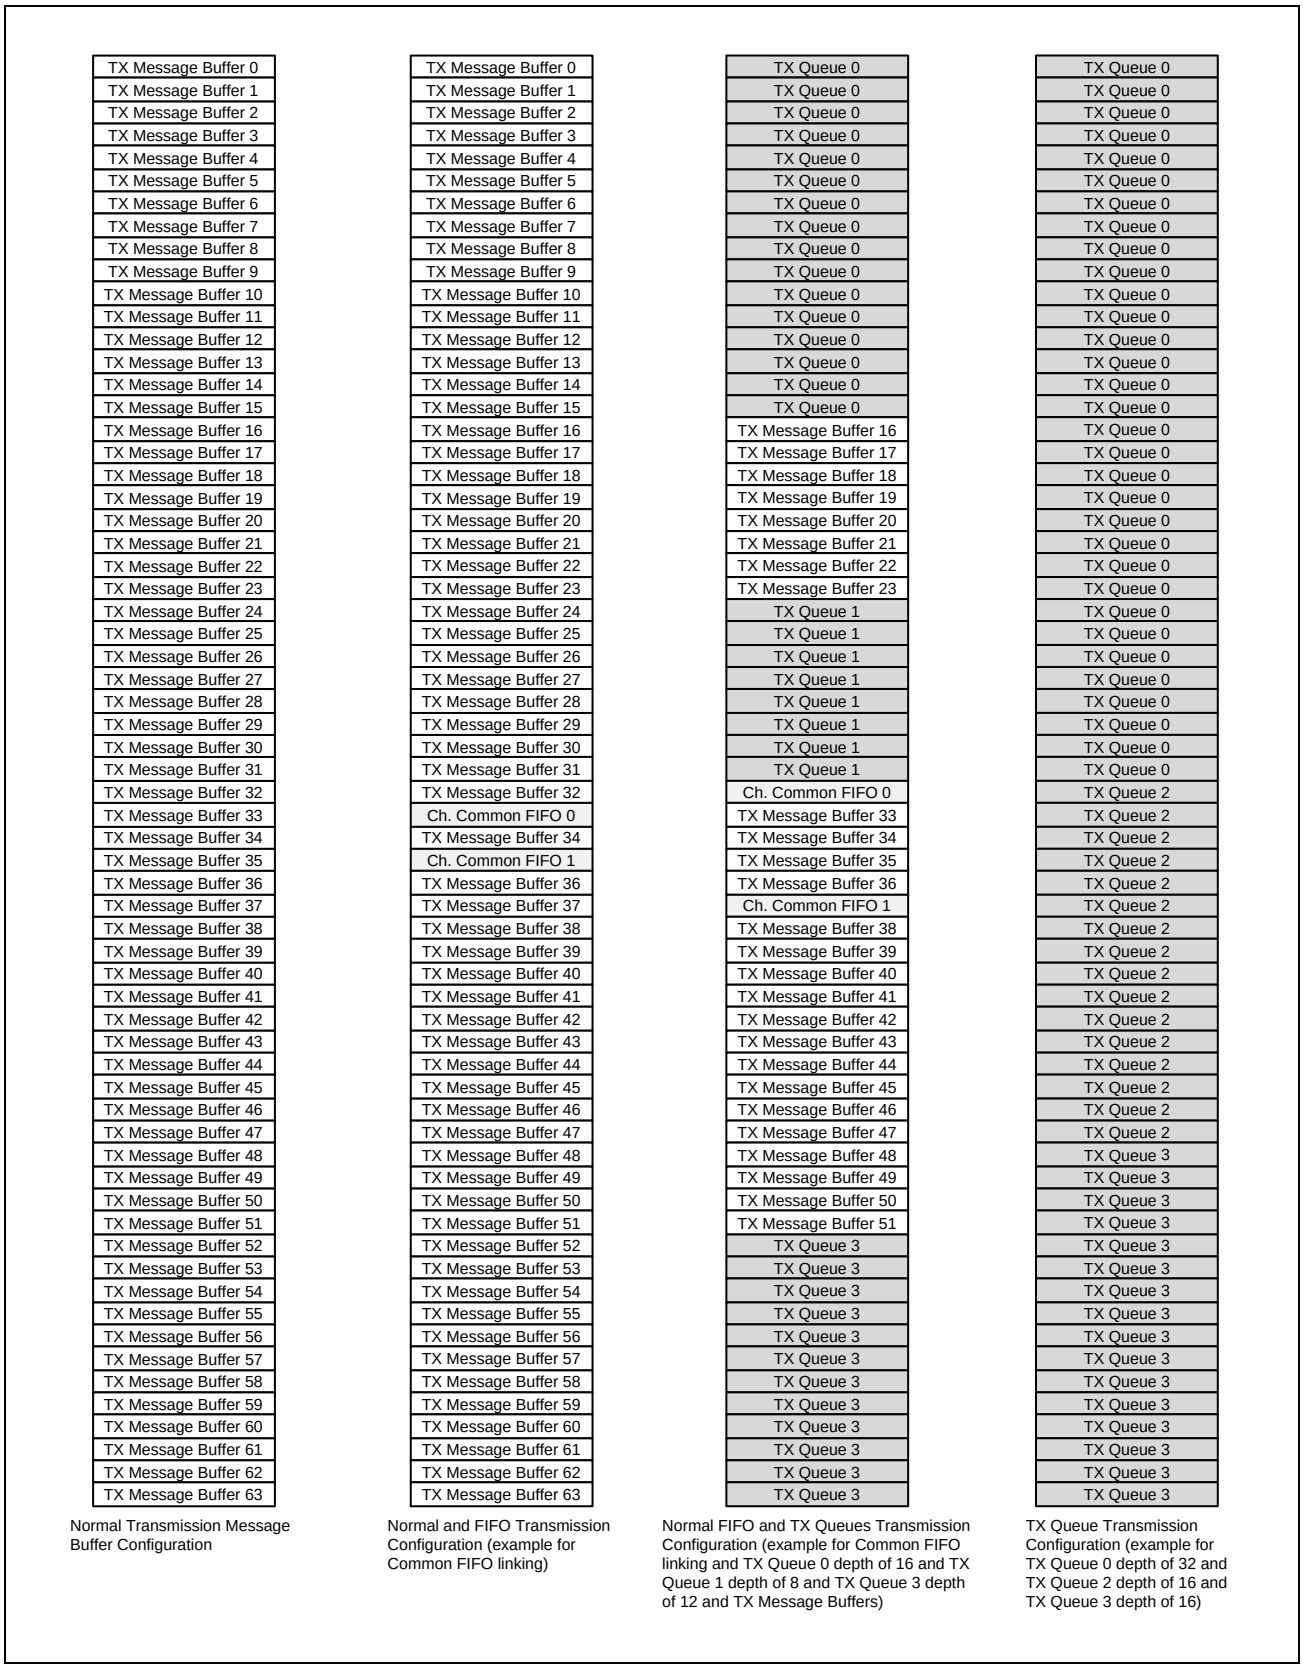


Figure 30.39 Channel Transmission Message Buffer Configuration

30.8.2.1 Transmission Priority

If two or more transmission message buffers of a channel are configured for transmission, the transmission priority in the CAN-FD module can be selected from the following two modes:

- CAN ID priority
- Message buffer number priority

The transmission priority mode is common for all message buffers and all CAN channels. It can be configured with the CFDGCFG.TPRI bit in the Global Configuration Register.

For message buffer number priority transmission, the smallest message buffer number with transmission request has the highest priority for transmission. This also includes the TX message buffers linked to the Common FIFO buffers configured in TX mode or GW mode.

However, message buffer number priority should not be used if TX Queue is enabled.

For CAN ID priority transmission, ID priority complies with the CAN bus arbitration rule (as specified in ISO 11898-1 specification). All TX message buffers can enter the ID priority comparison for message buffers configured for transmission. This also includes the TX message buffers linked to the Common FIFO buffers configured in TX mode or GW mode and includes the TX Queue message buffers.

If the ID of two or more message buffers is the same, the smaller message buffer number has higher priority for transmission.

Note: For Common FIFO buffers configured in TX mode or GW mode, only the message currently being pointed to by the FIFO read pointer can be included in the transmission arbitration.
If the message is being transmitted from the FIFO, the next pending message within the same FIFO will be considered in the transmission arbitration.
In contrast to this, all transmission message buffers of a TX Queue participate in internal transmission arbitration.

Figure 30.40 shows the transmission configuration flow.

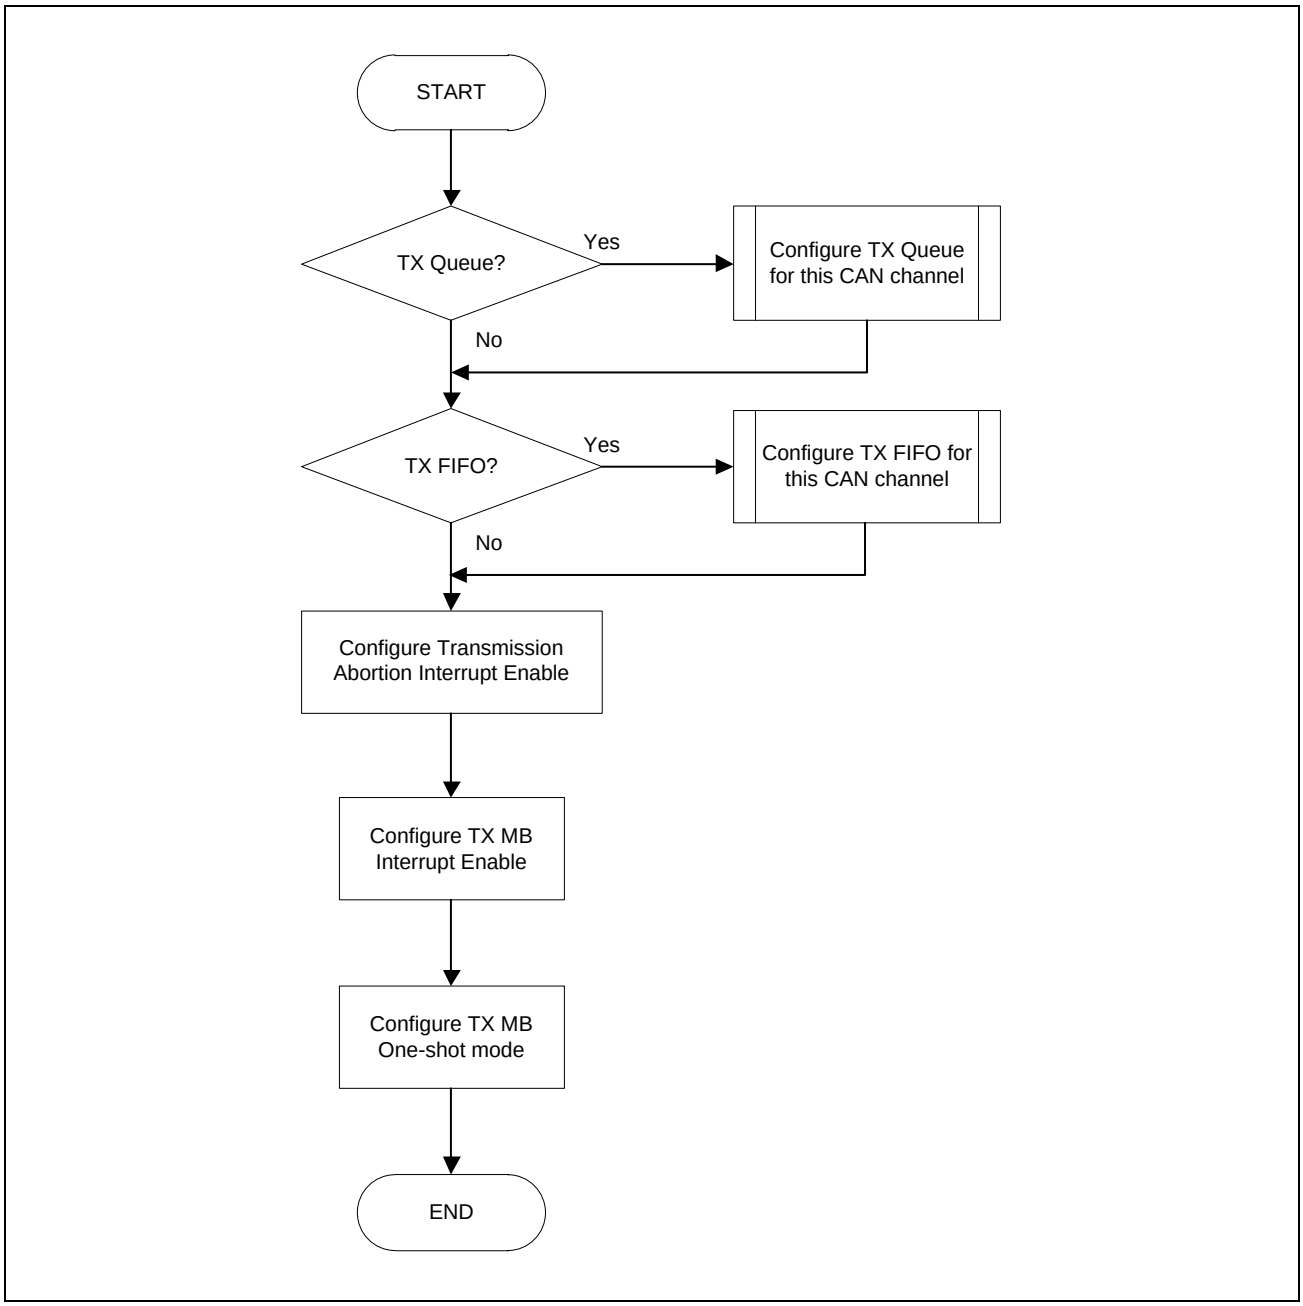

Figure 30.40 Transmission Configuration Flow

30.8.2.2 Normal Transmission

Each transmission message buffer has two modes of message transmission:

- Regular transmission mode
  If the message buffer is placed in regular transmission mode, the data frame or remote frame set in that message buffer can be transmitted.
  Completion of regular transmission can be checked through the related TX Message Buffer Transmission Result flag bits (CFDTMSTSn.TMTRF[1:0]) in the TX Message Buffer Status Registers. These bits are set to 10b or 11b when the regular transmission is successful.
  When arbitration is lost or an error occurs, message transmission will be attempted further if no transmission abort request is set for this transmission message buffer.
  New internal transmission arbitration for this channel is performed for all message buffers with transmission request.
- One-shot transmission mode
  When the CFDTMCn.TMOM bit of the TX Message Buffer Control Registers is set for a transmission message buffer, then the message buffer is placed in one-shot transmission mode and attempts to transmit a message only once.
  Completion of one-shot transmission can be checked through the related TX Message Buffer Transmission Result flag bits (CFDTMSTSn.TMTRF[1:0]) in the TX Message Buffer Status Registers. The CFDTMSTSn.TMTRF[1:0] bits are set to 10b or 11b when the one-shot transmission is successful.
  The CFDTMSTSn.TMTRF[1:0] bits are set to 01b when arbitration is lost or an error occurs during the transmission of the related message buffer.
  Additional message transmission will not be attempted in this case.

The regular transmission request procedure after a configuration is shown in **Figure 30.41**.

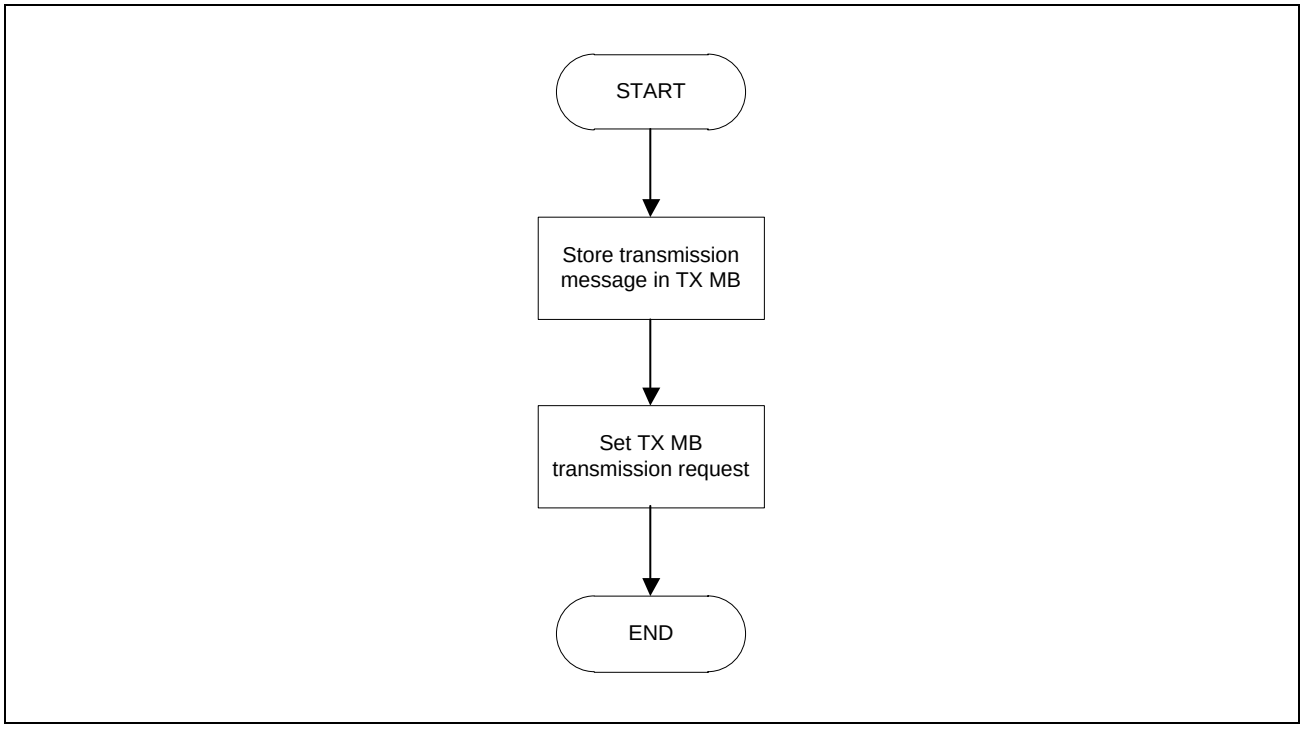

Figure 30.41 Transmission Request Procedure Using Normal TX Message Buffer Mode

(1) TX Message Buffer Control Register Setting

Table 30.37 shows configuration of the normal CAN transmission mode.

Table 30.37 Configuration of CAN Transmission Mode

Transmission Request CFDTMCn.TMTR	Transmission Abortion Request CFDTMCn.TMTAR	One Shot Enable CFDTMCn.TMOM	Communication Activity
0	0	0	Message buffer is disabled
0	0	1	Message buffer is disabled
1	0	0	Configured as a transmission message buffer for a data frame or a remote frame
1	0	1	Configured as a one shot transmission message buffer for a data frame or a remote frame
1	1	0	Transmission abortion is requested
1	1	1	One shot transmission abortion is requested

The configuration bits can be configured in the TX Message Buffer Control Registers.

Figure 30.42 shows timings for successful transmission for two message buffers of one channel.

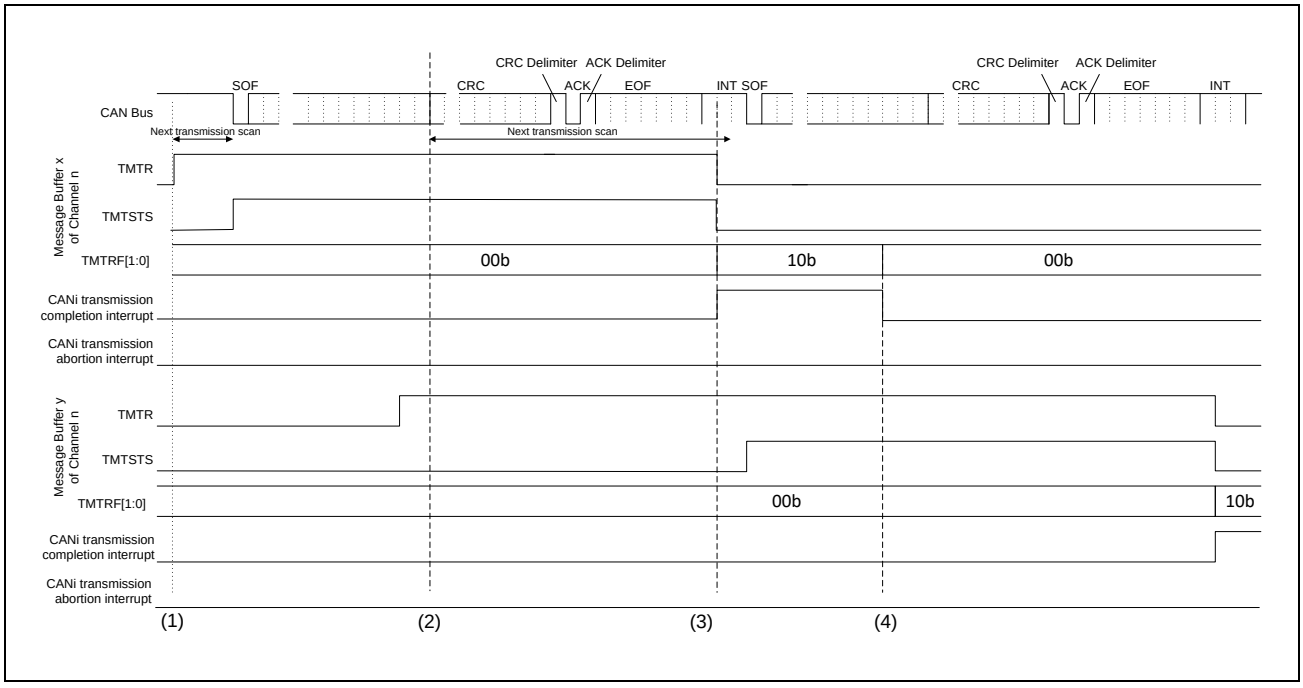

Figure 30.42 Timing of Request and Flag Bits for Successful Transmission

1. If the CFDTMCn.TMTR bit in the TX Message Buffer Control Registers is set in the bus idle state, message buffer scanning procedure starts to determine the highest priority message buffer for transmission.
   When the transmission message buffer is determined, the CFDTMSTSn.TMTSTS bit in the related TX Message Buffer Status Registers is set (Transmitting/Transmitter), and CAN channel starts the transmission*[1].
2. On the first bit of CRC, the transmission scanning procedure starts for the next possible transmission when pending transmission requests exist.

The scan time can be delayed due to other transmission scan on other channels, but it will be finished before Intermission 3 to be able to continue transmission without any gaps.

3. If the message is successfully transmitted, the CFDTMSTSn.TMTRF[1:0] bits in the corresponding TX Message Buffer Status Registers are set to 10b and CFDTMSTSn.TMTSTS and the CFDTMCn.TMTR bits are cleared. When the TMIE bits in the TX Message Buffer Interrupt Enable Configuration Registers is set (interrupt enabled), the CAN successful transmission interrupt request is generated.
   To clear the related interrupt line the CFDTMSTSn.TMTRF flag bits must be cleared.
4. Before starting the next transmission, clear the CFDTMSTSn.TMTRF[1:0] bits. Load the next message in the transmission message buffer and set the CFDTMCn.TMTR bit again. CFDTMCn.TMTR bit cannot be set again before CFDTMSTSn.TMTRF[1:0] bits are cleared.

Note 1. If arbitration is lost after the CAN channel starts the transmission, the CFDTMSTSn.TMTSTS bit is cleared.

The transmission scanning procedure is performed again to search for the highest priority transmission message buffer from the beginning of the first CRC bit.

If an error occurs either during the transmission or following the loss of arbitration, then during Error Frame, the transmission scanning procedure is performed again to search for the highest priority transmission message buffer.

Note: The setting point of CFDTMSTSn.TMTSTS is not always fixed at the start of the SOF. It may be delayed up to the start of the standard ID due to the synchronization logic implemented for the PLL bypass.

Figure 30.43 shows timings for transmission abort for two message buffers of one channel.

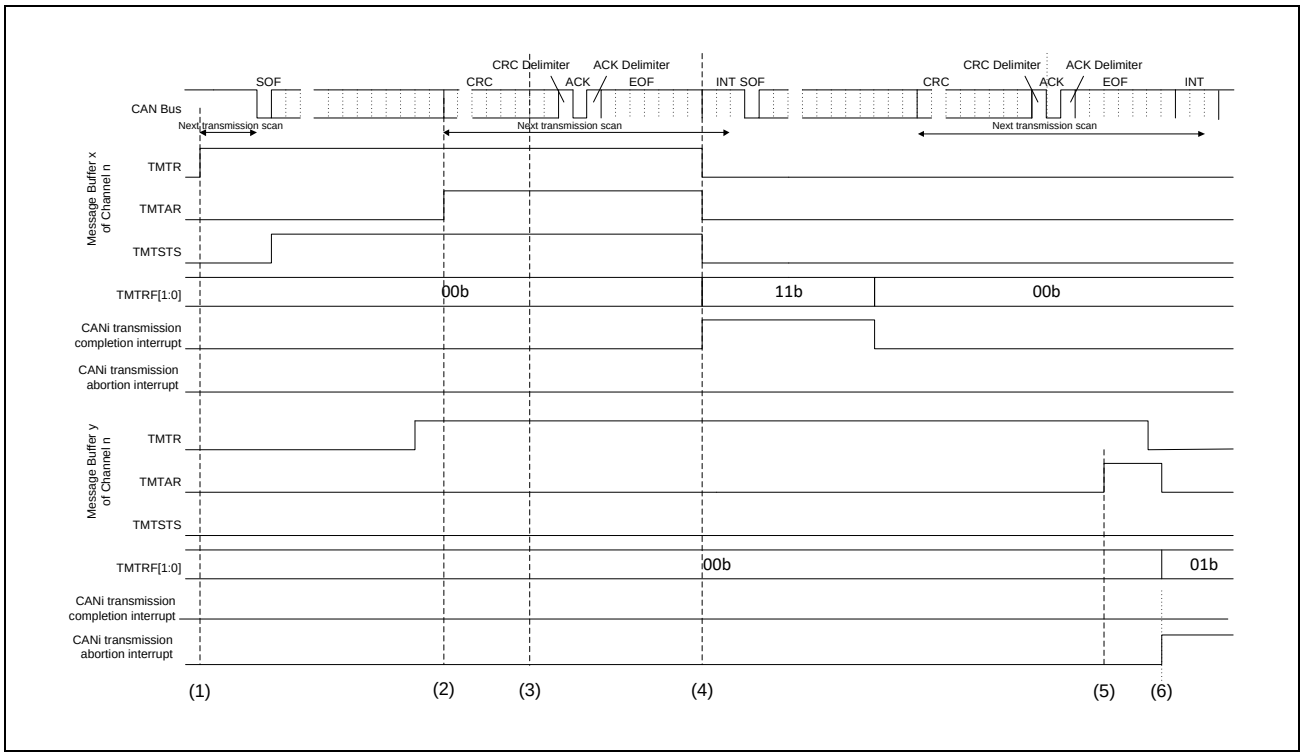

Figure 30.43 Timing of Request and Flag Bits for Transmission Abort

1. If the CFDTMCn.TMTR bit in the TX Message Buffer Control Registers is set in the bus idle state, message buffer scanning procedure starts to determine the highest priority message buffer for transmission.
   When the transmission message buffer is determined, the CFDTMSTSn.TMTSTS bit in the TX Message Buffer Status Registers is set (Transmitting/Transmitter), and CAN channel starts the transmission*[1].
2. If the CFDTMCn.TMTAR bit is set when the related message buffer is already selected for transmission or currently transmitting, the message is not aborted, if no error occurs or arbitration is lost.
3. On the first CRC bit, the transmission scanning procedure starts for the next transmission. In this example timing diagram, message buffer y is not selected as the next transmission message buffer.
   The scan time can be delayed due to other transmission scan on other channels, but it will be finished before Intermission 3 to be able to continue transmission without any gaps.
4. If the message is successfully transmitted, the CFDTMSTSn.TMTRF[1:0] bits in the corresponding TX Message Buffer Status Registers are set to 11b and CFDTMSTSn.TMTSTS and the CFDTMCn.TMTR bits are cleared.
   When the TMIE bits in the TX Message Buffer Interrupt Enable Configuration Registers is set (interrupt enabled), the CAN successful transmission interrupt request is generated.
   To clear the related interrupt line, clear the CFDTMSTSn.TMTRF[1:0] bits.
5. Another CAN node is transmitting on the CAN bus (CFDTMSTSn.TMTSTS not set). If the CFDTMCn.TMTAR bit is set when the related channel is under transmission scan, the transmission request cannot be cleared.
6. After internal processing time, the transmission is aborted and the CFDTMSTSn.TMTRF[1:0] bits are set to 01b.
   If the message buffer is not transmitting or selected as the next transmission message buffer or under transmit scan, then the abort is immediately accepted and the corresponding CFDTMSTSn.TMTRF[1:0] bits in the TX Message Buffer Status Registers are set to 01b.
   In addition, CFDTMCn.TMTR, and CFDTMCn.TMTAR bits are cleared automatically.
   When the transmission abort interrupt enable TAIE bit of the related Channel Control Register is set, an interrupt is generated for successful transmission abort.
   To clear the related interrupt line, clear the CFDTMSTSn.TMTRF[1:0] bits.

Note 1. If arbitration is lost after the CAN channel starts the transmission, the CFDTMSTSn.TMTSTS is cleared. The transmission scanning procedure is performed again to search for the highest priority transmission message buffer from the beginning of the first CRC bit. If an error occurs, either during the transmission, or following the loss of arbitration, then during Error Frame, the transmission scanning procedure is performed again to search for the highest priority transmission Message Buffer.

30.8.2.3 TX FIFO or GW FIFO Transmission

Three common FIFO buffers are assigned to each channel. The three FIFO buffers can be linked to any normal TX Message Buffer position for this channel by the CFDCFCCn.CFTML[4:0] bits in the Common FIFO Configuration/Control Register if configured in TX or GW mode.

When the transmission scan starts and the FIFO buffer corresponding to this TX Message Buffer is enabled, the relevant message in the FIFO buffer participates in the transmission scan.

Configuration of a TX Message Buffer linked to a FIFO buffer configured in TX or GW mode should not be done.

(1) TX FIFO Operation

CAN messages can be written into the TX FIFO by writing to the corresponding FIFO Access registers.

When the value H'FF is written into the corresponding FIFO Pointer Control Register, the message count of the related FIFO is incremented by 1.

Only write to the FIFO Pointer Control register after writing the complete message to the corresponding FIFO Access registers.

If the message count matches the FIFO Depth, the FIFO Full flag is set.

The oldest message in the TX FIFO is included in the scan for transmission by the corresponding CAN-FD module channel logic.

When a message is successfully transmitted from the TX FIFO, the message count value is decremented by 1. When all the messages from the FIFO are transmitted, the FIFO Empty flag is set.

The interrupt generation conditions for the TX FIFO buffers can be configured by configuring the CFDCFCCn.CFIM bit in the corresponding Common FIFO Configuration/Control Registers.

If CFDCFCCn.CFIM bit is 0, an interrupt is generated when the last message is successfully transmitted from the TX FIFO buffer.

If CFDCFCCn.CFIM bit is 1, an interrupt is generated for every successfully transmitted message from the TX FIFO buffer.

Common FIFO can set interrupt, when CAN frame transmitted is completed.

The Common FIFO buffers configured in TX mode can be disabled by clearing the CFDCFCCn.CFE bit in the Common FIFO Configuration/Control Registers. If this bit is cleared to 0, the FIFO Empty flag is set as follows:

- Immediately if the message from the TX FIFO is neither scheduled for the next transmission nor in transmission
- Following the transmission completion, the detection of an error on the CAN bus, loss of arbitration or transition to Channel or Global Halt mode if the transmission from the TX FIFO is already scheduled for transmission or already in transmission.

Note: The Common FIFO buffer is considered as disabled after clearing the CFDCFCCn.CFE bit only when the Empty flag is set for the corresponding Common FIFO Buffer.

Other possible messages pending from the TX FIFO are lost and their transmission must be requested again. Before CFDCFCCn.CFE is set again, ensure that CFDCFSTSn.CFEMP bit is set and that there is no pending abort from the TX FIFO.

When the CFDCFCCn.CFE bit is cleared, the message read and write pointers of the FIFO are cleared and are no longer active. Therefore, all messages in the FIFO buffers are lost and no further message can be stored into the FIFO.

The FIFO transmission request procedure after configuration is shown in **Figure 30.44**.

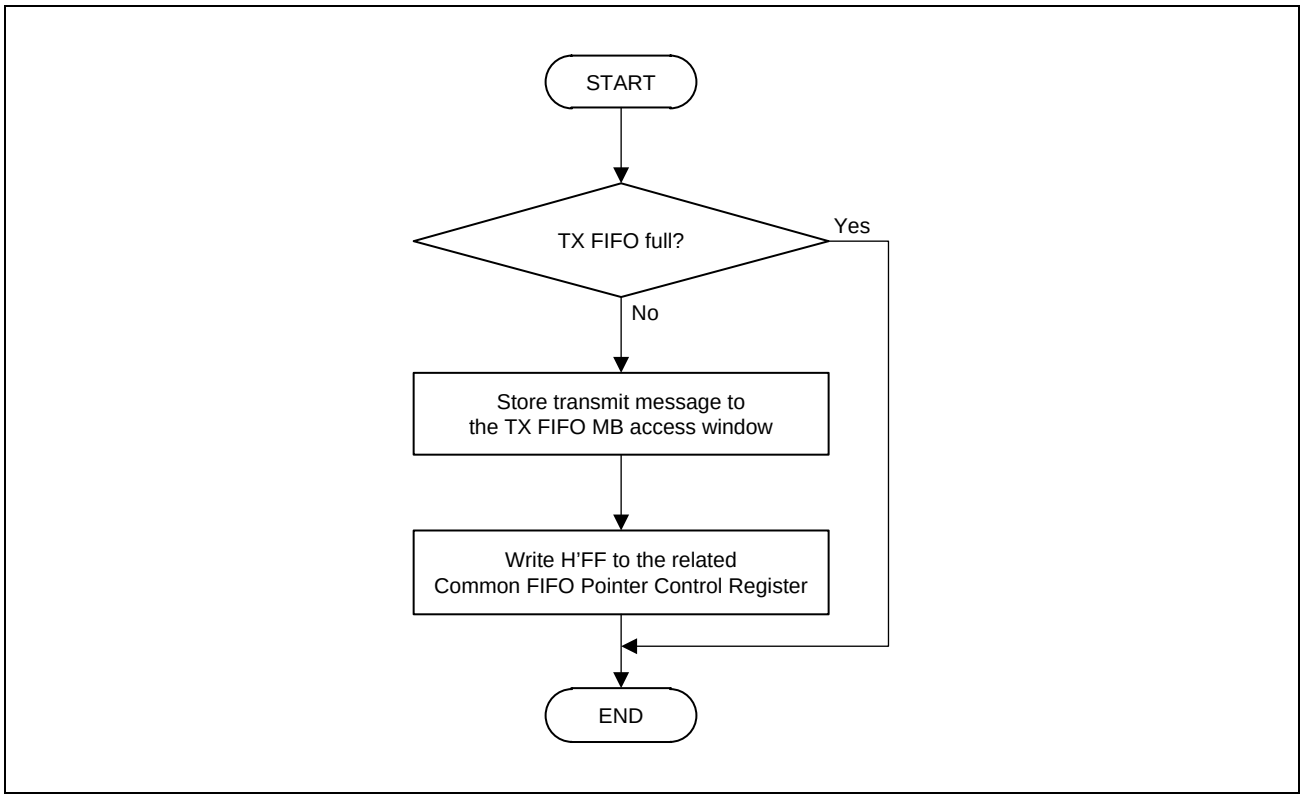

Figure 30.44 TX FIFO Transmission Request Procedure

(2) GW FIFO Operation

The AFL entries for routing the received messages to GW FIFO buffers should be configured based on the requirements of the system. The matching AFL entry selects the GW FIFO buffer for storage of a received message on any of the CAN channels.

When a message is successfully received and stored in a GW FIFO buffer, the FIFO message count in the corresponding FIFO Status Register is incremented by 1.

If the message count matches the FIFO depth, then the FIFO Full flag is set.

The oldest message in the GW FIFO is included in the scan for transmission by the corresponding CAN-FD module channel logic.

When a message is successfully transmitted from the GW FIFO, the message count value is decremented by 1. When all the messages from the GW FIFO are transmitted, the FIFO Empty flag is set.

If a new message is stored into the FIFO when the FIFO message count matches the FIFO depth (FIFO full condition), the FIFO Message Lost flag is set and the new message is lost (no overwrite of already stored messages takes place).

In GW mode, when a transmit/receive FIFO buffer is trying to receive a new message while the transmit/receive FIFO buffer is already full of data, the oldest data of the buffer is overwritten with the message received or the message is discarded. The behavior is determined by setting CFDCFCCEn.CFMOWM bit.

- When CFDCFCCEn.CFMOWM = 0:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the received message is discarded and CFDCFSTSn.CFMLT bit is set to 1.
- When CFDCFCCEn.CFMOWM = 1:
  When writing of data is required due to reception of a new message while a transmit/receive. FIFO buffer is full of

data, the oldest data in the buffer is overwritten with the received message.
The read pointer of the transmit/receive FIFO buffer simultaneously moves to the next oldest message.
The CFDCFSTSn.CFMOW bit is then set to 1, which notifies that the oldest message is overwritten with the received message.
In addition, when a CAN bus error or arbitration-lost for the transmitting message occurs in transmit/receive FIFO buffer full, the transmitting message is lost and retransmission for the message is not performed. The read point moves to the next message automatically.

The interrupt generation conditions for the GW FIFO buffers can be configured by configuring the CFDCFCCn.CFIM bit in the corresponding Common FIFO Configuration/Control Registers.

If CFDCFCCn.CFIM bit is 0, then RX interrupt flag is set when FIFO counter increments and reaches value configured by CFDCFCCn.CFIGCV and the TX interrupt flag is set when FIFO transmits the last message successfully.

If CFDCFCCn.CFIM bit is 1, then RX interrupt flag is set at the end of storage of every received message and TX interrupt flag is set if a message is successfully transmitted from the FIFO.

Common FIFO can set interrupt when:

- CAN frame transmitted is completed
- CAN frame reception is completed
- FIFO is in full status in RX mode or GW mode

When CFDCFCCEn.CFBME = 1, it becomes FIFO buffering mode, send data is stored in Common FIFO, and transmission is stopped. Transmission will be started if it is set as CFDCFCCEn.CFBME = 0.

The Common FIFO buffers configured in GW mode can be disabled by clearing the CFDCFCCn.CFE bit in the Common FIFO Configuration/Control Register. If this bit is cleared, the GW FIFO becomes empty as follows:

- Immediately if the message from the GW FIFO is neither scheduled for the next transmission nor in transmission
- Following the transmission completion, the detection of an error on the CAN bus, loss of arbitration or transition to Channel or Global Halt mode if the transmission from the GW FIFO is already scheduled for transmission or already in transmission

Other possible messages pending from the GW FIFO are lost.

Before CFDCFCCn.CFE is set again, ensure that the CFDCFSTSn.CFEMP bit is set and that there is no pending abort from the GW FIFO.

When the CFDCFCCn.CFE bit is cleared and the CFDCFSTSn.CFEMP bit is set, the message read and write pointers of the GW FIFO are cleared and are no longer active. Therefore, all messages in the GW FIFO buffers are lost and no further message can be stored into the GW FIFO.

In applications intended to be used as CAN-to-CAN gateways, it is useful if the Error State Indication (ESI) information of the routing messages is not replaced by the sending node Error State Indication. For this, each channel has the control function register CFDCnFDCFG.ESIC to replace their own ESI information by the routing ESI information.

Note: If the sending node is error passive, the ESI bit is sent anyway as error passive (ESI = 1).

(3) Interval Timer for FIFO Transmission

For each Common FIFO in TX or GW mode, it is possible to specify a delay between two consecutive messages that are configured for transmission from the same FIFO buffer. This delay is called interval time. This interval time starts after the first message has been successfully transmitted from the FIFO buffer after the CFDCFCCn.CFE bit is set.

When the Common FIFO in TX or GW mode is enabled, the first message is transmitted without considering this interval time.

The interval timer stops counting when:

- FIFO is disabled by clearing the CFDCFCCn.CFE bit
- CAN channel is in CH_RESET mode

The interval time is specified by the CFDCFCCn.CFITT value in the Common FIFO Configuration/Control Register and can be specified from 0 to 255 timer units.

The timer unit can be defined based on two different source clocks for the interval timer. To disable the interval timer for FIFO transmission, a value of 0 should be selected.

The timer source can be selected by the configuration bit CFITSS in the Common FIFO Configuration/Control Register. For the timer source the CAN bit timing clock of the FIFO related channel or a global reference clock can be selected.

If CAN channel bit time clock is configured as clock source and the CAN channel enters CH_HALT or CH_RESET or CH_SLEEP mode, the interval timer is stopped for that channel.

If peripheral clock is selected as interval timer clock source, then the interval timer is stopped only when the CAN channel is in CH_RESET or CH_SLEEP mode.

The reference clock can be used to configure the interval time in fixed time units. It is based on the peripheral clock. The reference clock prescaler value CFDGCFG.ITRCP in the Global Configuration Register defines the relation between the peripheral clock frequency/period and the reference clock period.

See **Table 30.38** for CFDGCFG.ITRCP configuration values to achieve different reference clock periods based on the peripheral clock frequency/period.

Table 30.38 Configuration Example for the FIFO Interval Timer Reference Clock

	Reference Clock		
Peripheral Clock (PCLKM)	1 µs	100 µs	500 µs
80 MHz / 12.5 ns	80	8000	40000
100 MHz / 10 ns	100	10000	50000

Additionally, the reference clock resolution can be specified by the interval timer reference clock resolution value CFDCFCCn.CFITR in the Common FIFO Configuration/Control Register.

The interval time is based on the reference clock period multiplied by the configured value (×1 or ×10).

The reference clock based interval timer can be used to follow the requirements of the ISO 15765-2 Separation Time. The whole range for the separation time from 100 µs to 127 ms can be covered.

The specified interval time starts after successful transmission event (after EOF7 state of the CAN protocol).

When the interval time has elapsed, the next transmission request is raised by the related TX/GW FIFO. Therefore, the interval time defines the minimum time between two messages transmitted from one FIFO.

The next message is sent at earliest after this interval time.

Figure 30.45 shows an example timing of the internal processing.

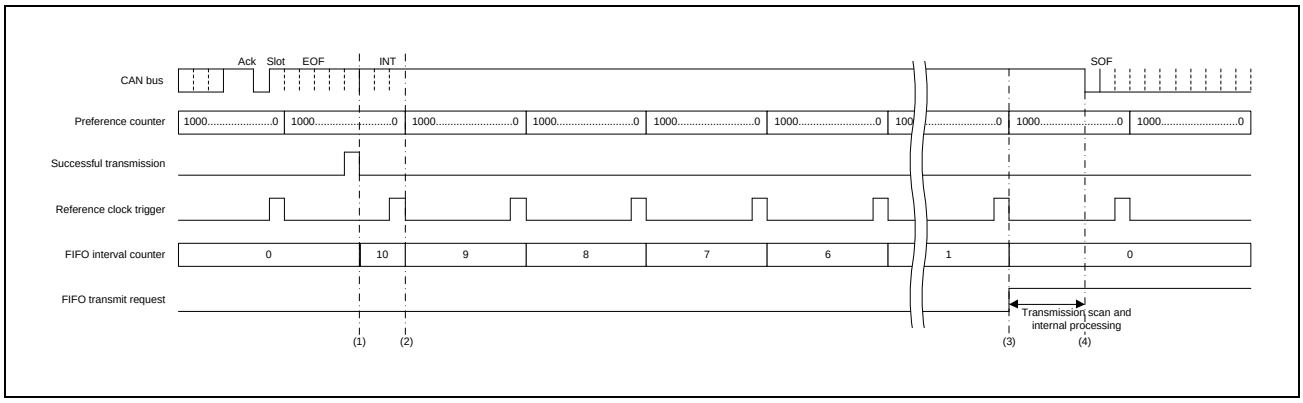

Figure 30.45 Example for Interval Processing Time

The configuration for the above timing is as follows:

- Peripheral clock frequency = 100 MHz
- Interval timer reference clock (CFDGCFG.ITRCP) = 1000 times
- Reference clock due to the above settings = 10 µs
- Common FIFO interval timer source selection (CFDCFCCn.CFITSS) = 0
- Common FIFO interval timer resolution (CFDCFCCn.CFITR) = 0
- Common FIFO interval transmission time (CFDCFCCn.CFITT) = 10 times
- Theoretical message separation interval = 100 µs

1. Internal FIFO interval timer is restarted with the occurrence of successful transmission result. This restart is not synchronized to the reference clock trigger. Therefore, the first interval is counting less or equal to one reference clock interval.
2. With the next reference clock trigger, the FIFO interval timer is decremented.
3. When the FIFO interval timer reached the value 0 the FIFO transmit request is set.
4. When the FIFO is selected for transmission, the transmission starts. Due to internal processing this usually takes less than 3 CAN bit time, between internal FIFO transmit request set 3 and actual transmission.

In the worst case when multi events such as reception scan, internal message routing, transmit scan on all channels occur, then it can take up to 432 peripheral clock cycles.

As shown in **Figure 30.45**, it is not guaranteed that the minimum interval is always equal to the configured value. If a minimum time must never be breached, configure CFDCFCCn.CFITT to the required minimum value + 1.

If additional TX message buffers or TX/GW FIFOs are configured for transmission for the same channel, the real delay between two messages transmitted from a TX FIFO can be much longer than specified by the interval time due to higher priority message transmission from these TX message buffers or TX/GW FIFOs.

Figure 30.46 shows a block diagram of the FIFO interval time generation circuit.

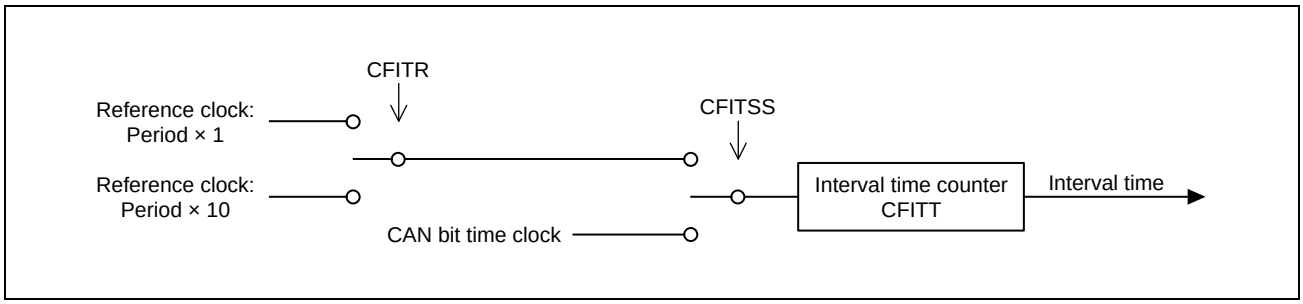

Figure 30.46 Block Diagram of FIFO Interval Timer

30.8.2.4 TX Queue

Each enabled TX Queue for a specific channel consists of 3 to 32 TX message buffers, which are accessed by one access window. One channel has 4 TX Queues. One TX Queue can be configured with a depth of 3 up to 32 buffers and it uses TX Message Buffer No. 0 as access window (referred to as TXQ0). The second TX Queue can be configured with a depth of 3 up to 32 buffers and it uses TX Message Buffer No. 31 as access window (referred to as TXQ1). The third TX Queue can be configured with a depth of 3 up to 32 buffers and it uses TX Message Buffer No. 32 as access window (referred to as TXQ2). The fourth TX Queue can be configured with a depth of 3 up to 32 buffers and it uses TX Message Buffer No. 63 as access window (referred to as TXQ3).

All TXQ0, TXQ1, TXQ2, and TXQ3 messages enter the priority comparison for the transmission, which should be only ID Priority (CFDGCFG.TPRI = 0).

The registers for TXQ0 are CFDTXQCC0n, CFDTXQSTS0n, and CFDTXQPCTR0n.
The registers for TXQ1 are CFDTXQCC1n, CFDTXQSTS1n, and CFDTXQPCTR1n.
The registers for TXQ2 are CFDTXQCC2n, CFDTXQSTS2n, and CFDTXQPCTR2n.
The registers for TXQ3 are CFDTXQCC3n, CFDTXQSTS3n, and CFDTXQPCTR3n.

When access window TX Message Buffer No.63 (TXQ3) or TX Message Buffer No.32 (TXQ2) or TX Message Buffer No.31 (TXQ1) or TX Message Buffer No.0 (TXQ0) is used, refer to the related access registers TX Message Buffer ID Registers (CFDTMIDn), TX Message Buffer Pointer Registers (CFDTMPTRn), TX Message Buffer Data Field 0 Registers (CFDTMDF0_n), and TX Message Buffer Data Field 1 Registers (CFDTMDF1_n).

The depth of each TXQ0 buffer can be configured by writing to the CFDTXQCC0n.TXQDC[4:0] bits of the TX Queue Configuration/Control Register.

TXQ0 can set from TXMB0 to TXMB31 as a queue buffer at the maximum.

The 31 available options for depth configuration are:

- H’00: TX Queue disabled
- H’01: Reserved
- H’02: 3 messages
  ⋮
- H’1D: 30 messages
- H’1E: 31 messages
- H’1F: 32 messages

The depth of each TXQ1 buffer can be configured by writing to the CFDTXQCC1n.TXQDC[4:0] bits of the TX Queue Configuration/Control Register.

TXQ1 can set from TXMB31 to TXMB0 as a queue buffer at the maximum.

The 31 available options for depth configuration are:

- H’00: TX Queue disabled
- H’01: Reserved
- H’02: 3 messages
  ⋮
- H’1D: 30 messages
- H’1E: 31 messages
- H’1F: 32 messages

The depth of each TXQ2 buffer can be configured by writing to the CFDTXQCC2n.TXQDC[4:0] bits of the TX Queue Configuration/Control Register.

TXQ2 can set from TXMB32 to TXMB63 as a queue buffer at the maximum.

The 31 available options for depth configuration are:

- H’00: TX Queue disabled
- H’01: Reserved
- H’02: 3 messages
  ⋮
- H’1D: 30 messages
- H’1E: 31 messages
- H’1F: 32 messages

The depth of each TXQ3 buffer can be configured by writing to the CFDTXQCC3n.TXQDC[4:0] bits of the TX Queue Configuration/Control Register.

TXQ3 can set from TXMB63 to TXMB32 as a queue buffer at the maximum.

The 31 available options for depth configuration are:

- H’00: TX Queue disabled
- H’01: Reserved
- H’02: 3 messages
  ⋮
- H’1D: 30 messages
- H’1E: 31 messages
- H’1F: 32 messages

When using TXQ1 and TXQ0 simultaneously, the depth of TXQ is 32 or less in total.

When using TXQ3 and TXQ2 simultaneously, the depth of TXQ is 32 or less in total.

Do not access all the TX message buffers forming the TX Queue directly (except TX Message Buffer No. 63, TX Message Buffer No. 32, TX Message Buffer No. 31 and TX Message Buffer No. 0, which acts as TX Queue access window).

When CFDGAFLP0n.GAFLSRD i (i = 0 to 2) is set and the CFDTXQCCin.TXQGWE (i = 0 to 2, n = 0, 1) is also set, a receiving frame is stored in the target TXQ as send data by routing.

When CFDTXQCCn.TXQOWE bit is 1, the TX Queue is in TX Queue overwrite mode. If the message of the same ID is stored in TX Queue when a frame is received and it is stored in TX Queue, an old message is overwritten by a new message. Therefore, an old message is not transmitted. When the old message of the same ID is transmitting and a CAN bus error and an arbitration-lost occur, the message of old ID is not resent.

When using the function in GW mode and TX Queue overwrite mode, the depth of TXQ (CFDTXQCC0n.TXQDC) should be configured to the value which is the various number of ID that is used in the TX Queue plus 3. If it accesses by routing in gateway mode when a TXQ buffer is full, CFDTXQSTS.TXQMLT is set and send data is thrown away.

The function is valid for the standard ID frame and is invalid for the extended ID frame.

Explanation of operation of the TX Queue with same ID over-writing function in GW mode is shown in **Figure 30.47**.

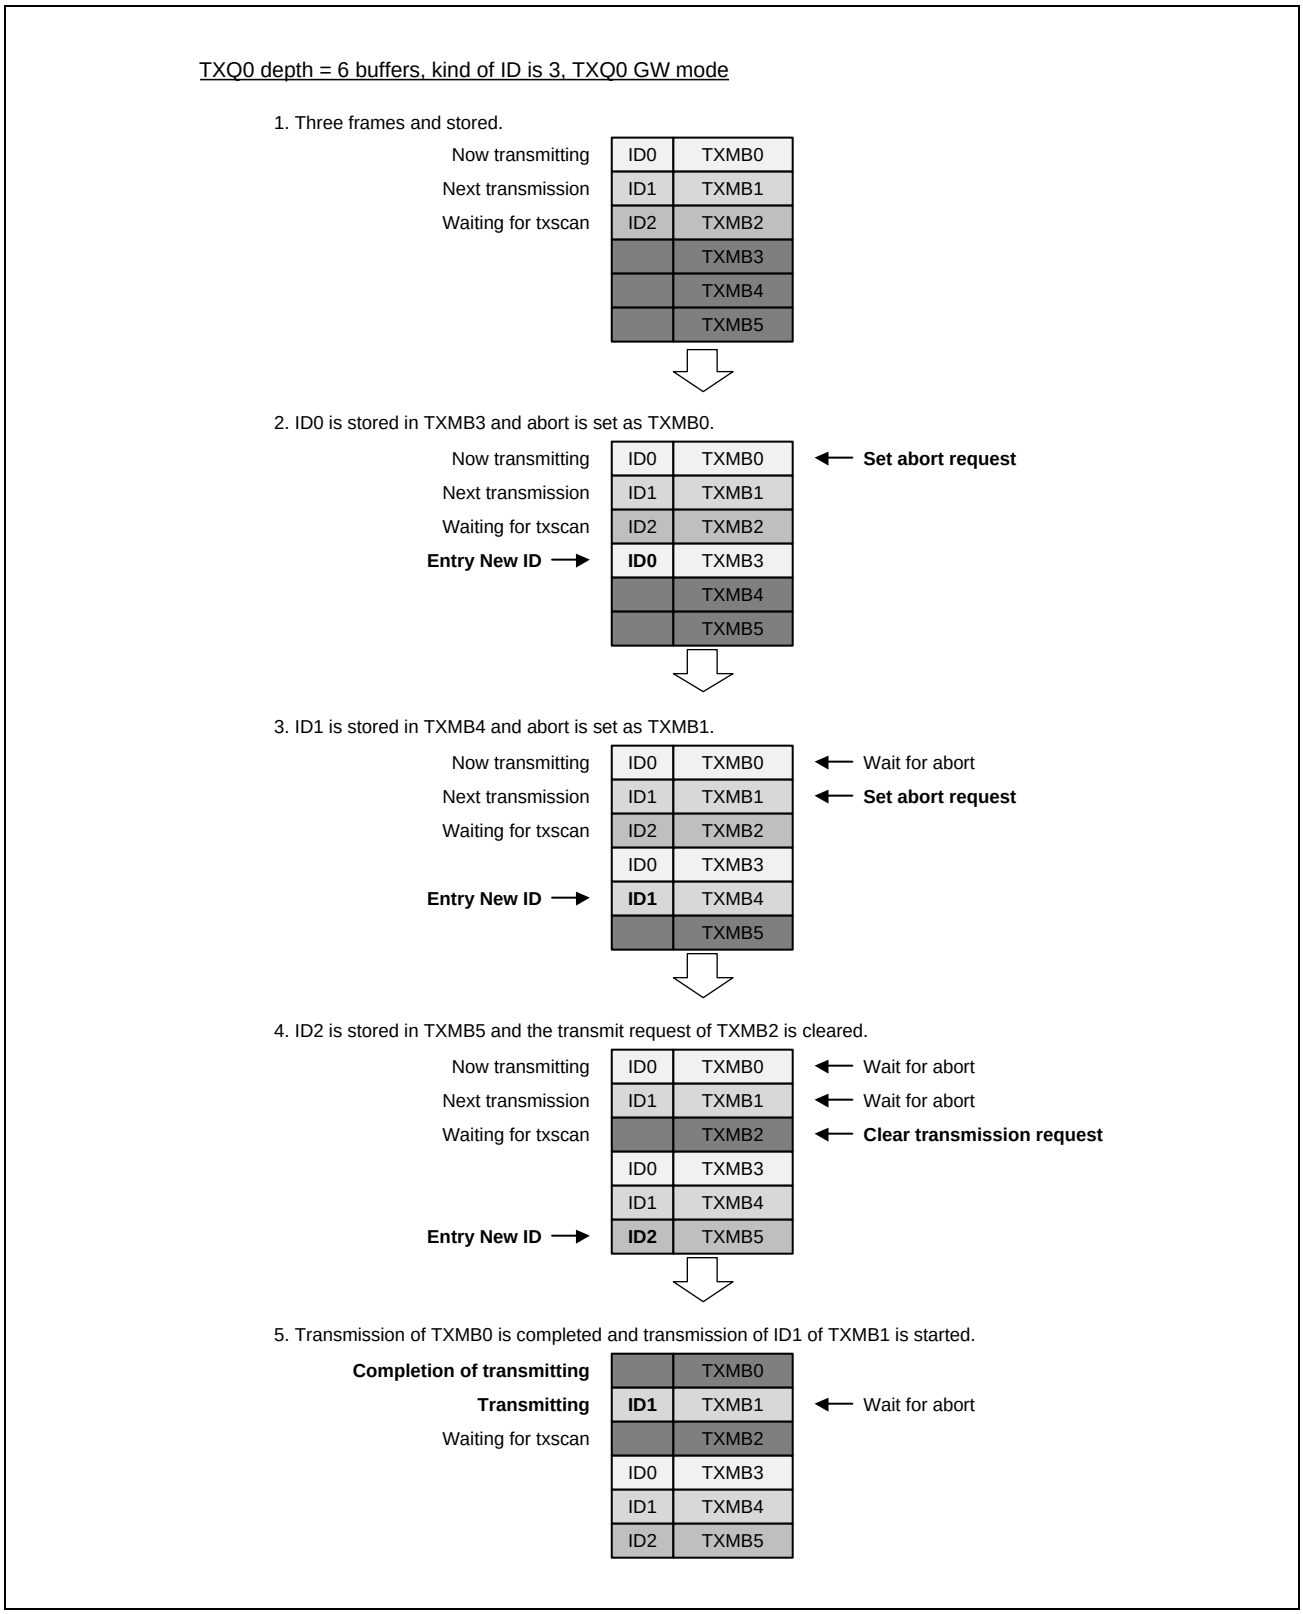

Figure 30.47 Operation of TXQ0 in Gateway Mode

When a system writes in TXQ, a system should write in send data, after checking the state of TXQ.

Do not access or configure the related TX Message Buffer Control Registers.

The messages stored to the TX Queue access window are internally stored to a free buffer of the TX Queue.

When the buffer is full then no further access should be done to the queue, until it is no longer full. If it accesses by software writing in when the buffer of TXQ is full, send data is overwritten.

The TX Queue can be disabled by clearing the TXQE bit in the TX Queue Configuration/Control Register. If this bit is cleared, the TX Queue Empty flag is set as follows:

- Immediately if the message from the TX Queue is neither scheduled for the next transmission nor in transmission
- Following the transmission completion, the detection of an error on the CAN bus, loss of arbitration or transition to Channel or Global Halt mode if the transmission from the TX Queue is already scheduled for transmission or already in transmission.

Note: The TX Queue is disabled only when the Empty flag is set after clearing the TXQE bit for the corresponding TX Queue.

Other possible messages pending from the TX Queue are lost and their transmission must be requested again.

Before TXQE is set again, ensure that the CFDTXQSTSn.TXQEMP bit is set and that there is no pending abort from the TX Queue.

When the TXQE bit is cleared, all messages in the TX Queue buffers are lost and no further message should be stored into the TX Queue.

When a message has been stored to the TX Queue, H’FF must be written into the TX Queue Pointer Control Register. This sets the transmit request automatically and changes the internal message buffer pointer to the next free message buffer location of the TX Queue.

Note: If two messages with the same identifier are stored in the TX Queue, then the order of transmission of these messages can be different from the order in which they were stored in the TX Queue.

To avoid this condition, it is important to confirm that the previous message with the same ID was successfully transmitted before a new message with the same identifier is stored in the TX Queue. Or if TX queue overwrite mode is used, the frame of the same ID is rewritten on a new frame.

For the TX Queue a dedicated interrupt can be enabled by setting the TXQIE bit of the TX Queue Configuration/Control Register.

The interrupt mode can be configured with the CFDTXQCCn.TXQIM bit of the same register either to generate an interrupt for every transmitted message or for the last transmitted message.

The TX Queue transmission request procedure after configuration is shown in **Figure 30.48**.

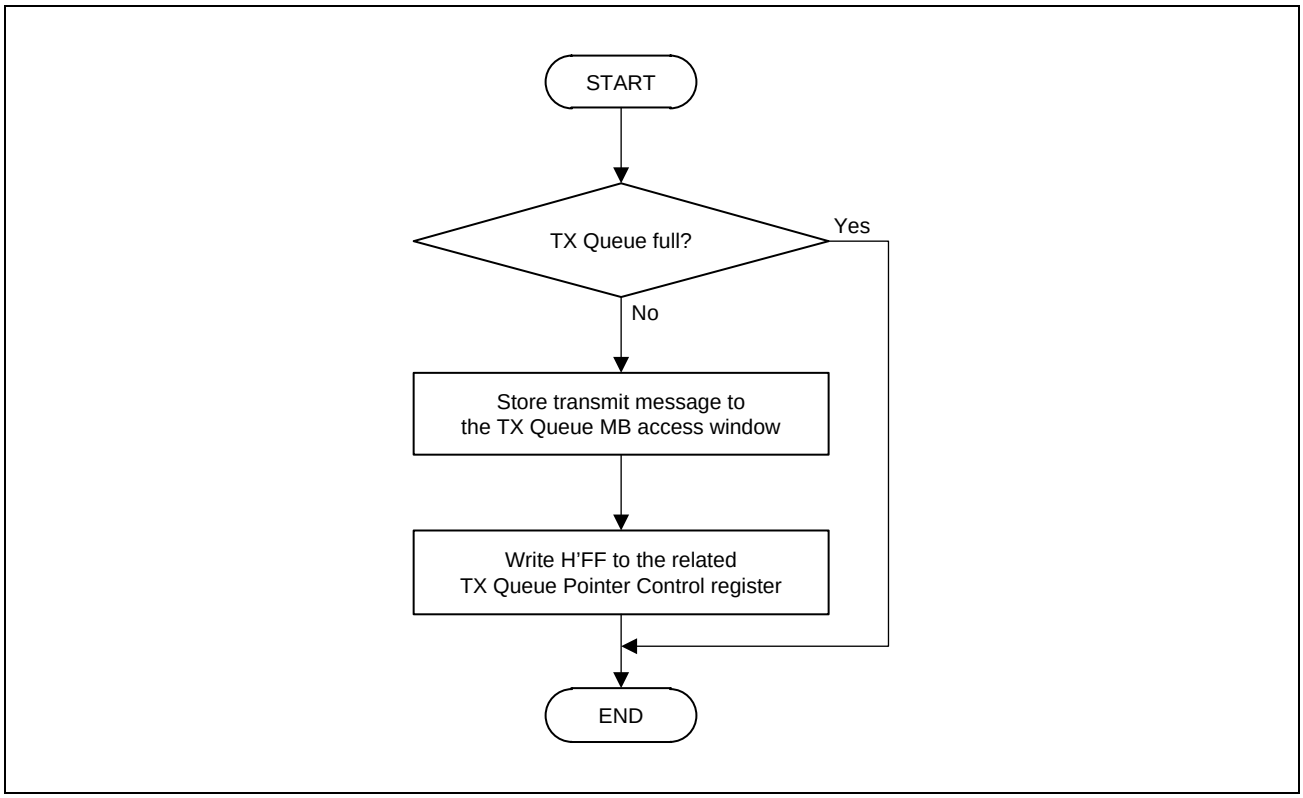

Figure 30.48 TX Queue Transmission Request

TXQ Name	Access Window	Range Width	Direction	Hardware Routing Access Point	CPU Access Point	DMA Access Point	Note
TXQ0	TXMB0	0, 3 - 32	TXMB0 → TXMB31	Yes	Yes	Yes	When using both TXQ0/1, the total number of stages is 32 or less
TXQ1	TXMB31	0, 3 - 32	TXMB31 → TXMB0	Yes	Yes	No	
TXQ2	TXMB32	0, 3 - 32	TXMB32 → TXMB63	Yes	Yes	No	When using both TXQ2/3, the total number of stages is 32 or less
TXQ3	TXMB63	0, 3 - 32	TXMB63 → TXMB32	No	Yes	Yes	

TXQ0 can use hardware routing, CPU access, and DMA access.

Hardware routing access, CPU access, and DMA access should not be used simultaneously. Choose one access method.

30.8.2.5 TX History List

The TX History List function records the information of the successfully transmitted message in the TX History List buffers for each CAN channel. Two TX History List buffers are provided for each CAN channel and each TX History List buffer can store up to 16 TX History List entries for a CAN channel.

The CFDTHLCCn.THLDTE bit of the TX History List Configuration/Control Register can be used to configure if only message information from TX FIFOs/TX Queue is stored or if all transmit message information from TX Queue, TX FIFO or normal TX message buffers should be stored in the TX History List for a CAN channel.

When a CFDTHLCCn.THLDGE bit is set up, the information on all the frames transmitted in GW mode is stored in TX History List.

Each transmit message can be individually configured for acceptance to the TX History List by the CFDCFID.THLEN bit in the Message Buffer Pointer Register.

The message information is stored to the TX History List Buffer of a CAN channel after the message is successfully transmitted on that CAN channel.

Storing to the List is not synchronized with the status of CFDTMSTSn.TMTRF[1:0] bits in the TX Message Buffer Status Register.

Due to internal processing, the storage to the List can happen with a delay after the successful transmission indication.

Storing the TX History List data can be recognized by the condition that the THLIF bit is set to 1 when the THLIE is configured to 1 or when the TX History List counter CFDTHLSTSn.THLMC[5:0] is increased.

The delay time is dependent on the number of channels due to internal processing.

- Maximum delay time from setting the CFDTMSTSn.TMTRF to storing the TX History List data is 224 peripheral bus clock cycles.

The History list records the following information of the transmitted message:

- Buffer type:
  - 001b: TX Message Buffer
  - 010b: TX FIFO
  - 100b: TX Queue
- Buffer number:
  TX Message Buffer, TX Queue Message Buffer or TX Message Buffer Link for the Common FIFO Buffer from which the transmission occurred. The number depends on the buffer type, see **Table 30.39**.
- Transmission ID:
  Transmission pointer stored in the transmission message
- Transmit timestamp:
  Message timestamp captured at the capture point as configured by CFDGFDCFG.TSCCFG.
- Transmission information label:
  Transmission information label stored in the transmission message.
- Transmit gateway buffer indication:
  For data transmitted from the gateway, CFDTHLACC0n.TGW bit is set to 1.

Table 30.39 TX History List Buffer Number Entry

CFDTHLACC0n.BT[2:0] Buffer Type		
001b	101b	100b
TX Message Buffer	TX FIFO	TX Queue
TXMB0	Number shown corresponds to the common FIFO. TX Message Buffer Link CFTML of the related Common FIFO Configuration	Number shown corresponds to the message buffer belonging to the TX Queue for which the frame was transmitted.
TXMB1		
TXMB2		
TXMB3		
⋮		
TXMB30		
TXMB31		
TXMB32		
TXMB33		
TXMB34		
⋮		
TXMB61		
TXMB62		
TXMB63		

The Transmission ID entry is used to identify which message of a TX FIFO or TX Queue has been successfully transmitted because the TX FIFO or TX Queue number alone is not sufficient.

Therefore, a unique number can be attached to each transmission message stored in a TX FIFO or TX Queue. This unique identification number should be written to the CFDCFFDCSTSn.CFPTR[15:0] part of the Common FIFO Access Pointer Register for a TX FIFO or to the CFDTMFDCTRn.TMPTR[15:0] part of the TX Message Buffer Pointer Register of the TX Queue access window message buffer.

When the message is successfully transmitted, the identification number is then stored together with the other message related information to the TX History List and can be read with the Transmission ID (TID) of the TX History List Access Register.

Also for normal TX message buffers, the CFDTMFDCTRn.TMPTR[15:0] part of the TX Message Buffer Pointer Register is stored in the Transmission History List. Information label is the same.

Figure 30.49 shows a transmission preparation flow when TX History List is used.

Read access to the TX History List Access Register is done for every single entry.

After reading one entry, H’FF must be written to the corresponding TX History List Pointer Control Register to be able to access the next entry until TX History List is empty.

Figure 30.50 shows an example flow for processing the TX History List information.

The TX History Lists have dedicated interrupts, which can be configured with the CFDTHLCCn.THLIM bit of the corresponding TX History List Configuration/Control Registers and enabled with the CFDTHLCCn.THLIE bit of the same registers, either to generate an interrupt when the history list reached a filling level of 75% or for every new TX History List entry.

An entry lost indication is flagged by the CFDTHLSTSn.THLELT bit in the TX History List Status Register.

Status of this bit is also shown by the THLES bit in the Global Error Flag Register.

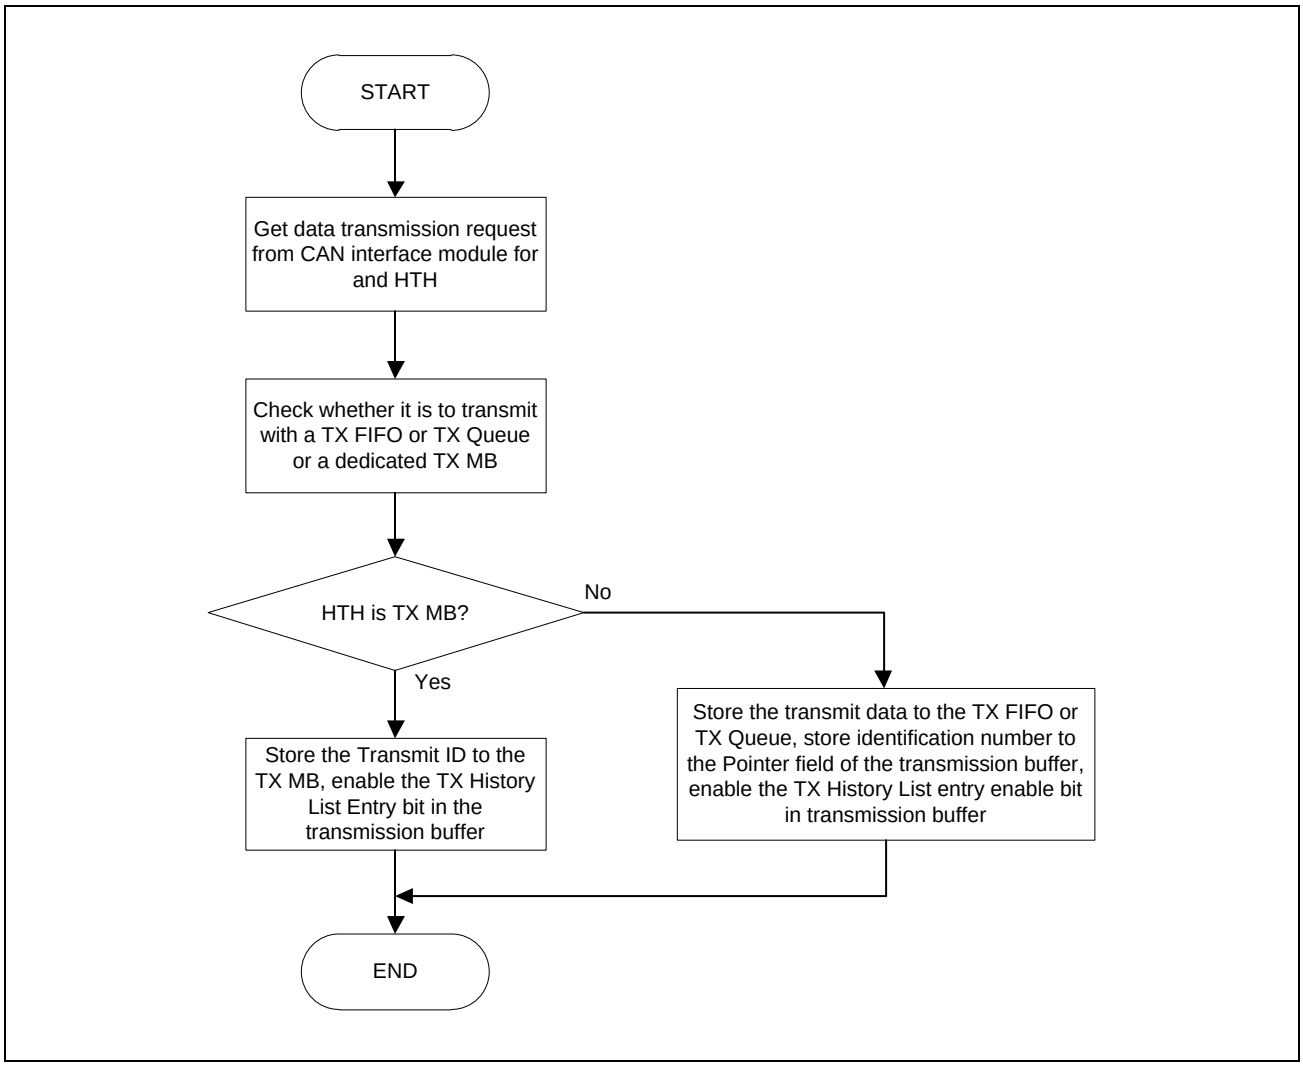

Figure 30.49 Transmission Preparation Flow when TX History List is Used

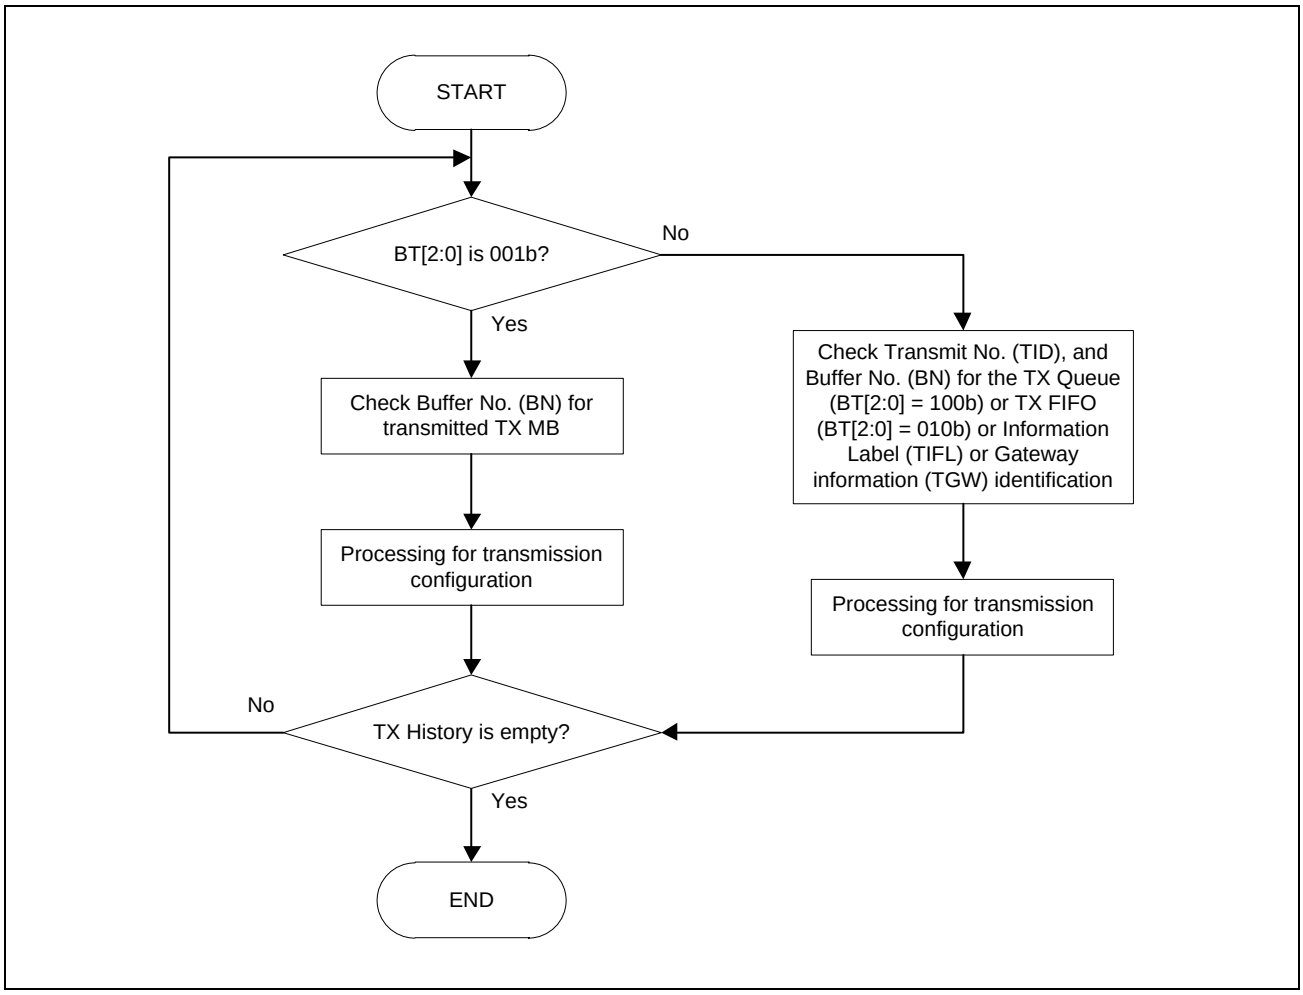

Figure 30.50 Example Flow for Processing TX History List Information

30.8.2.6 TX Data Padding

If the data length code (DLC) of the transmitting message has a higher number of data bytes than the buffer size, then the data bytes beyond the restricted range are replaced by bytes with the value of CC HEX.

This can happen for Common FIFOs configured as (TX or GW) when the transmit message DLC is higher than CFDCFCCn.CFPLS.

30.9 Test Mode

The CAN-FD module can be configured into test modes to allow testing of certain features. These features are provided only for special purposes and care must be taken when configuring the CAN-FD module in test modes.

All test modes are mutually exclusive unless it is explicitly stated that some functions can be enabled across other test modes.

Do not enable any combinations of the various test modes specified in this section.

The test modes can be broadly split into 2 groups:

- Channel specific test modes
- Global test modes

30.9.1 Channel Specific Test Modes

Each CAN channel can be configured into the following test modes:

- Basic test mode
- Listen-only mode
- Self-test mode 0 (External Loop Back mode)
- Self-test mode 1 (Internal Loop Back mode)
- Restricted operation mode

30.9.1.1 Basic Test Mode

The Basic test mode should be used when a particular test setting must be enabled other than when in Listen-Only and Self- test modes.

30.9.1.2 Listen-Only Mode

The ISO 11898-1 recommends an optional Bus-monitoring mode. In this mode, the CAN channel is able to receive valid data frames and valid remote frames. However, it sends only recessive bits on the CAN bus and is not allowed to transmit.

If the CAN engine is required to send a dominant bit (ACK bit, Overload flag, Active Error flag), the bit is routed internally so that the CAN engine monitors this as dominant. The external TX pin remains in recessive state.

This mode can be used for baud rate detection. In this mode, an error interrupt is generated if a bus error occurs and the interrupt is enabled.

In this mode, it is not permitted to request transmission from any normal TX Message Buffer or TX-/GW-FIFO of this channel.

Note: If a message is stored in GW FIFO or Routing TXQ, ensure that the transmitting channel is not in Listen-only mode so that transmission is not requested for this channel from the GW FIFO or Routing TXQ.

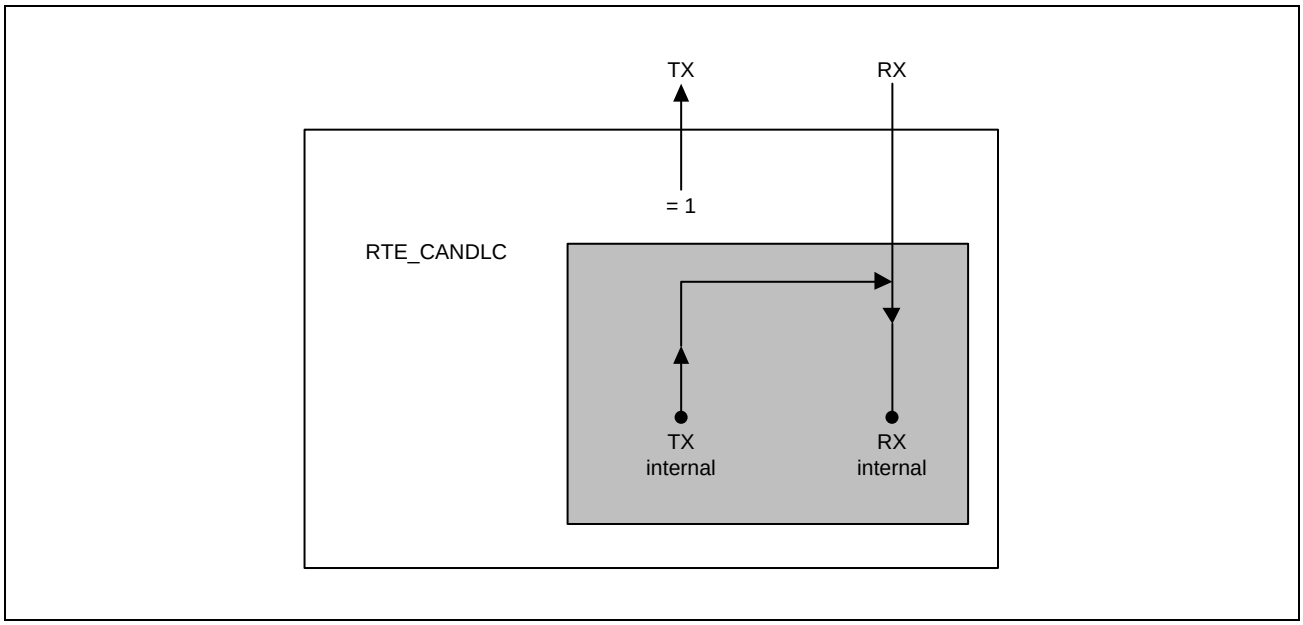

Figure 30.51 Listen-Only Mode

30.9.1.3 Self-Test Mode 0 (External Loop Back Mode)

In Self-test mode 0, the CAN engine treats its own transmitted messages as received messages through the CAN transceiver and can store them into its receive message buffers.

To be independent from external stimulation, the engine generates its own Acknowledge bit.

This test can be used for CAN transceiver tests.

The RX/TX pins should be connected to the transceiver.

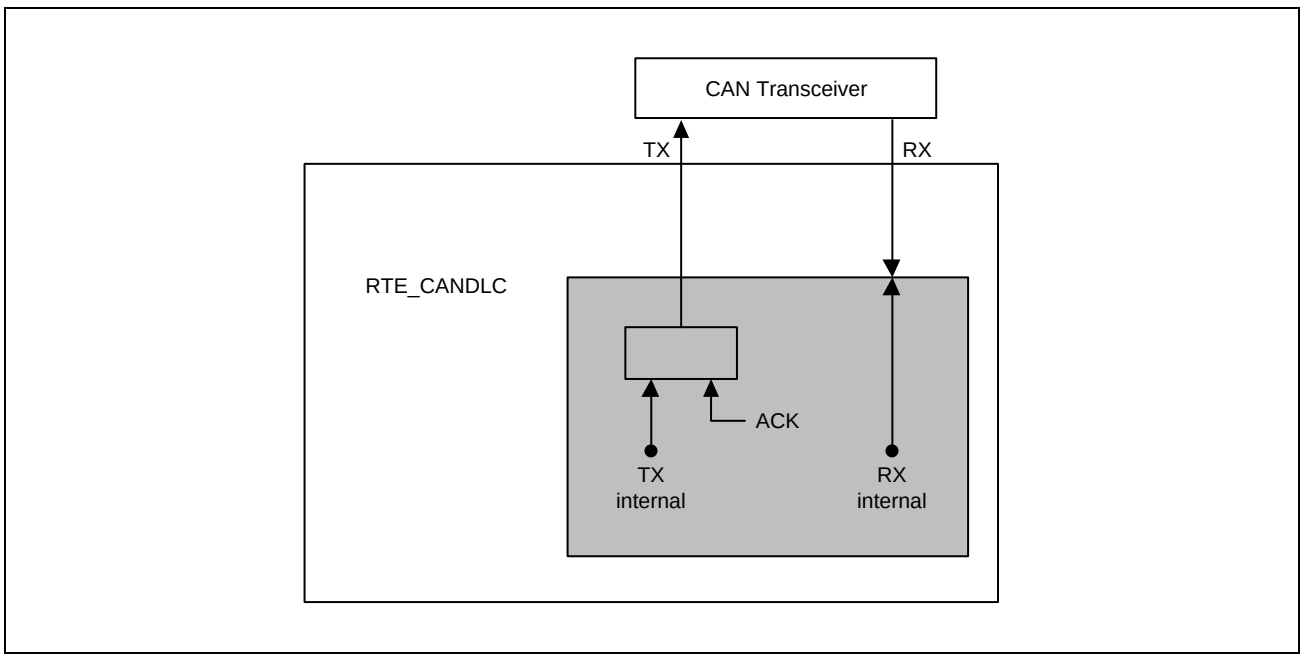

Figure 30.52 Self-Test Mode 0 (External Loop Back Mode)

30.9.1.4 Self-Test Mode 1 (Internal Loop Back Mode)

In Self-test mode 1, the CAN engine treats its own transmitted messages as received messages and stores them into the receive buffer. This mode is provided for self-test functions. To be independent from external stimulation, the CAN engine generates its own Acknowledge bit. In this mode the CAN engine performs an internal feedback from TX internal to RX internal. The actual value of the external RX input is disregarded by the CAN engine.

The external TX pin outputs only recessive bits.

The RX/TX pins do not need to be connected to the CAN bus or any external device.

Note: The channel pins are also disconnected from the internal CAN bus communication line.

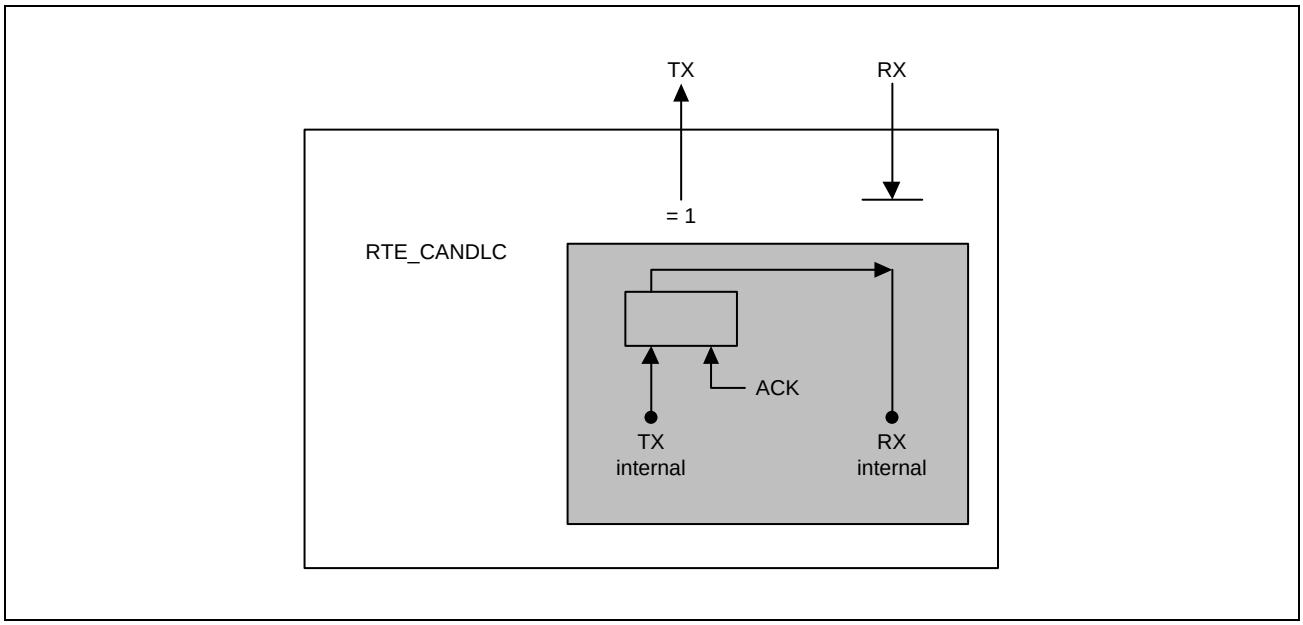

Figure 30.53 Self-Test Mode 1 (Internal Loop Back Mode)

30.9.1.5 Restricted Operation Mode

In Restricted operation mode, the CAN node is able to receive valid data and remote frames that generates the Acknowledge bit.

Active error and overload frames cannot be transmitted, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication after an error or overload condition occurs.

Additionally, the Receive and Transmit Error Counter (REC and TEC) are frozen independently from the occurrence of errors.

The mode is specified as in ISO 11898-1. However, it is permitted to set any requested transmit.

30.9.2 Global Test Modes

The CAN-FD module can be configured into the following test modes:

- RAM test mode
- Internal CAN bus communication mode
- CRC error test

These test modes are protected by a special software procedure to enable the mode. This software procedure enables write access to the test mode by a specific unlock key, the related unlock key can be seen in the following table.

Test Mode	Unlock Key 1	Unlock Key 2
RAM test mode	H'7575	H'8A8A

If the software sequence of the two consecutive unlock key write accesses (half-word or word accesses) is interrupted by any other write access to the SFR or if incorrect data is written to the Global Unlock Key Register then the corresponding test mode cannot be set and the sequence must be restarted.

After the two unlock key write accesses, the next write access should be to set the corresponding Test Mode Enable bit. If this is not followed, the unlock mechanism resets and the Test Mode Enable bit cannot be set. At this time, the unlock sequence must be restarted.

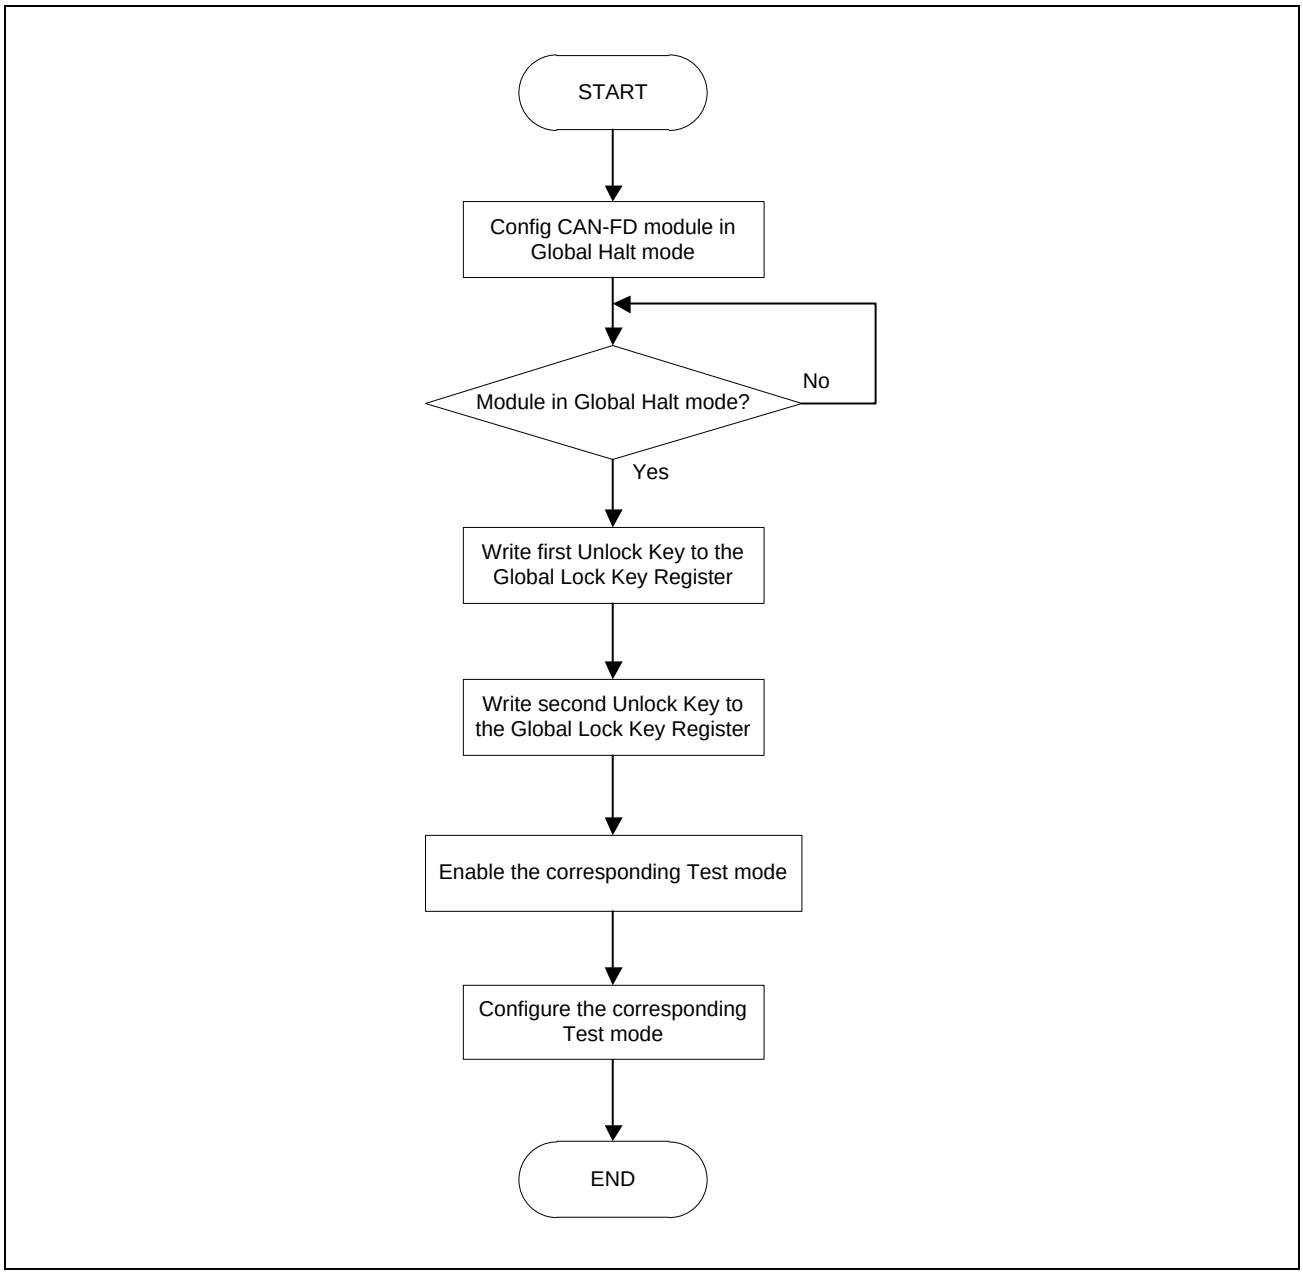

Figure 30.54 Unlock Software Protection Routine

30.9.2.1 RAM Test Mode

The CAN-FD module can be configured in RAM test mode by setting the CFDGTSTCTR.RTME bit in the Global Test Control Register when the corresponding lock key is previously written. This is a special test mode, in which, the complete RAM area can be accessed.

In this mode, the RAM area is split into number of pages (pn) of 256 bytes each. Which can be accessed with the CFDRPGACCn register.

The page should be selected for read/write access by writing to the CFDGTSTCFG.RTMPS[9:0] bits in the Global Test Control Register. Data can then be read from or written into the RAM Test Page Access Registers.

Figure 30.55 shows the structure of the pages in the RAM when performing a RAM test mode.

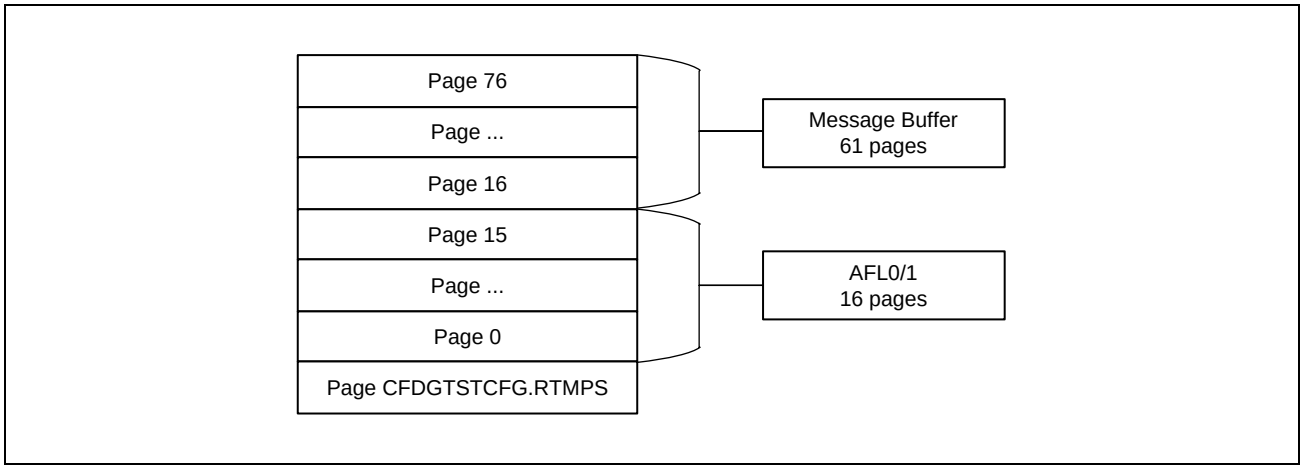

Figure 30.55 RAM Page Structure

The total available RAM size for a 2-CAN channel version is 4096 bytes for the AFL RAM and 15488 bytes for the Message Buffer RAM.

AFL RAM0/1 can treat RAM test mode as one RAM.

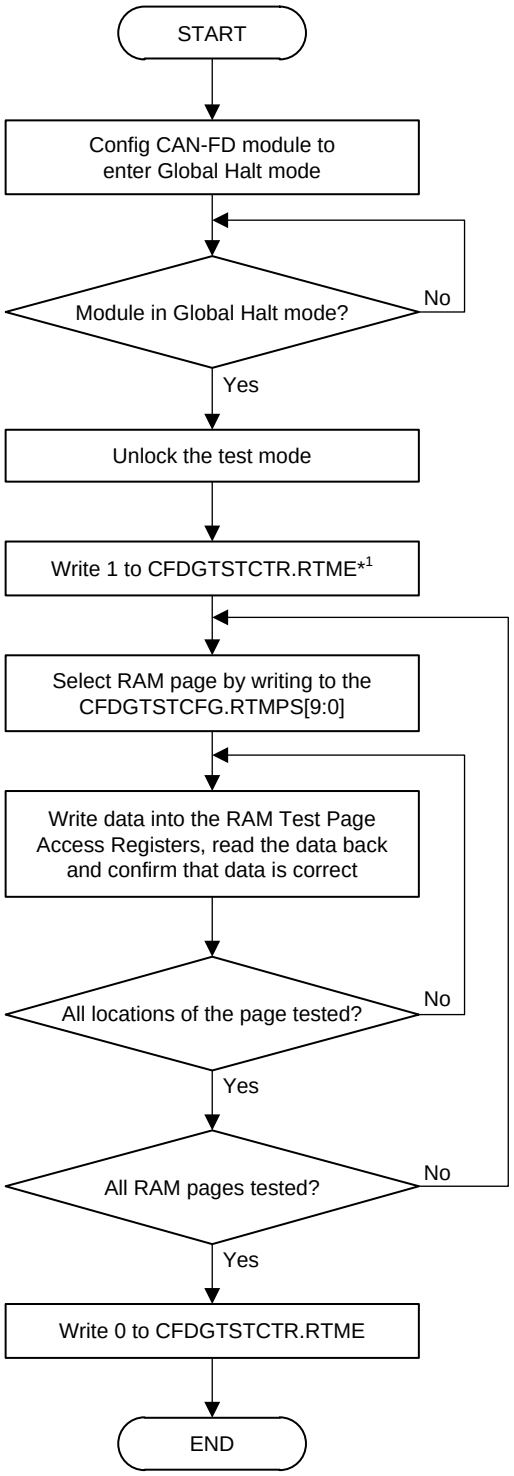
The number of pages (pn) and CFDGTSTCFG.RTMPS[9:0] values for the AFL and MB RAMs are calculated in the following way:

pn = ceil (total RAM size in bytes/number of bytes per page)

- AFL RAM:
  pn = ceil (4096/256) = 16 pages
  CFDGTSTCFG.RTMPS[9:0] = 0 to 15 (H’00F) inclusive
- MB RAM:
  pn = ceil (15488/256) = 61 pages
  CFDGTSTCFG.RTMPS[9:0] = 16 to 76 (H’04C) inclusive

Do not access more than 128 bytes of RAM on the last page (RTMPS[9:0] = H’04C).

Figure 30.56 shows the software flow for RAM test mode.



Note 1. Change into the following status before changing to RAMTEST.
- Cancel of a request of transmission
- Disable of all the FIFO and TXQ
- Clear of the receiving flag of a receiving buffer

Figure 30.56 Software Flow of RAM Test Mode

To exit this test mode, clear the CFDGTSTCTR.RTME bit. The CFDGTSTCTR.RTME bit is cleared by writing 0 to it.

The CFDGTSTCTR.RTME bit is cleared automatically when the CAN-FD module enters Global Reset mode from the test mode.

30.9.2.2 Internal CAN Bus Communication Mode

The CAN-FD module can be configured in Internal CAN bus communication test mode by setting the CFDGTSTCTR.ICBCTME bit in the Global Test Control Register. This is a special test mode, in which the CAN channels can be connected together internally to generate a CAN cluster within the CAN-FD module.

Only use the following sequence to enter Internal CAN bus communication test mode:

1. Configure all channels in Halt mode and check that all channels have entered Global Halt mode.
2. Write data into the Global Test Configuration Register to select the channels participating in the Internal CAN bus communication test.
3. Set the CFDGTSTCTR.ICBCTME bit of the Global Test Control Register.
4. Check that CFDGTSTCTR.ICBCTME bit is set in the Global Test Control Register.

In this mode, the TXD outputs of the channels participating (configured) in Internal CAN bus communication mode are connected together using AND gate. The output of the AND gate is connected to the RXD inputs of all participating channels to create a CAN cluster within the CAN-FD module. The channels are isolated from the external CAN bus while the CAN-FD module is in this test mode.

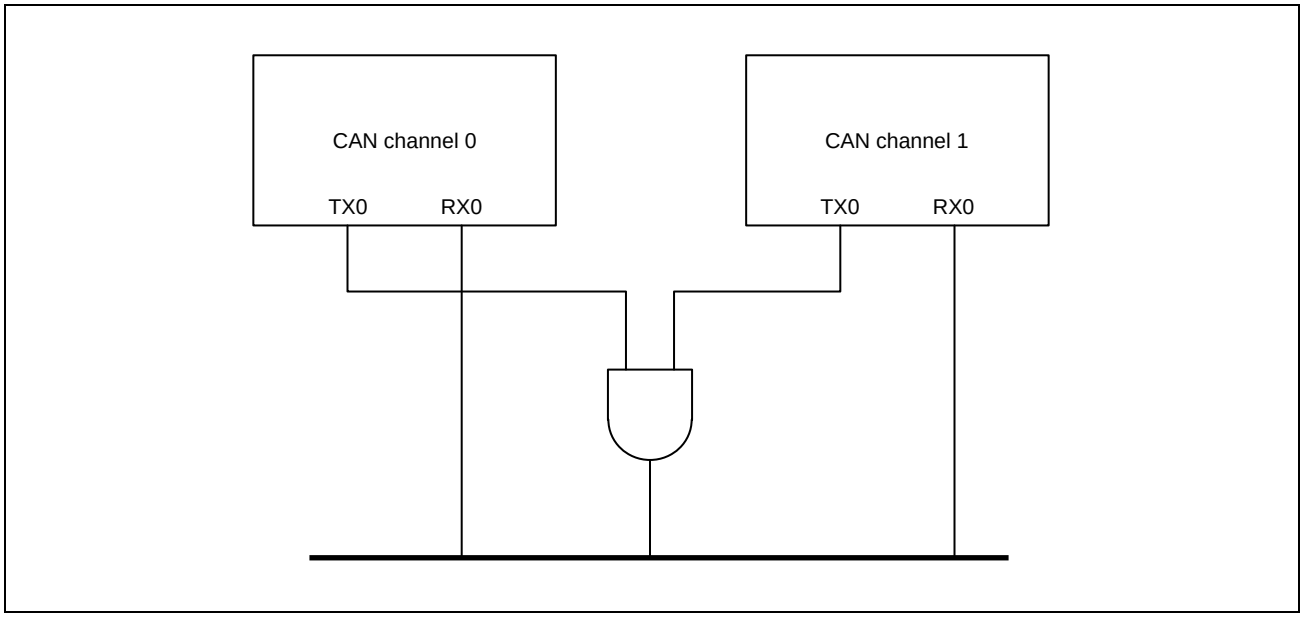


Figure 30.57 Internal CAN Bus Connections

The AFL, Flat RX message buffers, FIFO buffers, Flat TX message buffers, and various registers can now be configured as normal to start communication between channels.

The channels not participating in Internal CAN bus should only be configured in Halt mode.

30.9.2.3 CRC Error Test

After the CAN-FD module has been configured in Internal CAN bus communication test mode, use the following sequence to perform CRC error testing. In the following sequence, channel x is the reference transmitter CAN-FD module and channel y is the receiver CAN-FD module where (x, y = [0, …, n] and x ≠ y):

1. Configure channel x node to transmit one reference message.
2. Set the CFDCyCTR.CRCT bit to 1, in order to invert the first bit of the incoming bit stream from channel x.
3. Set the CFDTMCx.TMTR.
4. Read either CFDCyERFL.CRCREG or CFDCyFDCRC.CRCREG (depending on the received frame type: Classical or FD). The value should be different from the received CRC value of the reference message from channel x.
5. Check that CFDCyERFL.CERR is 1.

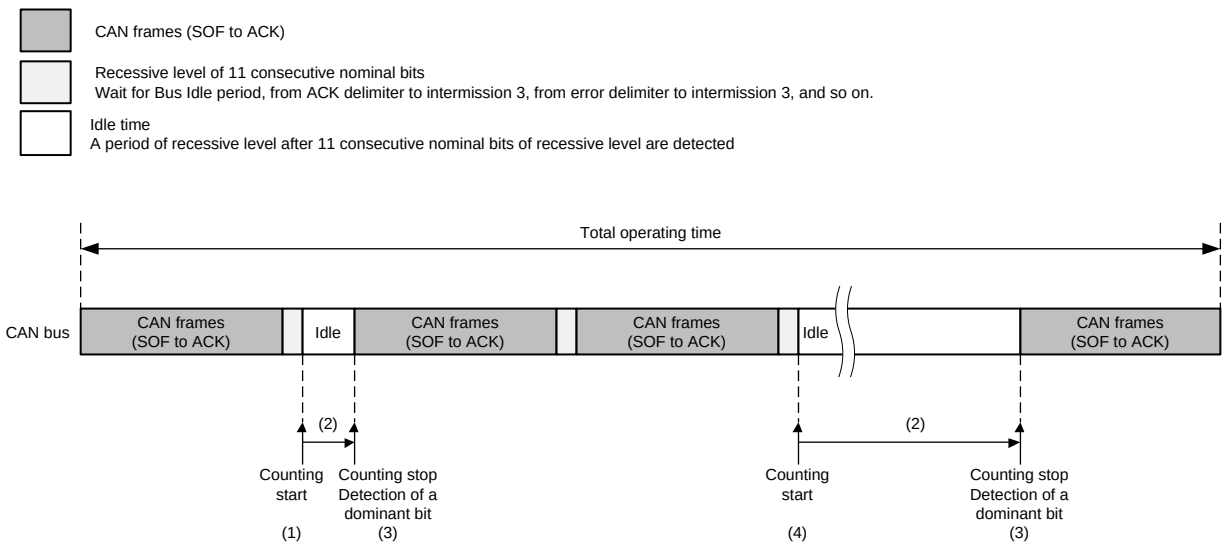
As the CRC generator logic is shared for RX and TX there is no need to create a separate TX CRC error test.

30.10 Bus Traffic Measurement

The idle time of the CAN bus can be measured using PCLKM or PCLKCAN. Bus traffic can be calculated based on the measurement results.

30.10.1 How to Count the CAN Bus Idle Time

Figure 30.58 shows the concept of measuring the idle time of the CAN bus.



(1) With the PCLKM clock, counting of the idle time starts after a recessive level input of 11 consecutive nominal bits are detected.
(2) The counting continues until a dominant level is detected on the CAN bus.
(3) The counting stops after a dominant level is detected on the CAN bus.
(4) After that, the counting restarts when 11 consecutive nominal bits are detected.

Figure 30.58 How to Measure Idle Time of the CAN Bus

30.10.2 Operations and Measurement Procedure

The following procedure is for measuring the idle time of the CAN bus.

1. The channel to be measured transits to operation mode.
2. Write 1 to CFDCnBLCT.BLCE bit to set the measuring counter to operating mode.
3. Write 1 to CFDCnBLCT.BLCLD bit to clear the counter register.
4. Detect a recessive level input of 11 consecutive nominal bits.
5. Start counting the bus idle time.
6. Detect a dominant level.
7. The counting stops.
8. Detect a recessive level input of 11 consecutive nominal bits.
9. The counting starts.

10. Write 1 to CFDCnBLCT.BLCLD bit to clear the counter register and simultaneously load the counter value to CFDCnBLSTS.
11. Read the value of CFDCnBLSTS.

To stop the measurement counter, write 0 to CFDCnBLCT.BLCE bit.

To initialize the counter, write 1 to CFDCnBLCT.BLCLD bit.

This measurement is enabled when the channel to be measured is in Operation mode.

When the relevant channels are in reset mode, the counter does not operate.

Also, accurate measurements are not available in test mode.

Write 1 to CFDCnBLCT.BLCLD bit to clear the counter register and simultaneously load the value of the counter to CFDCnBLSTS.

The lower 3 bits of CFDCnBLSTS are fixed to 0.

Based on the values of the counter, software can calculate the CAN bus traffic according to the following formulas:

$$\frac{(\text{Total operating time} - \text{Total idle time})}{\text{Total operating time}} = \frac{\text{Bus operating time}}{\text{Total operating time}} = \text{Bus usage ratio}$$

- Total idle time: a value read from CFDCnBLSTS × a clock cycle of PCLKM
- Total operating time: a setting interval of CFDCnBLCT.BLCLD bit

Example: Below is a calculation example under the following conditions:

- Conditions: nominal bit rate = 1 Mbps
- PCLKCAN clock = 40 MHz (= 25 ns)
- A setting interval of CFDCnBLCT.BLCLD bit = cycle of 1 ms
- A read value of CFDCnBLSTS register = H’4E20

$$\frac{(\text{Total operating time} - \text{Total idle time})}{\text{Total operating time}} = \frac{(1000000\ \text{ns} - 20000 \times 25\ \text{ns})}{1000000\ \text{ns}} = 50\%$$

31. Gigabit Ethernet Interface

Gigabit Ethernet Interface includes Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard. When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

Internal TCP/IP Offload Engine (TOE) calculates Checksum by hardware and has functions filtering Ethernet Frames and automatically responding specific frames. Dedicated Direct memory access controller (DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the URAM at high speed.

31.1 Features

31.1.1 Specification

- 2 channels
- Supports transfer at 1000 Mbps and 100 Mbps, 10 Mbps
- Supports filtering of Ethernet frames
- Supports interface conforming to IEEE802.3 PHY RGMII (Reduced Gigabit Media Independent Interface)
- Supports interface conforming to IEEE802.3 PHYMII (Media Independent Interface)

Table 31.1 lists the features of the Gigabit Ethernet Interface block.

Table 31.1 Specifications (Functions) (1/2)

IP Name	1. Function
E-MAC	(1) Transmission and reception of Ethernet (IEEE 802.3) frames (2) Supports transfer at 10, 100 and 1000 Mbps in Full-duplex Mode, 10, 100 Mbps in Half-duplex Mode (3) Flow control conforming with the IEEE 802.3x standard (4) Supports MII (Media Independent Interface) and RGMII (Reduced Gigabit Media Independent Interface) (5) Transmission/Reception Low Power Idle Code
TOE	(1) Calculation of Checksum for following part of frames – IPv4 Header – IPv4 TCP/UDP/ICMP – IPv6 TCP/UDP/ICMP (2) Filtering of Ethernet Frames The Possible Configuration of Filter Condition are followings. – Ethernet Type – IP Protocol No. – UDP destination port No. – Destination MAC address (Unicast) – Destination MAC address (Broadcast) – Destination MAC address (Multicast) – ARP Request of Local Station – Neighbor Solicitation of Local Station – Except IPv6 Next Header (Analyzable) (3) Automatically Responding to ARP Request and Neighbor Solicitation

Table 31.1 Specifications (Functions) (2/2)

IP Name	1. Function
DMAC	(1) Supports AXI for DMA (128bit data width) (2) Supports APB for register access (32bit data width) (3) Direct Memory Access between URAM and TOE/E-MAC by Descriptor Method (4) Supported Maximum Frame Size are followings. – Transmission Frame is 1.5 Kbytes – Reception Frame is 8 Kbytes

31.3 Register Configuration

31.3.1 Register Base Address

The base addresses of each channel are listed in the following table.

Table 31.3 Register Base Address

Register Name	Base Address Name	Base Address
ETH0	<ETH0_CA55_base>	H'0_11C3_0000
	<ETH0_CM33/CM33_FPU_S_base>	H'41C3_0000
	<ETH0_CM33/CM33_FPU_NS_base>	H'51C3_0000
ETH1	<ETH1_CA55_base>	H'0_11C4_0000
	<ETH1_CM33/CM33_FPU_S_base>	H'41C4_0000
	<ETH1_CM33/CM33_FPU_NS_base>	H'51C4_0000

Note: Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

31.3.2 IO Mode Registers

Refer to **Section 45, General Purpose Input Output Port (GPIO)** for Gigabit Ethernet Interface IO mode configuration.

31.3.3 DMAC Registers

Table 31.4 Configuration of DMAC-related Registers (From H'000 to H'4FF) (1/2)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
DMAC mode register	CCC	R/W	H'0000_0000	H'000	32
Descriptor base address table register	DBAT	R/W	H'0000_0000	H'004	32

31.4 Register Descriptions

31.4.1 DMAC Registers

31.4.1.1 DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the DMAC.

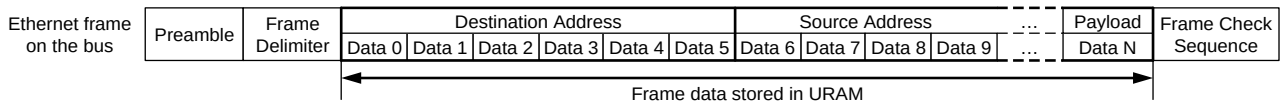
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	FCE	—	—	—	—	BOC	—	ERCS	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RDFD	DTSR	—	—	—	—	—	—	OPC[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25	FCE	0b	R/W	Flow Control Enable 0b Flow control disabled 1b Flow control enabled This bit enables the flow control support of E-MAC. When flow control is enabled, the E-MAC gets informed about the Reception FIFO level (Reception FIFO fill level reached RCR.RFCL).
24 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BOC	0b	R/W	Byte Order Configuration 0b First Ethernet byte in URAM [7:0] This bit defines the byte ordering of frame data in URAM in relation to the byte order in the Ethernet frame. The CPU can only write 0b to this bit.*1
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	ERCS	0b	R/W	Enable Reference 250 MHz Clock Stop function 0b Disable reference 250 MHz clock(clk_miitx_gtx_refclk) stop function. 1b Enable reference 250 MHz clock(clk_miitx_gtx_refclk) stop function. This bit enables the stop function of reference clock of Ethernet. When this bit is '1', Gigabit Ethernet Interface asserts Output Signal “refclk_stop_en” during it does not need reference clock. *Note*: If PHY does not support stopping TXC of RGMII Interface, set “0” to this bit. Because TXC is generated from clk_miitx_gtx_refclk. [Changing condition] This bit is set to 0b when RESET mode is entered.
17 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
9	RDFD	0b	R/W	Reception Descriptor Fetch Disable 0b Reception Descriptor Fetch Enable 1b Reception Descriptor Fetch Disable This register is used to stop the fetch of reception descriptor. By fetch stops, the state of Reception Descriptor Controller of DMAC will stop at IDLE. CSR.RDFDM indicates the current fetch status of reception descriptor. The CPU should not change any configuration or mode until CSR.RDFDM is updated once the Reception Descriptor Fetch Disable request is given. The CPU should not cancel the Reception Descriptor Fetch Disable request (set this bit to 0b) before CSR.RDFDM is read as 1b.
8	DTSR	0b	R/W	Data Transfer Suspend Request 0b Normal operation 1b Request suspension of data transfer This bit requests to suspend further Gigabit Ethernet Interface accesses to URAM. A currently on-going access is completed. CSR.DTS indicates the current suspend status. The CPU should not change any configuration or mode until CSR.DTS is updated once data transfer suspend request is given. The CPU should not cancel the data transfer suspend request (set this bit to 0b) before CSR.DTS is read as 1b.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	OPC	00b	R/W	OPeration Command 00b Enter RESET mode 01b Enter CONFIG mode 10b Enter OPERATION mode 11b Reserved These bits define the operating mode DMAC should enter. Refer to **Section 31.5.1, DMAC Operating Modes** for details about the operating modes. The CPU can write to these bits in any operating mode. [Changing condition] These bits are set to 00b when RESET mode is entered.

Note 1. Following illustrates a received Ethernet frame and the part of the frame stored in URAM.

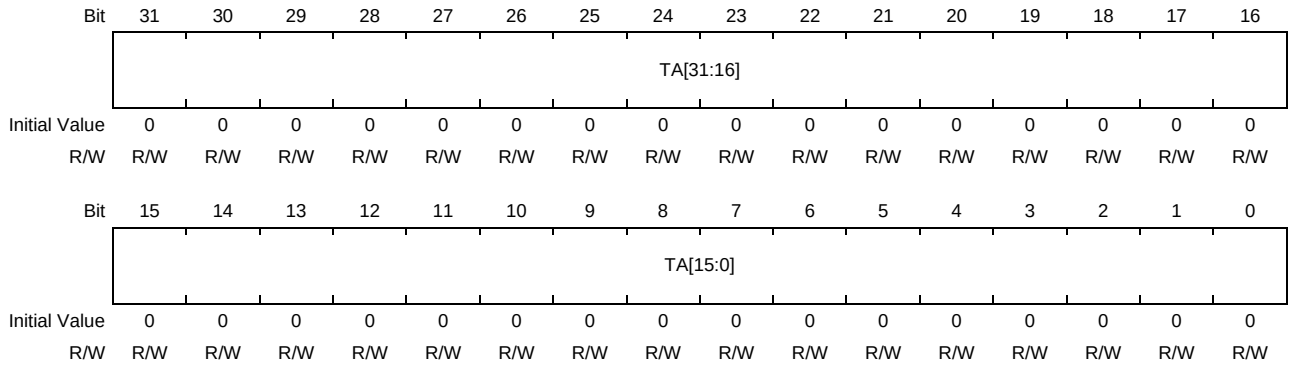


- When CCC.BOC is 0b, an Ethernet frame is represented in URAM as:

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DPTR + 0	Data 3								Data 2								Data 1								Data 0							
DPTR + 4	Data 7								Data 6								Data 5								Data 4							
DPTR + 8	Data 11								Data 10								Data 9								Data 8							

31.4.1.2 Descriptor Base Address Table Register (DBAT)

The DBAT register specifies the base address of the descriptor table in the URAM.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TA[31:0]	H'0000_0000	R/W	Table Address Address of descriptor base address table in URAM These bits define the address of the first entry of the descriptor base address table. Refer to **Section 31.5.2.3 Descriptor Base Address Table** about function and structure of the descriptor base address table. The CPU can only write to these bits if CSR.OPS is CONFIG and OPERATION. The CPU should only write values which are a multiple of 4 to these bits.

31.4.1.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the count descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	LBA4	—	—	—	LBA0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21 to 5	—	All 1	R	Reserved Whenever it is read, all bits 1 are read. The written value will be ignored.
4	LBA4	1b	R/W	Load Base Address 4(Rx0) 0b No pending load request 1b Pending load request This bit requests to set the current descriptor address of queue q (CDARq.CDA) to an entry of the descriptor base address table (DBAT.TA + 8 × 4). By setting this bit to 1b CPU requests a load of the current descriptor address of queue q. If there is an on-going transfer for queue q, the load is processed after the whole frame has been transferred. Note: In case of a transmission queue, the load function is not influencing the transmit start request (TCCR.TSRQ); so, fetching continues at base address. To prevent this behavior, it is recommended to request the load of transmission queues only when TCCR.TSRQ is 0b. The CPU can only write to this bit if CSR.OPS is OPERATION. The CPU can only write 1b to this bit. [Changing condition] This bit is set to 1b when leaving OPERATION mode. This bit is set to 0b when there is no on-going transfer (related to old chain) for queue q. Note for verification: In Rx, if the entirety or the final part of a frame is stored into a FEMPTY_ND descriptor, then there is no actual frame transfer to URAM but still LBA reload is processed only when the transfer from RxRAM to BMI is completed for that frame.
3 to 1	—	All 1	R	Reserved Whenever it is read, all bits 1 are read. The written value will be ignored.
0	LBA0	1b	R/W	Load Base Address 0(Tx0) 0b No pending load request 1b Pending load request This bit requests to set the current descriptor address of queue q (CDARq.CDA) to an entry of the descriptor base address table (DBAT.TA + 8 × 0). For the other description, refer to LBA4 bit of this register.

31.4.1.4 DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the DMAC is running and the individual communications states.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TDUO	RPO	—	—	—	TPO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RCSI	RDFDM	DTS	—	—	—	—	OPS[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	TDUO	0b	R	Transmission Descriptor Update On-going 0b No pending descriptor update 1b Pending descriptor update in URAM This bit indicates that there is pending descriptor update for a transmit queue. When this bit is 1b, there are descriptors of already or currently processed transmit storage elements not updated in URAM. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when all transmit queue related storage elements processed. This bit is set to 1b when descriptor related status update procedure starts (descriptor update and SFR flagging).
20	RPO	0b	R	Reception Process On-going 0b No pending reception 1b Pending received frames in Reception FIFO This bit indicates that there is pending receive data for a receive queues. When this bit is 1b, there are frames in Reception FIFO that are not completely stored in URAM. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when a frame is completely stored in URAM, the descriptor update has been completed, and there are no pending frames in Reception FIFO for storage to URAM. This bit is set to 1b when a frame received by E-MAC is completely stored in Reception FIFO.
19 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TPO	0b	R	Transmission Process On-going 0b No pending transmission 1b Pending frames for transmission This bit indicates that there is pending or on-going transmission process for transmit queue. When this bit is 1b, a frame fetch from the queue in URAM has been started or completed but this frame has not been completely transmitted by E-MAC Descriptor write back is not included in this bit.
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
10	RCSI	0b	R	Reference 250 MHz Clock is being Stopped Internally 0b Reference 250 MHz Clock is being not stopped internally 1b Reference 250 MHz Clock is being stopped internally This bit indicates that Gigabit Ethernet Interface has stopped Reference 250 MHz Clock (clk_miitx_gtx_refclk) internally or not. When this bit is 1b, Internal Gated Clock Cell for Reference 250 MHz Clock is closed. During that time, this clock is not provided to internal logics. [Changing condition] This bit is set to 0b when the condition of input signal “refclk_stop” changes to 0b. This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CCC.ERCS is 0b. This bit is set to 1b when the condition of output signal “refclk_stop_en” changes to 1b.
9	RDFDM	0b	R	Reception Descriptor Fetch Disable Monitor 0b Reception Descriptor Fetch will happen 1b Reception Descriptor Fetch is stopped This bit is for monitoring. It can be used in order to confirm a state of Reception Descriptor Controller of DMAC. If this bit is '1', it means the fetch of Reception Descriptor from URAM by DMAC is completely stopped. [Changing condition] This bit is set to 0b when CCC.RDFD is 0b. This bit is set to 0b when RESET mode is entered. This bit is set to 1b when CCC.RDFD is 1b and fetch of Reception Descriptor from URAM is completely stopped.
8	DTS	0b	R	Data Transfer Suspended 0b Access to URAM will happen 1b Access to URAM is suspended This bit indicates if DMAC is allowed to access URAM. [Changing condition] This bit is set to 0b when CCC.DTSR is 0b. This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when CCC.DTSR is 1b and there is no on-going URAM access.
7 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	OPS	0001b	R	OPerating mode Status 0001b RESET 0010b CONFIG 0100b OPERATION others reserved These bits represent the current operating mode of DMAC. [Changing condition] These bits are updated when an operating mode changes is processed.

31.4.1.5 Current Descriptor Address Register q (CDARq) (q = 0,4)

The CDARq register indicates the current descriptor address.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CDA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDA	All 0	R	Current Descriptor Address Current descriptor address of transmission / receive queue q These bits indicate the address of the descriptor which is currently being processed by queue q or which will be processed when queue q gets active. For q = 0 the addresses refer to the transmit queues. From q = 4 the addresses refer to the receive queues. *Note*: The current descriptor address cannot be used for HW/SW synchronization. CDARq.CDA may one or more descriptors ahead from information available in URAM. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to DBAT.TA + 8 × q when entering OPERATION mode. These bits are set to DBAT.TA + 8 × q when the load base address request of queue (DLR.LBA) has been processed. These bits are set to DESCR.DPTR when a link descriptor (LINK, LINKFIX) has been processed. These bits are incremented by the size of the descriptor control structure (8 for normal) when a frame data descriptor has been processed.

31.4.1.6 Error Status Register (ESR)

Error Status Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

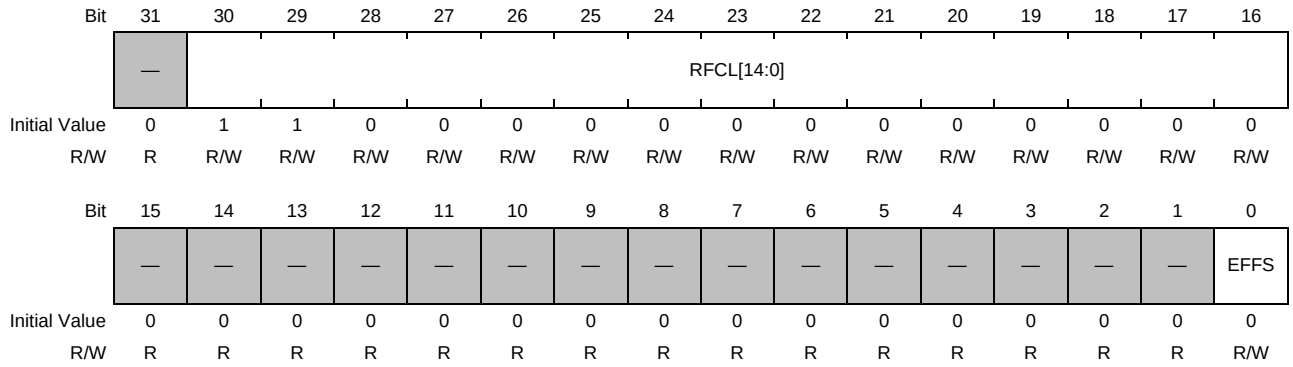
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	EIL	0b	R	Error Information Lost 0b No loss of error information 1b Lost of error information detected This bit indicates that error information detected by Gigabit Ethernet Interface is lost because the previous reported error has not been processed by CPU. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU writes 0b to EIS.QEF. This bit is set to 1b when the set condition of EIS.QEF is fulfilled while EIS.QEF is 1b.
11 to 8	ET	0000b	R	Error Type 0000b (0) Read descriptor from URAM 0001b (1) Write descriptor to URAM 0010b (2) Interpret read descriptor 0011b (3) Transmission FIFO is corrupted 0100b (4) Read data from URAM 0101b (5) Write data to URAM 0110b (6) Reading data from Reception FIFO 0111b (7) Reception FIFO is corrupted 1000b (8) Frame size error during reception detected 1001b (9) Reserved 1010b (10) Transmission FIFO Data access error others reserved These bits indicate details about the transfer stage which was handled when Gigabit Ethernet Interface has detected an error. When the fault is related to the read descriptor (ESR.ET=0 or 2), CPU needs to correct the faulty descriptor before the related queue can continue processing. In this case the queue halts at the faulty descriptor and CDARq.CDA (with q=ESR.EQN) identifies faulty descriptor. All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction. The CPU should only evaluate these bits when EIS.QEF is 1b. [Changing condition] These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0b.
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	EQN	00000b	R	Number of faulty queue These bits indicate the queue number which was being handled when Gigabit Ethernet Interface has detected an error. A fault reported for ESR.EQN = 0 is related to transmit queue. From ESR.EQN = 4 the fault is related to receive queue. The CPU should only evaluate these bits when EIS.QEF is 1b. The CPU should not evaluate these bits when ESR.ET is 0011b, 0111b. [Changing condition] These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0b.

31.4.1.7 Receive Configuration Register (RCR)

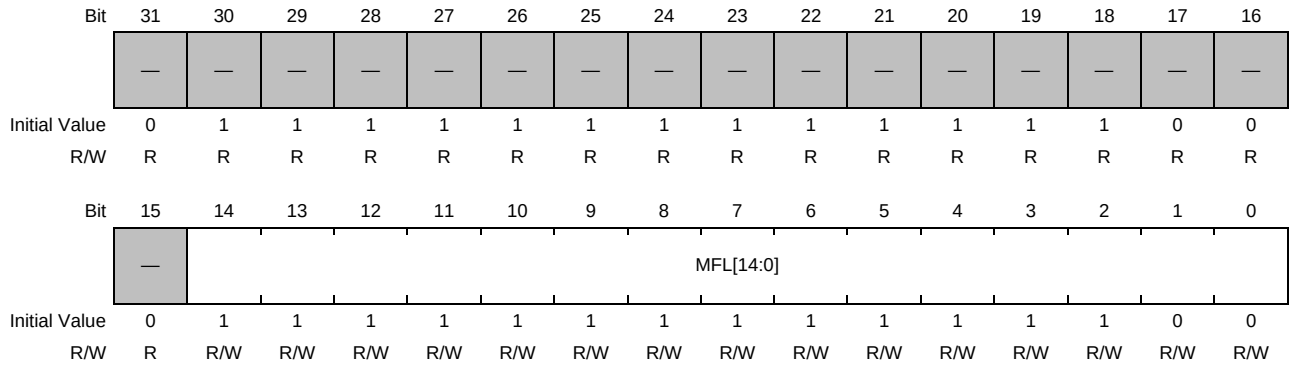
The RCR register is used to make settings related to reception for the DMAC.



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 16	RFCL[14:0]	H'6000	R/W	Reception FIFO Critical Level Number of bytes stored in Reception FIFO before critical level is reached (RFCL[1:0] are fixed to 0). These bits define a fill level of the Reception FIFO in bytes to generate FIFO critical level reached warning notification (RIS1.RFWF). The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	EFFS	0b	R/W	Enable Faulty Frame Storage 0b Storage of faulty frames disabled 1b Storage of faulty frames enabled (for debug) This bit enables the storage of received frames classified as faulty by the TOE or E-MAC. Faulty received frames will always be stored in receive queue. *Note*: DESCR.MSC informs about the reception fault detected by the TOE or E-MAC. The CPU can only write to this bit if CSR.OPS is CONFIG. *Note*: This bit is used only for debug. Do not set RCR.EFFS=1 during normal operation.

31.4.1.8 Reception Truncation Configuration Register I (RTC)

Reception Truncation Configuration register



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 18	—	All 1	R	Reserved Whenever it is read, all bits 1 are read. The written value will be ignored.
17 to 15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 0	MFL	H'7FFC	R/W	Maximum Frame Length These bits define the maximum frame length (64 to 8k bytes) stored to URAM. When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is 1000b). Additionally, the DESCR.TI in the updated descriptor is set to 1b. The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits.

31.4.1.9 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the DMAC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TBD[1:0]		—	—	—	—	—	—	—	—
Initial Value	0	0	1	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
20 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
16 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
12 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 8	TBD	10b	R/W	Transmission FIFO Depth This bit defines the depth of the Transmission FIFO used for transmit queue. Gigabit Ethernet Interface fetches up to TGC.TBD frames from URAM to Transmission FIFO for transmit queue. The CPU can only write “10b” to this bit. Frame transmission by E-MAC can start for transmission queue when at least one frame from transmit queue is available in Transmission FIFO. The CPU can only write to these bits if CSR.OPS is CONFIG.
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.10 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the DMAC and is used to make related settings.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	MFR2	MFEN2	MFR	MFEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

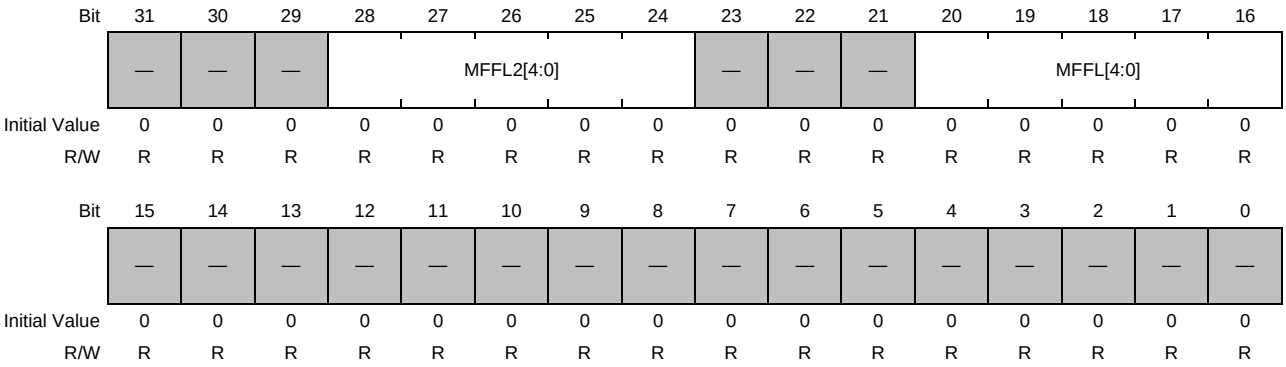
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSRQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	MFR2	0b	R/W	MAC status FIFO2 Release 0b No requests to MAC status FIFO2 1b Release oldest entry of MAC status FIFO2 This bit releases the oldest entry of the MAC status FIFO2. When 1b is written to this bit, Gigabit Ethernet Interface gets informed that CPU has processed the oldest MAC status FIFO2 entry as visible in MFA2 register. The oldest entry is removed from MAC status FIFO2. This bit is always read as 0b. *Note*: Do not use the function of this bit in the Duplex Mode (CXR20.DPM=1).
18	MFEN2	0b	R/W	MAC status FIFO2 Enable 0b Disabled 1b Enabled This bit enables the storage of transmission status information (the E-MAC flags for frame transmission) in the MAC status FIFO2. When this bit is set to 0b all pending FIFO entries are removed. *Note*: Do not use the function of this bit in the Duplex Mode (CXR20.DPM=1).
17	MFR	0b	R/W	MAC status FIFO Release 0b No request to MAC status FIFO 1b Release oldest entry of MAC status FIFO This bit releases the oldest entry of the MAC status FIFO. When 1b is written to this bit, DMAC gets informed that CPU has processed the oldest MAC status FIFO entry as visible in MFA register. The oldest entry is removed from MAC status FIFO. This bit is always read as 0b.
16	MFEN	0b	R/W	MAC status FIFO Enable 0b Disabled 1b Enabled This bit enables the storage of transmission status information (the TOE flags for frame transmission) in the MAC status FIFO. Additionally, CPU can control the status storage for each frame provided for transmission using DESCR.MSR. When this bit is set to 0b all pending FIFO entries are removed.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	TSRQ	0b	R/W	Transmission Start Request Queue 0b Transmission queue empty or stopped 1b Pending frames in queue to fetch This bit defines that frames, provided by CPU in transmit queue in URAM should be transmitted. When this bit is 1b, there are pending frames in transmit queue which have not been fetched to the Transmission FIFO. *Note*: The transmission start request cannot be used for HW/SW synchronization. TCCR.TSRQ may be cleared before frame data is completely fetched from URAM. *Note*: The frame transmission by E-MAC is decoupled from the fetching to the Transmission FIFO. Transmission scheduling for a queue depends on the transmission priority. CSR.TPO gives an indication about pending transmissions. The CPU can only write to this bit if CSR.OPS is OPERATION. The CPU can only write 1b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when CPU writes 1b to it. This bit is set to 0b when DMAC has processed an EEMPTY, FEMPTY or LEMPTY descriptor (no data available). This bit is set to 0b when DMAC has processed an EOS descriptor (end of set). This bit is set to 0b when DMAC has processed a faulty descriptor. This bit is set to 0b when CCC.OPC is 01b and there is no on-going fetch transfer for queue.

31.4.1.11 Transmit Status Register (TSR)

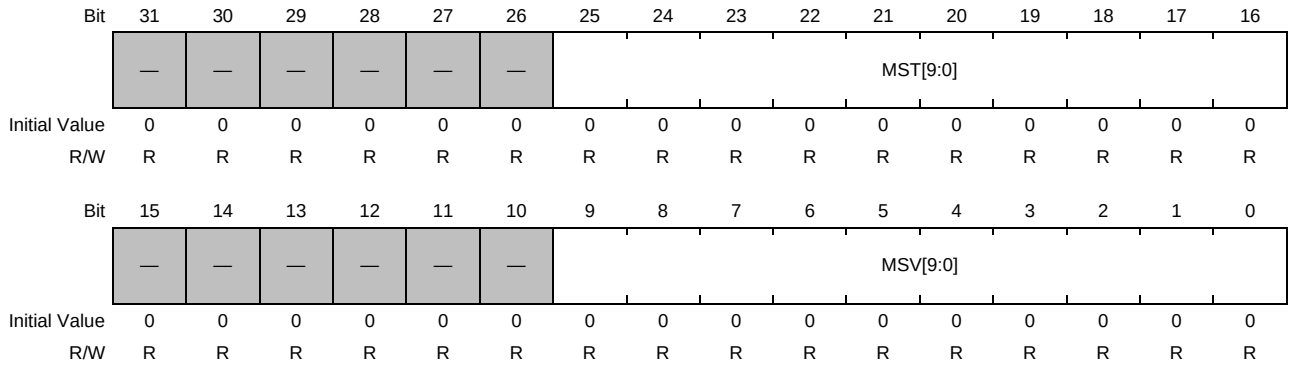
The TSR register indicates the state of transmission by the DMAC.



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28 to 24	MFFL2	00000b	R	MAC status FIFO2 Fill Level Number of entries stored in the MAC status FIFO2 These bits indicate the number of entries available in the MAC status FIFO2. If this value is 0, the FIFO2 is empty. If this value is 16, the FIFO2 is full. The values 17 to 31 are reserved. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to 0 when TCCR.MFEN2 is 0b. This value is incremented when TCCR.MFEN2 is 1b, TSR.MFFL2 is not 16, and E-MAC detects an error during transmission of frame. This value is decremented when 1b is written to TCCR.MFR2 and TSR.MFFL2 is not 0.
23 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 16	MFFL	00000b	R	MAC status FIFO Fill Level Number of entries stored in the MAC status FIFO These bits indicate the number of entries available in the MAC status FIFO. If this value is 0, the FIFO is empty. If this value is 16, the FIFO is full. The values 17 to 31 are reserved. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to 0 when TCCR.MFEN is 0b. This value is incremented when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is not 16. This value is decremented when 1b is written to TCCR.MFR and TSR.MFFL is not 0.
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.12 MAC status FIFO Access Register (MFA)

MAC status FIFO Access register



Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 16	MST	H'000	R	MAC Status Tag Tag number from descriptor identifying the frame MAC status relation These bits represent the DESCR.TAG bits from the descriptor defining the data for frame transmission. The tag is used to get the relation between the frame inside a transmit queue and the TOE status available in the FIFO (MFA.MSV). The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR). These bits are updated when the FIFO is overwritten (a frame with DESCR.MSR in descriptor has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16). Note for verification: These bits are set to 0 when leaving OPERATION mode.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 0	MSV	H'000	R	MAC status value These bits represent the TOE status bits as stored in the oldest MAC status FIFO entry. MSV [9] Unsupported transmission frame MSV [8:0] Reserved The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR). These bits are updated when the FIFO overwritten (a frame with DESCR.MSR in descriptor has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16). Note for verification: These bits are set to 0 when leaving OPERATION mode.

31.4.1.13 MAC status FIFO Access 2 Register (MFA2)

MAC status FIFO Access 2 register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8 to 0	MSV2	H'000	R	MAC Status Value2 These bits represent the MAC status bits as stored in the oldest MAC status FIFO2 entry. MSV [8] abort information MSV [7:3] Reserved MSV [2] Carrier lost during frame transmission MSV [1] Delay collision MSV [0] Transmission time out The CPU should not read these bits when TSR.MFFL2 is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO2 (TSR.MFFL2 changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR2). These bits are updated when the FIFO2 is overwritten when TCCR.MFEN2 is 1b, TSR.MFFL2 is 16, and E-MAC detects an error during transmission of frame.

31.4.1.14 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 1	DPFi	All 0	R/W	Descriptor Processed Flag i (i = 1 to 15) 0b No interrupt pending 1b Descriptor interrupt pending This bit indicates that a descriptor in a reception or transmit queue has been processed where DESCR.DIE is i. *Note*: When DESCR.DIE is 0000b, no descriptor interrupt is generated. *Note*: When DESCR.DIE is 0001b, in addition a queue specific descriptor interrupt is generated. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor has been processed where DESCR.DIE is i.
0	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.15 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 1	DPDi	All 0	R/W	Descriptor Processed interrupt Disable i (i = 1 to 15) 0b No change of DIC.DPEi 1b Set DIC.DPEi to 0b This bit supports interrupt enable. It controls set of DIC.DPEi. This bit is always read as 0b.
0	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.18 Error Interrupt Status Register (EIS)

The EIS register indicates the states of DMAC-related error interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFFF2	—	MFFF	—	—	—	—	—	—	QEF	MTEF	MREF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	QFS	0b	R	Queue Full Summary 0b No interrupt pending 1b Queue full interrupt pending Summary bit to indicate that at least one queue is full. [Changing condition] This bit is set when any matching pair of RIC2.QFE enable and RIS2.QFF flag are both 1b; or when both the RIS2.RFFF flag and RIC2.RFFE enable are 1b.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFF2	0b	R/W	MAC status FIFO2 Full Flag 0b No interrupt pending 1b MAC status FIFO2 full, oldest MAC status lost MAC status FIFO2 Full Flag This bit indicates that a transmission MAC status is overwritten because the MAC status FIFO2 is full (overwrite condition). The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when TCCR.MFEN2 is 1b, TSR.MFFL2 is 16, and E-MAC detects an error during transmission of frame.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFF	0b	R/W	MAC status FIFO Full Flag 0b No interrupt pending 1b MAC status FIFO full, oldest MAC status lost This bit indicates that a transmission MAC status is overwritten because the MAC status FIFO is full (overwrite condition). The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
2	QEF	0b	R/W	Queue Error Flag 0b No interrupt pending 1b Interrupt pending This bit indicates that an error has been detected while processing receive or transmit queue. Detail about the detected error is indicated by ESR. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when an error condition is detected.
1	MTEF	0b	R/W	MAC Transmission Error Flag 0b No interrupt pending 1b MAC has reported an error during transmission This bit indicates that the E-MAC has detected a fault during transmission. For detail, the E-MAC registers have to be checked. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when E-MAC detects an error during frame transmission.
0	MREF	0b	R/W	MAC Reception Error Flag 0b No interrupt pending 1b MAC has reported an error during reception This bit indicates that the E-MAC has detected a fault during reception. For detail, the E-MAC registers have to be checked. *Note*: When the storage of faulty received frames (RCR.EFFS) is enabled, the E-MAC error code is stored in the descriptor (DESCR.MSC). By evaluating this information CPU can identify corrupted frames in URAM. The CPU can only write 0b to this bit.

31.4.1.19 Error Interrupt Control Register (EIC)

The EIC register controls the DMAC-related error interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFFE2	—	MFFE	—	—	—	—	—	—	QEE	MTEE	MREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFE2	0b	R/W	MAC status FIFO2 Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MFFF2 is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MFFD2. This bit is set to 1b when writing 1b to EIE.MFFS2.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFE	0b	R/W	MAC status FIFO Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MFFF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MFFD. This bit is set to 1b when writing 1b to EIE.MFFS.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	QEE	0b	R/W	Queue Error interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.QEF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.QED. This bit is set to 1b when writing 1b to EIE.QES.
1	MTEE	0b	R/W	MAC Transmission Error interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MTEF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MTED. This bit is set to 1b when writing 1b to EIE.MTES.

Bit	Bit Name	Initial Value	R/W	Description
0	MREE	0b	R/W	MAC Reception Error interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MREF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MRED. This bit is set to 1b when writing 1b to EIE.MRES.

31.4.1.20 Error Interrupt Enable Register (EIE)

The EIE register set to 1 each bits in error interrupt control register (EIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFFS2	—	MFFS	—	—	—	—	—	—	QES	MTES	MRES
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFS2	0b	R/W	MAC status FIFO2 Full interrupt Set 0b No change of EIC.MFFE2 1b Set EIC.MFFE2 to 1b This bit supports interrupt enable. It controls set of EIC.MFFE2. This bit is always read as 0b.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFS	0b	R/W	MAC status FIFO Full interrupt Set 0b No change of EIC.MFFE 1b Set EIC.MFFE to 1b This bit supports interrupt enable. It controls set of EIC.MFFE. This bit is always read as 0b.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	QES	0b	R/W	Queue Error interrupt Set 0b No change of EIC.QEE 1b Set EIC.QEE to 1b This bit supports interrupt enable. It controls set of EIC.QEE. This bit is always read as 0b.
1	MTES	0b	R/W	MAC Transmission Error interrupt Set 0b No change of EIC.MTEE 1b Set EIC.MTEE to 1b This bit supports interrupt enable. It controls set of EIC.MTEE. This bit is always read as 0b.
0	MRES	0b	R/W	MAC Reception Error interrupt Set 0b No change of EIC.MREE 1b Set EIC.MREE to 1b This bit supports interrupt enable. It controls set of EIC.MREE. This bit is always read as 0b.

31.4.1.21 Error Interrupt Disable Register (EID)

The EID register set to 0 each bit in error interrupt control register (EIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFFD2	—	MFFD	—	—	—	—	—	—	QED	MTED	MRED
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFD2	0b	R/W	MAC status FIFO2 Full interrupt Disable 0b No change of EIC.MFFE 1b Set EIC.MFFE to 0b This bit supports interrupt enable. It controls set of EIC.MFFE2. This bit is always read as 0b.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFD	0b	R/W	MAC status FIFO Full interrupt Disable 0b No change of EIC.MFFE 1b Set EIC.MFFE to 0b This bit supports interrupt enable. It controls set of EIC.MFFE. This bit is always read as 0b.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	QED	0b	R/W	Queue Error interrupt Disable 0b No change of EIC.QEE 1b Set EIC.QEE to 0b This bit supports interrupt enable. It controls set of EIC.QEE. This bit is always read as 0b.
1	MTED	0b	R/W	MAC Transmission Error interrupt Disable 0b No change of EIC.MTEE 1b Set EIC.MTEE to 0b This bit supports interrupt enable. It controls set of EIC.MTEE. This bit is always read as 0b.
0	MRED	0b	R/W	MAC Reception Error interrupt Disable 0b No change of EIC.MREE 1b Set EIC.MREE to 0b This bit supports interrupt enable. It controls set of EIC.MREE. This bit is always read as 0b.

31.4.1.22 Receive Interrupt Status Register 0 (RIS0)

The RIS0 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRF	0b	R/W	Frame Received Flag 0b No interrupt pending 1b New frame data is available in URAM This bit indicates that in receive queue r a frame is stored, and data is available to be processed by CPU. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame is stored in receive queue.

31.4.1.23 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRE	0b	R/W	Frame Received interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS0.FRF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID0.FRD. This bit is set to 1b when writing 1b to RIE0.FRS.

31.4.1.24 Receive Interrupt Enable Register 0 (RIE0)

The RIE0 register set to 1 each bits in receive interrupt control register (RIC0).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRS	0b	R/W	Frame Received interrupt Set r 0b No change of RIC0.FRE 1b Set RIC0.FRE to 1b This bit supports interrupt enable. It controls set of RIC0.FRE. This bit is always read as 0b.

31.4.1.25 Receive Interrupt Disable Register 0 (RID0)

The RID0 register set to 0 each bits in receive interrupt control register (RIC0).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRD	0b	R/W	Frame Received interrupt Disable 0b No change of RIC0.FRE 1b Set RIC0.FRE to 0b This bit supports interrupt enable. It controls set of RIC0.FRE. This bit is always read as 0b.

31.4.1.26 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWF	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWF	0b	R/W	Reception FIFO Warning Flag 0b No interrupt pending 1b Reception FIFO warning level reached This bit indicates that the Reception FIFO has reached the configured critical warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a complete frame is received in the Reception FIFO and the fill level goes above the configured critical warning level during reception of this frame (RCR.RFCL).
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.27 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWE	0b	R/W	Reception FIFO Warning interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS1.RFWF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID1.RFWD. This bit is set to 1b when writing 1b to RIE1.RFWS.
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.28 Receive Interrupt Enable Register 1 (RIE1)

The RIE register set to 1 each bits in error receive control register (RIC1).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWS	0b	R/W	Reception FIFO Warning interrupt Set 0b No change of RIC1.RFWE 1b Set RIC1.RFWE to 1b This bit supports interrupt enable. It controls set of RIC1.RFWE. This bit is always read as 0b.
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.29 Receive Interrupt Disable Register 1 (RID1)

The RID1 register set to 1 each bits in receive interrupt control register (RIC1).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWD	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWD	0b	R/W	Reception FIFO Warning interrupt Disable 0b No change of RIC1.RFWE 1b Set RIC1.RFWE to 0b This bit supports interrupt enable. It controls set of RIC1.RFWE. This bit is always read as 0b.
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

31.4.1.30 Receive Interrupt Status Register 2 (RIS2)

The RIS2 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFF	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFF	0b	R/W	Reception FIFO Full Flag 0b No interrupt pending 1b Reception FIFO full, received frame data lost This bit indicates that a frame was received by E-MAC which could not be completely stored in the Reception FIFO. The incomplete frame is lost. There is no information available which receive queue would handle this frame. Frames which are marked by E-MAC as faulty after complete reception can also trigger an overrun. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when frame data provided by E-MAC cannot be stored in the Reception FIFO.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFF	0b	R/W	Queue Full Flag 0b No interrupt pending 1b Queue full, received frame data lost This bit indicates that there was no sufficient space in receive queue to store completely a received frame. A receive queue is treated as full when no empty descriptor (read descriptor with DESCR.DT = FEMPTY or FEMPTY_ND) is available. *Note*: If there is no empty descriptor left in queue during storage of a split frame, an incomplete frame will be stored in the queue. Such incomplete frame can be identified based on a descriptor sequence error (no FEND). *Note*: Reading descriptor may be one or more storage elements ahead from actual storage in URAM. CDARq.CDA provides information where queue has been stopped. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when there is pending receive data in Reception FIFO for receive queue and there is no space left for storage. This bit is set to 1b when a SW defined stop point (EOS descriptor) reached within a split frame.

31.4.1.31 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFE	0b	R/W	Reception FIFO Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS2.RFFF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID2.RFFD. This bit is set to 1b when writing 1b to RIE2.RFFS.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFE	0b	R/W	Queue Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS2.QFF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID2.QFD. This bit is set to 1b when writing 1b to RIE2.QFS.

31.4.1.32 Receive Interrupt Enable Register 2 (RIE2)

The RIE2 register set to 1 each bits in receive interrupt control register (RIC2).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFS	0b	R/W	Reception FIFO Full interrupt Set 0b No change of RIC2.RFFE 1b Set RIC2.RFFE to 1b This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0b.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFS	0b	R/W	Queue Full interrupt Set 0b No change of RIC2.QFE 1b Set RIC2.QFE to 1b This bit supports interrupt enable. It controls set of RIC2.QFE. This bit is always read as 0b.

31.4.1.33 Receive Interrupt Disable Register 2 (RID2)

The RID2 register set to 1 each bit in receive interrupt control register (RIC2).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFD	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFD	0b	R/W	Reception FIFO Full interrupt Disable 0b No change of RIC2.RFFE 1b Set RIC2.RFFE to 0b This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0b.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFD	0b	R/W	Queue Full interrupt Disable 0b No change of RIC2.QFE 1b Set RIC2.QFE to 0b This bit supports interrupt enable. It controls set of RIC2.QFE. This bit is always read as 0b.

31.4.1.34 Receive Interrupt Status Register 3 (RIS3)

The RIS3 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPF	0b	R/W	Receive Descriptor Processed Flag 0b No interrupt pending 1b Descriptor interrupt pending This bit indicates that a descriptor in reception queue has been processed where DESCR.DIE is 0001b. *Note*: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue has been processed where DESCR.DIE is 1.

31.4.1.35 Receive Interrupt Control Register 3 (RIC3)

The RIC3 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPE	0b	R/W	Receive Descriptor Processed interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS3.RDPF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID3.RDPD. This bit is set to 1b when writing 1b to RIE3.RDPS.

31.4.1.36 Receive Interrupt Enable Register 3 (RIE3)

The RIE3 register set to 1 each bits in receive interrupt control register (RIC3).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPS	0b	R/W	Receive Descriptor Processed interrupt Set 0b No change of RIC3.RDPE 1b Set RIC3.RDPE to 1b This bit supports interrupt enable. It controls set of RIC3.RDPE. This bit is always read as 0b.

31.4.1.37 Receive Interrupt Disable Register 3 (RID3)

The RID3 register set to 0 each bits in receive interrupt control register (RIC3).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPD	0b	R/W	Receive Descriptor Processed interrupt Disable 0b No change of RIC3.RDPE 1b Set RIC3.RDPE to 0b This bit supports interrupt enable. It controls set of RIC3.RDPE. This bit is always read as 0b.

31.4.1.38 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the DMAC transmit interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RCSRF	MFWF2	MFUF2	MFWF	MFUF	—	—	—	—	—	—	—	—	—	FTF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPF	0b	R/W	Transmit Descriptor Processed Flag 0b No interrupt pending 1b Descriptor interrupt pending This bit indicates that a descriptor in transmit queue has been processed where DESCR.DIE is 0001b. *Note*: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in transmit queue has been processed where DESCR.DIE is 1.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRF	0b	R/W	Reference Clock Stop Req Flag 0b No interrupt pending 1b Reference Clock Stop Request occurred This bit indicates that Gigabit Ethernet Interface expects to stop “clk_miitx_gtx_refclk”. Whenever this flag is asserted, CPU has to stop ETH_PLL (PLL to generate “clk_miitx_gtx_refclk”). To stop ETH_PLL, refer to the document of System Controller. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CCC.ERCS is 0b. This bit is set to 1b when Gigabit Ethernet Interface has expected to stop “clk_miitx_gtx_refclk”.

Bit	Bit Name	Initial Value	R/W	Description
13	MFWF2	0b	R/W	MAC status FIFO2 Warning Flag 0b No interrupt pending 1b Tx Status FIFO2 warning level has been reached This bit indicates that the warning level of the MAC status FIFO2 (12 out of 16 entries) has been reached. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN2 is 0b. This bit is set to 0b when writing 1b to TCCR.MFR2. This bit is set to 1b when TCCR.MFEN2 is 1b, the MAC Status FIFO2 contains already 11 entries (TSR.MFFL2 is 11), and E-MAC detects an error during transmission of frame.
12	MFUF2	0b	R/W	MAC status FIFO2 Updated Flag 0b No interrupt pending 1b Tx Status FIFO2 has been updated This bit indicates that the MAC status FIFO2 has been updated when the E-MAC detects an error during transmission of frame. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN2 is 0b. This bit is set to 0b when writing 1b to TCCR.MFR2. This bit is set to 1b when TCCR.MFEN2 is 1b and E-MAC detects an error during transmission of frame.
11	MFWF	0b	R/W	MAC status FIFO Warning Flag 0b No interrupt pending 1b Tx Status FIFO warning level has been reached This bit indicates that the warning level of the MAC status FIFO (12 out of 16 entries) has been reached. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN is 0b. This bit is set to 0b when writing 1b to TCCR.MFR. This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and the MAC Status FIFO contains already 11 entries (TSR.MFFL is 11).
10	MFUF	0b	R/W	MAC status FIFO Updated Flag 0b No interrupt pending 1b Tx Status FIFO has been updated This bit indicates that the MAC status FIFO has been updated after the TOE has transmitted a frame. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN is 0b. This bit is set to 0b when writing 1b to TCCR.MFR. This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE and TCCR.MFEN is 1b.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	FTF	0b	R/W	Frame Transmitted Flag 0b No interrupt pending 1b Frame transmitted by E-MAC This bit indicates that from transmit queue a frame is transmitted from DMAC. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame from transmit queue has been transmitted from DMAC.

31.4.1.39 Transmit Interrupt Control Register (TIC)

The TIC register controls the DMAC transmit interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RCSRE	MFWE2	MFUE2	MFWE	MFUE	—	—	—	—	—	—	—	—	—	FTE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPE	0b	R/W	Transmit Descriptor Processed interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.TDPF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.TDPD. This bit is set to 1b when writing 1b to TIE.TDPS.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRE	0b	R/W	Reference Clock Stop Req interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.RCSRF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.RCSRD. This bit is set to 1b when writing 1b to TIE.RCSRS.
13	MFWE2	0b	R/W	MAC status FIFO2 Warning interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFWF2 is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFWD2. This bit is set to 1b when writing 1b to TIE.MFWS2.
12	MFUE2	0b	R/W	MAC status FIFO2 Updated interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFUF2 is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFUD2. This bit is set to 1b when writing 1b to TIE.MFUS2.

Bit	Bit Name	Initial Value	R/W	Description
11	MFWE	0b	R/W	MAC status FIFO Warning interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFWF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFWD. This bit is set to 1b when writing 1b to TIE.MFWS.
10	MFUE	0b	R/W	MAC status FIFO Updated interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFUF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFUD. This bit is set to 1b when writing 1b to TIE.MFUS.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FTE	0b	R/W	Frame Transmitted interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.FTF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.FTD. This bit is set to 1b when writing 1b to TIE.FTS.

31.4.1.40 Transmit Interrupt Enable Register (TIE)

The TIE register set to 1 each bits in transmit interrupt control register (TIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPS	0b	R/W	Transmit Descriptor Processed interrupt Set 0b No change of TIC.TDPE 1b Set TIC.TDPE to 1b This bit supports interrupt enable. It controls set of TIC.TDPE. This bit is always read as 0b.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRS	0b	R/W	Reference Clock Stop Req interrupt Set 0b No change of TIC.RCSRE 1b Set TIC.RCSRE to 1b This bit supports interrupt enable. It controls set of TIC.RCSRE. This bit is always read as 0b.
13	MFWS2	0b	R/W	MAC status FIFO2 Warning interrupt Set 0b No change of TIC.MFWE2 1b Set TIC.MFWE2 to 1b This bit supports interrupt enable. It controls set of TIC.MFWE2. This bit is always read as 0b.
12	MFUS2	0b	R/W	MAC status FIFO2 Updated interrupt Set 0b No change of TIC.MFUE2 1b Set TIC.MFUE2 to 1b This bit supports interrupt enable. It controls set of TIC.MFUE2. This bit is always read as 0b.
11	MFWS	0b	R/W	MAC status FIFO Warning interrupt Set 0b No change of TIC.MFWE 1b Set TIC.MFWE to 1b This bit supports interrupt enable. It controls set of TIC.MFWE. This bit is always read as 0b.
10	MFUS	0b	R/W	MAC status FIFO Updated interrupt Set 0b No change of TIC.MFUE 1b Set TIC.MFUE to 1b This bit supports interrupt enable. It controls set of TIC.MFUE. This bit is always read as 0b.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	FTS	0b	R/W	Frame Transmitted interrupt Set 0b No change of TIC.FTE 1b Set TIC.FTE to 1b This bit supports interrupt enable. It controls set of TIC.FTE. This bit is always read as 0b.

31.4.1.41 Transmit Interrupt Disable Register (TID)

The TID register set to 0 each bits in transmit interrupt control register (TIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPD	0b	R/W	Transmit Descriptor Processed interrupt Disable 0b No change of TIC.TDPE 1b Set TIC.TDPE to 0b This bit supports interrupt enable. It controls set of TIC.TDPE. This bit is always read as 0b.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRD	0b	R/W	Reference Clock Stop Req interrupt Disable 0b No change of TIC.RCSRE 1b Set TIC.RCSRE to 0b This bit supports interrupt enable. It controls set of TIC.RSCRE. This bit is always read as 0b.
13	MFWD2	0b	R/W	MAC status FIFO2 Warning interrupt Disable 0b No change of TIC.MFWE2 1b Set TIC.MFWE2 to 0b This bit supports interrupt enable. It controls set of TIC.MFWE2. This bit is always read as 0b.
12	MFUD2	0b	R/W	MAC status FIFO2 Updated interrupt Disable 0b No change of TIC.MFUE2 1b Set TIC.MFUE2 to 0b This bit supports interrupt enable. It controls set of TIC.MFUE2. This bit is always read as 0b.
11	MFWD	0b	R/W	MAC status FIFO Warning interrupt Disable 0b No change of TIC.MFWE 1b Set TIC.MFWE to 0b This bit supports interrupt enable. It controls set of TIC.MFWE. This bit is always read as 0b.
10	MFUD	0b	R/W	MAC status FIFO Updated interrupt Disable 0b No change of TIC.MFUE 1b Set TIC.MFUE to 0b This bit supports interrupt enable. It controls set of TIC.MFUE. This bit is always read as 0b.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	FTD	0b	R/W	Frame Transmitted interrupt Disable 0b No change of TIC.FTE 1b Set TIC.FTE to 0b This bit supports interrupt enable. It controls set of TIC.FTE. This bit is always read as 0b.

31.4.1.42 Common Interrupt Enable register (CIE)

The CIE register is used to control interrupts line.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTIE	—	—	—	—	—	—	—	CRIE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	CTIE	0b	R/W	Common Transmit Interrupt Enable 0b Disabled 1b Enabled This bit controls transmit related interrupt outputs of Gigabit Ethernet Interface. It has no influence on internal flagging in Gigabit Ethernet Interface SFR (e.g. ISS).
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CRIE	0b	R/W	Common Receive Interrupt Enable 0b Disabled 1b Enabled This bit controls receive related interrupt outputs of Gigabit Ethernet Interface. It has no influence on internal flagging in Gigabit Ethernet Interface SFR (e.g. ISS).

31.4.1.43 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of DMAC-related interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPM15	DPM14	DPM13	DPM12	DPM11	DPM10	DPM9	DPM8	DPM7	DPM6	DPM5	DPM4	DPM3	DPM2	DPM1	RCSRM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MFWM2	MFUM2	—	RFWM	MFWM	MFUM	—	—	MM	EM	—	—	—	FTM	—	FRM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	DPMi	All 0	R	Descriptor Processed Mirror i 0b No interrupt pending 1b Descriptor interrupt pending Descriptor Processed Mirror i (i = 1 to 15) [Changing condition] This bit is set when any matching pair of DIC.DPEi enable and DIS.DPFi flag are both 1b.
16	RCSRM	0b	R	Reference Clock Stop Req Mirror 0b No interrupt pending 1b Reference Clock Stop Req interrupt pending This bit indicates that TIS.RCSRF is 1b and TIC.RCSRE is 1b. [Changing condition] This bit is updated when TIS.RCSRF or TIC.RCSRE changes.
15	MFWM2	0b	R	MAC status FIFO2 Warning Mirror 0b No interrupt pending 1b MAC status FIFO2 warning interrupt pending This bit indicates that TIS.MFWF2 is 1b and TIC.MFWE2 is 1b. [Changing condition] This bit is updated when TIS.MFWF2 or TIC.MFWE2 changes.
14	MFUM2	0b	R	MAC status FIFO2 Updated Mirror 0b No interrupt pending 1b MAC status FIFO2 updated interrupt pending This bit indicates that TIS.MFUF2 is 1b and TIC.MFUE2 is 1b. [Changing condition] This bit is updated when TIS.MFUF2 or TIC.MFUE2 changes.
13	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	RFWM	0b	R	Reception FIFO Warning Summary 0b No interrupt pending 1b Reception FIFO warning interrupt pending This bit indicates that RIS1.RFWF is 1b and RIC1.RFWE is 1b. [Changing condition] This bit is updated when RIS1.RFWF or RIC1.RFWE changes.

Bit	Bit Name	Initial Value	R/W	Description
11	MFWM	0b	R	MAC status FIFO Warning Mirror 0b No interrupt pending 1b MAC status FIFO warning interrupt pending This bit indicates that TIS.MFWF is 1b and TIC.MFWE is 1b. [Changing condition] This bit is updated when TIS.MFWF or TIC.MFWE changes.
10	MFUM	0b	R	MAC status FIFO Updated Mirror 0b No interrupt pending 1b MAC status FIFO updated interrupt pending This bit indicates that TIS.MFUF is 1b and TIC.MFUE is 1b. [Changing condition] This bit is updated when TIS.MFUF or TIC.MFUE changes.
9 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	MM	0b	R	MAC Mirror 0b No interrupt pending 1b MAC interrupt pending This bit indicates that there is a pending interrupt request issued by MAC. *Note*: The MAC is able to assert interrupt also in CONFIG mode.
6	EM	0b	R	Error Mirror 0b No interrupt pending 1b Error interrupt pending This bit indicates that at least one enabled flag in EIS is 1b or EIS.QFS is 1b. [Changing condition] This bit is updated when EIS or EIC changes.
5 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	FTM	0b	R	Frame Transmitted Mirror 0b No interrupt pending 1b Frame transmitted interrupt pending [Changing condition] This bit is set when any matching pair of TIC.FTE enable and TIS.FTF flag are both 1b. This bit is set when any matching pair of TIC.TDPE enable and TIS.TDPF flag are both 1b.
1	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRM	0b	R	Frame Received Mirror 0b No interrupt pending 1b Frame received interrupt pending [Changing condition] This bit is set when any matching pair of RIC0.FRE enable and RIS0.FRF flag are both 1b. This bit is set when any matching pair of RIC3.RDPE enable and RIS3.RDPF flag are both 1b.

31.4.2 E-MAC Registers

31.4.2.1 E-MAC operating mode register 1 (CXR20)

CXR20 sets the E-MAC operating mode.

Rewriting the bits in this register is prohibited when the transmission function is enabled (TPE = 1) and reception function is enabled (RPE = 1).

[Write restrictions]

Rewrite all the bits except for TPE and RPE when transmission function is disabled (TPE = 0) and reception function is disabled (RPE = 0).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	RCPT	TCPT	RCSC	CXSER	DPAD	RZPF	TZPF	PFR	RXF	TXF

R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CER	—	—	—	—	—	RPE	TPE	LPM	—	—	DPM	PRM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	TRCCM	0b	R/W	TINT/RINT Counter Clear Mode Specifies the method of clearing TINT source counter (CXR40-43) and RINT source counter (CXR50-57). 1: Clears the register to 0 when reading the register. 0: Clears the register to 0 when writing to the register. (clears any write data to 0 at write)
25	RCPT	0b	R/W	Reception CRC Pass Through 1: CRC of received frame is transferred to TOE. RCSC (auto calculation of checksum of received frame data part) function is disabled at this time. 0: CRC of received frame is not transferred to TOE.
24	TCPT	0b	R/W	Transmit CRC Pass Through 1: CRC of transmit frame is not calculated automatically (hardware calculation). It is necessary to input the data with CRC added in AT port. 0: CRC of transmit frame is calculated automatically (hardware calculation). It is necessary to input the data without CRC added in AT port.
23	RCSC	0b	R/W	Reception Check Sum Calculation 1: Checksum of received frame data part is automatically calculated (hardware calculation). RCPT must be set to 0 at this time. 0: Checksum of received frame data part is not calculated automatically (hardware calculation).
22	CXSER	0b	R/W	Carrier extension Short Error Function for debug. It should always be set to 0.
21	DPAD	0b	R/W	Data Padding 1: Less than 60-byte data is transmitted without padding. 0: Less than 60-byte data is padded and transmitted as 60-byte data.

Bit	Bit Name	Initial Value	R/W	Description
20	RZPF	0b	R/W	Reception Zero PAUSE Frame 1: Enables to receive PAUSE frame with TIME parameter value being 0. 0: Disables receiving PAUSE frame with TIME parameter value being 0.
19	TZPF	0b	R/W	Transmit Zero PAUSE Frame 1: PAUSE frame of 0 Time parameter value is transmitted at asserting “Reception FIFO Critical Level Notification” from DMAC 0: PAUSE frame of 0 Time parameter value is not transmitted at asserting “Reception FIFO Critical Level Notification” from DMAC
18	PFR	0b	R/W	PAUSE Frame Receive 1: PAUSE frame is transferred to TOE. 0: PAUSE frame is not transferred to TOE.
17	RXF	0b	R/W	Receive Flow control mode 1: Receive flow control function (PAUSE frame reception) is enabled. 0: Receive flow control function (PAUSE frame reception) is disabled.
16	TXF	0b	R/W	Transmit Flow control mode 1: Transmit flow control function (PAUSE frame transmission) is enabled. 0: Transmit flow control function (PAUSE frame transmission) is disabled.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	CER	0b	R/W	CRC Error Used for debugging. It should always be set to 0.
11 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	RPE	0b	R/W	Receive Port Enable 1: Receive function of E-MAC is enabled. 0: Receive function of E-MAC is disabled. If 1 is changed to 0 while a frame is being received, the frame is completely received.
5	TPE	0b	R/W	Transmit Port Enable 1: Transmission function of E-MAC is enabled. 0: Transmission function of E-MAC is disabled. If 1 is changed to 0 while a frame is being transmitted, the frame is completely transmitted.
4	LPM	0b	R/W	Low Power Mode 1: E-MAC operates as Low Power Mode. 0: E-MAC operates as Normal Mode. (When LPM bit is set to “1”, DPM bit should be also set to “1”)
3 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DPM	0b	R/W	Duplex Mode 1: Operates in full duplex mode. 0: Operates in half duplex mode.
0	PRM	0b	R/W	Promiscuous Mode 1: All the frames except for PAUSE frame are received. Self-addressed unicast, different address unicast, multicast, and broadcast frames are all transferred to TOE. PAUSE frame reception is controlled by PFR bit. 0: Self-addressed unicast, multicast, and broadcast frames are received, then transferred to TOE.

31.4.2.2 Maximum receive frame length register (CXR2A)

CXR2A sets the maximum receive frame length.

[Write restrictions]

If CXR20_bit6 is set to 1, it is not allowed to rewrite to this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17 to 0	LEN_LMT	H'0_0000	R/W	frame LENgth upper LiMiT value Sets the maximum receive frame length (Including CRC). If the receive frame length exceeds the set value, frame length error (RINT4) is asserted. < Set value > — < Check value > H'0_0000 to H'0_05EE — 1518 bytes H'0_05EF — 1519 bytes H'0_05F0 — 1520 bytes … H'0_07FF — 2047 bytes H'0_0800 — 2048 bytes … H'0_1000 — 4096 bytes … H'1_0000 — 65536 bytes … H'2_0000 to H'3_FFFF — 131072 bytes

31.4.2.3 Interrupt status register (CXR21)

CXR21 indicates interrupt status.

[Read restrictions]

When the PHY used does not have an INT signal, consider the read value of PHYI bit (bit3) as undefined.

[Write restrictions]

Writing 0 is invalid. 1 or 0 cannot be written to bit 3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFRI	PHYI	LINKI	—	FCI
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	X	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PFRI	0b	R/W	PAUSE Frame Retry Interrupt Interrupt source based on the PAUSE frame transmission retry count: Indicates that the PAUSE frame transmission is retried for the number of times specified using the CXR81 register. This bit can be cleared to 0 in the following way. (1) Read the CXR82 register to clear CXR82. (2) Write 1 to this bit.
3	PHYI	Xb	R/W	PHY Interrupt PHY chip interrupt source: Indicates status of 'PHY INT' of the E-MAC input/output signals. 1: Interrupt from PHY is asserted. 0: Interrupt from PHY is negated. Signal polarity of 'PHY INT' can be set using CXR2C. *Note*: When the PHY used does not have an INT signal, the read value of this bit should be undefined.
2	LINKI	0b	R/W	LINK Interrupt Link status change interrupt source: Indicates that on/off of bit 0 (LINK) of CXR2B has changed. Write 1 to clear this bit. *Note*: Before referring to this bit, determine whether to use PHY_LINK input signal or RGMII-Inband Status LINK bit as the link using SEL_LINK (bit 0) in the CXR31 register.
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	FCI	0b	R/W	False Carrier Interrupt Invalid carrier detected interrupt source: Indicates that an invalid carrier was detected in the PHY chip. Write 1 to clear this bit to 0.

31.4.2.4 Enables/disables interrupts register (CXR22)

CXR22 enables/disables interrupts.

It is possible to enable/disable interrupts for each interrupt source indicated in CXR21 (bit unit).

[Write restrictions]

If the PHY used does not have an INT signal, set PHYIM bit (bit 3) to 0. In the case of without using PHY_LINK signal and without using RGMII Inband Status function (case of setting '10' or '11' to SEL_LINK of CXR31), set PHYIM bit (bit 2) to 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	PFRIM	PHYIM	LINKIM	—	FCIM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PFRIM	0b	R/W	PAUSE Frame Retry Interrupt Mask 1: Interrupt by PFRI bit in the CXR21 register is enabled. 0: Interrupt by PFRI bit in the CXR21 register is disabled.
3	PHYIM	0b	R/W	PHY Interrupt Mask 1: Interrupt by PHYI bit in the CXR21 register is enabled. 0: Interrupt by PHYI bit in the CXR21 register is disabled. *Note*: If the PHY used does not have an INT signal, set this bit to 0.
2	LINKIM	0b	R/W	LINK Interrupt Mask 1: Interrupt by LINKI bit in the CXR21 register is enabled. 0: Interrupt by LINKI bit in the CXR21 register is disabled.
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	FCIM	0b	R/W	False Carrier Interrupt Mask 1: Interrupt by FCI bit in the CXR21 register is enabled. 0: Interrupt by FCI bit in the CXR21 register is disabled.

31.4.2.5 PHY register access register (CXR23)

There are two methods to access the PHY register: using the E-MAC-MDIOC block and using the CXR23 register.

Which access method to be used can be set using the MDIOMOD register.

For PHY register access using CXR23, see **Section 31.5.14.3(2), PHY Register Access Method (Using CXR23)** and IEEE Standard 802.3, 2000 Edition “22.2.4.5 Management frame structure.”

[Write restrictions]

Writing bit 3 is invalid.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	MDI	Xb	R/W	Management Data Input
2	MDO	0b	R/W	Management Data Output
1	MM	0b	R/W	Management Data Management mode The write value should be 1. The read value should be 0.
0	MDC	0b	R/W	Management Clock

31.4.2.6 Link status register (CXR2B)

CXR2B indicates link status.

[Write restrictions]

Write disabled

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SOFT_LINK	SIGNAL_LINK	INBAND_LINK	LINK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	X	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	SOFT_LINK	0b	R	Software LINK Indicates the LINK ON/OFF status of software LINK setting (CXR2G) 1: Link ON (Link Up) 0: Link OFF (Link Down) This bit indicates the value of CXR2G.
2	SIGNAL_LINK	0b	R	LINK signal input Indicates the LINK ON/OFF status of the PHY_LINK input signal. 1: Link ON (Link Up) 0: Link OFF (Link Down) *Note*: Before referring to this bit, set the polarity of the PHY_LINK input signal using PHYLINKP (bit 1) in the CXR2C register.
1	INBAND_LINK	Xb	R	Inband Status LINK Indicates the link bit of RGMII Inband status. 1: Link ON (Link Up) 0: Link OFF (Link Down) *Note*: If the PHY used does not support Inband-status, the read value of this bit should be undefined.
0	LINK	0b	R	LINK status Indicates link status. 1: Link ON (Link Up) 0: Link OFF (Link Down) *Note*: Before referring to this bit, determine whether to use the PHY_LINK input signal, RGMII-Inband Status LINK bit or software LINK as the link using SEL_LINK (bit3, bit0) in the CXR31 register. In addition, to use the PHY_LINK input signal, set the polarity of PHY_LINK input using PHYLINKP (bit 1) in the CXR2C register.

31.4.2.7 Polarity set register (CXR2C)

CXR2C sets the polarity of ‘PHY_LINK’ and ‘PHY_INT’ signals.

[Write restrictions]

Rewrite to this register with bits 2 and 3 in CXR22 being 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	PHYLINKP	0b	R/W	PHY_LINK Polarity Sets polarity of input signal ‘avb_miimg_link’. 1: High active (LINK ON [LINK UP] status with high) 0: Low active (LINK ON [LINK UP] status with low)
0	PHYIP	0b	R/W	PHY Interrupt Polarity Sets polarity of input signal ‘avb_miimg_int’. 1: High active (interrupt status with high) 0: Low active (interrupt status with low)

31.4.2.8 In-Band Status set register (CXR31)

CXR31 sets whether to apply In-Band Status function*1 of RGMII-IF to the E-MAC operating mode.

It is possible to select the configured value by software for Link status.

Note 1. In-Band Status function (optional) is a notification function from PHY to E-MAC about Link Status (Up/Down), transmission speed (10 M/100 M/1 G) and Duplex (Half/Full) via RGMII-IF.

[Write restrictions]

Rewrite to this register with transmission function disabled (CXR20 TPE = 0) and reception function also disabled (CXR20 RPE = 0). If the PHY used does not support In-band Status, set ‘H’000_0000’ to this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	SEL_LINK[1]	0b	R/W	Select LINK See bit0 of this register.
2	SEL_SPEED	0b	R/W	Select Speed*1,*2 ‘1’: The information from In-band Status is used for setting the E-MAC operation speed. ‘0’: CXR2D register value is used for setting the E-MAC operation speed.
1	SEL_DUPLEX	0b	R/W	Select Duplex*1,*2 ‘1’: The information from In-band Status is used for setting Full/Half Duplex. ‘0’: CXR20 DPM bit value is used for setting Full/Half Duplex.
0	SEL_LINK[0]	0b	R/W	Select LINK*1,*2 SEL_LINK [1:0] ‘11’: The information from CXR20 TPE bit value is used for setting the LINK.*3 The status of CXR20 TPE bit is set to CXR2B LINK bit. When this value is set, set ‘0’ (disable LINK interrupt) to CXR22 LINKIM bit. ‘10’: The information from CXR2B SOFTWR_LINK bit value is used for setting the LINK.*3 The status of CXR2G SOFT_LINK bit is set to CXR2B LINK bit. When this value is set, set ‘0’ (disable LINK interrupt) to CXR22 LINKIM bit. ‘01’: The information from In-band Status is used for setting the LINK. ‘00’: The information from the PHY_LINK input signal is used for setting the LINK.

Note 1. If the PHY does not support In-band Status is used or If MII-IF is used, do not set value using In-band Status.

Note 2. If the device driver software is developed as common for MII-IF and RGMII-IF, not using this register is recommended.

Note 3. When Low Power Mode E-MAC is used, it needs to know the status of PHY as Link Up (Link ON). But, when it does not have the information to judge the status of LINK (because MII-IF is used and PHY_LINK signal is not used), set ‘10’ or ‘11’.
In the case of SEL_LINK [1:0] = ‘10’, CXR2B SOFT_LINK is used. So, software has to check the LINK status by register of

PHY and set that information to CXR2G.
In the case of SEL_LINK [1:0] = ‘11’, CXR20 TPE is used as LINK status.

31.4.2.9 In-Band Status indicate register (CXR32)

CXR32 indicates In-Band-Status of RGMII-IF.

In-Band Status function (option) is the function that the PHY notifies the E-MAC of link status (Up/Down), transfer rate (10 M/100 M/1 G) and duplex (full or half duplex), using the RGMII interface signal.

[Write restrictions]

Write disabled

0	LINK	0b	R	LINK ‘1’: LINK status is Link On (Link Up). ‘0’: LINK status is Link Off (Link Down).

31.4.2.11 PHY interface select register (CXR35)

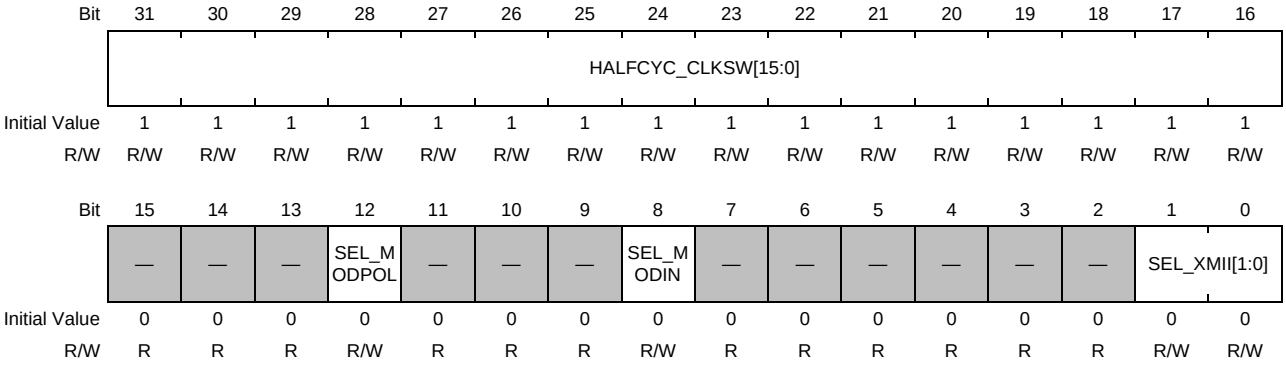
CXR35 selects RGMII or MII interface.

[Write restrictions]

(1) After release reset, make write-access to this register before making write-access to other registers (except MDIOMOD). Even if not need to change the value of this register, make write-access to this register at least one time. Because RGMII/MII MODE is recognized by accessing this register.

(2) If need to re-write the value of this register after making write-access to other register, reset to E-MAC is needed.

(3) If need to re-write the value of this register without making write-access to other register, wait the quadruple time which is set at HALFCYC_CLKSW.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	HALFCYC_CLKSW	H'FFFF	R/W	A clock stop time at the clock switching The wait time (over 20 µs) is needed when PHY interface is selected at initializing Gigabit Ethernet Interface. Set the number of clk_chi (APB clock) cycle to be half of wait time (over 10 us). H'0000: 1 cycle of clk_chi H'0001: 2 cycles of clk_chi H'0002: 3 cycles of clk_chi … H'03E8: 1000 cycles of clk_chi (If clk_chi is 100 MHz (10 ns), half of wait time will be 10 us) H'07D0: 2000 cycles of clk_chi (If clk_chi is 200 MHz (5 ns), half of wait time will be 10 us) … H'FFFF: 65536 cycles of clk_chi (default value)
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	SEL_MODPOL	0b	R/W	polar selection of RGMII/MII Mode input signal '0': (default value) E-MAC recognizes RGMII-IF is used. '1': E-MAC recognizes MII-IF is used.
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SEL_MODIN	0b	R/W	method for selection of RGMII/MII '0': SEL_XMII field of this register is used for RGMII/MII selection (default value) '1': Reserved
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1 to 0	SEL_XMII	00b	R/W	Selection of PHY interface to be used '00': RGMII interface is used (default value) '01': Reserved '10': MII interface is used '11': Reserved *Note*: The case of SEL_MODIN (bit8) = '0', this field is used to select PHY interface. The case of SEL_MODIN (bit8) = '1', this field is not used and Mode signals which is provided from out of E-MAC is used to select PHY interface.

Note: This register needs to write access at least one time.

[A] The case which CXR35 SEL_XMII is used for the selection of RGMII/MII in APB Clock 100 MHz.

(1) To use RGMII interface, Set 'H'03E8_0000' to this register.

(2) To use MII interface, Set 'H'03E8_0002' to this register.

31.4.2.12 PHY interface indicate register (CXR36)

CXR36 indicates the status of RGMII/MII Interface.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	UMADR	H'0000_0000	R/W	Upper MAC Address Upper-32bit MAC address

31.4.2.22 Mac Address register 2 (CXR25)

CXR25 set the universal MAC address (lower 16 bits).

[Write restrictions]

Rewriting this register is prohibited when 1 is set to CXR20_bit 5 or 6.

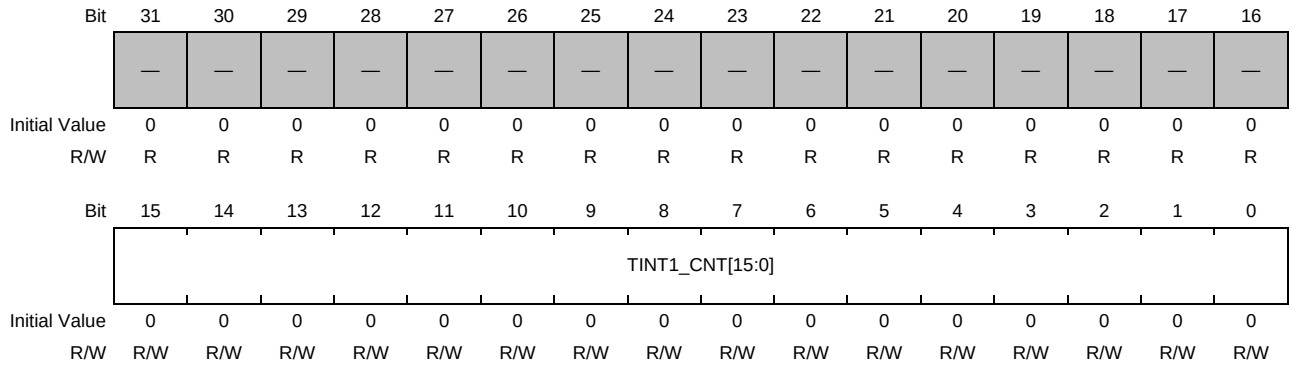
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LMADR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	LMADR	H'0000	R/W	Lower MAC Address Lower-16bit MAC address

31.4.2.23 TINT1 counter register (CXR40)

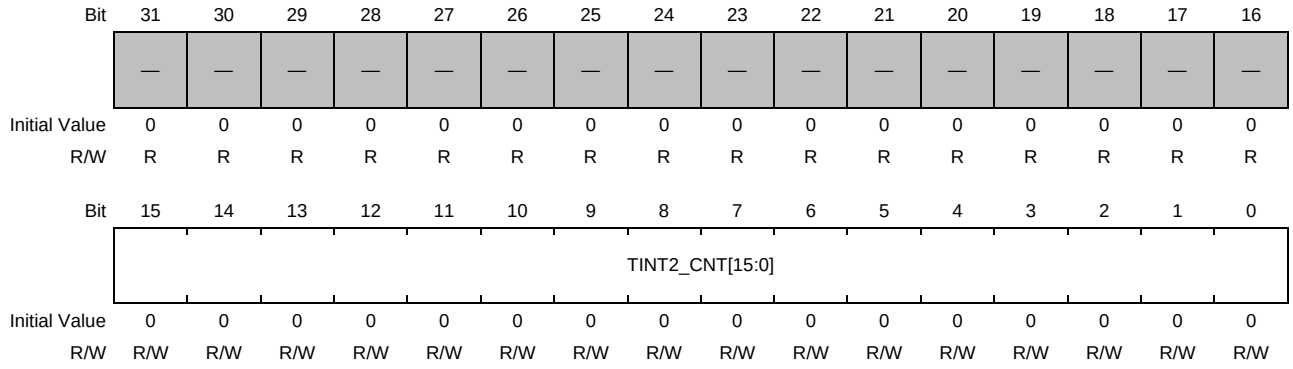
CXR40 indicates the number of occurrences of TINT1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	TINT1_CNT	H'0000	R/W	TINT1 Counter Indicates the number of occurrences of TINT1. TINT1: Frame transmission timeout When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.24 TINT2 counter register (CXR41)

CXR41 indicates the number of occurrences of TINT2.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	TINT2_CNT	H'0000	R/W	TINT2 Counter Indicates the number of occurrences of TINT2. TINT2: Delayed collision detection When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.25 TINT3 counter register (CXR42)

CXR42 indicates the number of occurrences of TINT3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TINT3_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	TINT3_CNT	H'0000	R/W	TINT3 Counter Indicates the number of occurrences of TINT3. TINT3: Transmission is terminated in error with TINT3 generated under the following conditions: Delay collision occurs at the end of transmit frame, the receive frame at the time of the collision continues until the start of next frame transmission, but does not continue until the end of the transmission. However, these conditions do not occur in normal operation.

31.4.2.26 RINT1 counter register (CXR50)

CXR50 indicates the number of occurrences of RINT1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT1_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT1_CNT	H'0000	R/W	RINT1 Counter Indicates the number of occurrences of RINT1. RINT1: Receive frame CRC error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.27 RINT2 counter register (CXR51)

CXR51 indicates the number of occurrences of RINT2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT2_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT2_CNT	H'0000	R/W	RINT2 Counter Indicates the number of occurrences of RINT2. RINT2: Frame reception error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.28 RINT3 counter register (CXR52)

CXR52 indicates the number of occurrences of RINT3.

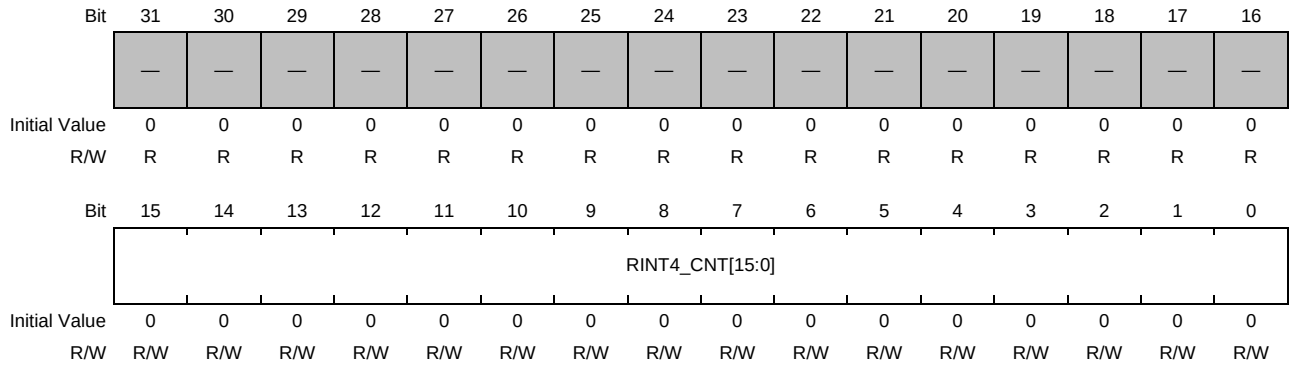
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT3_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT3_CNT	H'0000	R/W	RINT3 Counter Indicates the number of occurrences of RINT3. RINT3: Erroneous frame length (less than 64 bytes frame was received.) When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.29 RINT4 counter register (CXR53)

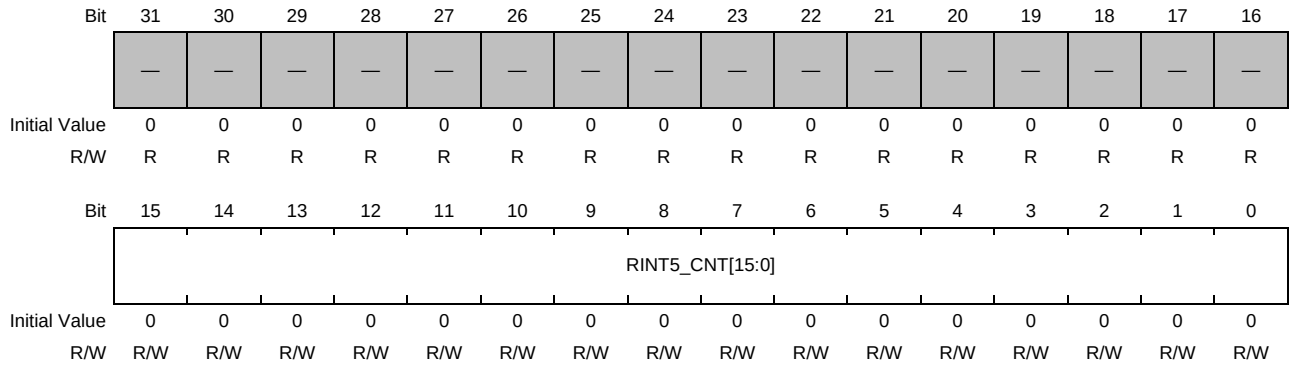
CXR53 indicates the number of occurrences of RINT4.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT4_CNT	H'0000	R/W	RINT4 Counter Indicates the number of occurrences of RINT4. RINT4: Erroneous frame length {A frame longer than the maximum frame length was received. Maximum frame length (including CRC) can be specified using the LEN_LMT field in the CXR2A register.} When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.30 RINT5 counter register (CXR54)

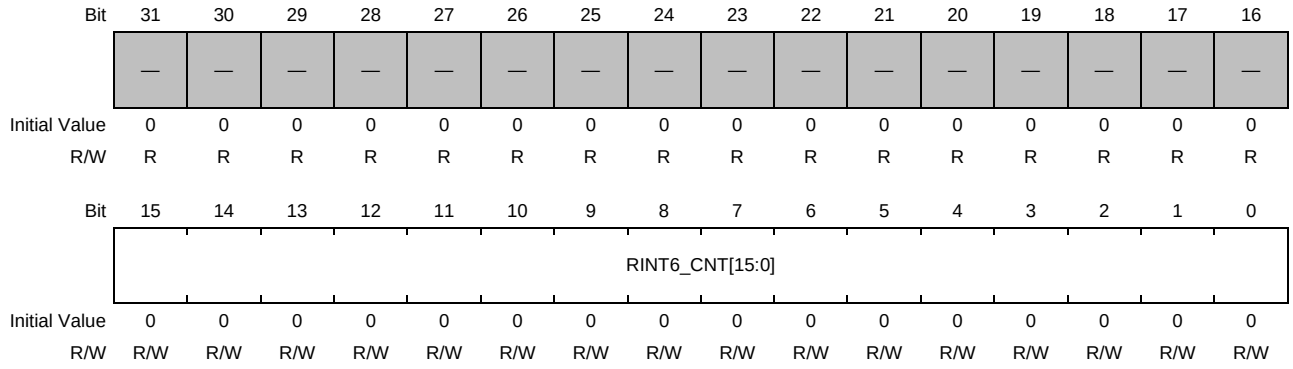
CXR54 indicates the number of occurrences of RINT5.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT5_CNT	H'0000	R/W	RINT5 Counter Indicates the number of occurrences of RINT5. RINT5: Fractional bit error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data)

31.4.2.31 RINT6 counter register (CXR55)

CXR55 indicates the number of occurrences of RINT6.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT6_CNT	H'0000	R/W	RINT6 Counter Indicates the number of occurrences of RINT6. RINT6: Carrier extension lost When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.32 RINT7 counter register (CXR56)

CXR56 indicates the number of occurrences of RINT7.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT7_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT7_CNT	H'0000	R/W	RINT7 Counter Indicates the number of occurrences of RINT7. RINT7: Carrier extension error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.33 RINT8 counter register (CXR57)

CXR57 indicates the number of occurrences of RINT8.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT8_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT8_CNT	H'0000	R/W	RINT8 Counter Indicates the number of occurrences of RINT8. RINT8: Multicast frame received When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

31.4.2.34 MDIO status register (MDIOSTS)

MDIOSTS indicates the status of PHY register access (MDIO access).

[Write restrictions]

Write disabled

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	BSY	0b	R	PHY register access Busy flag 0: Access enabled 1: Busy Do not write to MDIOCMD, MDIOADR, MDIODAT or MDIOMOD registers when this bit is1.

31.4.2.35 MDIO command register (MDIOCMD)

MDIOCMD specifies the commands for PHY register access (MDIO access).

[Write restrictions]

Do not write to this register when the BSY bit in the MDIOSTS register is 1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 5	A[9:5]	00000b	R/W	PHY address 5 bits
4 to 0	A[4:0]	00000b	R/W	PHY register address 5 bits

31.4.2.37 MDIO data register (MDIODAT)

MDIODAT specifies PHY write data and indicates read data.

[Write restrictions]

Do not write to this register when the BSY bit in the MDIOSTS register is 1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	D[15:0]	H'0000	R/W	PHY register data When writing: Write data When reading: Read data

31.4.2.38 MDIO mode register (MDIOMOD)

MDIOMOD sets the operating mode of the MDIO controller.

[Write restrictions]

Writing to this bit is prohibited during PHY register access.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEL_MDIO_N	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CYC_OCLK[7:0]							
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SEL_MDIO_N	1b	R/W	Selection for PHY register access (MDIO access selection) 0: Uses MDIO controller for PHY register access. 1: Uses CXR23 register for PHY register access. (Initial value)
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	CYC_OCLK	H'FF	R/W	MDC (MDIO control clock) half cycle (number of cycles for system clock) H'00: 7 cycles H'01: 7 cycles ... H'06: 7 cycles H'07: 8 cycles H'08: 9 cycles H'09: 10 cycles ... H'FE: 255 cycles H'FF: 256 cycles (Initial value) MDC half cycle should be set to be 200 ns or more. [Calculation example] 27 cycles at a 133-MHz Clock (1 cyc = 7.5 ns), 200 ns or more -> Setting value is H'1A (26d) 7.5 × 27 = 202.5 ≥ 200 [Setting example] //66.66 MHz (15 ns): Setting value ≥ H'0D (13d) (14 cyc × 15 ns = 210 ns) //133.3 MHz (7.5 ns): Setting value ≥ H'1A (26d) (27 cyc × 7.5 ns = 202.5 ns) //266.6 MHz (3.75 ns): Setting value ≥ H'35 (53d) (54 cyc × 3.75 ns = 202.5 ns)

31.4.2.39 Low Power Mode register 1 (LPTXMOD1)

LPTXMOD1 sets the operating mode of the Low Power Transmission.

[Write restrictions]

Write to this register when the CXR20_bit6 = ‘0’ and CXR20_bit5 = ‘0’. Recommended value is H’0000_0000 (Initial value).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	GCYC_TCSTOP	H’000	R/W	Number of minimum clock cycles until stopping RGMII TXC (1 Gbps) 0: 10 cycles (Initial value) 1 to 8: (Setting prohibited) 9: 9 cycles 10: 10 cycles 11: 11 cycles (skip the rest)
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	MCYC_TCSTOP	H’000	R/W	Number of minimum clock cycles until stopping RGMII TXC (100 Mbps) 0: 10 cycles (Initial value) 1 to 8: (Setting prohibited) 9: 9 cycles 10: 10 cycles 11: 11 cycles (skip the rest)

31.4.2.40 Low Power Mode register 2 (LPTXMOD2)

LPTXMOD2 sets the operating mode of the Low Power Transmission.

[Write restrictions]

Write to this register when the CXR20_bit6 = ‘0’ and CXR20_bit5 = ‘0’. When set ‘1’ to this register, check the configuration of Clock stoppable of PHY is ‘1’.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MAC_TLPI_TYPE	0b	R/W	Transmission LPI Operation Type of MAC ‘1’: MAC TX LPI Slave Mode E-MAC does not transmit LPI code during LPI period. But using LPI Wakeup parameters (LPTXGTH3/LPTXMTH3) to make the delay time of transmitting such as for PAUSE Frame. When making PHY control the operation of LPI (Low Power Idle), set ‘1’ to this bit. ‘0’: MAC TX LPI Master Mode E-MAC controls the operation of LPI. (Initial value)
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	STP_TXC_LPI	0b	R/W	Setting of stopping LPI TXC (this bit is used only RGMII Mode) ‘1’: The clock for RGMII transmitting (fet_miitx_gtx_clk) is stopped during output of LPI code. ‘0’: The clock for RGMII transmitting (fet_miitx_gtx_clk) is not stopped during output of LPI code. (Initial value) Set ‘1’ to this bit when TX Clock stop capable (Note1) of PHY is ‘1’ *Note 1.* See the Bit 6 Clock Stop Capable (MAC may stop clock during LPI) of PCS Status register in PHY MMD extended register (MMD address 3, REG address 1) *Note 2.* In the case of CCC.ERCS = 1 (The “clk_miitx_gtx_refclk” stop function is enable), even if this bit was set to ‘0’, the clock for RGMII transmitting (fet_miitx_gtx_clk) is stopped during the stopping period of “clk_miitx_gtx_refclk”. Because “fet_miitx_gtx_clk” is generated from “clk_miitx_gtx_refclk”.

31.4.2.41 RGMII Low Power parameter register 1 (LPTXGTH1)

LPTXGTH1 sets the change timing to Low Power Idle Transmission Mode at 1 Gbps.

[Write restrictions]

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’0000_0000 (Initial value).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

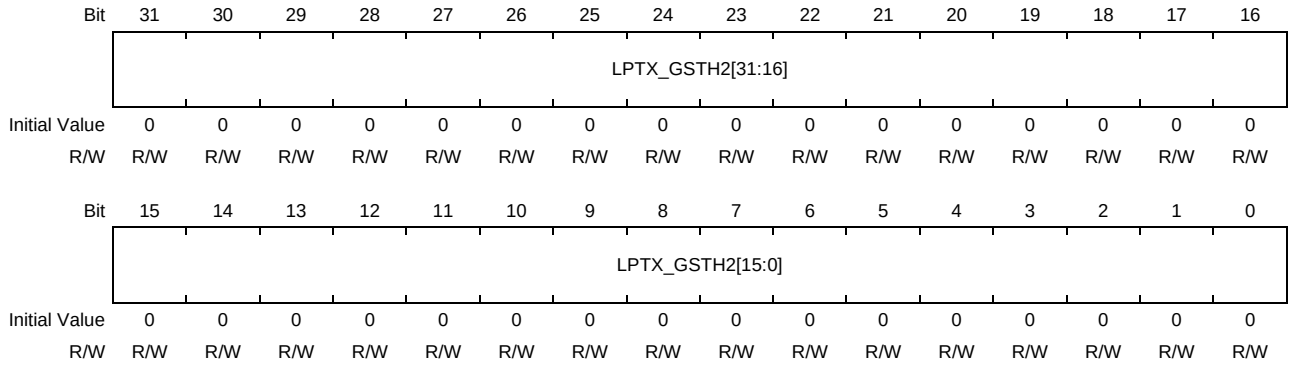
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_GSTH1	H’0000_0000	R/W	Threshold value of LPI code transmission standby status (1 Gbps) (Unit is 32 ns) 0: (Initial value) When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code. 1 to 7: Setting prohibited ... 32: When MAC does not receive transmission request during 1024 ns. MAC starts transmitting LPI code. ... 31250: When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code. ... (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.

31.4.2.42 RGMII Low Power parameter register 2 (LPTXGTH2)

LPTXGTH2 sets the change timing to Low Power Idle Transmission Mode after enabled function of transmitting LPI code at 1Gbps.

[Write restrictions]

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’0000_0000 (Initial value).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_GSTH2	H’0000_0000	R/W	Threshold value of starting LPI code transmission standby status (1 Gbps) (Unit is 32 ns) 0: (Initial value) MAC will be ready for transmitting LPI code after 1.01 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. 1 to 7: Setting prohibited ... 32: MAC will be ready for transmitting LPI code after 1024 ns later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 31250000: MAC will be ready for transmitting LPI code after 1 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 31562500: MAC will be ready for transmitting LPI code after 1.01 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 100000000: MAC will be ready for transmitting LPI code after 3.2 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. Recommended setting value In the standard, the behavior of PHY is undefined if PHY receives LPI code within 1 s after Link Up. Therefore, the recommended value was determined as 1.01 s. (1 s plus 1% margin) The following is reason why “LPM bit of CXR20 is set to ‘1’” was include to the condition. Intenal Clock (32 ns:1 Gbps, 320 ns:100 Mbps) is used to measure the time after Link Up. But Internal Clock will change during transmission rate is un-determined. So, it is difficult to measure the time after Link Up exactly. Therefore, “LPM bit of CXR20 is set to ‘1’” was include to the condition as determined point of transmission rate of Low Power Mode.

31.4.2.43 RGMII Low Power parameter register 3 (LPTXGTH3)

LPTXGTH3 sets the operation return from Low Power Idle Transmission Mode at 1 Gbps.

[Write restrictions]

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’0000_0000 (Initial value). Do not set 262144 (H’0004_0000) or more to this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_GRTH	H'0000_0000	R/W	Transmission Low Power resume time (1 Gbps) (Unit 32 ns) 0: (Initial value) After received transmit request, MAC transmits Normal Idle code during 17.184 µs. And then MAC returns to Normal Mode from Low Power Mode. 1 to 7: Setting prohibited ... 32: After received transmit request, MAC transmits Normal Idle code during 1024 ns And then MAC returns to Normal Mode from Low Power Mode. ... 516: After received transmit request, MAC transmits Normal Idle code during 16.512 µs. And then MAC returns to Normal Mode from Low Power Mode. 521: After received transmit request, MAC transmits Normal Idle code during 16.672 µs. And then MAC returns to Normal Mode from Low Power Mode. 532: After received transmit request, MAC transmits Normal Idle code during 17.024 µs. And then MAC returns to Normal Mode from Low Power Mode. 537: After received transmit request, MAC transmits Normal Idle code during 17.184 µs. And then MAC returns to Normal Mode from Low Power Mode. ... 1000: After received transmit request, MAC transmits Normal Idle code during 17.184 µs. And then MAC returns to Normal Mode from Low Power Mode. ... 262144 or more: Reserved (Setting prohibited) (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. Recommended setting value The basic value of this field is LPI WakeUp Time (Tw_sys_tx) with 1% margin. In the case of 1000BASE-T, Tw_sys_tx is 16.5 us. But some of PHY needs 1 us for Wakeup Time. Therefore, Recommended value was determined as 17.184 us. The setting value of this field will be the overhead time return from Low Power Mode. Do not set the value will be under the 16.5 µs (Minimum Wakeup Time which is defined by standard) to this field. In addition, if PHY has the LPI transmission control function, PHY also make overhead time same as Wake-Up Time.

31.4.2.44 RGMII Low Power parameter register 4 (LPTXGTH4)

LPTXGTH4 sets the minimum period for Low Power Idle Transmission Mode at 1 Gbps.

[Write restrictions]

Write to this register when the CXR20_bit6 = '0', CXR20_bit5 = '0'. Recommended value is H'0000_0000 (Initial value).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(skip the rest) *Note*: This value is used by internal logic and doesn’t mean indicating accurate time on PHY IF. Recommended setting value Recommended value of this field is 3.2 µs (3200 ns) for 100BASE-TX. This value based on followings: [1] his value should be sufficiency longer than 360 ns [2] This value should be sufficiency shorter than Wake Up Time (30 µs). And selected the value which is close to geometric mean of [1] and [2].

31.4.3 TOE Registers

31.4.3.1 Checksum operating mode register (CSR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFOCAP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RBP	TBP	—	—	RPE	TPE	—	—	—	CCM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17 to 16	FIFOCAP	00b	R/W	FIFO CAPACITY TOE FIFO Capacity 00b: 2 Kbytes (512 Word × 32bit) 01b: 4 Kbytes (1024 Word × 32bit) 10b: 8 Kbytes (2048 Word × 32bit) 11b: 16 Kbytes (4096 Word × 32bit) Write to this field when TPE is ‘0’.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	RBP	0b	R/W	Receive Bypass Enable Bypass Enable of TOE Rx function. 0b: Rx Function is not bypassed. 1b: Rx Function is bypassed. (for debug) *Note*: This bit is used only for debug. Do not set 1b during normal operation. When this bit is set to “1", all Rx Functions of TOE are bypassed. Therefore, TOE sends Rx frame from E-MAC to DMAC even if RPE is ‘0’. Write to this bit when RPE is ‘0’. When this bit is set to “0", set E-MAC as CRC Pass Through Mode (CXR20 RCPT = “1”). When this bit is set to “1”, set E-MAC as Non-CRC Pass Through Mode (CXR20 RCPT = “0”).
8	TBP	0b	R/W	Transmit Bypass Enable Bypass Enable of TOE Tx Function 0b: Tx Function is not bypassed. 1b: Tx Function is bypassed (for debug) *Note*: This bit is used only for debug. Do not set 1b during normal operation. When this bit is set to “1", all Tx Functions of TOE are bypassed. Therefore, TOE sends Tx frame from DMAC to E-MAC even if TPE is ‘0’. Since Tx Frame does not go through TOE FIFO, there is no latency. Write to this bit when TPE is ‘0’.
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
5	RPE	0b	R/W	Receive Port Enable Enable of Frame Output Function to DMAC. 0b: Output Function is disabled. 1b: Output Function is enabled. When value is changed from ‘1’ to ‘0’ during TOE is outputting any frames, the value of this bit will be ‘0’ after finished outputting. Therefore, ‘1’ is read as read value during TOE is outputting frames.
4	TPE	0b	R/W	Transmit Port Enable Enable of Frame Output Function to E-MAC. 0b: Output Function is disable. 1b: Output Function is enabled. Procedure of setting ‘0’ to this bit. (1) Set ‘0’ to TPE. (2) Continue to read TPE until it will be read as ‘0’. (TPE will be ‘0’ when TOE FIFO will be empty) (3) If read value is ‘0’, procedure of setting ‘0’ is finished.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CCM	0b	R/W	Counter Clear Mode This bit designates the clear method of Interrupt Status Counters (CSR20, CSR30, CSR31, CSR32) 1b: When each Counter Registers are read, they are cleared to ‘0’. 0b: When each Counter Registers are written any value, they are cleared to ‘0’. Write to this bit when TPE is ‘0’ and RPE is ‘0’.

31.4.3.2 Tx Frame Checksum Enable register (CSR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	TDHD	0b	R/W	Transmit Destination Option Header Enable When the frame from DMAC has a Destination Option header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when TPE is ‘0’.
26	TAHD	0b	R/W	Transmit Authentication Header Enable When the frame from DMAC has an AH header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when TPE is ‘0’.
25	TROUT	0b	R/W	Transmit Routing Header Enable When the frame from DMAC has a Routing header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when TPE is ‘0’.
24	THOP	0b	R/W	Transmit Hop-by-Hop Option Header Enable When the frame from DMAC has a Hop-by-Hop Option header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when TPE is ‘0’.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	TICMP6	0b	R/W	Transmit ICMP Checksum in IPv6 Enable Enable of IPv6 ICMP Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable When this bit is ‘1’, the value of bits [27:24] are valid. Write to this bit when TPE is ‘0’.

Bit	Bit Name	Initial Value	R/W	Description
21	TUDP6	0b	R/W	Transmit UDP Checksum in IPv6 Enable Enable of IPv6 UDP Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable When this bit is ‘1’, the value of bits [27:24] are valid. Write to this bit when TPE is ‘0’.
20	TTCP6	0b	R/W	Transmit TCP Checksum in IPv6 Enable Enable of IPv6 TCP Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable When this bit is ‘1’, the value of bits [27:24] are valid. Write to this bit when TPE is ‘0’.
19 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	TICMP4	0b	R/W	Transmit ICMP Checksum in IPv4 Enable Enable of IPv4 ICMP Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable Write to this bit when TPE is ‘0’.
5	TUDP4	0b	R/W	Transmit UDP Checksum in IPv4 Enable Enable of IPv4 UDP Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable Write to this bit when TPE is ‘0’.
4	TTCP4	0b	R/W	Transmit TCP Checksum in IPv4 Enable Enable of IPv4 TCP Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable Write to this bit when TPE is ‘0’.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	TIP4	0b	R/W	Transmit IPv4 Checksum Enable Enable of IPv4 Header Checksum Calculation in the frame from DMAC. 0b: Disable 1b: Enable Write to this bit when TPE is ‘0’.

31.4.3.3 Rx Frame Checksum Enable register (CSR2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	RDHD	RAHD	RROUT	RHOP	—	RICMP6	RUDP6	RTCP6	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	RDHD	0b	R/W	Receive Destination Option Header Enable When the frame from E-MAC has a Destination Option header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
26	RAHD	0b	R/W	Receive Authentication Header Enable When the frame from E-MAC has an AH header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
25	RROUT	0b	R/W	Receive Routing Header Enable When the frame from E-MAC has a Routing header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
24	RHOP	0b	R/W	Receive Hop-by-Hop Option Header Enable When the frame from E-MAC has a Hop-by-Hop Option header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	RICMP6	0b	R/W	Receive ICMP Checksum in IPv6 Enable Enable of IPv6 ICMP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable When this bit is ‘1’, the value of bits [27:24] are valid. Write to this bit when RPE is ‘0’.

Bit	Bit Name	Initial Value	R/W	Description
21	RUDP6	0b	R/W	Receive UDP Checksum in IPv6 Enable Enable of IPv6 UDP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable When this bit is '1', the value of bits [27:24] are valid. Write to this bit when RPE is '0'.
20	RTCP6	0b	R/W	Receive TCP Checksum in IPv6 Enable Enable of IPv6 TCP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable When this bit is '1', the value of bits [27:24] are valid. Write to this bit when RPE is '0'.
19 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	RICMP4	0b	R/W	Receive ICMP Checksum in IPv4 Enable Enable of IPv4 ICMP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'.
5	RUDP4	0b	R/W	Receive UDP Checksum in IPv4 Enable Enable of IPv4 UDP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'.
4	RTCP4	0b	R/W	Receive TCP Checksum in IPv4 Enable Enable of IPv4 TCP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'. These bits are read as 0. The write value should be always 0.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RIP4	0b	R/W	Receive IPv4 Checksum Enable Enable of IPv4 Header Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'.

31.4.3.4 Tx Extended Header Number register (CSR3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	RNUEXHED	H’8	R/W	Receive Support Number of Extension Header Receive Support Number of Extension Header in the frame from E-MAC. H’0: 16 H’1: 1 … H’E: 14 H’F: 15 If the number of Extension Header in the IPv6 frame is over the configuration of this field, TOE ascribes this frame to unsupported. Write to this field when RPE is ‘0’.

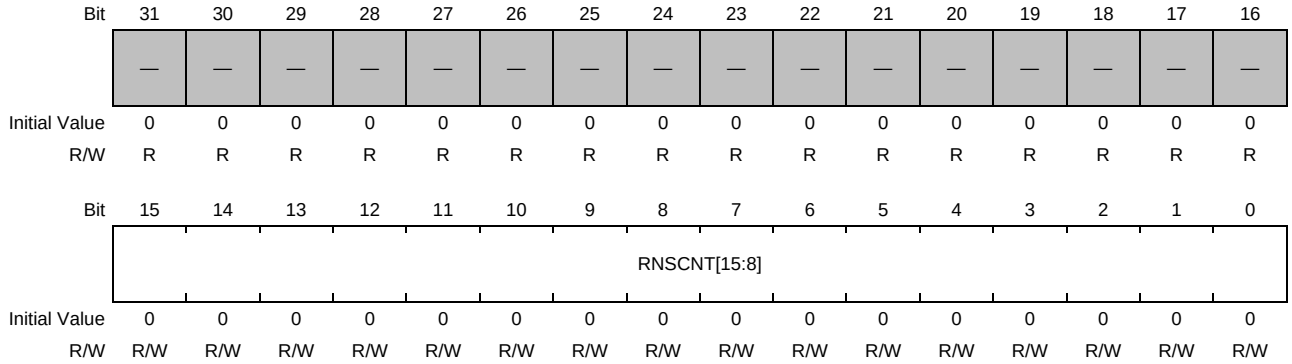
31.4.3.6 Unsupported Tx Frame Counter register (CSR20)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TNSCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	TNSCNT	H'0000	R/W	Transmit Not Support Frame Counter Counter for Transmitted Unsupported Frames When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is OR of followings. • TYPE/TPID is Unsupported • Not ("MF = 0" and "Fragment Offset = H'0000") • Protocol is Unsupported • Next Header of IPv6 frame is Unsupported • The number of Next Header in IPv6 frame is 9 or more • Checksum calculation for a particular frame is disabled by CSR1 • The Frame Length is shorter than the result of Frame Analysis by TOE.

31.4.3.7 Unsupported Rx Frame Counter register (CSR30)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RNSCNT	H'0000	R/W	Receive Not Support Frame Counter Counter for Received Unsupported Frames When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is OR of followings. • TYPE/TPID is Unsupported • Not ("MF = 0" and "Fragment Offset = H'0000") • Protocol is Unsupported • Next Header of IPv6 frame is Unsupported • The number of Next Header in IPv6 frame is 9 or more • Checksum calculation for a particular frame is disabled by CSR2 • The Frame Length is shorter than the result of Frame Analysis by TOE.

31.4.3.8 Rx IPv4 Header checksum Error Counter register (CSR31)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	R4ECNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	R4ECNT	H'0000	R/W	Receive IPv4 Header Checksum Error Counter Counter for the number of IPv4 Header Checksum Error in the frames from E-MAC. When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is following. When the frame which has IPv4 Checksum Error comes, TOE counts up this register.

31.4.3.9 Rx TCP/UDP/ICMP checksum Error Counter register (CSR32)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

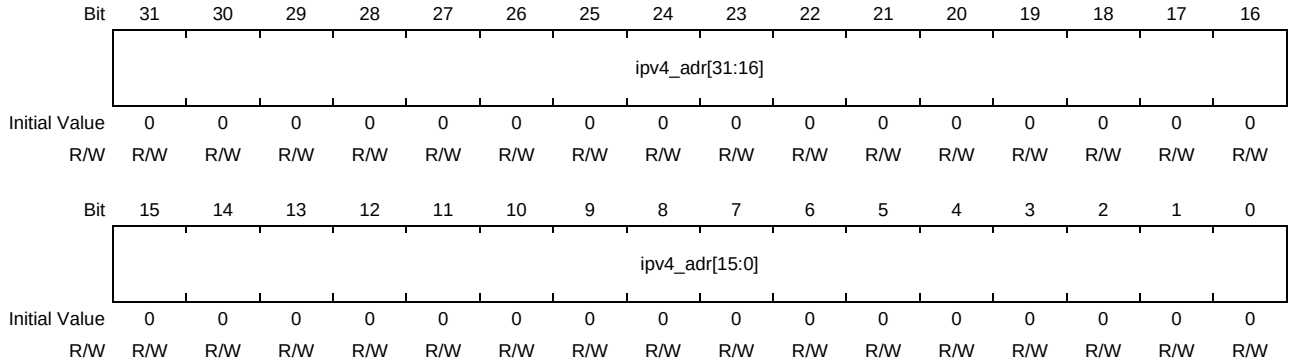
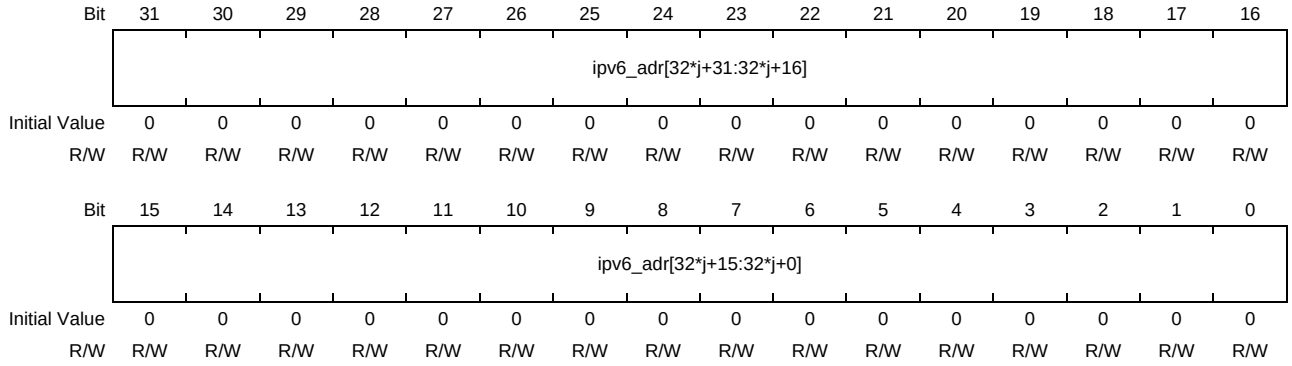
2	type_fen	0b	R/W	Type Filter Enable Filtering Operation by Ethernet TYPE/TPID. 0b: Non-Filtering 1b: Filtering
1 to 0	sby_mode	00b	R/W	Standby Mode Filtering Operation Mode 00b: Non-Filtering 1*b: Filtering

31.4.3.11 Local IPv4 address register (CSFR01)



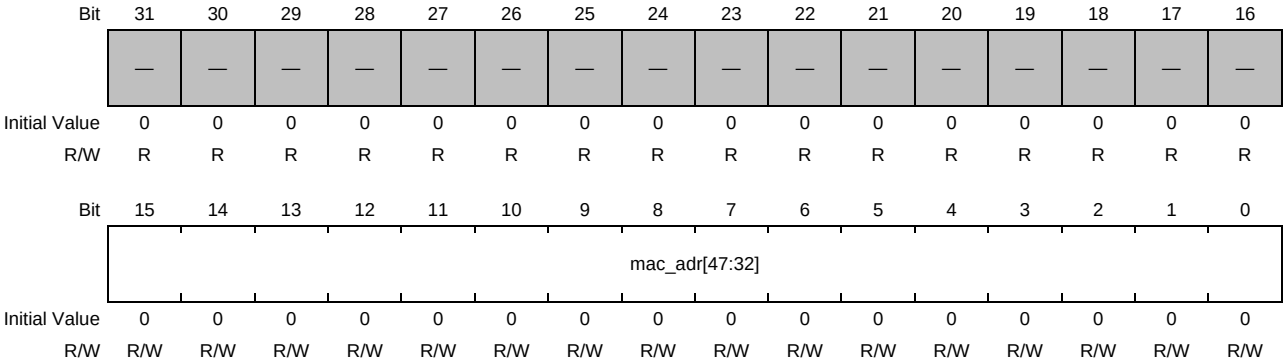
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ipv4_adr	H'0000_0000	R/W	IPv4 address IPv4 Address of Local Station Write to this field when CSFR00.reply_fifo_en = "0", reg_fifo_en = "0" and sby_mode = "00b".

31.4.3.12 Local IPv6 address register i (i = 0 to 3) (CSFR02_i)



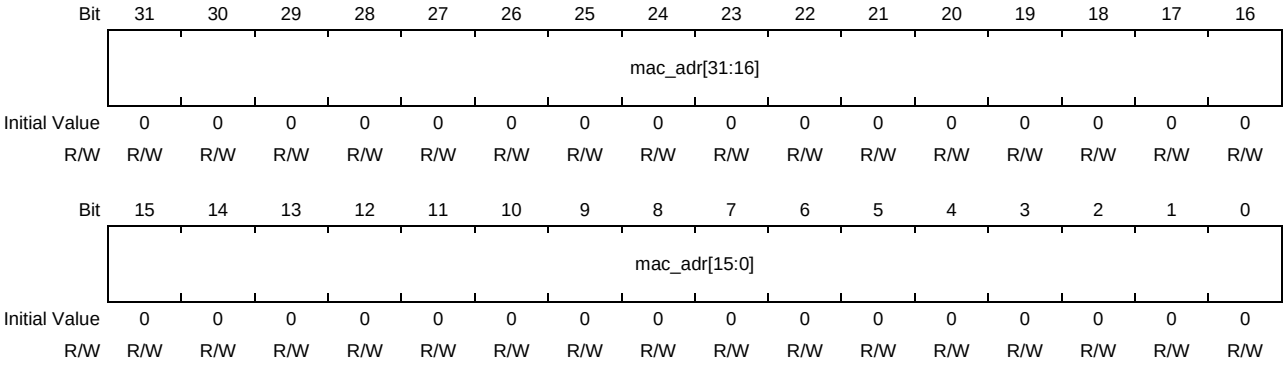
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ipv6_adr	H'0000_0000	R/W	IPv6 Address IPv6 Address[32*j+31:32*j] of Local Station The relationship between 'i' and 'j' is the following. i = 0 -> j = 3 i = 1 -> j = 2 i = 2 -> j = 1 i = 3 -> j = 0 Write to this field when CSFR00.reply_fifo_en = "0", reg_fifo_en = "0" and sby_mode = "00b".

31.4.3.13 Upper Local MAC address register (CSFR03_U)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	mac_adr	H'0000	R/W	MAC Address MAC Address [47:32] of Local Station Write to this field when CSFR00.reply_fifo_en = "0", reg_fifo_en = "0" and sby_mode = "00b".

31.4.3.14 Lower Local MAC address register (CSFR03_L)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	mac_adr	H'0000_0000	R/W	MAC Address MAC Address [32:0] of Local Station Write to this field when CSFR00.reply_fifo_en = "0", reg_fifo_en = "0" and sby_mode = "00b".

31.4.3.15 IPv6 no_next_header Protocol Number register (CSFR04)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	no_next_header[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	0	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	no_next_header	H'3B	R/W	Protocol Number of IPv6 no_next_header Usually, do not need to change from Initial values (59). Write to this field when CSFR00.sby mode is '00b'.

31.4.3.16 Ethernet Type Condition register i (i = 0 to 3) (CSFR10_i)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	type_2*i+1[15:8]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	type_2*I[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	type_2*i+1	H'0000	R/W	Ethernet Type 2*i+1 Configuration of the Ethernet TYPE for Filter Condition and Interrupt Condition. Write to this field when CSFR10. type_2*i+1_en is "0".
15 to 0	type_2*i	H'0000	R/W	Ethernet Type 2*i Configuration of the Ethernet TYPE for Filter Condition and Interrupt Condition. Write to this field when CSFR10. type_2*i_en is "0".

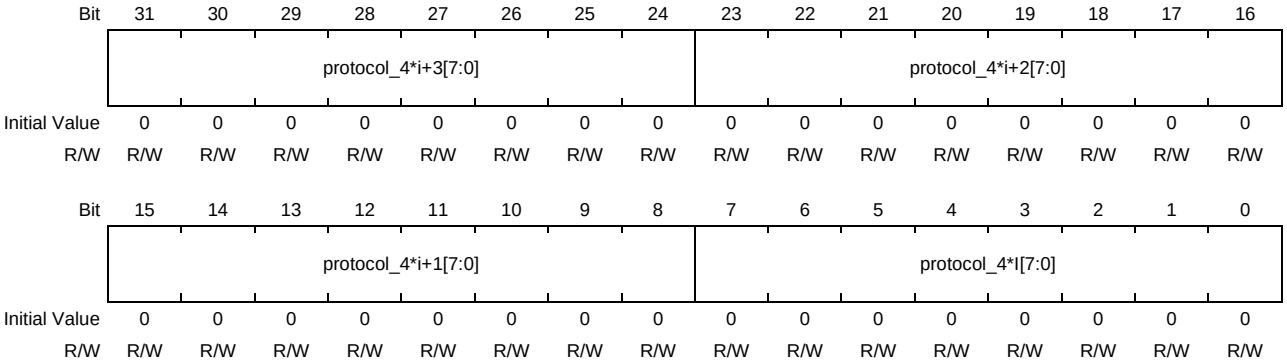
31.4.3.17 Ethernet Type Condition Enable register (CSFR10)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	type_7_en	type_6_en	type_5_en	type_4_en	type_3_en	type_2_en	type_1_en	type_0_en
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	type_7_en	0b	R/W	type_7 enable Enable for the value of type_7 which is configured in CSFR10_i. 0b: Disable 1b: Enable
6	type_6_en	0b	R/W	type_6 enable Enable for the value of type_6 which is configured in CSFR10_i. 0b: Disable 1b: Enable
5	type_5_en	0b	R/W	type_5 enable Enable for the value of type_5 which is configured in CSFR10_i. 0b: Disable 1b: Enable
4	type_4_en	0b	R/W	type_4 enable Enable for the value of type_4 which is configured in CSFR10_i. 0b: Disable 1b: Enable
3	type_3_en	0b	R/W	type_3 enable Enable for the value of type_3 which is configured in CSFR10_i. 0b: Disable 1b: Enable
2	type_2_en	0b	R/W	type_2 enable Enable for the value of type_2 which is configured in CSFR10_i. 0b: Disable 1b: Enable
1	type_1_en	0b	R/W	type_1 enable Enable for the value of type_1 which is configured in CSFR10_i. 0b: Disable 1b: Enable
0	type_0_en	0b	R/W	type_0 enable Enable for the value of type_0 which is configured in CSFR10_i. 0b: Disable 1b: Enable

31.4.3.18 Protocol Condition register i (i = 0 to 3) (CSFR11_i)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	protocol_4*i+3	H'00	R/W	protocol No 4*i+3 Configuration of the Protocol No for Filter Condition and Interrupt Condition. Write to this field when CSFR11. protocol_4*i+3_en is "0".
23 to 16	protocol_4*i+2	H'00	R/W	protocol No 4*i+2 Configuration of the Protocol No for Filter Condition and Interrupt Condition. Write to this field when CSFR11. protocol_4*i+2_en is "0".
15 to 8	protocol_4*i+1	H'00	R/W	protocol No 4*i+1 Configuration of the Protocol No for Filter Condition and Interrupt Condition. Write to this field when CSFR11. protocol_4*i+1_en is "0".
7 to 0	protocol_4*i	H'00	R/W	protocol No 4*i Write to this field when CSFR11. protocol_4*i_en is "0".

31.4.3.19 Protocol Condition Enable register (CSFR11)

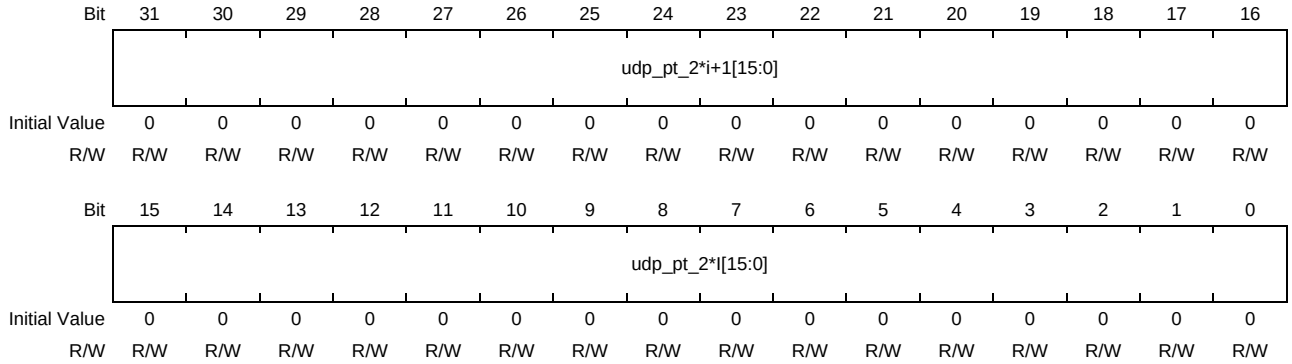
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	protocol_15_en	protocol_14_en	protocol_13_en	protocol_12_en	protocol_11_en	protocol_10_en	protocol_9_en	protocol_8_en	protocol_7_en	protocol_6_en	protocol_5_en	protocol_4_en	protocol_3_en	protocol_2_en	protocol_1_en	protocol_0_en
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	protocol_15_en	0b	R/W	protocol_15 enable Enable for the value of protocol_15 which is configured in CSFR11_i. 0b: Disable 1b: Enable
14	protocol_14_en	0b	R/W	protocol_14 enable Enable for the value of protocol_14 which is configured in CSFR11_i. 0b: Disable 1b: Enable
13	protocol_13_en	0b	R/W	protocol_13 enable Enable for the value of protocol_13 which is configured in CSFR11_i. 0b: Disable 1b: Enable
12	protocol_12_en	0b	R/W	protocol_12 enable Enable for the value of protocol_12 which is configured in CSFR11_i. 0b: Disable 1b: Enable
11	protocol_11_en	0b	R/W	protocol_11 enable Enable for the value of protocol_11 which is configured in CSFR11_i. 0b: Disable 1b: Enable
10	protocol_10_en	0b	R/W	protocol_10 enable Enable for the value of protocol_10 which is configured in CSFR11_i. 0b: Disable 1b: Enable
9	protocol_9_en	0b	R/W	protocol_9 enable Enable for the value of protocol_9 which is configured in CSFR11_i. 0b: Disable 1b: Enable
8	protocol_8_en	0b	R/W	protocol_8 enable Enable for the value of protocol_8 which is configured in CSFR11_i. 0b: Disable 1b: Enable
7	protocol_7_en	0b	R/W	protocol_7 enable Enable for the value of protocol_7 which is configured in CSFR11_i. 0b: Disable 1b: Enable

Bit	Bit Name	Initial Value	R/W	Description
6	protocol_6_en	0b	R/W	protocol_6 enable Enable for the value of protocol_6 which is configured in CSFR11_i. 0b: Disable 1b: Enable
5	protocol_5_en	0b	R/W	protocol_5 enable Enable for the value of protocol_5 which is configured in CSFR11_i. 0b: Disable 1b: Enable
4	protocol_4_en	0b	R/W	protocol_4 enable Enable for the value of protocol_4 which is configured in CSFR11_i. 0b: Disable 1b: Enable
3	protocol_3_en	0b	R/W	protocol_3 enable Enable for the value of protocol_3 which is configured in CSFR11_i. 0b: Disable 1b: Enable
2	protocol_2_en	0b	R/W	protocol_2 enable Enable for the value of protocol_2 which is configured in CSFR11_i. 0b: Disable 1b: Enable
1	protocol_1_en	0b	R/W	protocol_1 enable Enable for the value of protocol_1 which is configured in CSFR11_i. 0b: Disable 1b: Enable
0	protocol_0_en	0b	R/W	protocol_0 enable Enable for the value of protocol_0 which is configured in CSFR11_i. 0b: Disable 1b: Enable

31.4.3.20 UDP Por Condition register i (i = 0 to 11) (CSFR12_i)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	udp_pt_2*i+1	H'0000	R/W	UDP port No. Configuration of the UDP Port No for Filter Condition and Interrupt Condition. Write to this field when CSFR12. udp_pt_2*i+1_en is "0".
15 to 0	udp_pt_2*i	H'0000	R/W	UDP port No. Configuration of the UDP Port No for Filter Condition and Interrupt Condition. Write to this field when CSFR12. udp_pt_2*i_en is "0".

31.4.3.21 UDP Port Condition Enable register (CSFR12)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	udp_pt_23_en	udp_pt_22_en	udp_pt_21_en	udp_pt_20_en	udp_pt_19_en	udp_pt_18_en	udp_pt_17_en	udp_pt_16_en
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	udp_pt_15_en	udp_pt_14_en	udp_pt_13_en	udp_pt_12_en	udp_pt_11_en	udp_pt_10_en	udp_pt_9_en	udp_pt_8_en	udp_pt_7_en	udp_pt_6_en	udp_pt_5_en	udp_pt_4_en	udp_pt_3_en	udp_pt_2_en	udp_pt_1_en	udp_pt_0_en
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	udp_pt_23_en	0b	R/W	udp_pt_23 enable Enable for the value of udp_pt_23 which is configured in CSFR12_i. 0b: Disable 1b: Enable
22	udp_pt_22_en	0b	R/W	udp_pt_22 enable Enable for the value of udp_pt_22 which is configured in CSFR12_i. 0b: Disable 1b: Enable
21	udp_pt_21_en	0b	R/W	udp_pt_21 enable Enable for the value of udp_pt_21 which is configured in CSFR12_i. 0b: Disable 1b: Enable

Bit	Bit Name	Initial Value	R/W	Description
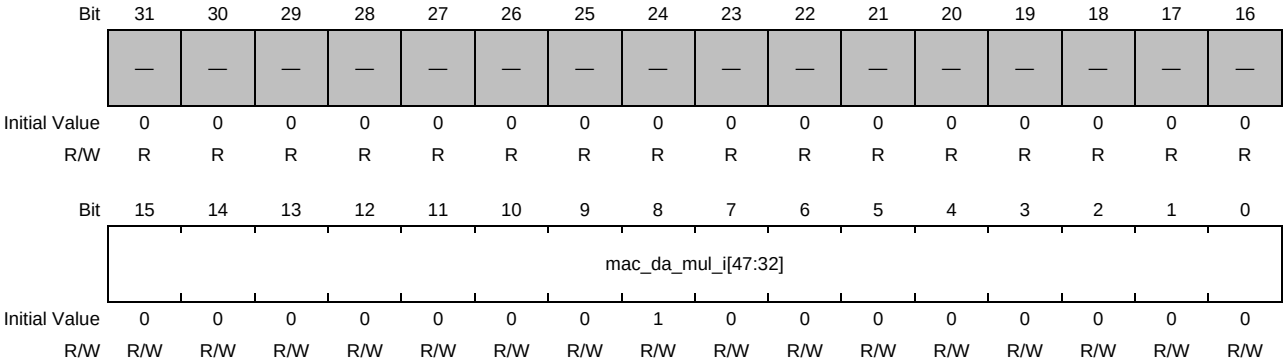
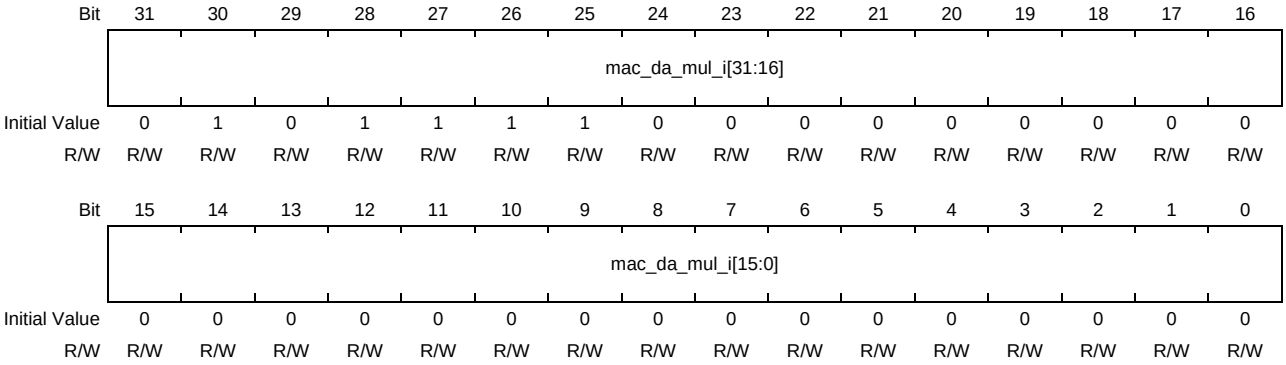
31 to 0	mac_da_bro	H'FFFF_FFFF	R/W	MAC DA Broadcast address Configuration of the MAC DA broadcast Address [31:0] for Filter Condition and Interrupt Condition. Write to this field when CSFR15.mac_da_bro_en = "0".

31.4.3.26 Upper MAC DA multicast address Condition register i (i = 0 to 19) (CSFR15_U_i)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	mac_da_mul_i	H'0100	R/W	MAC DA Multicast address Configuration of the MAC DA multicast Address [47:32] for Filter Condition and Interrupt Condition. Write to this field when CSFR15.mac_da_mul_i_en = "0".

31.4.3.27 Lower MAC DA multicast address Condition register i (i = 0 to 19) (CSFR15_L_i)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	mac_da_mul_i	H'5E00_0000	R/W	MAC DA Multicast address Configuration of the MAC DA multicast Address [31:0] for Filter Condition and Interrupt Condition. Write to this field when CSFR15.mac_da_mul_i _en = "0".

31.4.3.28 MAC DA Condition Enable register (CSFR15)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	mac_da_uni_en	—	—	—	mac_da_bro_en	—	—	—	—	mac_da_mul_19_en	mac_da_mul_18_en	mac_da_mul_17_en	mac_da_mul_16_en
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

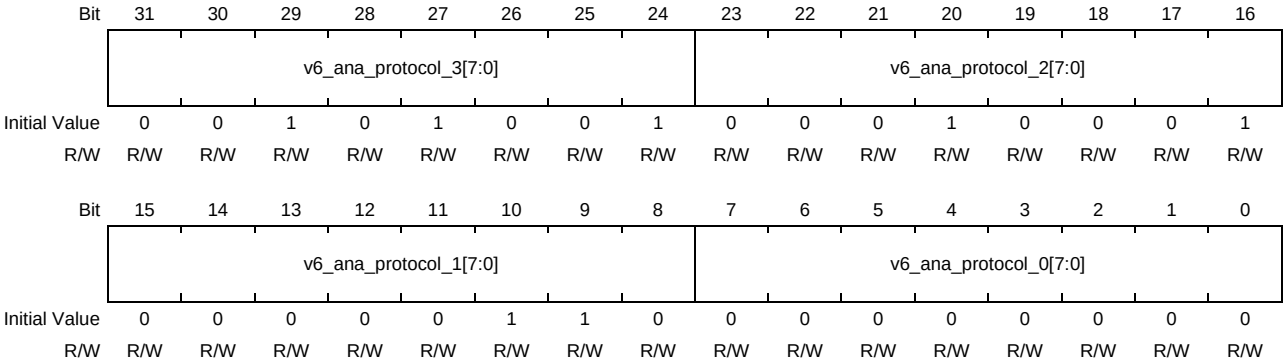
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	mac_da_uni_en	0b	R/W	Mac_da_uni enable Enable for the value of mac_da_uni which is configured in CSFR13_U/L. 0b: Disable 1b: Enable
27 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	mac_da_bro_en	0b	R/W	Mac_da_bro enable Enable for the value of mac_da_bro which is configured in CSFR14_U/L. 0b: Disable 1b: Enable
23 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	mac_da_mul_19_en	0b	R/W	mac_da_mul_19 enable Enable for the value of mac_da_mul_19 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
18	mac_da_mul_18_en	0b	R/W	mac_da_mul_18 enable Enable for the value of mac_da_mul_18 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
17	mac_da_mul_17_en	0b	R/W	mac_da_mul_17 enable Enable for the value of mac_da_mul_17 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
16	mac_da_mul_16_en	0b	R/W	mac_da_mul_16 enable Enable for the value of mac_da_mul_16 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
15	mac_da_mul_15_en	0b	R/W	mac_da_mul_15 enable Enable for the value of mac_da_mul_15 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable

Bit	Bit Name	Initial Value	R/W	Description
14	mac_da_mul_14_en	0b	R/W	mac_da_mul_14 enable Enable for the value of mac_da_mul_14 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
13	mac_da_mul_13_en	0b	R/W	mac_da_mul_13 enable Enable for the value of mac_da_mul_13 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
12	mac_da_mul_12_en	0b	R/W	mac_da_mul_12 enable Enable for the value of mac_da_mul_12 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
11	mac_da_mul_11_en	0b	R/W	mac_da_mul_11 enable Enable for the value of mac_da_mul_11 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
10	mac_da_mul_10_en	0b	R/W	mac_da_mul_10 enable Enable for the value of mac_da_mul_10 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
9	mac_da_mul_9_en	0b	R/W	mac_da_mul_9 enable Enable for the value of mac_da_mul_9 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
8	mac_da_mul_8_en	0b	R/W	mac_da_mul_8 enable Enable for the value of mac_da_mul_8 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
7	mac_da_mul_7_en	0b	R/W	mac_da_mul_7 enable Enable for the value of mac_da_mul_7 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
6	mac_da_mul_6_en	0b	R/W	mac_da_mul_6 enable Enable for the value of mac_da_mul_6 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
5	mac_da_mul_5_en	0b	R/W	mac_da_mul_5 enable Enable for the value of mac_da_mul_5 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
4	mac_da_mul_4_en	0b	R/W	mac_da_mul_4 enable Enable for the value of mac_da_mul_4 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
3	mac_da_mul_3_en	0b	R/W	mac_da_mul_3 enable Enable for the value of mac_da_mul_3 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
2	mac_da_mul_2_en	0b	R/W	mac_da_mul_2 enable Enable for the value of mac_da_mul_2 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable

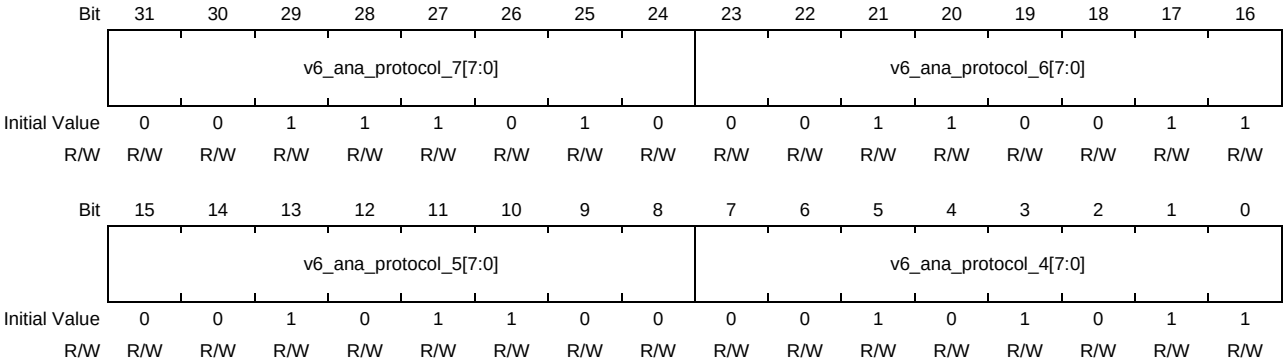
Bit	Bit Name	Initial Value	R/W	Description
1	mac_da_mul_1_en	0b	R/W	mac_da_mul_1 enable Enable for the value of mac_da_mul_1 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
0	mac_da_mul_0_en	0b	R/W	mac_da_mul_0 enable Enable for the value of mac_da_mul_0 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable

31.4.3.29 IPv6 analysis Protocol Condition register 0 (CSFR16_0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	v6_ana_protocol_3	H'29	R/W	IPv6 Analyzable Protocol No 3 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'29 IPV6 (41). Write to this field when CSFR16. v6_ana_protocol_3_en is '0b'.
23 to 16	v6_ana_protocol_2	H'11	R/W	IPv6 Analyzable Protocol No 2 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'11 UDP (17). Write to this field when CSFR16. v6_ana_protocol_2_en is '0b'.
15 to 8	v6_ana_protocol_1	H'06	R/W	IPv6 Analyzable Protocol No 1 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'06 TCP (6). Write to this field when CSFR16. v6_ana_protocol_1_en is '0b'.
7 to 0	v6_ana_protocol_0	H'00	R/W	IPv6 Analyzable Protocol No 0 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'00 Hop-by-Hop (0). Write to this field when CSFR16. v6_ana_protocol_0_en is '0b'.

31.4.3.30 IPv6 analysis Protocol Condition register 1 (CSFR16_1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	v6_ana_protocol_7	H'3A	R/W	IPv6 Analyzable Protocol No.7 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'3A ICMPv6 (58). Write to this field when CSFR16. v6_ana_protocol_7_en is '0b'.
23 to 16	v6_ana_protocol_6	H'33	R/W	IPv6 Analyzable Protocol No.6 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'33 Authentication (51). Write to this field when CSFR16. v6_ana_protocol_6_en is '0b'.
15 to 8	v6_ana_protocol_5	H'2C	R/W	IPv6 Analyzable Protocol No.5 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'2C Flag (44). Write to this field when CSFR16. v6_ana_protocol_5_en is '0b'.
7 to 0	v6_ana_protocol_4	H'2B	R/W	IPv6 Analyzable Protocol No.4 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'2B Routing (43). Write to this field when CSFR16. v6_ana_protocol_4_en is '0b'.

31.4.3.31 IPv6 analysis Protocol Condition register 2 (CSFR16_2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	v6_ana_protocol_8[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	v6_ana_protocol_8	H'3C	R/W	IPv6 Analyzable Protocol No 8 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'3C Destination Options (60). Write to this field when CSFR16. v6 ana protocol 8 en is '0b'.

31.4.3.32 IPv6 analysis Protocol Condition Enable register (CSFR16)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	v6_ana_protocol_8_en	v6_ana_protocol_7_en	v6_ana_protocol_6_en	v6_ana_protocol_5_en	v6_ana_protocol_4_en	v6_ana_protocol_3_en	v6_ana_protocol_2_en	v6_ana_protocol_1_en	v6_ana_protocol_0_en
Initial Value	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	v6_ana_protocol_8_en	1b	R/W	v6_ana_protocol_8 enable Enable for the value of v6_ana_protocol_8 which is configured in CSFR16_i. 0b: Disable 1b: Enable
7	v6_ana_protocol_7_en	1b	R/W	v6_ana_protocol_7 enable Enable for the value of v6_ana_protocol_7 which is configured in CSFR16_i. 0b: Disable 1b: Enable
6	v6_ana_protocol_6_en	1b	R/W	v6_ana_protocol_6 enable Enable for the value of v6_ana_protocol_6 which is configured in CSFR16_i. 0b: Disable 1b: Enable
5	v6_ana_protocol_5_en	1b	R/W	v6_ana_protocol_5 enable Enable for the value of v6_ana_protocol_5 which is configured in CSFR16_i. 0b: Disable 1b: Enable
4	v6_ana_protocol_4_en	1b	R/W	v6_ana_protocol_4 enable Enable for the value of v6_ana_protocol_4 which is configured in CSFR16_i. 0b: Disable 1b: Enable
3	v6_ana_protocol_3_en	1b	R/W	v6_ana_protocol_3 enable Enable for the value of v6_ana_protocol_3 which is configured in CSFR16_i. 0b: Disable 1b: Enable
2	v6_ana_protocol_2_en	1b	R/W	v6_ana_protocol_2 enable Enable for the value of v6_ana_protocol_2 which is configured in CSFR16_i. 0b: Disable 1b: Enable
1	v6_ana_protocol_1_en	1b	R/W	v6_ana_protocol_1 enable Enable for the value of v6_ana_protocol_1 which is configured in CSFR16_i. 0b: Disable 1b: Enable
0	v6_ana_protocol_0_en	1b	R/W	v6_ana_protocol_0 enable Enable for the value of v6_ana_protocol_0 which is configured in CSFR16_i. 0b: Disable 1b: Enable

31.4.3.33 Wake Up Interrupt Status register (CSFR20)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	trs_dmac	0b	R/W	Transmit to DMAC Wake Up Interrupt which occurs by transmitting Frame from TOE to DMAC without discarding of filtering ‘1’ Write: Clear ‘0’ Write: Invalid
27 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	ieee_len	0b	R/W	IEEE Length filter Wake Up Interrupt which occurs by reception of IEEE802.3 Length Frame ‘1’ Write: Clear ‘0’ Write: Invalid
19	ns_dis	0b	R/W	Neighbor Solicitation discarded filter Wake Up Interrupt which occurs by reception of Invalid Neighbor Solicitations ‘1’ Write: Clear ‘0’ Write: Invalid
18	ns_dup	0b	R/W	Neighbor Solicitation Duplicate filter Wake Up Interrupt which occurs by reception of IP Duplicate Detection Neighbor Solicitations. ‘1’ Write: Clear ‘0’ Write: Invalid
17	ns_uni_nopt	0b	R/W	Neighbor Solicitation Unicast no option filter Wake Up Interrupt which occurs by reception of unicast Neighbor Solicitations (Except “Option Type=1” or No “Option Type”). ‘1’ Write: Clear ‘0’ Write: Invalid
16	ns_uni	0b	R/W	Neighbor Solicitation Unicast filter Wake Up Interrupt which occurs by reception of unicast Neighbor Solicitations (“Option Type=1”). ‘1’ Write: Clear ‘0’ Write: Invalid
15	ns_mul	0b	R/W	Neighbor Solicitation Multicast filter Wake Up Interrupt which occurs by reception of multicast Neighbor Solicitations. ‘1’ Write: Clear ‘0’ Write: Invalid

Bit	Bit Name	Initial Value	R/W	Description
14	ana_stp	0b	R/W	Analysis stop filter Wake Up Interrupt which occurs by reception of Un-analyzable Frames. ‘1’ Write: Clear ‘0’ Write: Invalid
13	v6_ana_protocol	0b	R/W	IPv6 Analysis protocol filter Wake Up Interrupt which occurs by reception of Un-analyzable IPv6 Protocol No. ‘1’ Write: Clear ‘0’ Write: Invalid
12	arp_noreq	0b	R/W	ARP no request filer Wake Up Interrupt which occurs by reception of ARP (Except ARP REQ). ‘1’ Write: Clear ‘0’ Write: Invalid
11	garp_self	0b	R/W	GARP self-filter Wake Up Interrupt which occurs by reception of GARP REQ for Local Station. ‘1’ Write: Clear ‘0’ Write: Invalid
10	garp_other	0b	R/W	GARP other filter Wake Up Interrupt which occurs by reception of GARP REQ for Other Station. ‘1’ Write: Clear ‘0’ Write: Invalid
9	arp_self	0b	R/W	ARP self-filter Wake Up Interrupt which occurs by reception of ARP REQ for Local Station. ‘1’ Write: Clear ‘0’ Write: Invalid
8	arp_other	0b	R/W	ARP other filter Wake Up Interrupt which occurs by reception of ARP REQ for Other Station. ‘1’ Write: Clear ‘0’ Write: Invalid
7	v6_udp_pt	0b	R/W	IPv6 UDP port filter Wake Up Interrupt which occurs by match of IPv6 UDP Port No. ‘1’ Write: Clear ‘0’ Write: Invalid
6	v4_udp_pt	0b	R/W	IPv4 UDP port filter Wake Up Interrupt which occurs by match of IPv4 UDP Port No. ‘1’ Write: Clear ‘0’ Write: Invalid
5	v6_protocol	0b	R/W	IPv6 protocol filter Wake Up Interrupt which occurs by match of IPv6 Protocol No. ‘1’ Write: Clear ‘0’ Write: Invalid
4	v4_protocol	0b	R/W	IPv4 protocol filter Wake Up Interrupt which occurs by match of IPv4 Protocol No. ‘1’ Write: Clear ‘0’ Write: Invalid
3	type	0b	R/W	Type filter Wake Up Interrupt which occurs by match of Ether Type. ‘1’ Write: Clear ‘0’ Write: Invalid
2	mac_da_mul	0b	R/W	MAC DA multicast filter Wake Up Interrupt which occurs by match of Multicast MAC DA. ‘1’ Write: Clear ‘0’ Write: Invalid

Bit	Bit Name	Initial Value	R/W	Description
1	mac_da_bro	0b	R/W	MAC DA broadcast filter Wake Up Interrupt which occurs by match of Broadcast MAC DA. ‘1’ Write: Clear ‘0’ Write: Invalid
0	mac_da_uni	0b	R/W	MAC DA unicast filter Wake Up Interrupt which occurs by match of Unicast MAC DA. ‘1’ Write: Clear ‘0’ Write: Invalid

NOTE

- From b[0] to b[20] are set to “1” when TOE received the Rx Frame which matches to Filter Conditions even if that frame has any error (such as CRC error, short length error or etc.). Therefore, use these bits only for Debug.
- b [28] is set to “1” only when TOE sent a normal Rx Frame to DMAC.

31.4.3.34 Wake Up Interrupt Mask register (CSFR21)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	arp_sa_mac[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

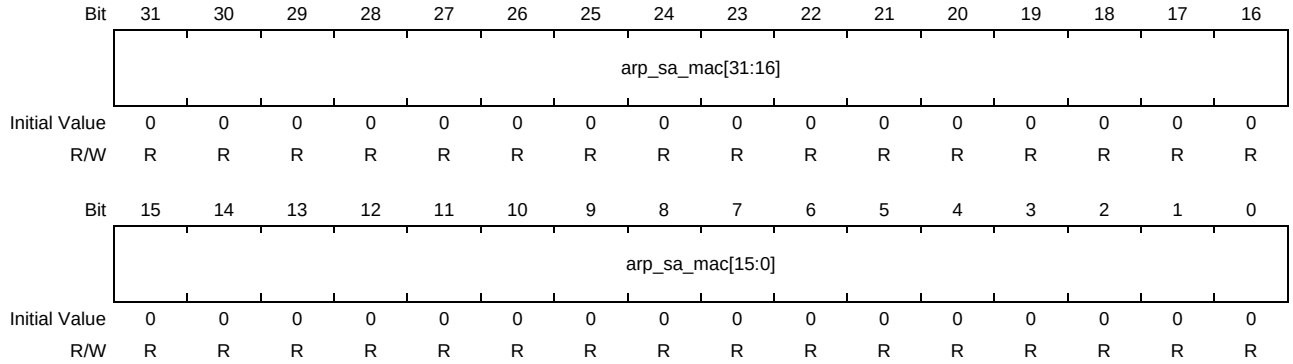
Bit	Bit Name	Initial Value	R/W	Description
31 to 5	ns_option_type	H'00	R	Neighbor Solicitations option type This field indicates Received Neighbor Solicitations Option Type. "H'00" means that Received Frame did not have Option. When rx_arp_ns = 0 (ARPREQ), this field is invalid.
23 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	arp_ns_spec	0b	R	ARP Neighbor Solicitations spec This field indicates Received ARPREQ/Neighbor Solicitations Frame Type. The Case of ARPREQ (rx_arp_ns = 0) 0b: ARPREQ 1b: GARPREQ The Case of Neighbor Solicitations (rx_arp_ns = 1) 0b: Multicast Neighbor Solicitations 1b: Unicast Neighbor Solicitations
16	rx_arp_ns	0b	R	ARP Neighbor Solicitations This field indicates which frame did TOE receive ARPREQ or Neighbor Solicitations. 0b: ARPREQ 1b: Neighbor Solicitations
15 to 0	arp_sa_mac	H'0000	R	ARP source Address MAC This field indicates the Source MAC Address [47:32] of Received ARPREQ/Neighbor Solicitation. When rx_arp_ns = 1 and ns_option_type = H'00, this field is invalid.

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is cleared by CSFR40.arp_ns.

31.4.3.40 Rx ARPREQ/Neighbor Solicitation Lower MAC SA register (CSFR42_L)



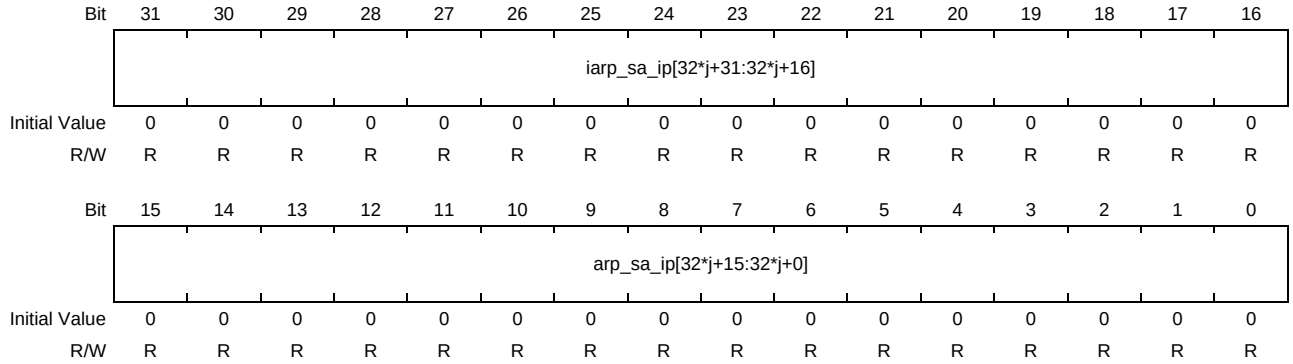
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	arp_sa_mac	H'0000_0000	R	ARP source Address MAC This field indicates the Source MAC Address [31:0] of Received ARPREQ/Neighbor Solicitation. When rx_arp_ns = 1 and ns_option_type = H'00, this field is invalid.

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is cleared by CSFR40.arp_ns.

31.4.3.41 Rx ARPREQ/Neighbor Solicitation IP SA register i (i = 0 to 3) (CSFR43_i)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	arp_sa_ip	All 0	R	ARP source Address IP This field indicates the Source IP Address[32*j+31:32*j] of Received ARPREQ/Neighbor Solicitations. The relationship between ‘i’ and ‘j’ is the following. i = 0 -> j = 3 i = 1 -> j = 2 i = 2 -> j = 1 i = 3 -> j = 0 When rx_arp_ns = 0 (ARPREQ), Only Lower 32bit (CSFR43_3) is valid.

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by “Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO” is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by “Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO” is cleared by CSFR40.arp_ns.

31.5 Operation

The Gigabit Ethernet Interface consists of the following functional units:

- DMA transfer controller (DMAC):
  Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO
- TCP/IP Offload Engine (TOE):
  Calculates Checksum by hardware. And also filters Ethernet Frames and responds specific frames automatically.
- MAC controller (E-MAC):
  Handles reception/transmission transfer from/to the RGMII or MII.

Using its direct memory access (DMA) function, the DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO for reception and transmission. Data cannot be directly read from or written to the FIFO.

To handle DMA transfer, the DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

TOE calculates checksum of received frames from E-MAC. And then it outputted to DMAC. TOE also calculates checksum of transmission frames from DMAC. And then it outputted to E-MAC. When TOE received any frames from E-MAC, it analyzes them. By the configuration of registers, TOE filters received frames. If received frame does not correspond to the configured filter conditions by registers, it will be discarded. By using this analysis function, TOE is also able to respond to ARP Request and Neighbor Solicitation automatically.

The E-MAC supports a RGMII and MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC transmits frames from TOE to the RGMII or MII. It also transmits frames from the RGMII or MII to TOE.

31.5.1 DMAC Operating Modes

Figure 31.2 illustrates the operating modes of the DMAC.

Transitions of DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset)
- Configuration of the operating mode configuration bits (CCC.OPC) in the DMAC mode register

The operating mode can be confirmed by reading the operating mode status bits in the DMAC status register (CSR.OPS).

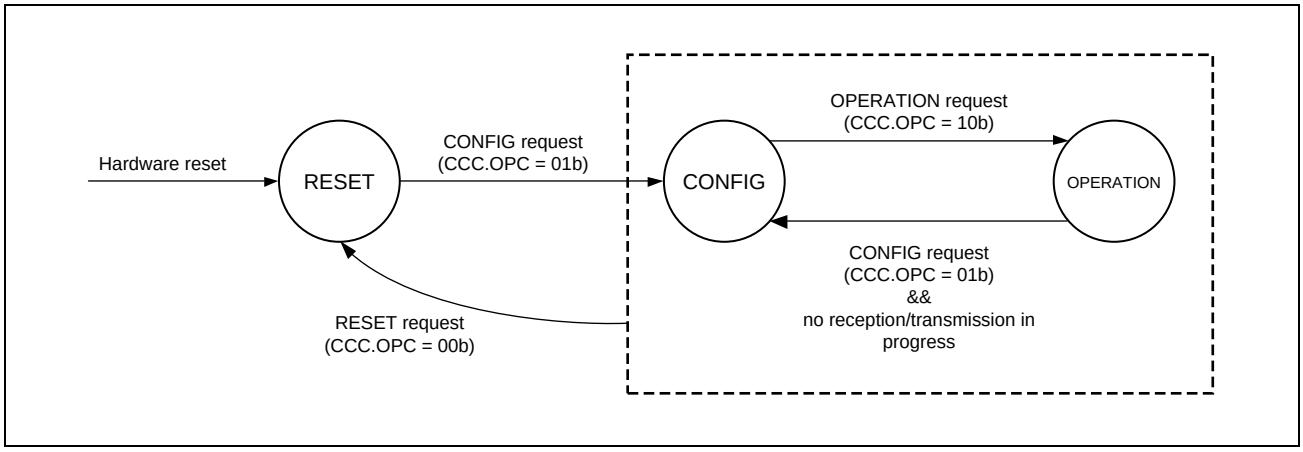


Figure 31.2 Operating Mode of DMAC

31.5.1.1 Operating Modes

(1) RESET mode

After a hardware reset, the DMAC enters RESET mode.

In RESET mode, only the DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(2) CONFIG mode

In CONFIG mode, various settings for the DMAC can be made.

The operation of most functions is stopped, and all status registers are initialized to their reset values.

(3) OPERATION mode

In OPERATION mode, all functions of the DMAC can operate. Ethernet communications can only proceed in this mode.

31.5.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the operating mode can be checked by reading the operating mode status bits in the DMAC status register (CSR.OPS).

Transitions other than leaving from OPERATION mode are made after the value is written to the operating mode configuration bits (CCC.OPC).

For transitions leaving from OPERATION mode, it is not executed immediately because any transmission and reception in progress will be executed before leaving from OPERATION mode. To prevent any trouble, follow the "Stop Procedure" of **Section 31.5.13.4 Stop Procedure**.

31.5.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the DMAC operating mode.

(1) Hardware reset

Resetting of the LSI chip leads to resetting of the entire Gigabit Ethernet Interface. The operating mode shifts to RESET mode.

31.5.2 Descriptors

31.5.2.1 Data Representation in URAM

The DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the DMAC.

Figure 31.3 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor processed interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see **Section 31.5.3.2, Setting Up Reception Descriptors**, and **Section 31.5.4.1, Setting Up Transmission Descriptors**.

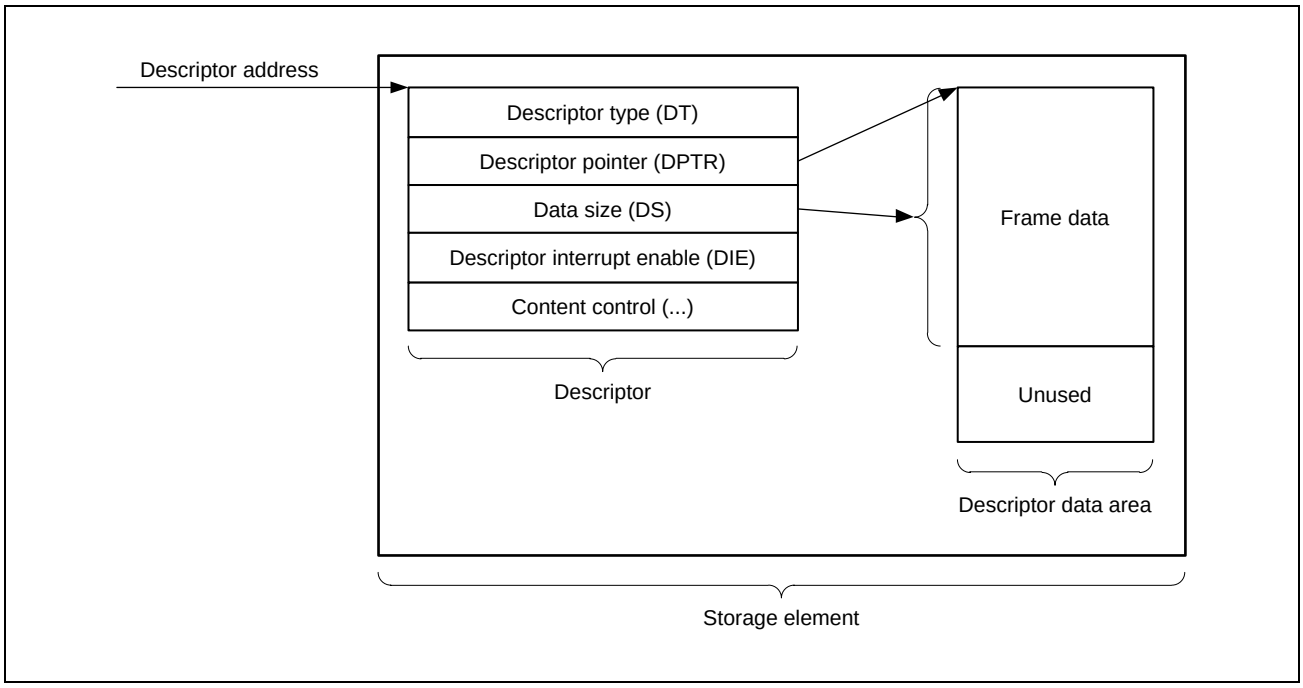

Figure 31.3 Outline of Storage Element Used for Receive and Transmit Queues

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are configured of 64 bits.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

31.5.2.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. The queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see **Section 31.5.2.6, Descriptor Type**.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 31.4 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).

- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

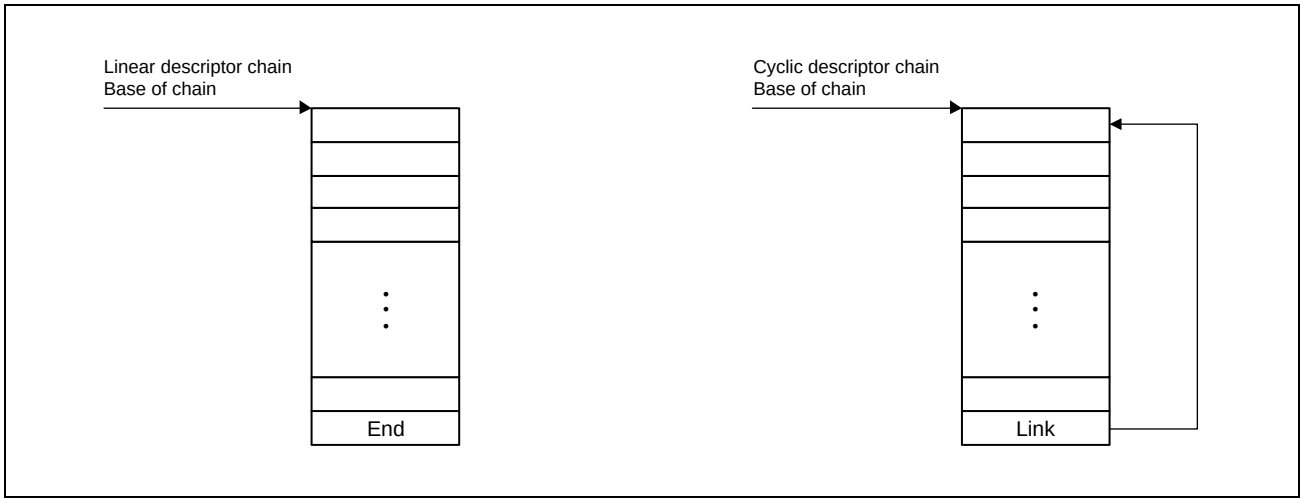

Figure 31.4 Outline of the Basic Descriptor Chains

The relationship between queue and descriptor chain is defined by the base addresses of chain. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in OPERATION mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure should be used or which topology is suitable depend on the application. A description of how to design descriptor chains to suit various applications is given in **Section 31.5.3.2, Setting Up Reception Descriptors**, and **Section 31.5.4.1, Setting Up Transmission Descriptors**.

31.5.2.3 Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entry 0 is used to access transmission queues. Entry 4 is used to access reception queue.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 31.5 shows an example of a base address table for controlling transmission and reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

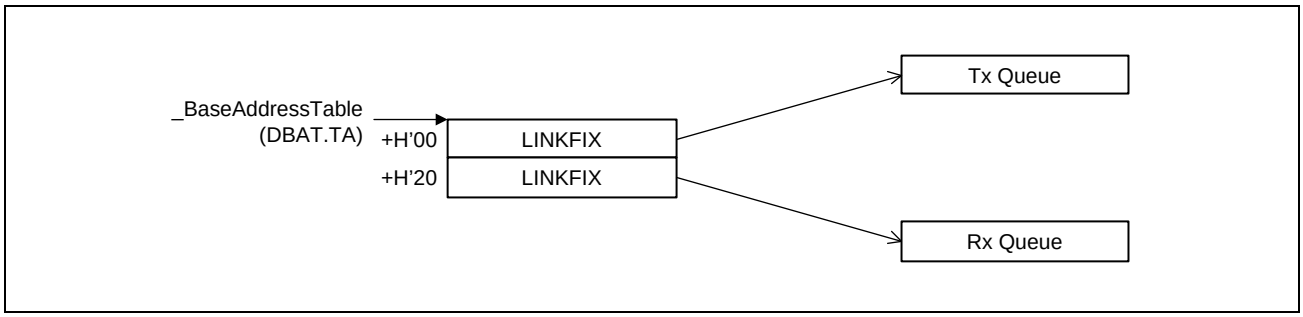

Figure 31.5 Example of a Base Address Table for Reception and Transmission Queues

31.5.2.4 Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8*q) when the operating mode shifts to OPERATION mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue. The DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

31.5.2.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enables bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 31.6 illustrates the way in which the DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

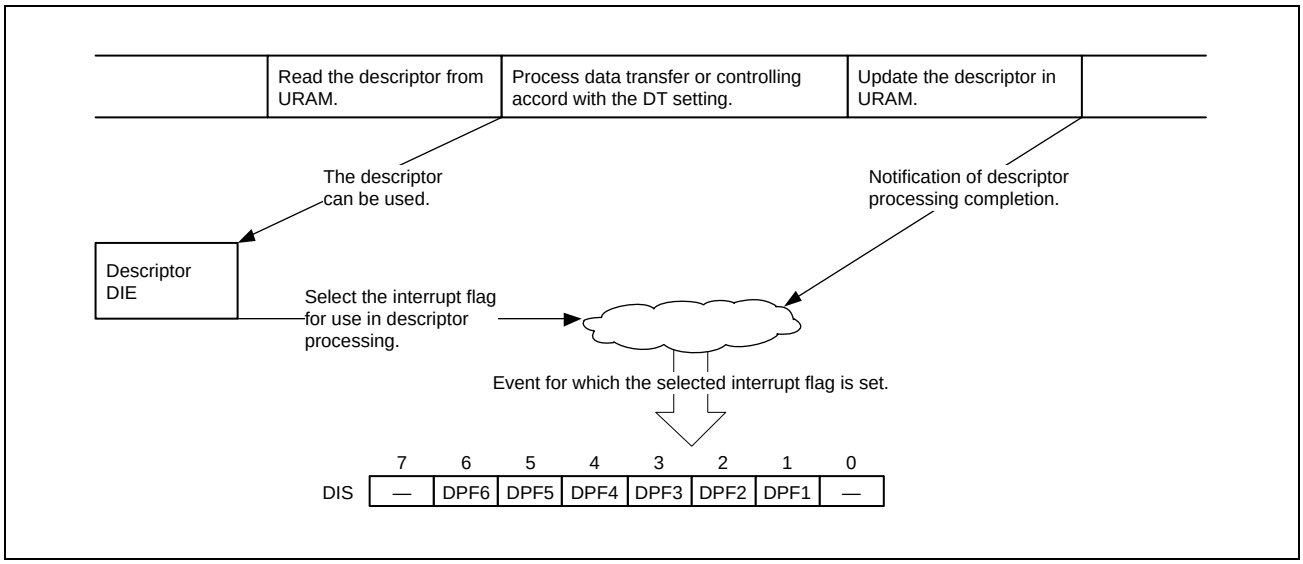

Figure 31.6 Method of Descriptor Interrupt Generation

31.5.2.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 31.7 is a summary of the descriptor types available for the DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (DMAC).

Definition of HW:

- The descriptor is processed by hardware (DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

- This descriptor type is not used in transfer in the given direction (transmission or reception).
- Do not write to this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

- Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 31.7 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Same as LINK, but not changed by DMAC after processing.	SW	SW
EOS	10	End Of Set Control element to split a descriptor chain. The chain stops and waits for user interaction.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
DT13	13	Reserved	Invalid	Invalid
DT14	14	Reserved	Invalid	Invalid
FEMPTY_ND	15	Frame Empty No Data storage A descriptor related to frame data but not containing valid data for a frame. The descriptor is processed in the same way as FEMPTY, but data are not stored in the URAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

31.5.2.7 Layout of General Descriptors in the URAM

The DMAC updates processed descriptors in the URAM. The field to be changed in the descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(1) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.
usable in both reception and transmission

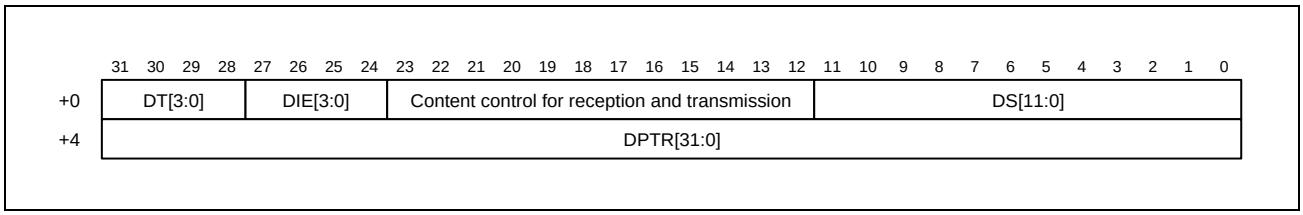

Figure 31.7 The allocation of bits in the frame data descriptors

Table 31.8 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see **Section 31.5.3.2, Setting Up Reception Descriptors**, and **Section 31.5.4.1, Setting Up Transmission Descriptors**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see **Section 31.5.3.2, Setting Up Reception Descriptors**, and **Section 31.5.4.1, Setting Up Transmission Descriptors**.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(2) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

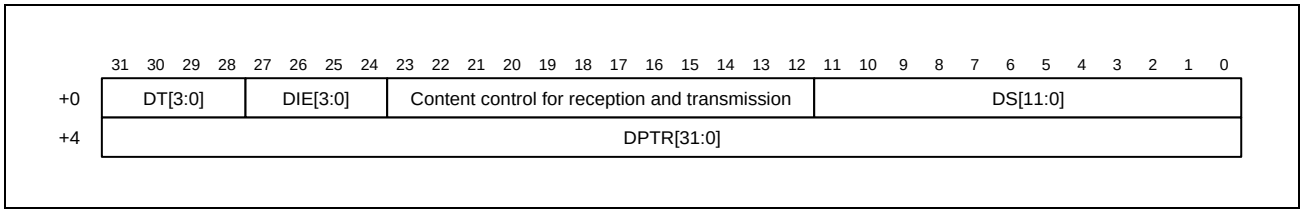

Figure 31.8 The allocation of bits in the arbitration descriptors

Table 31.9 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 15: FEMPTY_ND For details, see **Table 31.7, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see **Section 31.5.3.2, Setting Up Reception Descriptors**, and **Section 31.5.4.1, Setting Up Transmission Descriptors**.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(3) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

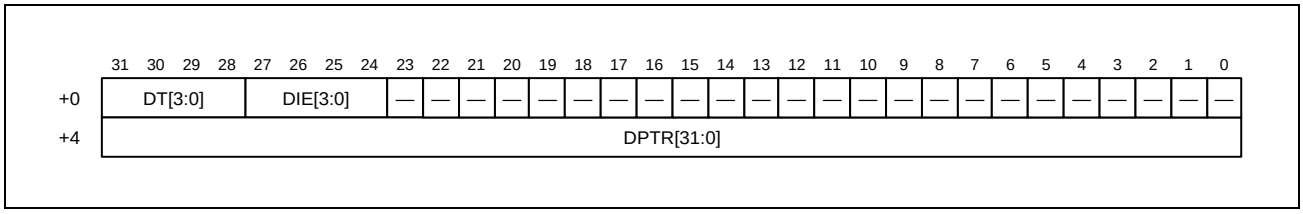

Figure 31.9 The allocation of bits in the link descriptors

Table 31.10 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see **Table 31.7, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(4) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

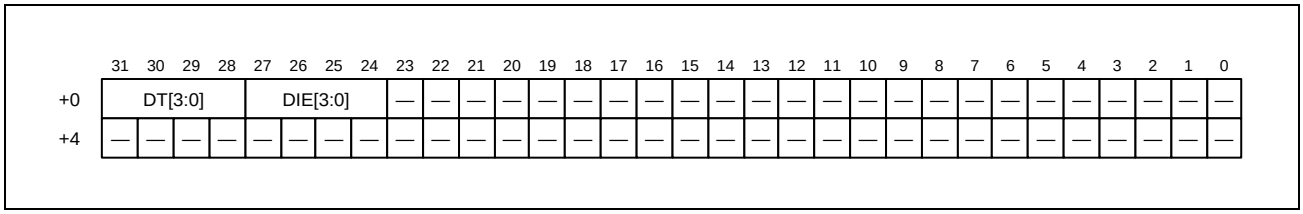

Figure 31.10 The allocation of bits in the other descriptors

Table 31.11 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see **Table 31.7, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).

31.5.2.8 How to Use Frame Data Descriptors

In general, Ethernet frames are not of uniform length. The DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle frames and descriptors, four descriptor types (DESCR.DT) as FSTART, FEND, FMID and FSINGLE are defined.

Figure 31.11 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

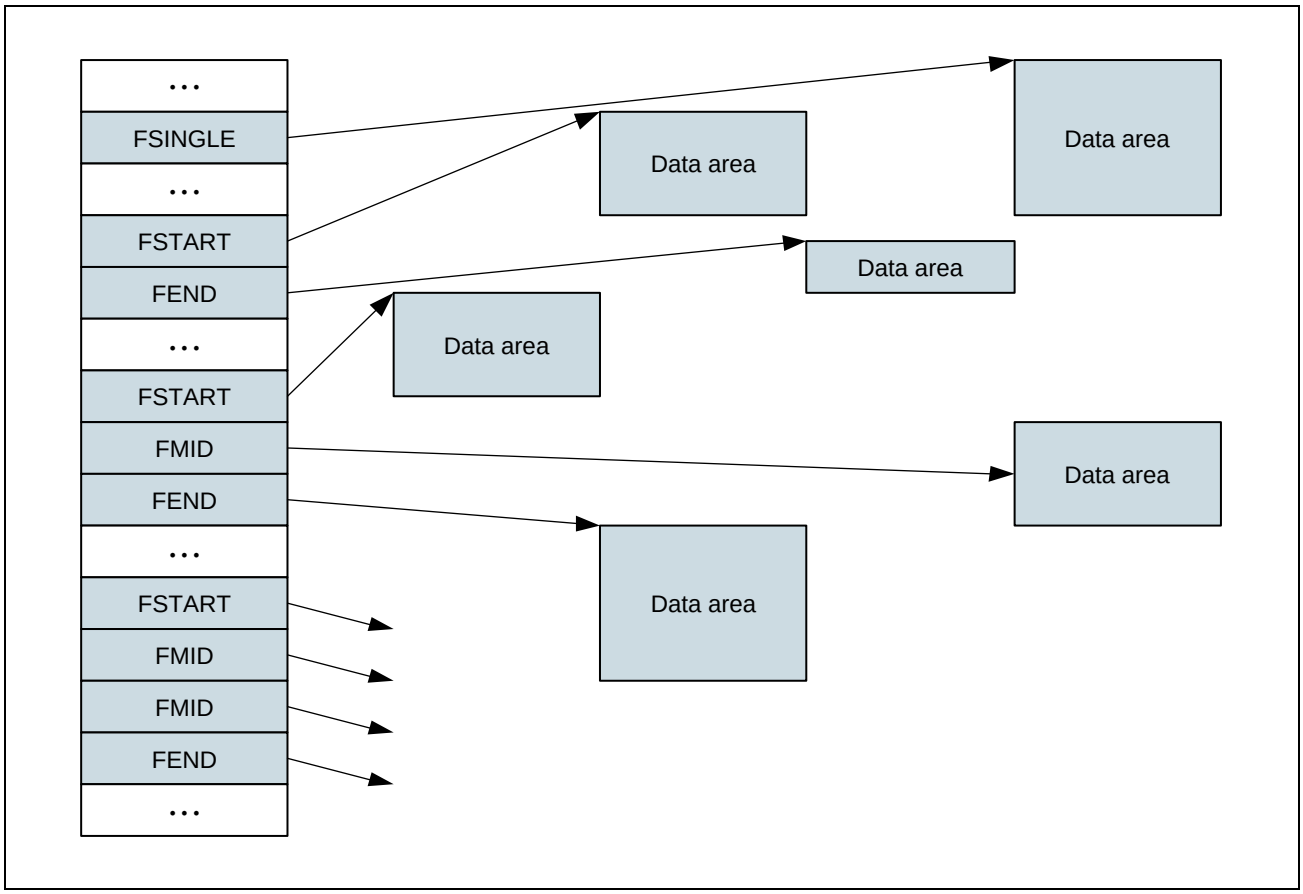

Figure 31.11 Mapping of Frame Data

For reception, the DMAC will store received frame data in the given area. If a received frame has more data than the descriptor data size (DESCR.DS), the DMAC will divide the data up.

For transmission, set the descriptor data size (DESCR.DS) to the actual data size. The DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

31.5.2.9 How to Use Chain Control Descriptors

(1) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see **Section 31.5.2.2, Using Descriptor Chains in Queues**)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

(2) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFF), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

31.5.2.10 How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(1) FEMPTY and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission. The descriptor pointer of a FEMPTYxxx descriptor refers to a descriptor data area.

(2) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(3) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

31.5.2.11 Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. By this, the number of CPU accesses to registers of Gigabit Ethernet Interface can be minimized and performance can be increased.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see **Table 31.7, Summary of Descriptor Types**).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

31.5.2.12 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment.
- While in OPERATION mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Frame data is accessed in blocks up to 128 bytes.
- The number of 128 byte borders (addresses H’x_xx00 and H’x_xx80) and frame data inside should be minimized.
- Design the descriptor chains in ways that minimize parallelism of processing. This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

31.5.3 Reception Control

The point of the DMAC is to transfer data between the TOE/E-MAC and URAM without intervention by the CPU.

DMAC needs descriptors that define the amounts of frame data to be stored and the locations. When the E-MAC received a frame, it is transferred to TOE and the conditions of reception is also transferred to DMAC as the E-MAC state. The checksum of received frame is calculated by TOE, the received frame is stored to Reception FIFO temporary. If TOE detects any errors from received frame (such as it was unsupported frame or checksum error), the error information is notified to DMAC. After that, the received frame is transferred to URAM by DMAC. At the time, MAC-Status and Error Information of TOE are written to Reception Descriptor by Write Back. For a description of how to set up descriptors for use in reception, see **Section 31.5.3.2, Setting Up Reception Descriptors**.

Figure 31.12 shows the reception data bus.

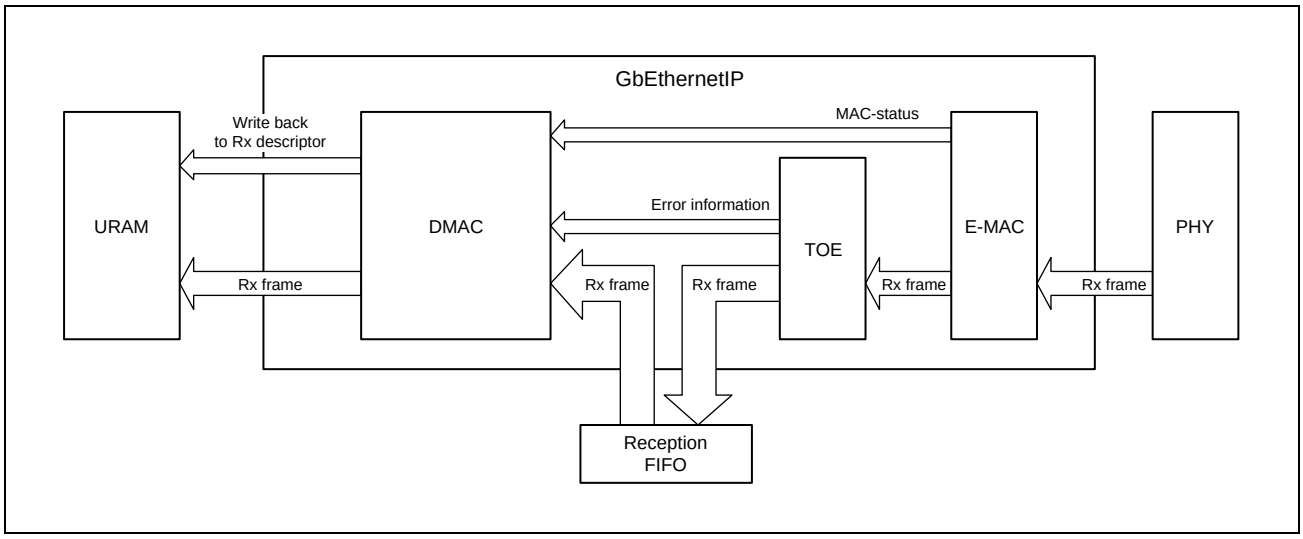

Figure 31.12 Mechanism of General Reception

31.5.3.1 Reception Queues

The DMAC stores all received frames in the URAM.

There is a condition for the DMAC to discard a received frame.

- Detection of an error during reception by the TOE and E-MAC
  - Whether error frames are discarded or stored in reception queue depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1*[1]), they are always stored in queue. In this case, characteristics specific to the queue (e.g. truncation) will vary.

Note 1. RCR.EFFS = 1 is only for debug. Do not set this condition during normal operation.

The flowchart in **Figure 31.13** shows how the DMAC selects the reception queue in accord with the frame type. The result is storage of the frame in the proper queue or the frame being discarded.

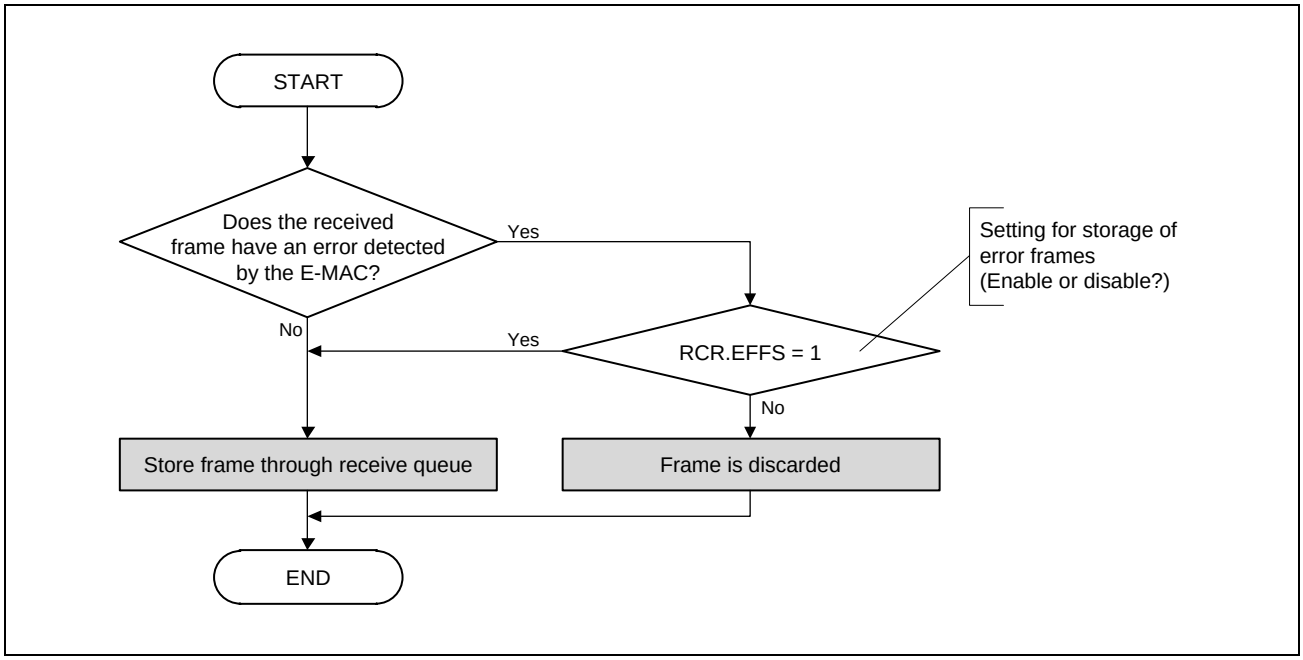

Figure 31.13 Mechanism of Reception Queue Selection

31.5.3.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in **Section 31.5.2, Descriptors**.

This section describes memory operations that are especially required in handling reception queues.

(1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 31.12 shows the descriptor types used in reception.

Table 31.12 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	Condition for data not being stored in a reception queue: The RIS2.QFF bit indicates that queue r is full, and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A descriptor of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFF indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see **Section 31.5.3.3(1), Storing Frame Data in the Descriptor Data Area**.	FSTART, FMID, FEND, or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the Reception FIFO but not stored. After processing, DESCR.DS is written back as 0.	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

(2) Configuration of Reception Frame Data Descriptors

Figure 31.14 shows the configuration of descriptors for use with reception queues. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TI) are described in **Table 31.8**.

For the other fields and the descriptor types, see **Section 31.5.2.6, Descriptor Type**.

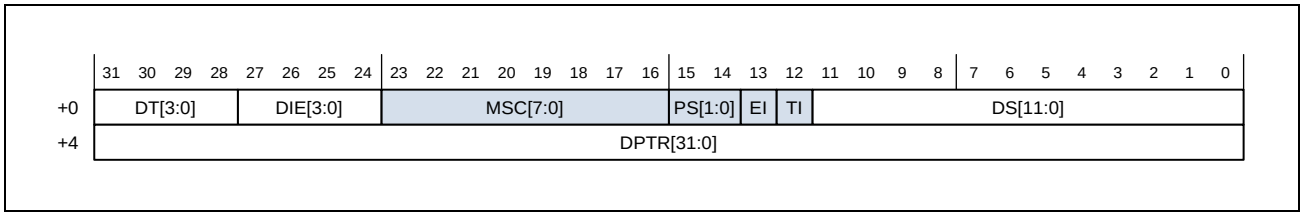

Figure 31.14 Configuration of Descriptor for a Received Frame

Table 31.13 Configuration of a Received Descriptor

Bit Name	Function
MSC	E-MAC/TOE Status Code These bits indicate errors in reception detected by the E-MAC and TOE. In the case of a divided frame, the bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows. MSC [7]: Received frame has a multicast address. (E-MAC) MSC [6]: Check-sum error (TOE) MSC [5]: Received Unsupported frame (TOE) MSC [4]: Received frame has alignment error. (E-MAC) MSC [3]: Received frame is too long. (E-MAC) MSC [2]: Received frame is too short (E-MAC) MSC [1]: Error in frame reception (E-MAC) MSC [0]: Received frame has a CRC error. (E-MAC)
PS	Padding Selection 00b: Padding is not to be inserted.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted. 0: No error 1: Error is detected
TI	Truncation Indication This bit indicates whether frame data received from the E-MAC have been truncated before being stored. The bits are set to the same value within all frame data descriptors for a divided frame. 0: Data have not been truncated.

Note: The RCR.EFFS bit specifies whether frames with errors detected by the TOE or E-MAC are to be stored in the URAM or not. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

31.5.3.3 Reception Processing

After initialization, the DMAC can store received frames in the data area in the URAM as indicated by the descriptor. The DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

If the Reception FIFO contains even one frame, storing is executed to the reception queue.

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor) are discarded from the Reception FIFO.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first descriptor of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

The CPU can write FEMPTY (or FEMPTY_ND) directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTY (or FEMPTY_ND) is written to DESCR.DT.

(1) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FSINGLE descriptor is stored in place of the FEMPTY or FEMPTY_ND descriptor after processing.

(2) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI is only valid in the last descriptor of the sequence for a divided frame.

NOTE

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the Reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

(3) No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

(2) Flow of Reception Descriptor Processing

Constructing a descriptor chain requires software (see **Figure 31.15**).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after OPERATION mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

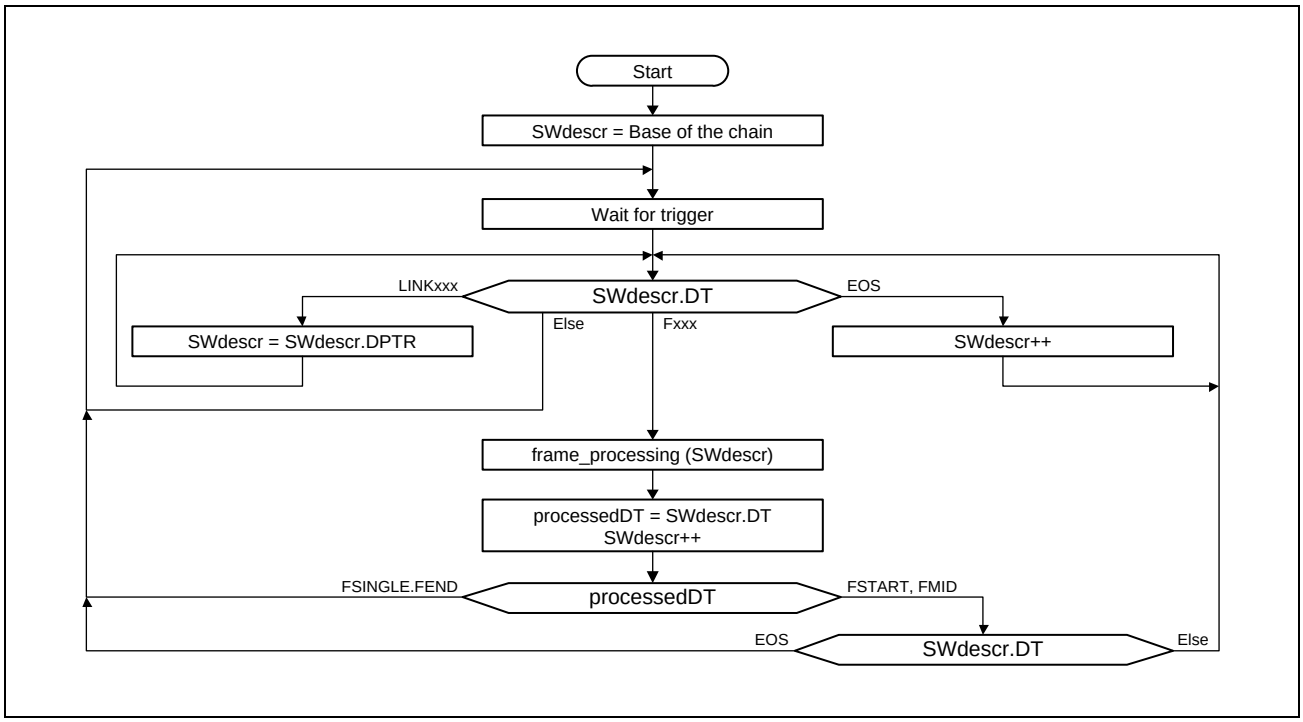

Figure 31.15 Flow of Reception Descriptor Processing

31.5.4 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see **Section 31.5.2, Descriptors**).

The DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between status for the software and the DMAC. The status information for transmitted frames remains accessible after their transmission is completed.

When DMAC started to transfer a frame, it reaches to TOE via Transmission FIFO and TOE FIFO. And after the calculation of transmission frame checksum by TOE, it is transferred to PHY by E-MAC. If any error information is detected by TOE or E-MAC, they are notified to DMAC and stored to MAC Status FIFO/MAC Status FIFO2. The oldest information in them is indicated to MFA/MFA2 of DMAC register.

Figure 31.16 shows the transmission data bus

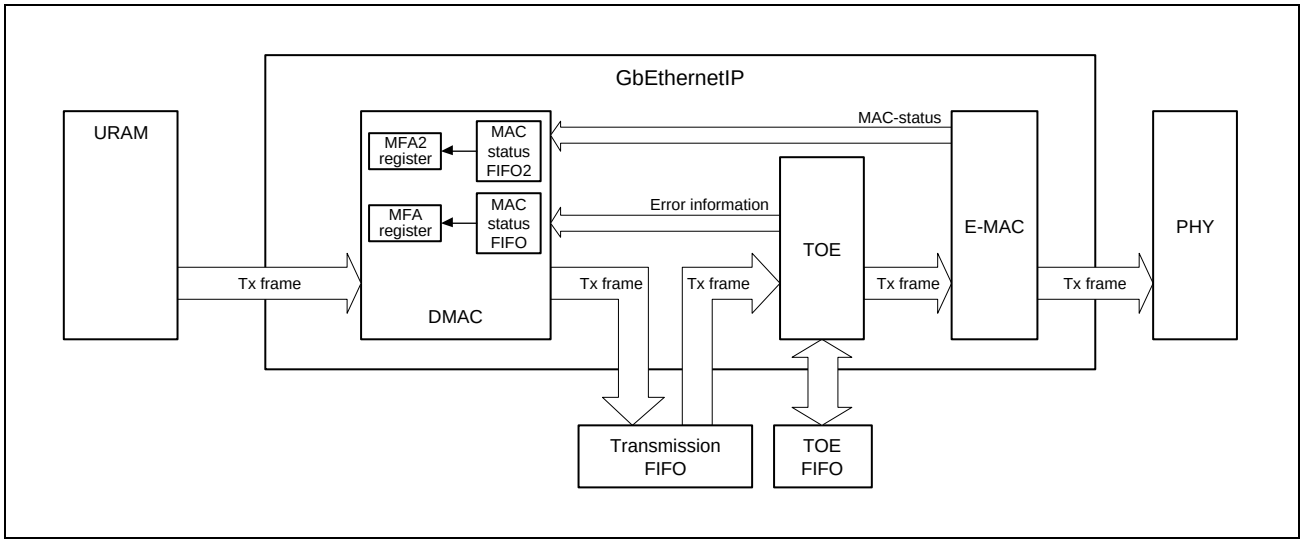

Figure 31.16 Mechanism of General Transmission

31.5.4.1 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 31.14 shows the descriptor types used in transmission.

Table 31.14 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The DMAC fetches the last of the data for the divided frame. The frame of data that has been fetched to the Transmission FIFO is ready for transmission by the E-MAC, and then the DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The DMAC fetches the frame of data. The frame of data that has been fetched to the Transmission FIFO is ready for transmission by the E-MAC, and then the DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (TCCR.TSRQ), which stops transmission. When the TCCR.TSRQ is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (TCCR.TSRQ), which stops transmission. When the TCCR.TSRQ is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 31.17 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in **Table 31.15**.

For the other fields and the descriptor types, see **Section 31.5.2.6, Descriptor Type**.

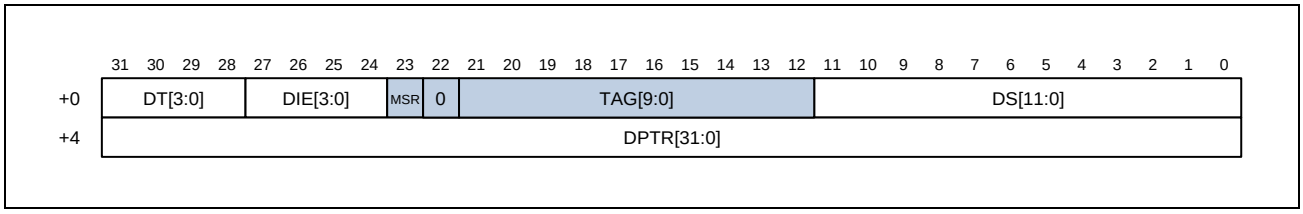

Figure 31.17 Configuration of Descriptor for a Transmitted Frame

Table 31.15 Configuration of a Transmission Descriptor

Bit Name	Function
MSR	MAC Status storage Request This bit configures if MAC transmission status of the frame is stored in MAC status FIFO. 0b: No status information is stored 1b: Status information is to be kept for this frame in MAC status FIFO This bit is considered only if DESCR.DT = FEND or FSINGLE. *Note*: If there is error during transmission of frame then status is always stored.
TAG	Frame Tag This TAG field is used to associate each frame data. Frame TAG is not required but is recommended. This bit is available while the current DESCR.DT is FEND or FSINGLE.

31.5.4.2 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA) for the queue (with q = 0) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in **Section 31.5.2, Descriptors**).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 31.18 shows descriptor processing during transmission.

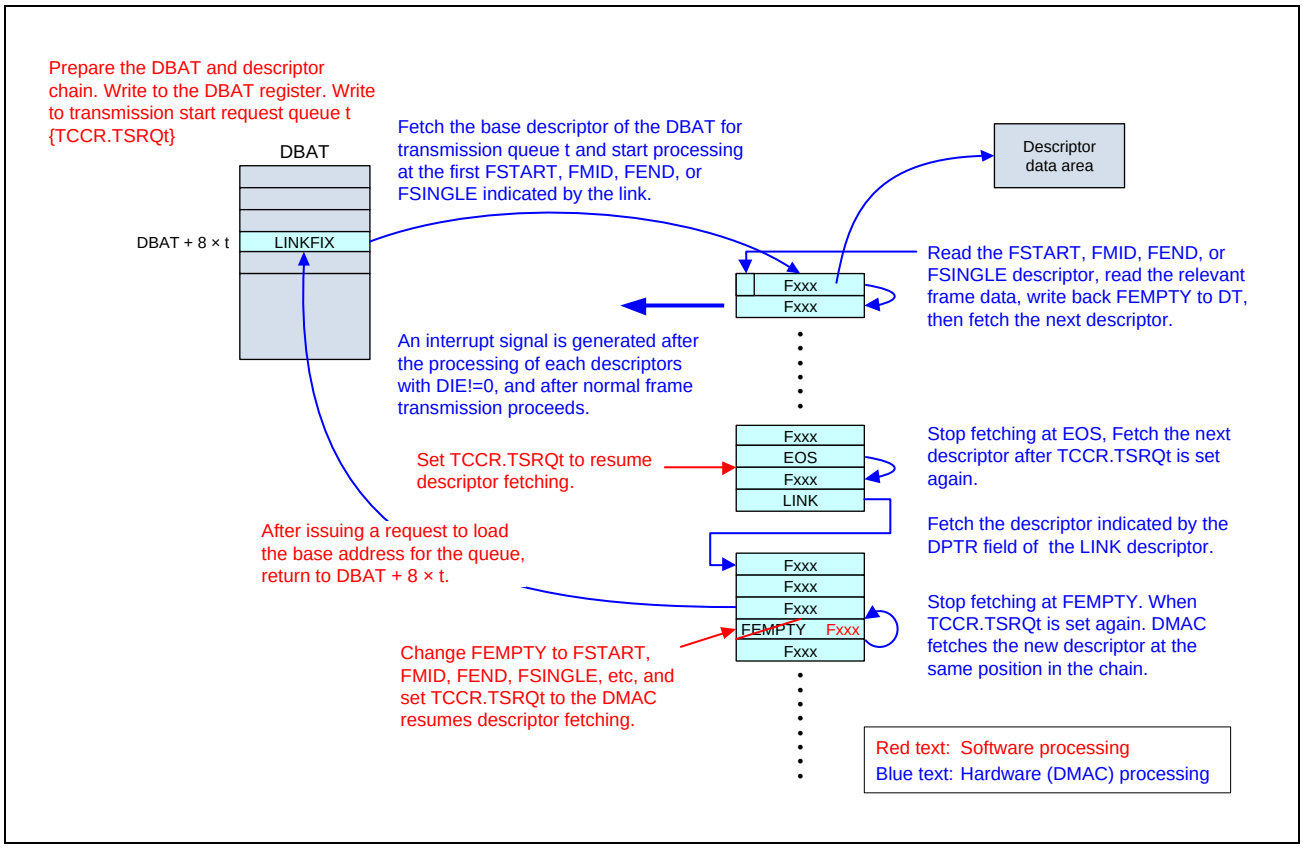

Figure 31.18 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(1) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 31.19 shows the flow for software implementing this pattern. SW should read back written descriptor between changing FEMPTY descriptor before writing to TCCR.TSRQ.

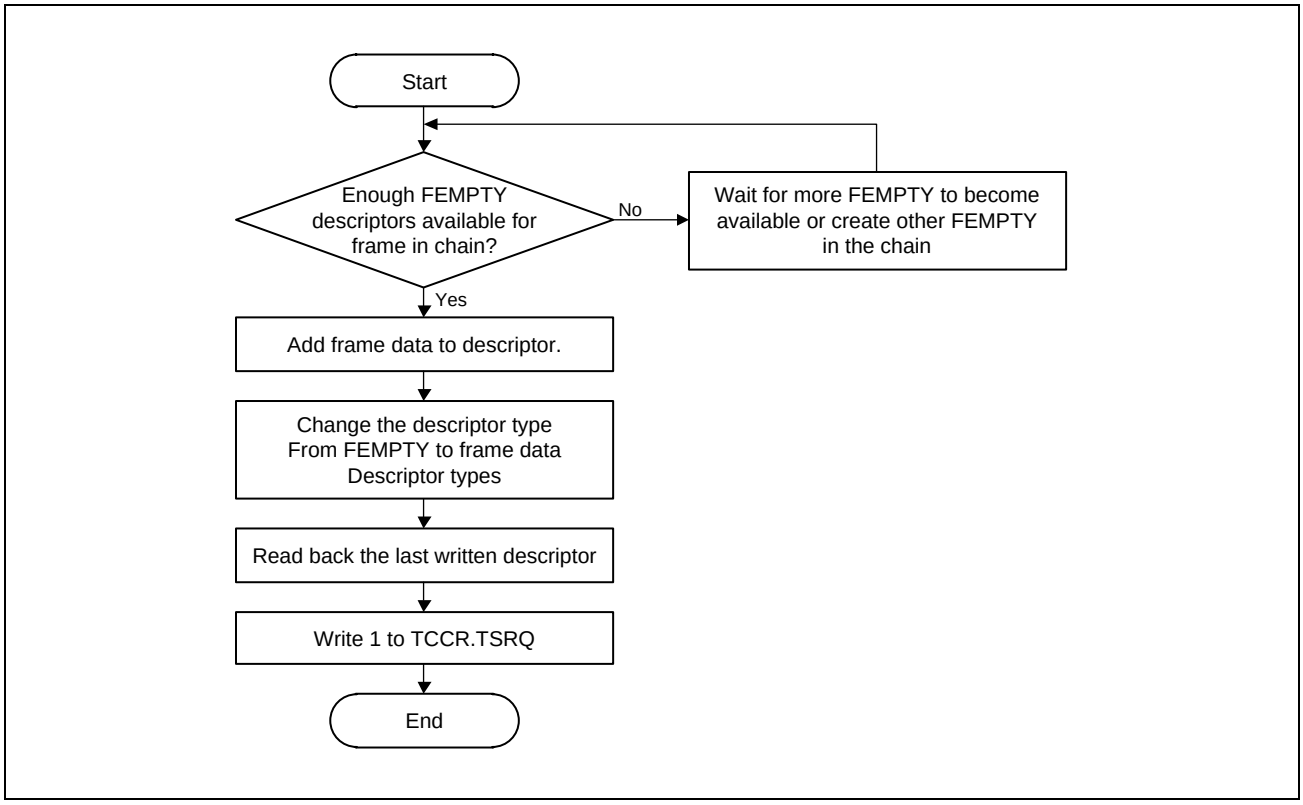

Figure 31.19 Software Flow for Immediate Frame Transmission

Figure 31.20 shows software and DMAC operations for immediate frame transmission.

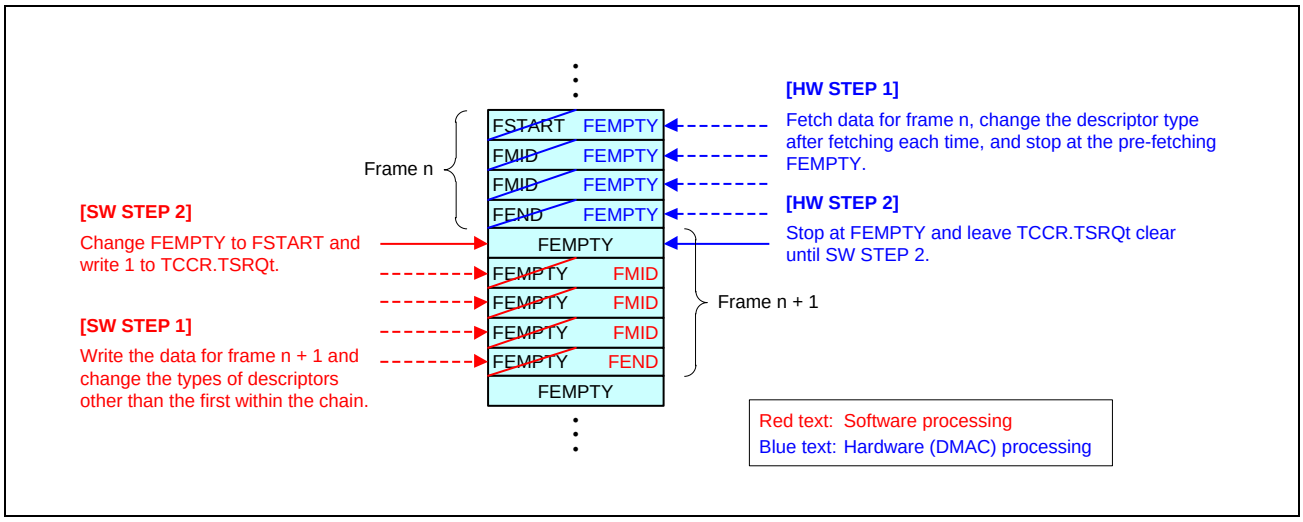

Figure 31.20 Software and DMAC Operations for Immediate Frame Transmission

(2) Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points. Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

Figure 31.21 shows the software flow in this pattern.

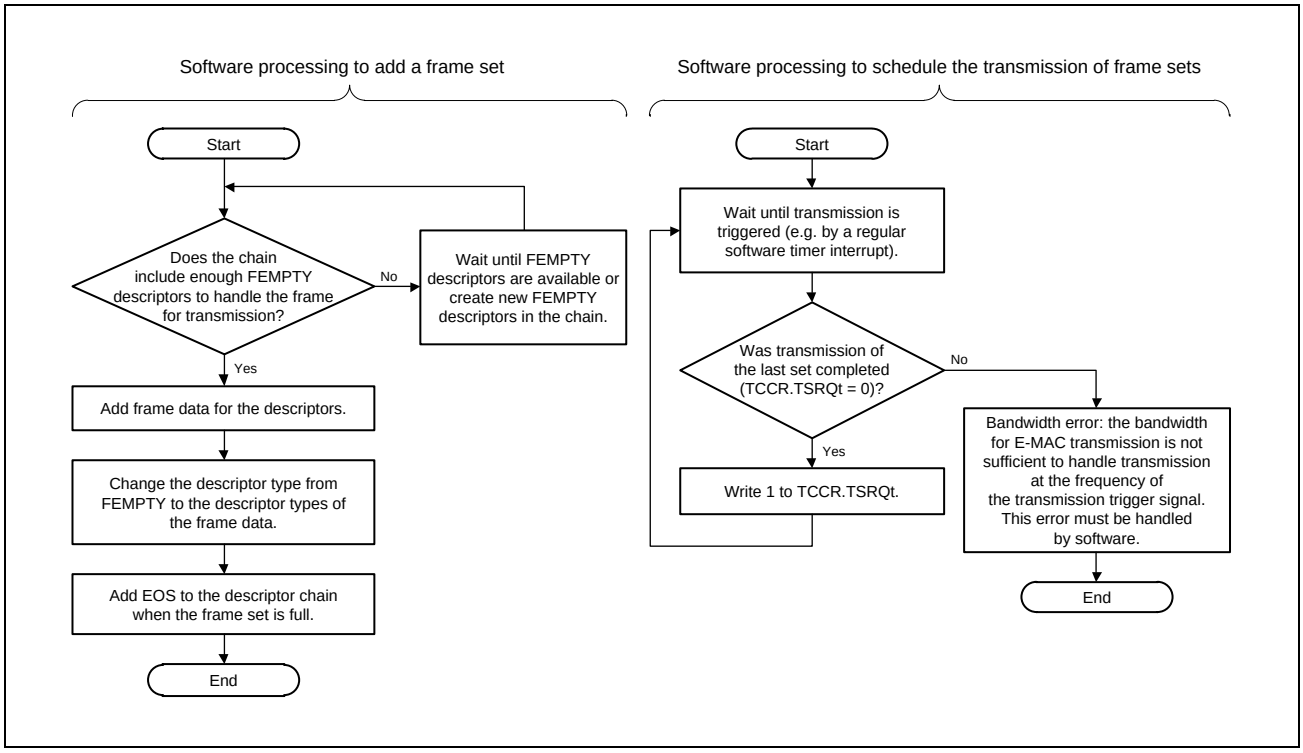

Figure 31.21 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 31.22 shows software and DMAC operations for frame set transmission.

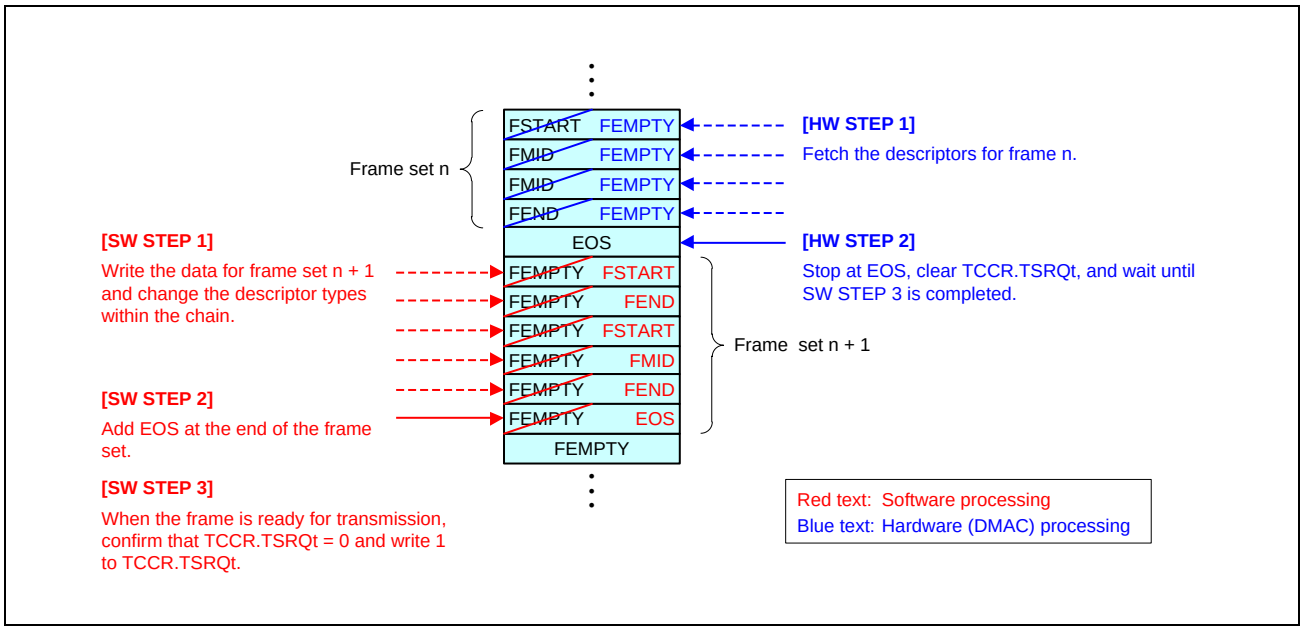

Figure 31.22 SW and DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

(3) Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 31.23 shows the flow for software implementing this pattern.

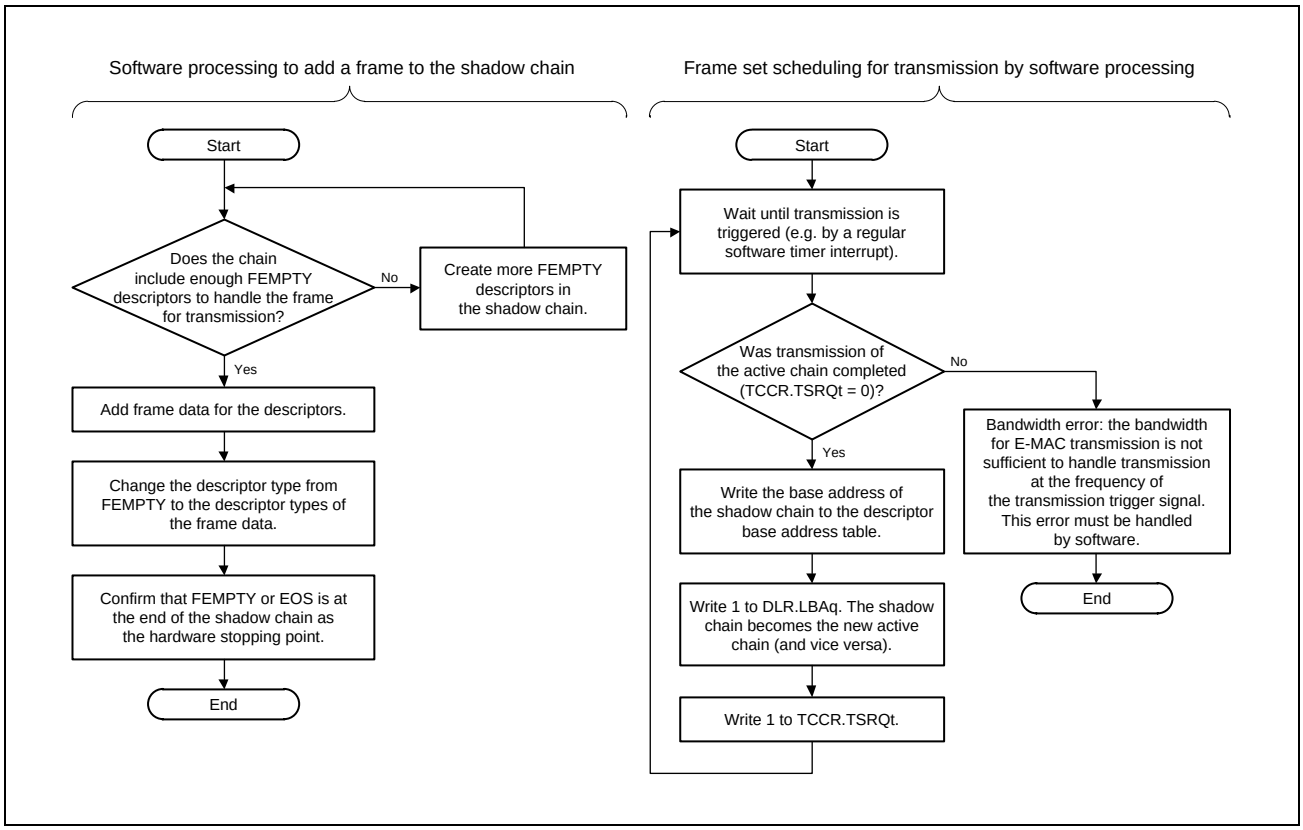

Figure 31.23 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 31.24 shows software and DMAC operations for frame set transmission.

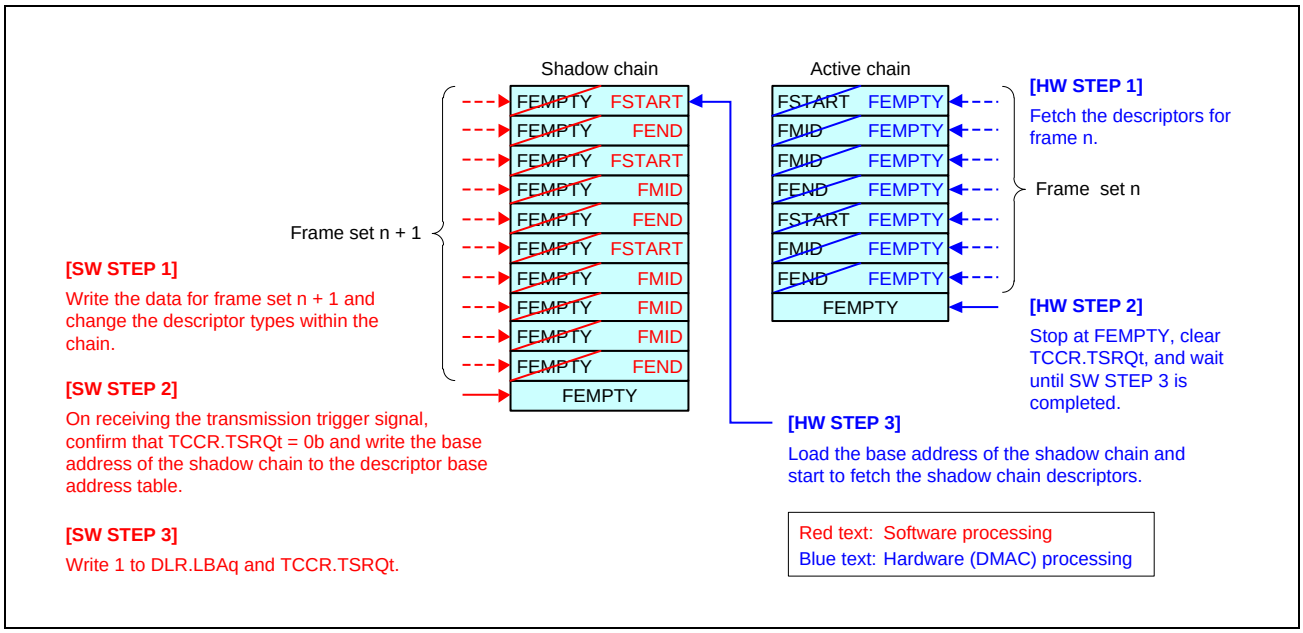

Figure 31.24 SW and DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

31.5.5 Integrity Checking

The DMAC can detect and identify errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

31.5.5.1 Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

31.5.5.2 Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

31.5.5.3 Monitoring in Both Reception and Transmission

(1) Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception:

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission:

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.
- The frame will be lost from the Transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus.

(2) Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception:

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission:

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.
- The frame will be lost from the Transmission FIFO.

(3) Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

31.5.5.4 Monitoring in Reception

(1) Errors in access to the URAM for writing of data

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

(2) Error of the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the Reception FIFO RAM faults, DMAC detects the fault as error of the Reception FIFO.

31.5.5.5 Monitoring in Transmission

(1) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the Transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:z
  As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQ) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  The current descriptor address (CDARq.CDA) is not updated.
  The transmit start bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

(2) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQ) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(3) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.
- The information of MAC Status FIFO and MAC Status FIFO2 will be inconsistent.

If damaged data in the Transmission FIFO is an error due to the Transmission FIFO, this is detected by the DMAC.

31.5.6 Checksum Calculation

TOE calculates Checksum of received frames from E-MAC. And then it is outputted to DMAC. TOE also calculates Checksum of transmission frames from DMAC. And then it is outputted to E-MAC.

To use this function, configure E-MAC as CRC Pass Through Mode (CXR20.RCPT = 1).

TOE supports Checksum Calculation for following part of frames. See **Section 31.5.6.4, Supported Frame for Checksum Calculation** for about the details of Supported Frames.

- IPv4 Header
- IPv4 TCP/UDP/ICMP
- IPv6 TCP/UDP/ICMP

31.5.6.1 Checksum Calculation handling

(1) Reception Handling

The result of Checksum Calculation is attached to last 4 bytes of Ethernet Frames like **Figure 31.25**. And then the handled frames are transferred to memory by DMAC. If the frame does not have checksum error at the part of IPv4 Header or TCP/UDP/ICMP, the value of “H’0000” is attached to each part as the result of Checksum Calculation. The case of Unsupported Frame, the value of “H’FFFF” is attached. For example, if the part of IP Header is unsupported, “H’FFFF” is set to both field of IPv4 Header and TCP/UDP/ICMP. The case of IPv6, IPv4 Header field is always set to “H’FFFF”. And the set value of TCP/UDP/ICMP field depends on configuration for support conditions.

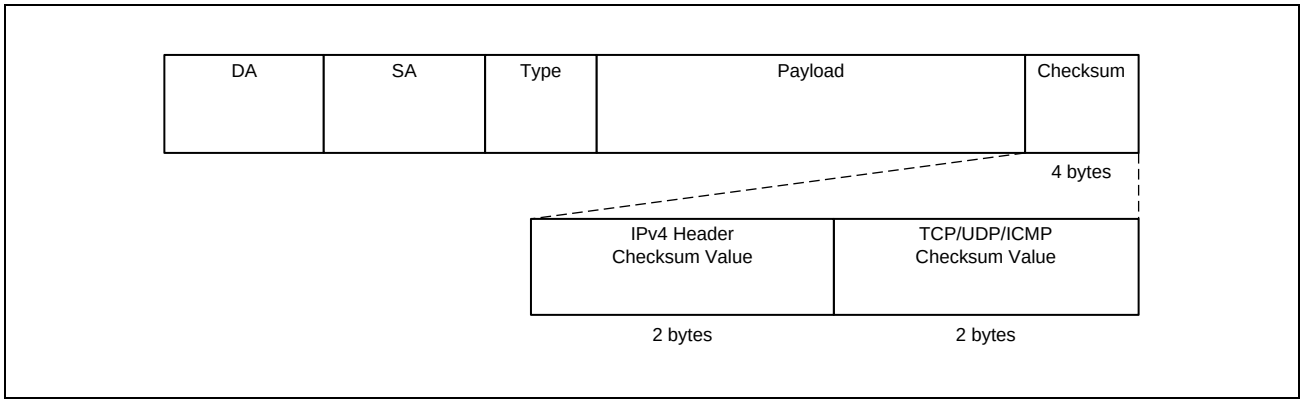

Figure 31.25 The Field of Checksum Attaching Field (Ex. Ethernet Frame of DIX)

(2) Transmission Handling

The result of Checksum Calculation is set to the Checksum field of each IPv4 Header/TCP/UDP/ICPM. For the Unsupported Frames, those fields are not changed. If a transmission frame is an UDP frame of IPv4 and its Checksum value in the UDP Header field is “H’0000”, TOE does not calculate Checksum for UDP part of this frame. Because Checksum for IPv4 UDP frame is defined as optional function in standards. If a transmission IPv4 UDP frame does not need to Checksum Value, set “H’0000” to the Checksum field in the UDP Header.

31.5.6.2 Error Notification

When TOE detects any errors by Checksum Calculation, the error information is notified to DMAC. The errors are detected by TOE are followings:

- Unsupported Transmission Frame Error (This error information is indicated to “MFA” register)
- Unsupported Reception Frame Error (This error information is stored to Descriptor by Write Back)
- Reception Frame has Checksum Error (This error information is stored to Descriptor by Write Back)

31.5.6.3 Individually Configuration by the frame type

The Enable/Disable setting of Checksum Calculation is configurable by CSR1 and CSR2 register. And CSR1 and CSR2 register are able to configure Enable/Disable setting individually for frame type. For example, it is possible to disable the checksum calculation for only UDP part of IPv4 frame.

The relationship between the Frame Type and Error Notification to DMAC are indicated at **Table 31.16** and **Table 31.17**. **Table 31.16** is for Transmission Frames. **Table 31.17** is for Reception Frames. The condition of both tables is that the checksum calculation for all frame type is enabled by CSR1 and CSR2 register.

If the checksum calculation of each Frame Type is configured as Disable individually by CSR1 and CSR2 register, the operation is followings. (Following descriptions are for the normal frames)

(1) Disabled Transmission Checksum Calculation

TOE notifies an Unsupported Transmission Frame Error to DMAC. And the Checksum Values which Type is configured as “Disable” are not changed.

(2) Disabled Reception Checksum Calculation

The frames which have Disabled configuration Types are handled as Unsupported Frame. So, the error notification to DAMC is same as the case of Unsupported Frames.

If the other checksum field which is configured as Enable has Checksum Error, Received Checksum Error is notified to DMAC. Received Unsupported Error also is notified. The value of “H’FFFF” is set to the checksum field which is configured as Disable.

Table 31.16 Relationship between Transmission Frame Type and Error Notification to DMAC

Transmission Frame Type						Checksum Operation		
VLAN-tag		IP		Transport protocol		Error Notification to DMAC	Checksum Value	
Number of tags	TPID	Protocol	Condition	Protocol	Condition	Unsupported Frame Error	IPv4 Header	TCP/UDP/ICMP
0 or 1	Nothing or H'8100	IPv4	Not Fragmented Packet	TCP/ICMP	—	Non-Asserted	Calculated Value	Calculated Value
				UDP	Checksum Field is not H'0000	Non-Asserted	Calculated Value	Calculated Value
					Checksum Field is H'0000	Non-Asserted	Calculated Value	Through (H'0000)
				Except TCP/ICMP/UDP	—	Asserted	Calculated Value	—
			Fragmented Packet	don't care	don't care	Asserted	Calculated Value	—
		IPv6	Non-Extended Header or The number of Supported Extended Header is from 1 to 8*1	TCP/ICMP	—	Non-Asserted	—	Calculated Value
				UDP	—	Non-Asserted	—	Calculated Value
				Except TCP/ICMP/UDP	—	Asserted	—	—
			The number of Supported Extended Header is 9 or more*1	don't care	don't care	Asserted	—	—
			Has Unsupported Extended Header*1	don't care	don't care	Asserted	—	—
		Except IPv4/IPv6	—	don't care	don't care	Asserted	—	—
1	Except H'8100	don't care	don't care	don't care	don't care	Asserted	—	—
2 or more	don't care	don't care	don't care	don't care	don't care	Asserted	—	—
Illegal Frames*2						Asserted	—	—

Note 1. See the **Section 31.5.6.4 Supported Frame for Checksum Calculation** for about the Supported Extended Headers.

Note 2. The Frame Length is shorter than the result of Frame Analysis by TOE.

Table 31.17 Relationship between Reception Frame Type and Error Notification to DMAC

Reception Frame Type						Field of Checksum Error	Checksum Operation			
VLAN-tag		IP		Transport protocol			Error Notification to DMAC		Checksum Value	
Number of tags	TPID	Protocol	Condition	Protocol	Condition		Checksum Error	Unsupported Frame Error	IPv4 Header	TCP/ UDP/ ICMP
0 or 1	Nothing or H'8100	IPv4	Not Fragmented Packet	TCP/ICMP	—	Non-Error	Non-Asserted	Non-Asserted	H'0000	H'0000
					—	IPv4 Header	Asserted	Non-Asserted	Calculated Value	H'0000
					—	TCP/ICMP	Asserted	Non-Asserted	H'0000	Calculated Value
					—	IPv4 Header and TCP/ICMP	Asserted	Non-Asserted	Calculated Value	Calculated Value
				UDP	Checksum Field is not H'0000	Non-Error	Non-Asserted	Non-Asserted	H'0000	H'0000
						IPv4 Header	Asserted	Non-Asserted	Calculated Value	H'0000
						UDP	Asserted	Non-Asserted	H'0000	Calculated Value
						IPv4 Header and UDP	Asserted	Non-Asserted	Calculated Value	Calculated Value
					Checksum Field is H'0000	Non-Error	Non-Asserted	Non-Asserted	H'0000	H'FFFF
						IPv4 Header	Asserted	Non-Asserted	Calculated Value	H'FFFF
				Except TCP/ ICMP/ UDP	—	Non-Error	Non-Asserted	Asserted	H'0000	H'FFFF
					—	IPv4 Header	Asserted	Asserted	Calculated Value	H'FFFF
			Fragmented Packet	don't care	don't care	Non-Error	Non-Asserted	Asserted	H'0000	H'FFFF
				don't care	don't care	IPv4 Header	Asserted	Asserted	Calculated Value	H'FFFF
		IPv6	Non-Extended Header or The number of Supported Extended Header is from 1 to 8*1	TCP/ICMP	—	Non-Error	Non-Asserted	Non-Asserted	H'FFFF	H'0000
					—	TCP/ICMP	Asserted	Non-Asserted	H'FFFF	Calculated Value
				UDP	Checksum Field is not H'0000	Non-Error	Non-Asserted	Non-Asserted	H'FFFF	H'0000
						UDP	Asserted	Non-Asserted	H'FFFF	Calculated Value
					Checksum Field is H'0000	—	Asserted	Non-Asserted	H'FFFF	H'FFFF
				Except TCP/ ICMP/ UDP	—	—	Non-Asserted	Asserted	H'FFFF	H'FFFF
			The number of Supported Extended Header is 9 or more*1	don't care	don't care	—	Non-Asserted	Asserted	H'FFFF	H'FFFF
			Has Unsupported Extended Header*1	don't care	don't care	—	Non-Asserted	Asserted	H'FFFF	H'FFFF
		Except IPv4/IPv6	—	don't care	don't care	—	Non-Asserted	Asserted	H'FFFF	H'FFFF
1	Except H'8100	don't care	don't care	don't care	don't care	—	Non-Asserted	Asserted	H'FFFF	H'FFFF
2 or more	don't care	don't care	don't care	don't care	don't care	—	Non-Asserted	Asserted	H'FFFF	H'FFFF
Illegal Frames*2						—	Non-Asserted	Asserted	H'FFFF	H'FFFF

Note 1. See the **Section 31.5.6.4 Supported Frame for Checksum Calculation** for about the Supported Extended Headers.

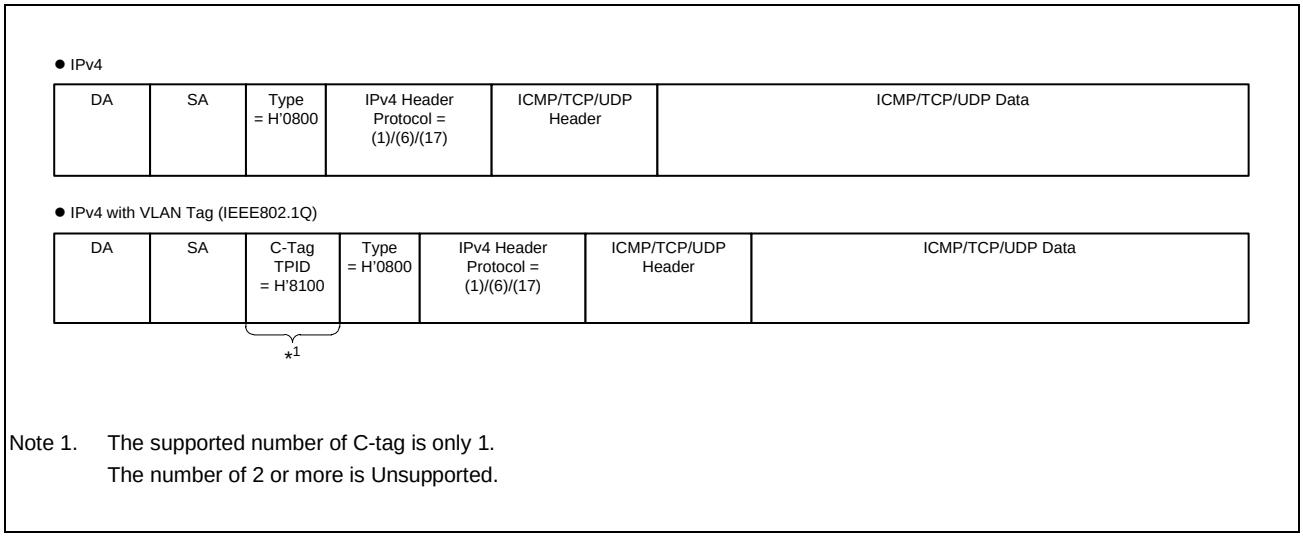
Note 2. The Frame Length is shorter than the result of Frame Analysis by TOE. Or the case of E-MAC detected Errors.

31.5.6.4 Supported Frame for Checksum Calculation

Following Frames are example of Supported/Unsupported Frame Formats for Checksum Calculation.

(1) For IPv4 Checksum Calculation

Figure 31.26 is Supported Frame Format for the Checksum Calculation of IPv4 Header and IPv4 TCP/UDP/ICMP.

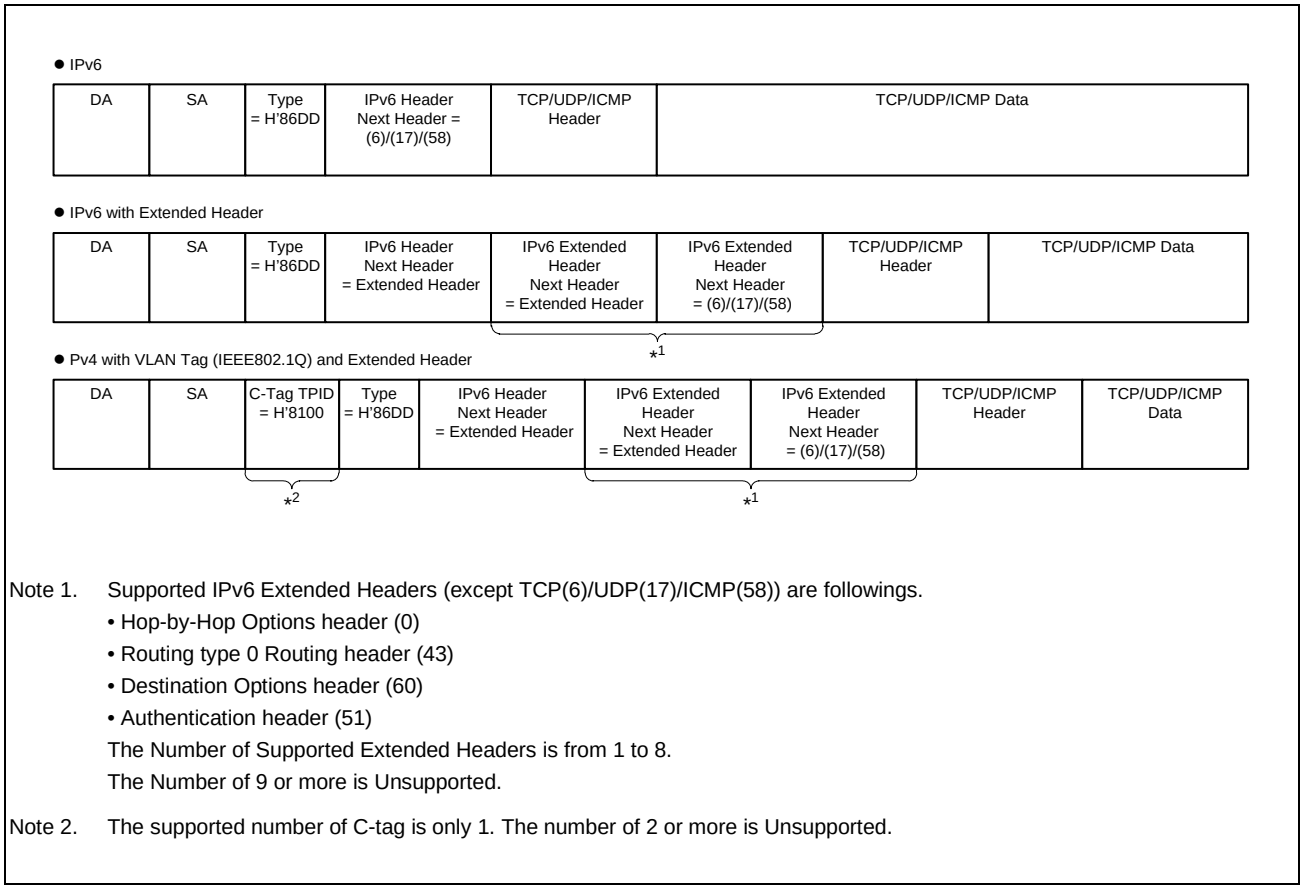


Note 1. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 31.26 Supported Frame Format for IPv4 Checksum Calculation

(2) For IPv6 Checksum Calculation

Figure 31.27 is Supported Frame Format for the Checksum Calculation of IPv6 TCP/UDP/ICMP.



Note 1. Supported IPv6 Extended Headers (except TCP(6)/UDP(17)/ICMP(58)) are followings.
- Hop-by-Hop Options header (0)
- Routing type 0 Routing header (43)
- Destination Options header (60)
- Authentication header (51)

The Number of Supported Extended Headers is from 1 to 8.
The Number of 9 or more is Unsupported.

Note 2. The supported number of C-tag is only 1. The number of 2 or more is Unsupported.

Figure 31.27 Supported Frame Format for IPv6 Checksum Calculation

(3) Unsupported Frame Format (example)

Figure 31.28 is an Example Unsupported Frame Format.

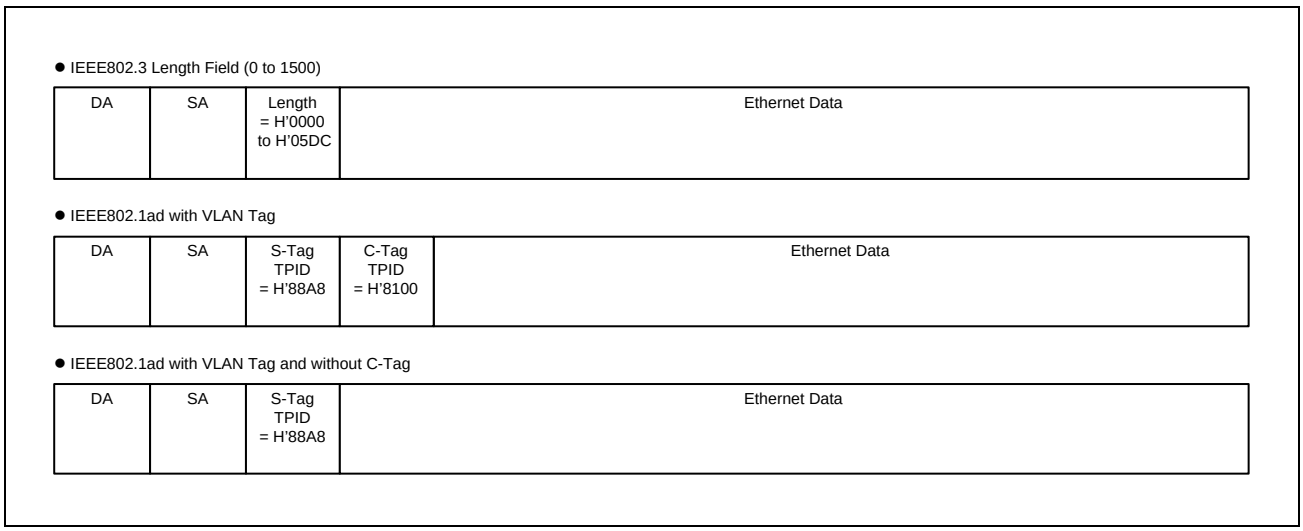


Figure 31.28 Unsupported Frame Format (Example)

31.5.6.5 Checksum Calculation Flow

Figure 31.29 and **Figure 31.30** are Flows for Checksum Calculation by TOE.

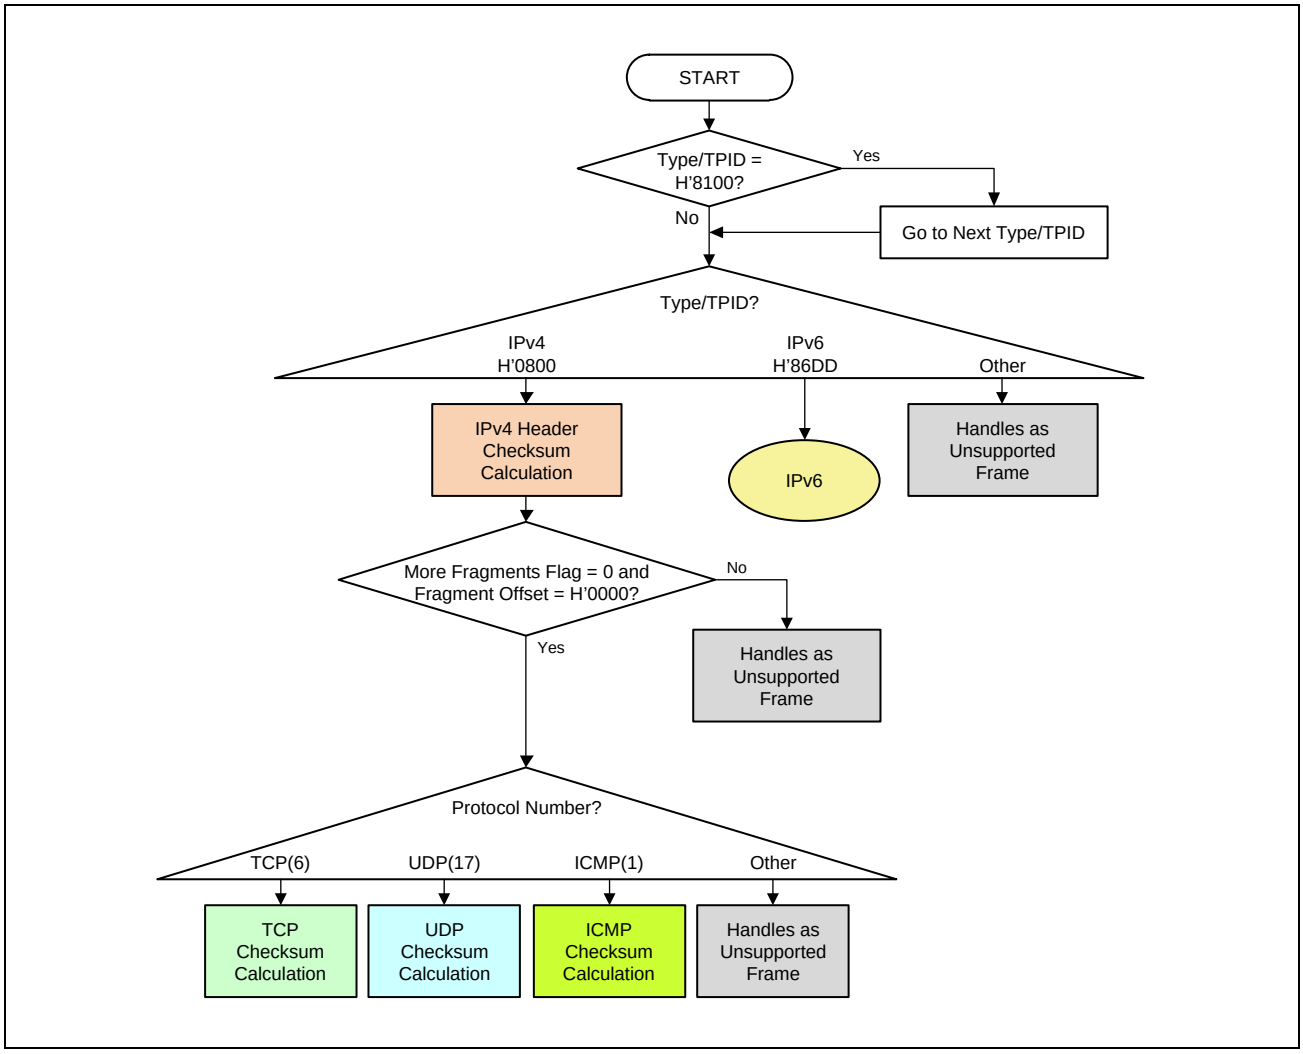

Figure 31.29 Checksum Calculation Flow (Part1)

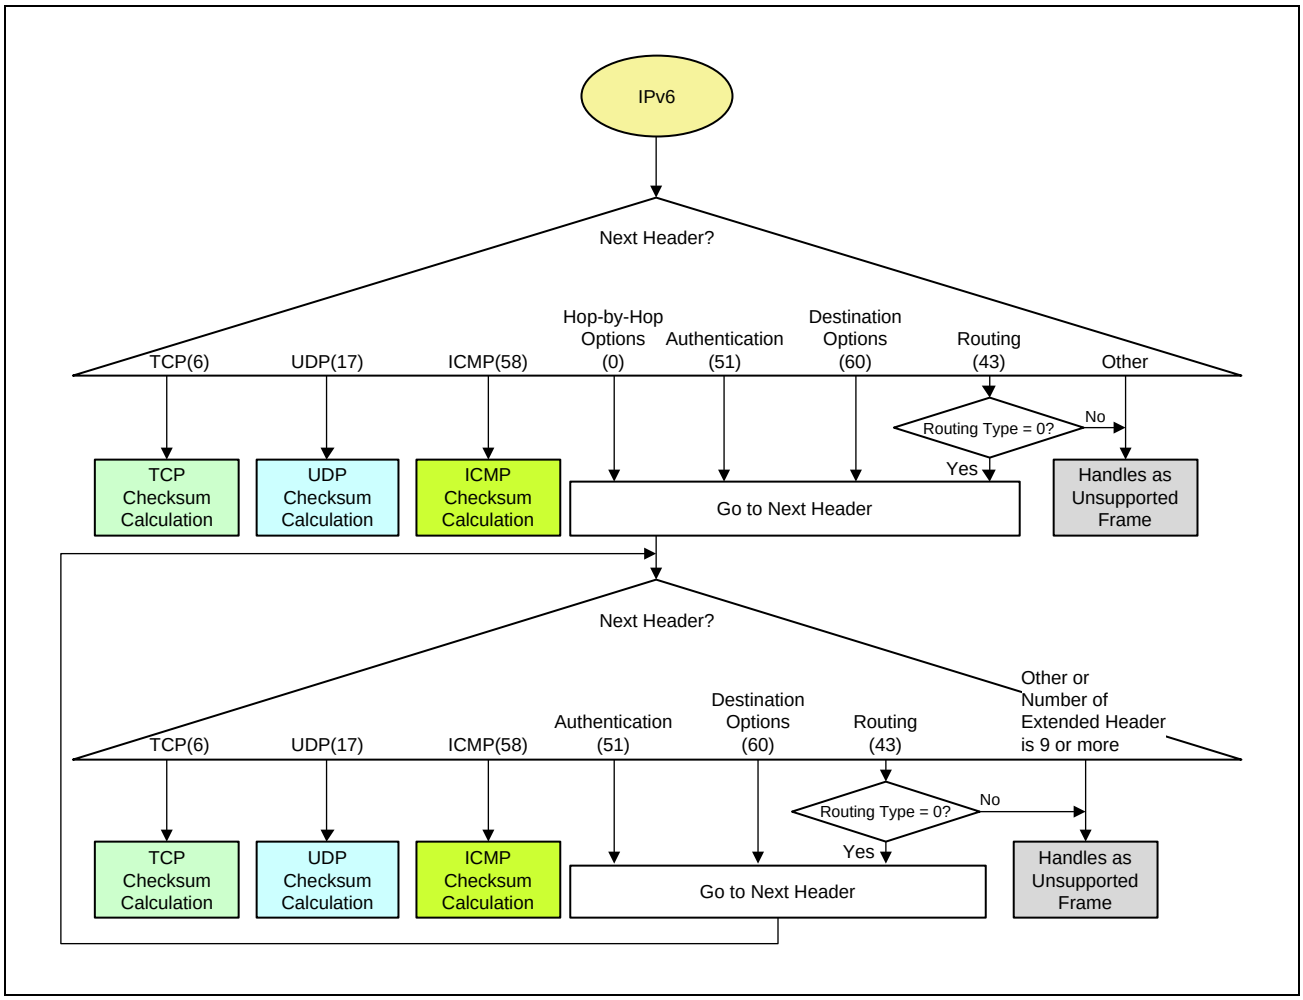

Figure 31.30 Checksum Calculation Flow (Part2)

31.5.7 Received Frame Filter

TOE has Received Frame Filters. When TOE received the frame which is not match to filters, TOE discards (abort) that frame. TOE is also able to assert an interrupt if TOE received the frame which is match to filters.

The Possible Configuration of Filter Condition are followings.

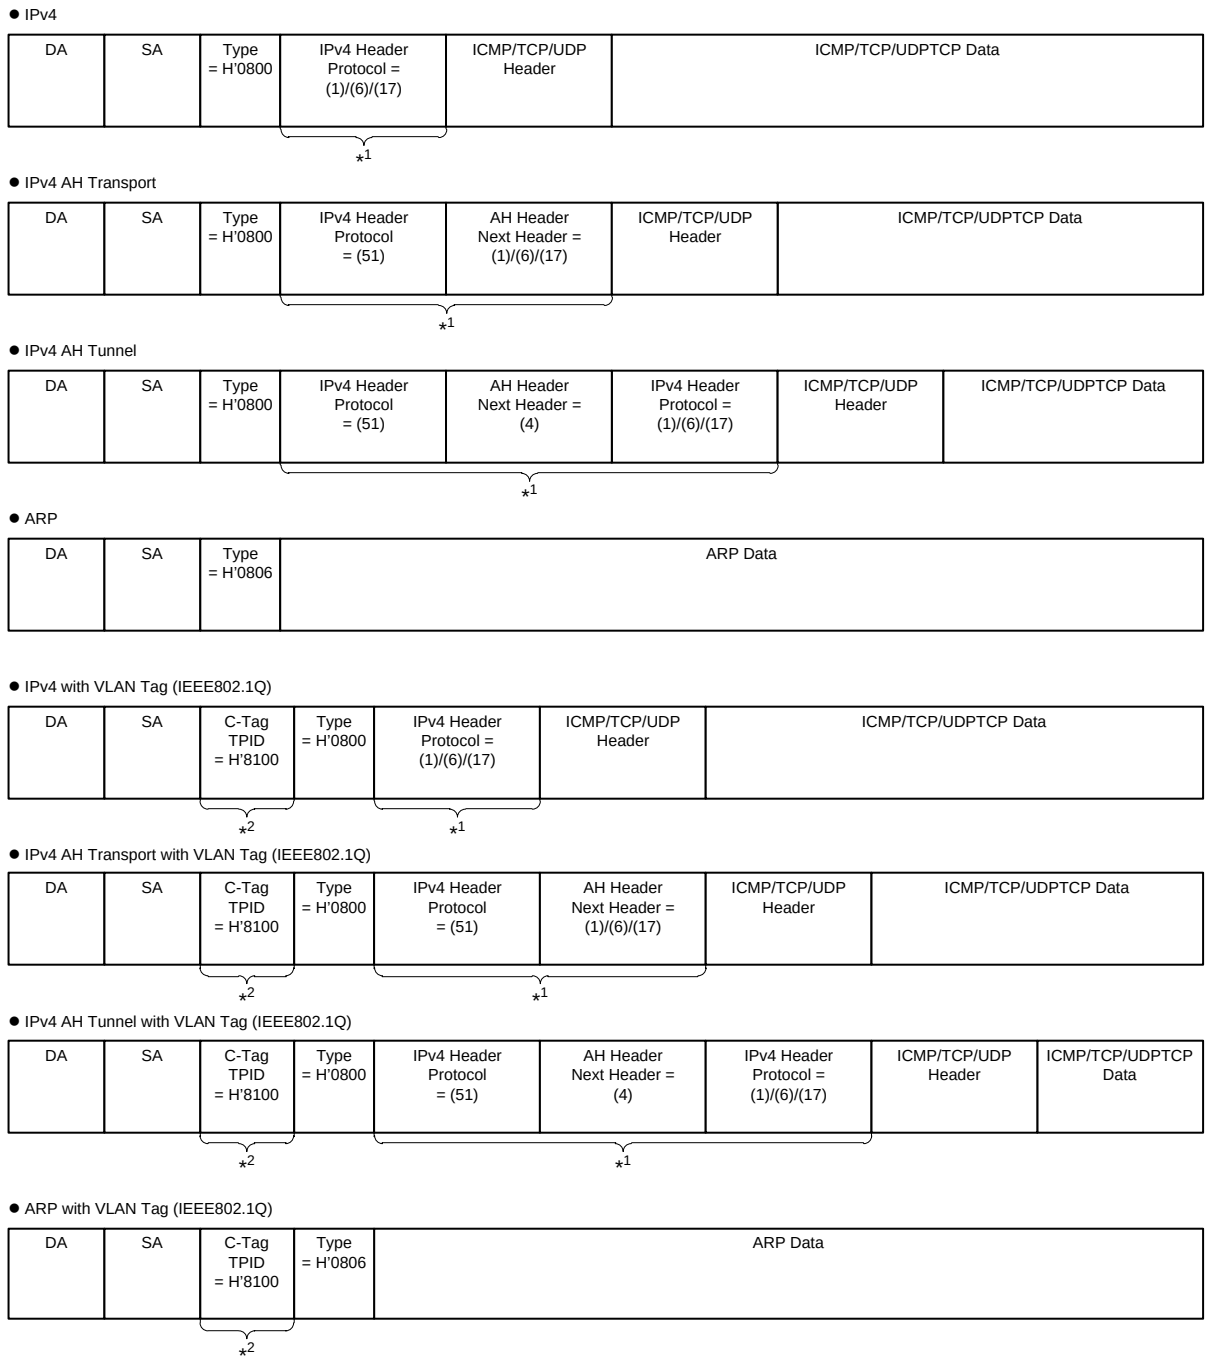
- Ethernet Type
- IP Protocol No.
- UDP destination port No.
- Destination MAC address (Unicast)
- Destination MAC address (Broadcast)
- Destination MAC address (Multicast)
- ARP Request of Local Station
- Neighbor Solicitation of Local Station
- Except IPv6 Next Header (Analyzable)

31.5.7.1 Supported Frame for Received Frame Filter

Followings are Supported /Unsupported Frame Formats by Received Frame Filter.

(1) For IPv4 Frame Filter

Figure 31.31 is Supported Frame format of IPv4.



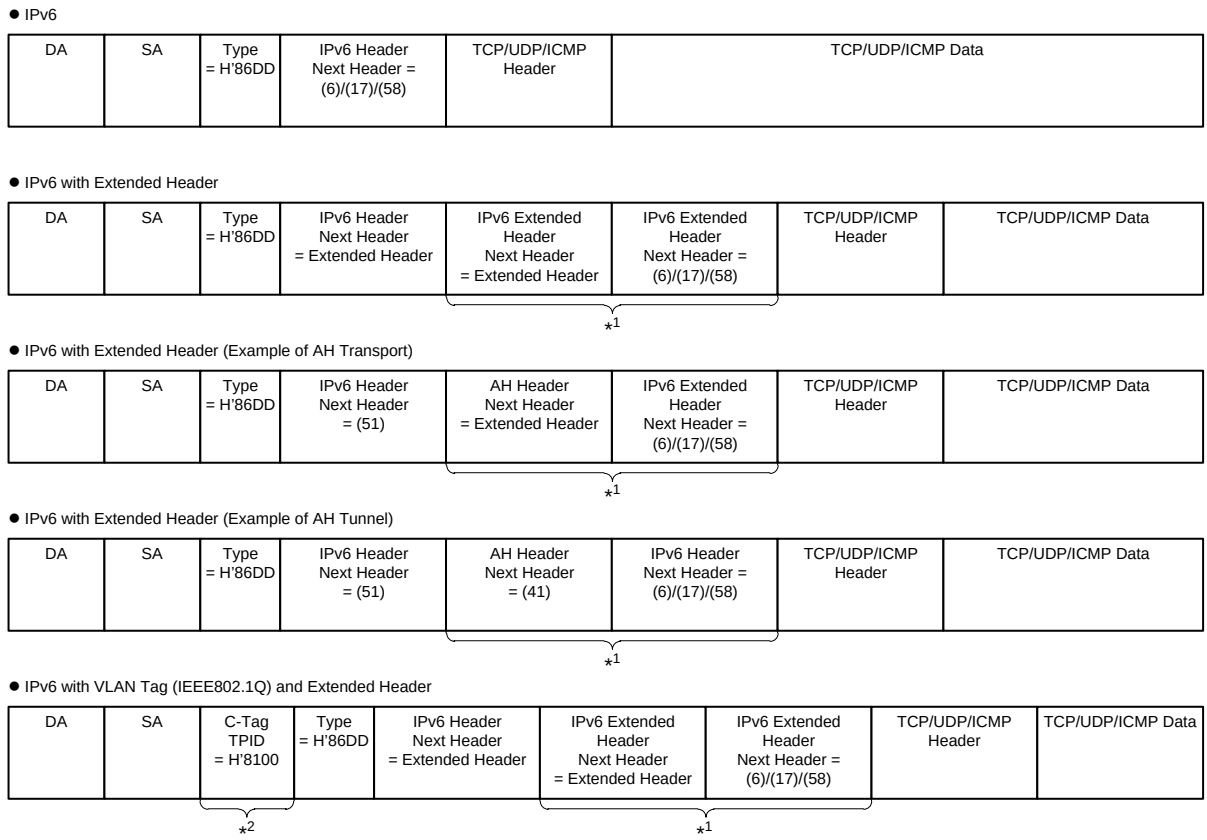
Note 1. Frame analysis is stopped if the Protocol No. is not ICMP (1), IPinIP (4), TCP (6), UDP (17) or AH (51)

Note 2. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 31.31 Supported Frame of IPv4

(2) For IPv6 Frame Filter

Figure 31.32 is Supported Frame format of IPv6.



Note 1. Supported Extended Header (except TCP (6), UDP (17) and ICMP (58) are followings.
- Hop-by-Hop Options header (0)
- IPv6 (41)
- Routing type 0 Routing header (43)
- Flag (44)
- Authentication header (51)
- Destination Options header (60)

Others are Unsupported and Frame analysis is stopped.

Note 2. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 31.32 Supported Frame Format of IPv6

(3) Unsupported Frame Format (Example)

Figure 31.33 is Example Unsupported Frame Format.

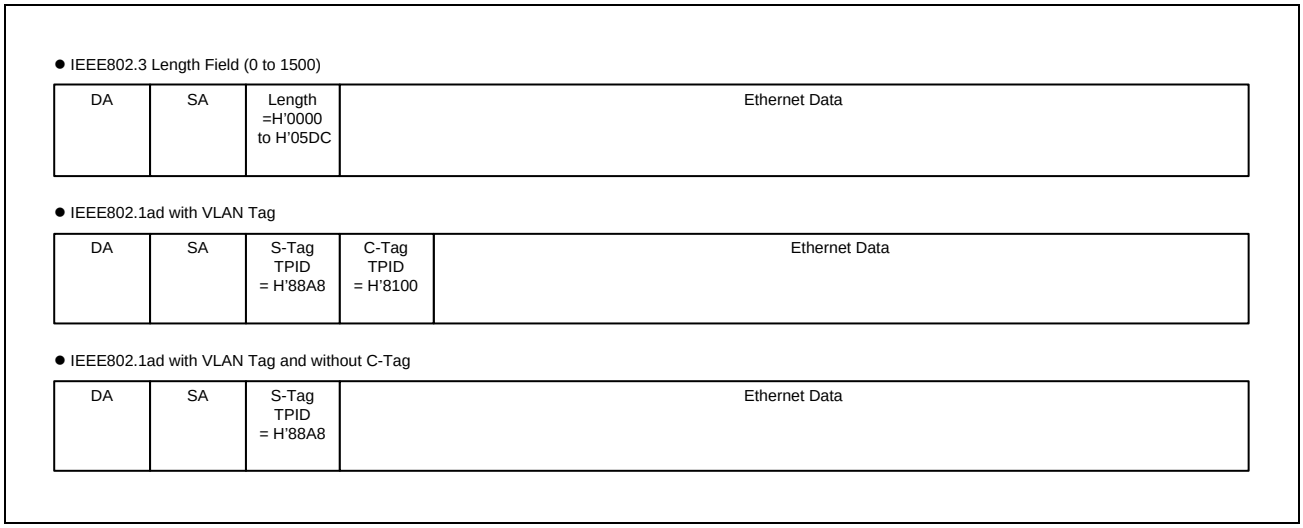


Figure 31.33 Example Unsupported Frame Format

31.5.7.2 Received Frame Filtering Flow

Figure 31.34 to **Figure 31.40** are Received Frame Filtering Flows.

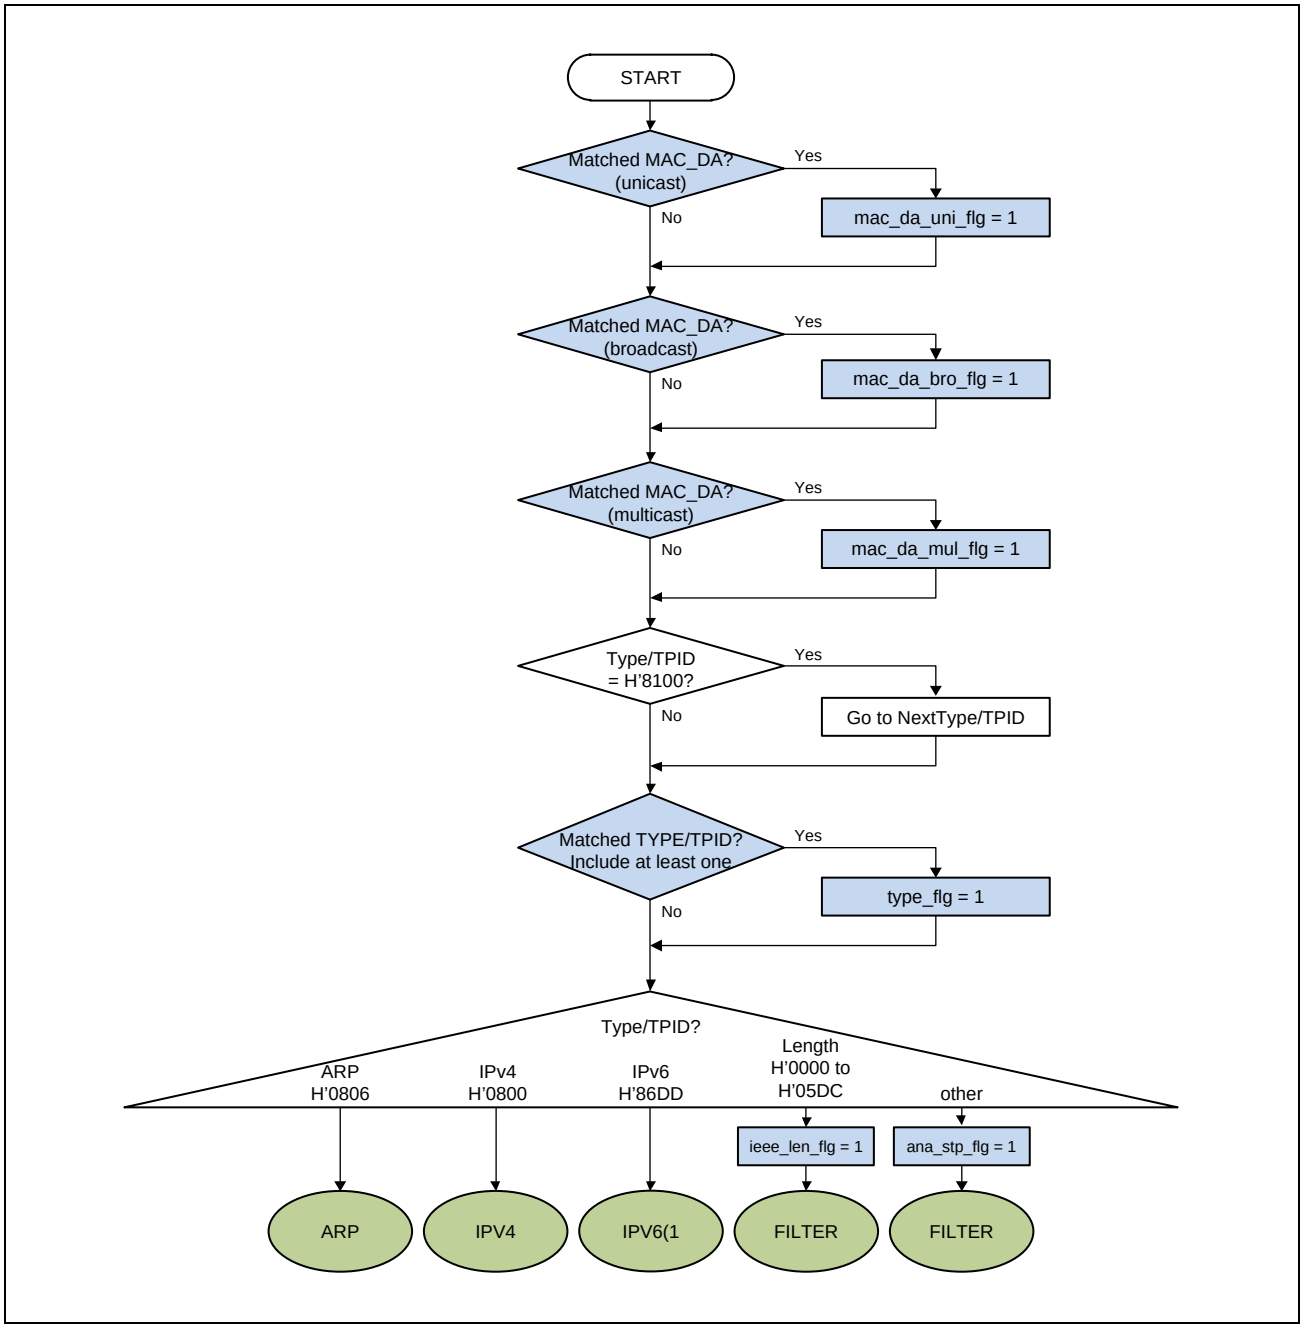

Figure 31.34 Received Frame Filtering Flow (Part1)

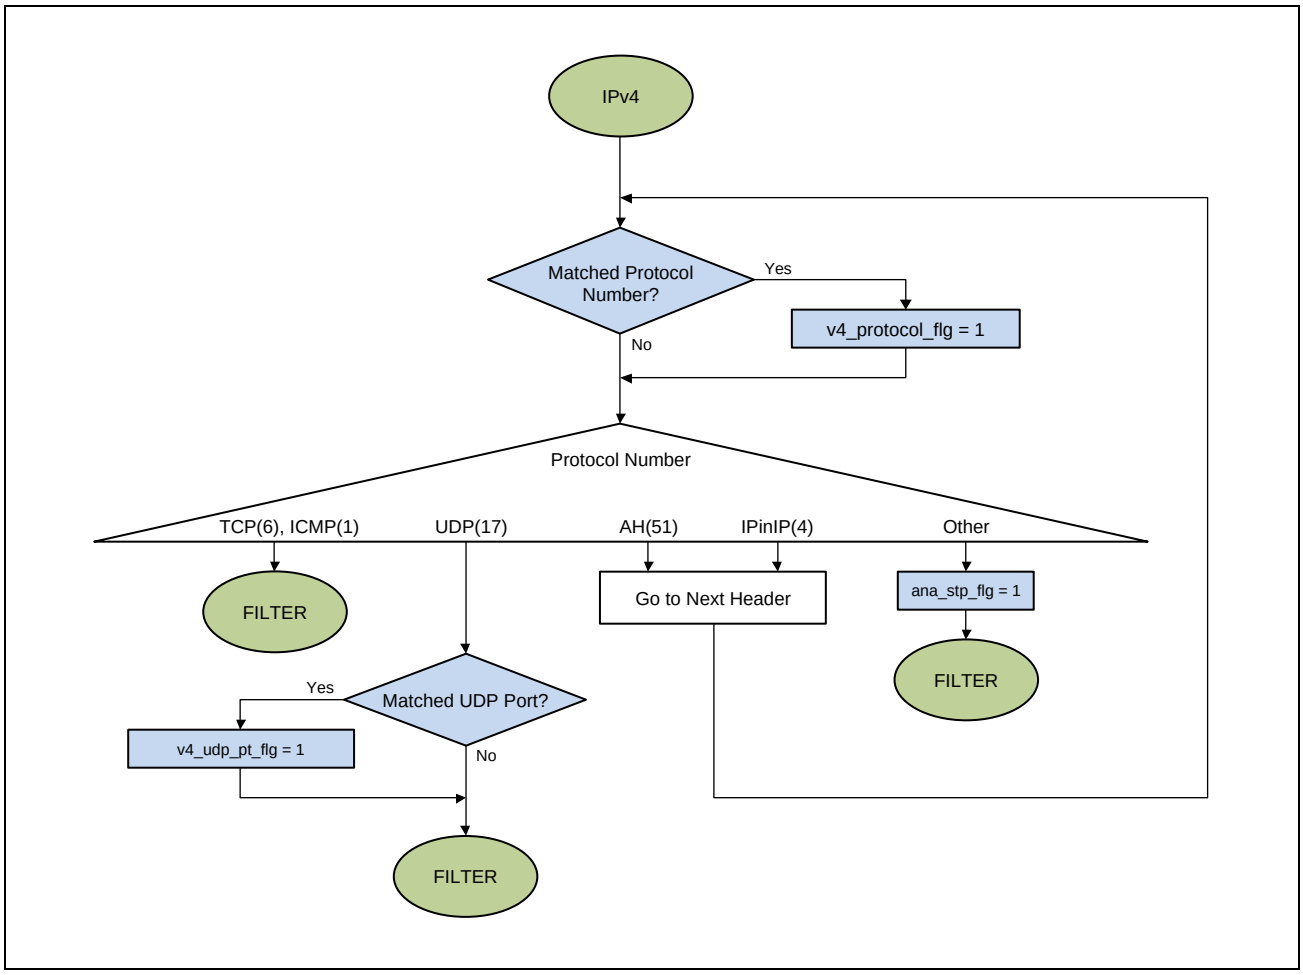

Figure 31.35 Received Frame Filtering Flow (Part2)

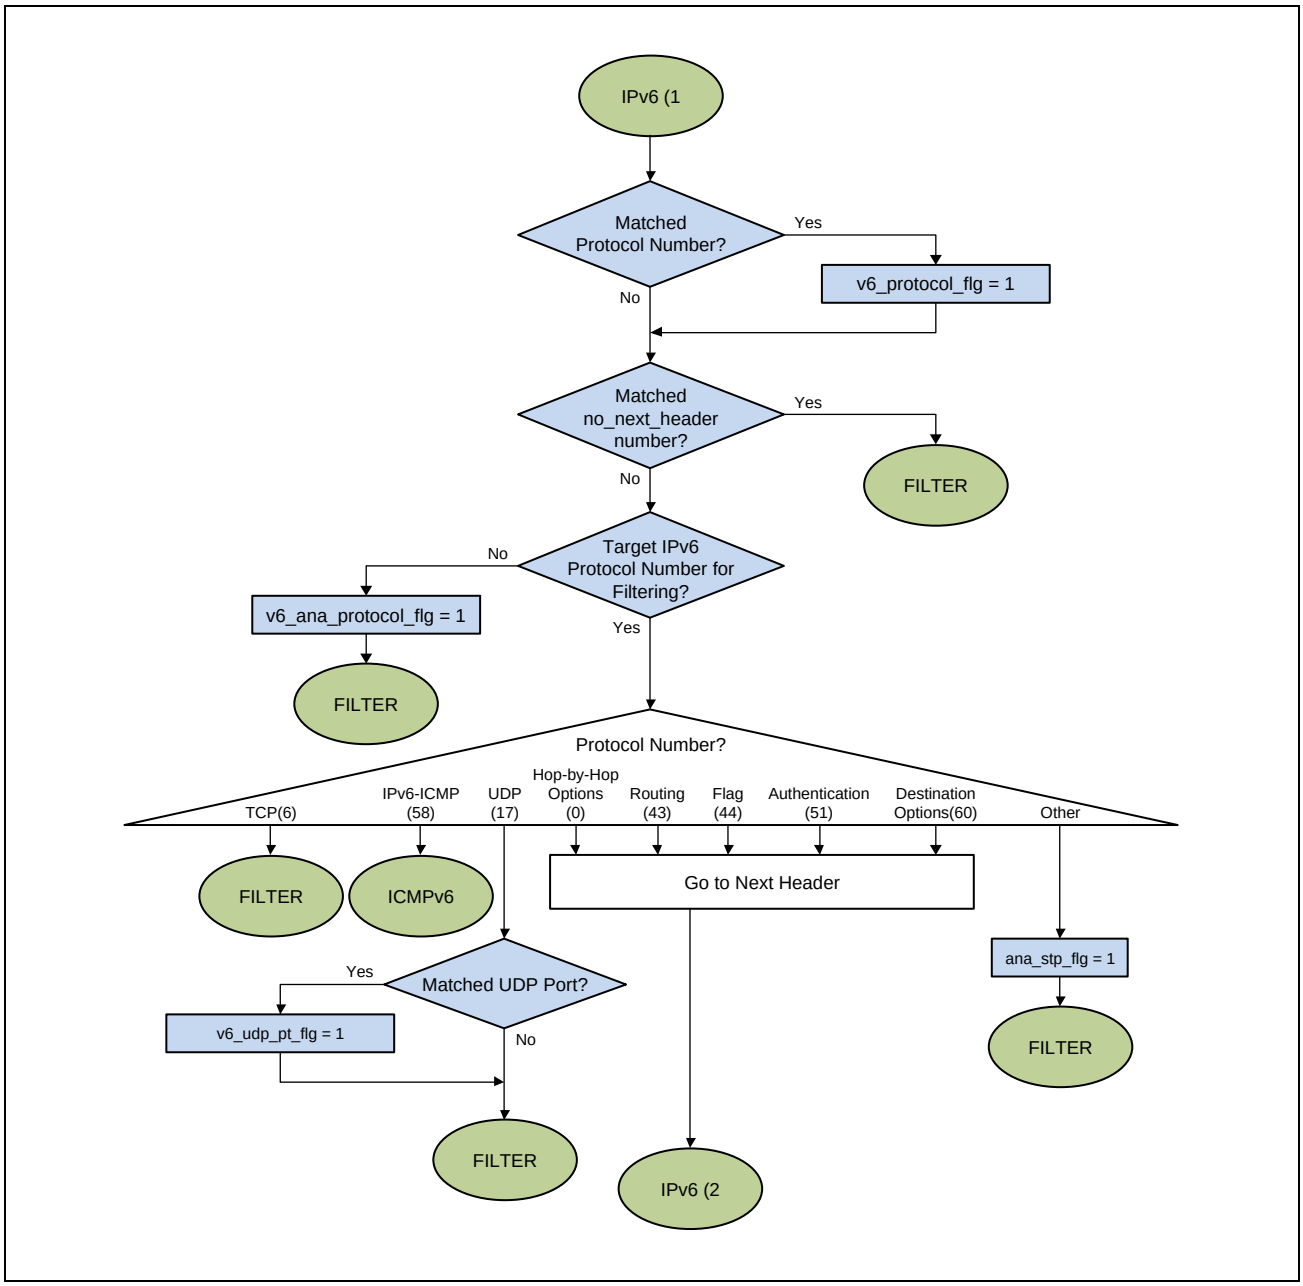

Figure 31.36 Received Frame Filtering Flow (Part3)

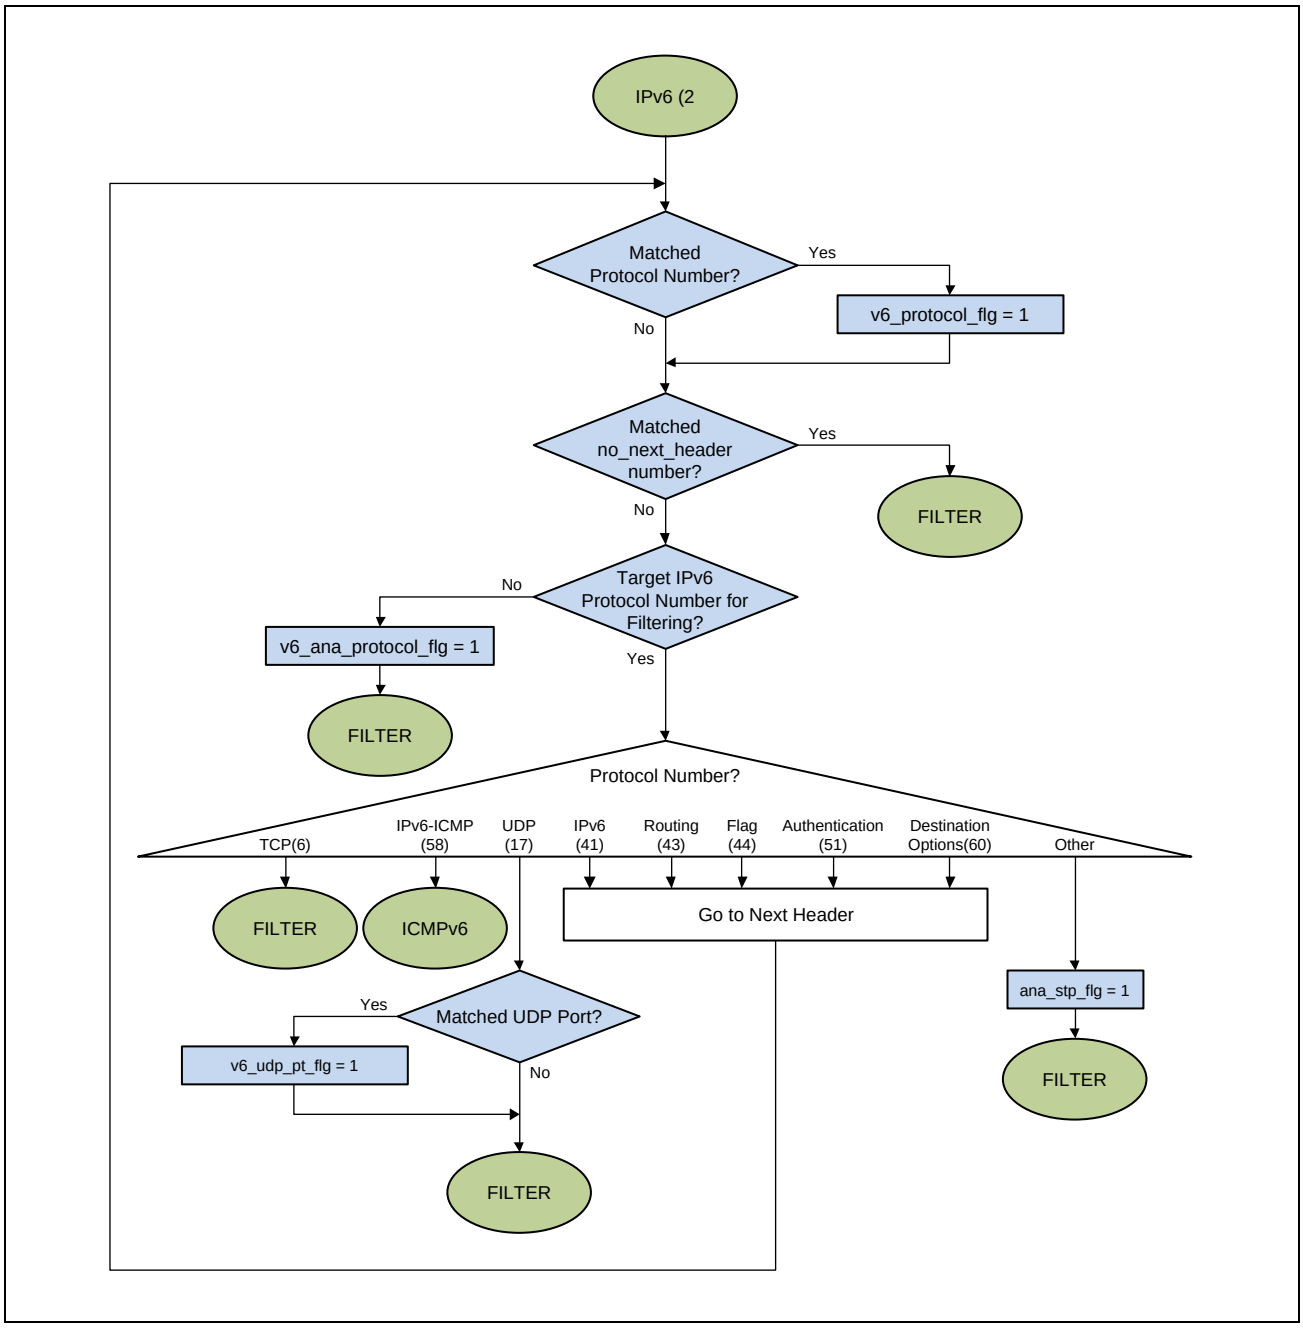

Figure 31.37 Received Frame Filtering Flow (Part4)

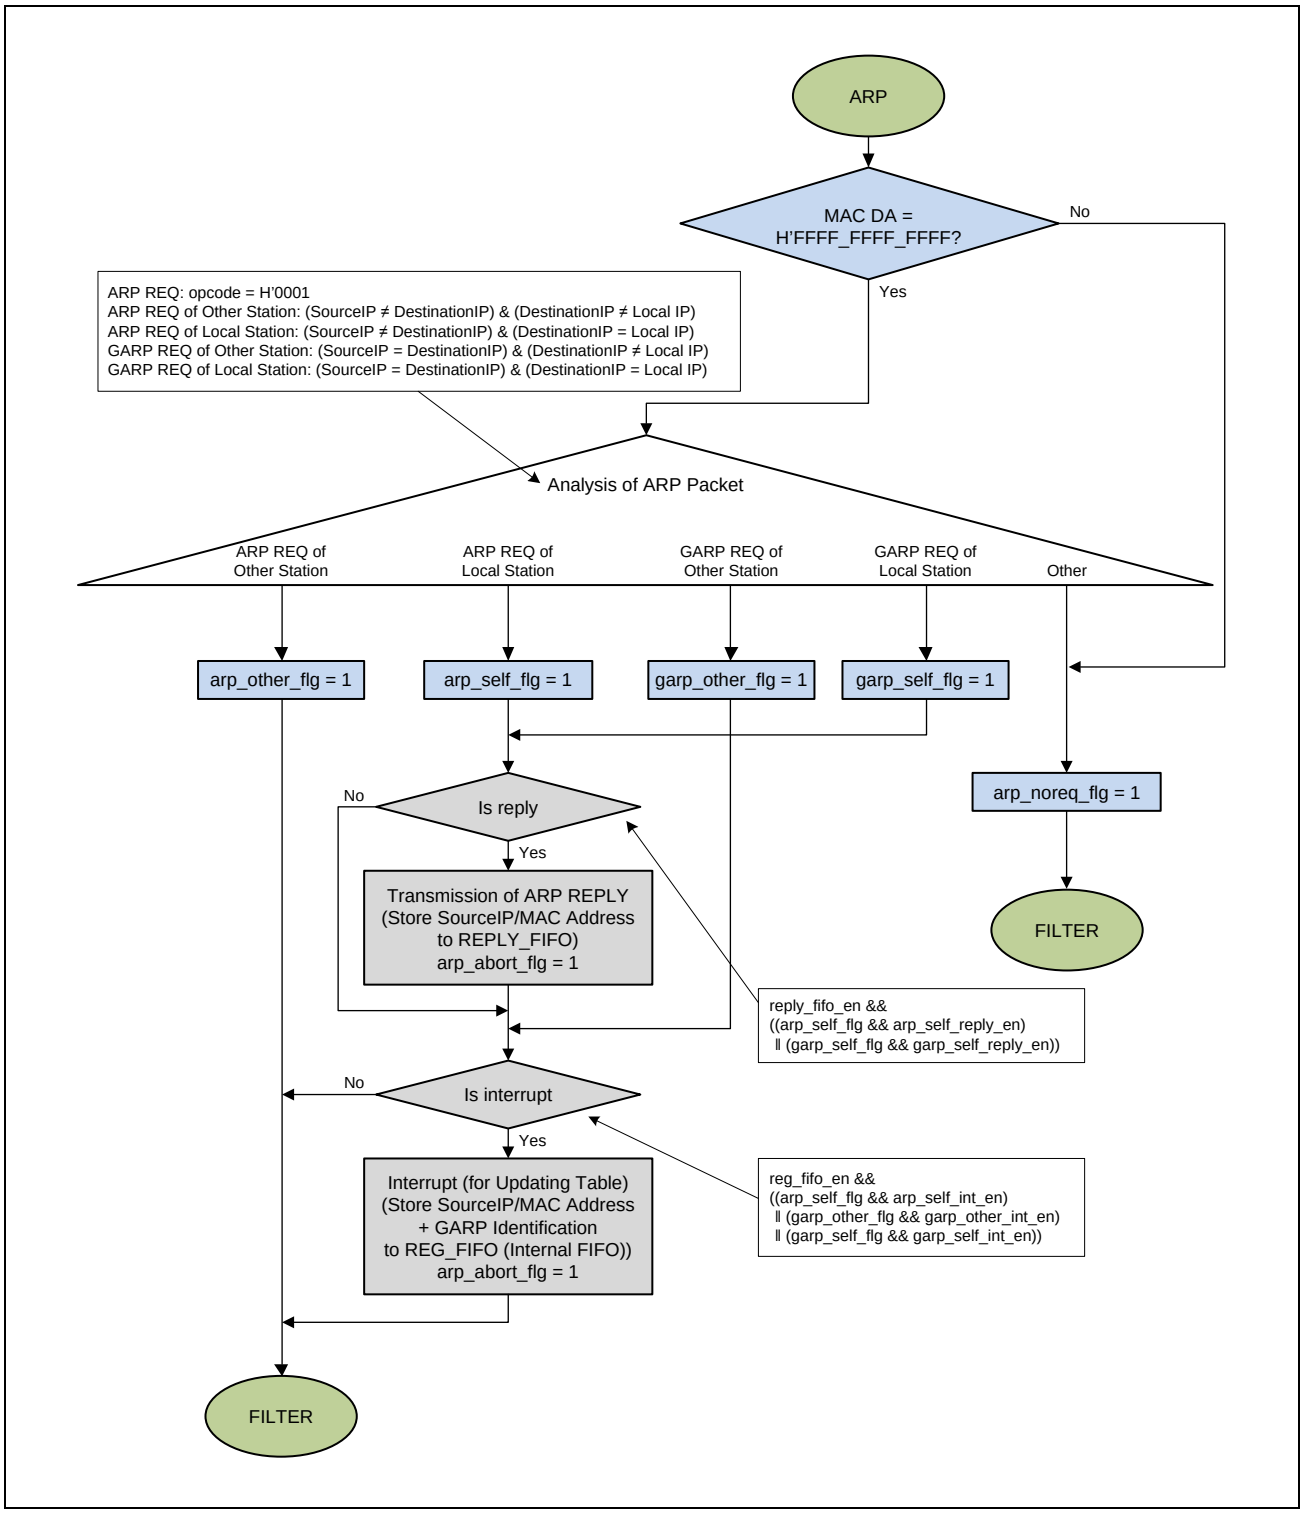

Figure 31.38 Received Frame Filtering Flow (Part5)

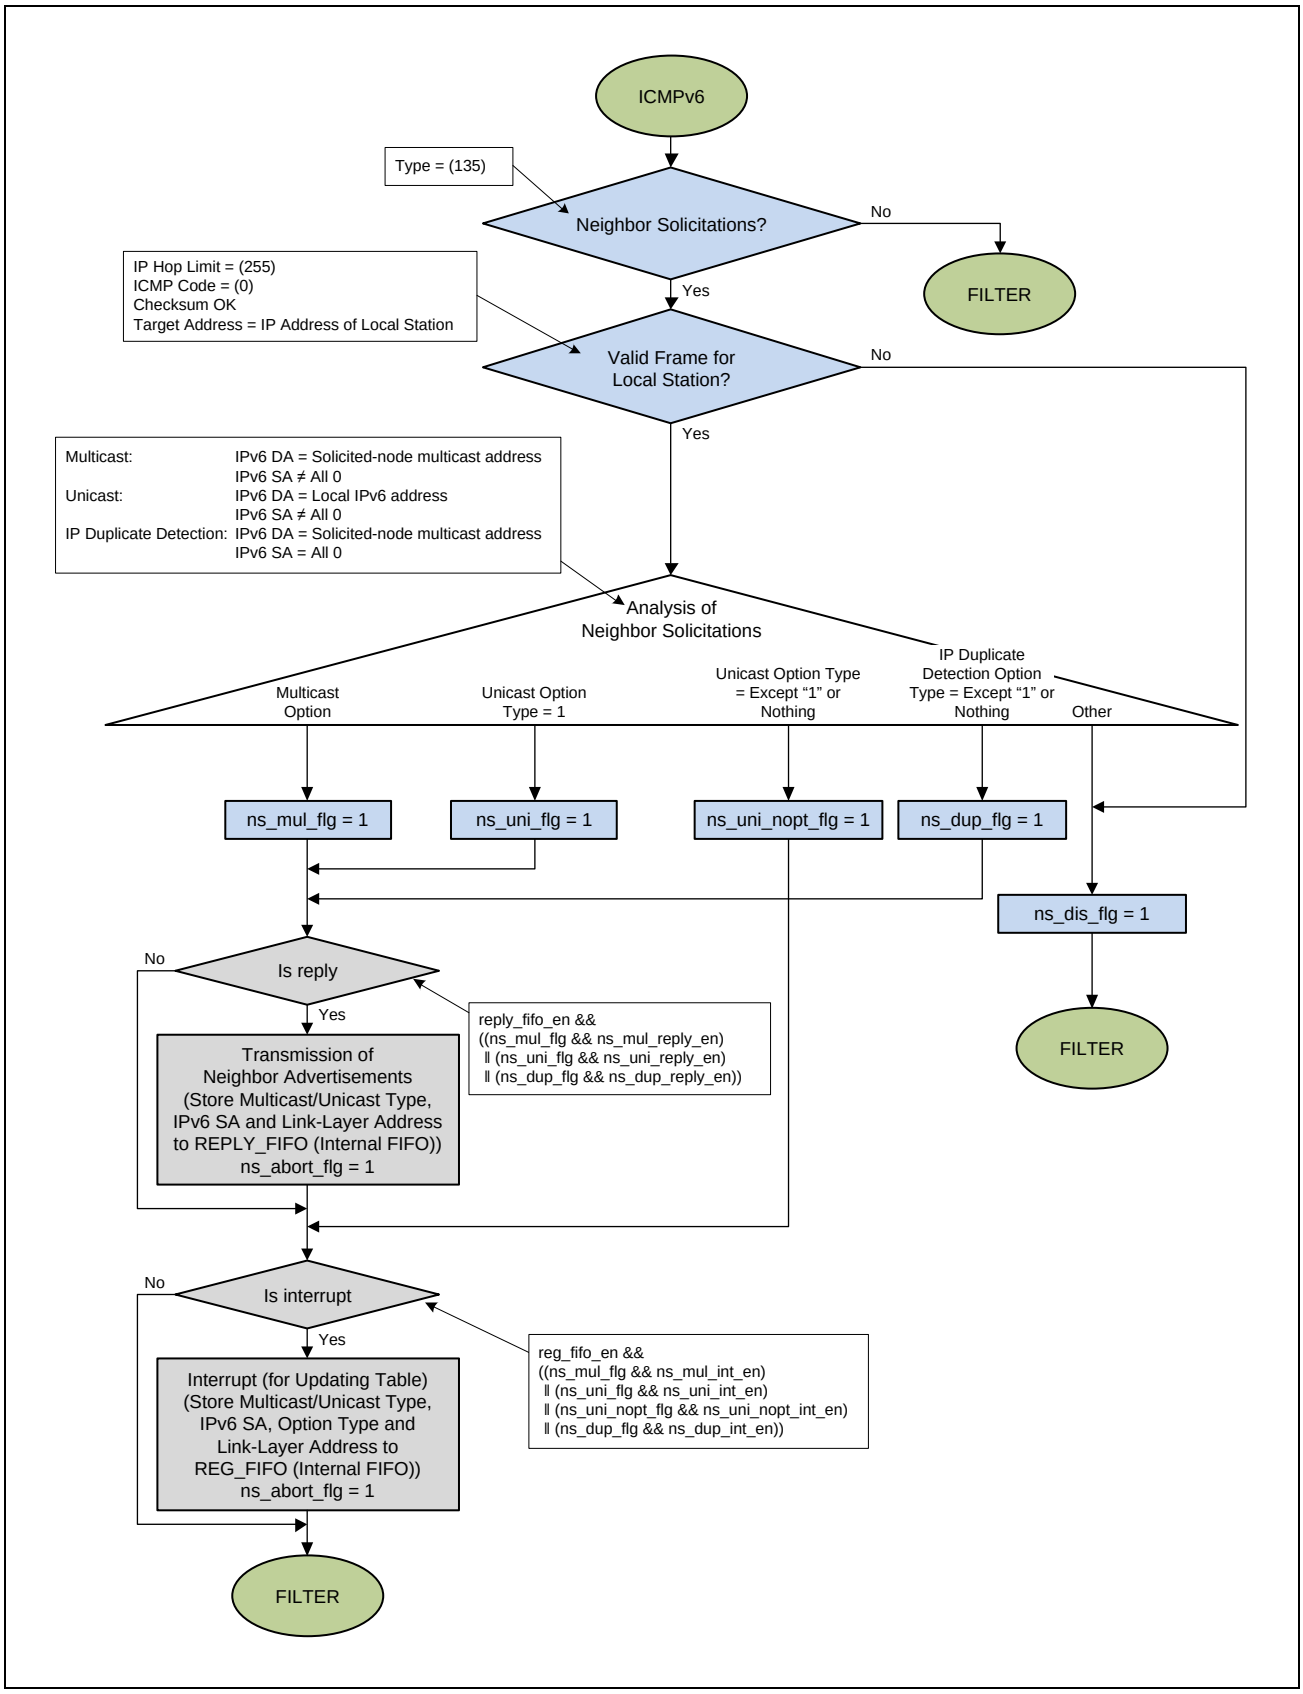

Figure 31.39 Received Frame Filtering Flow (Part6)

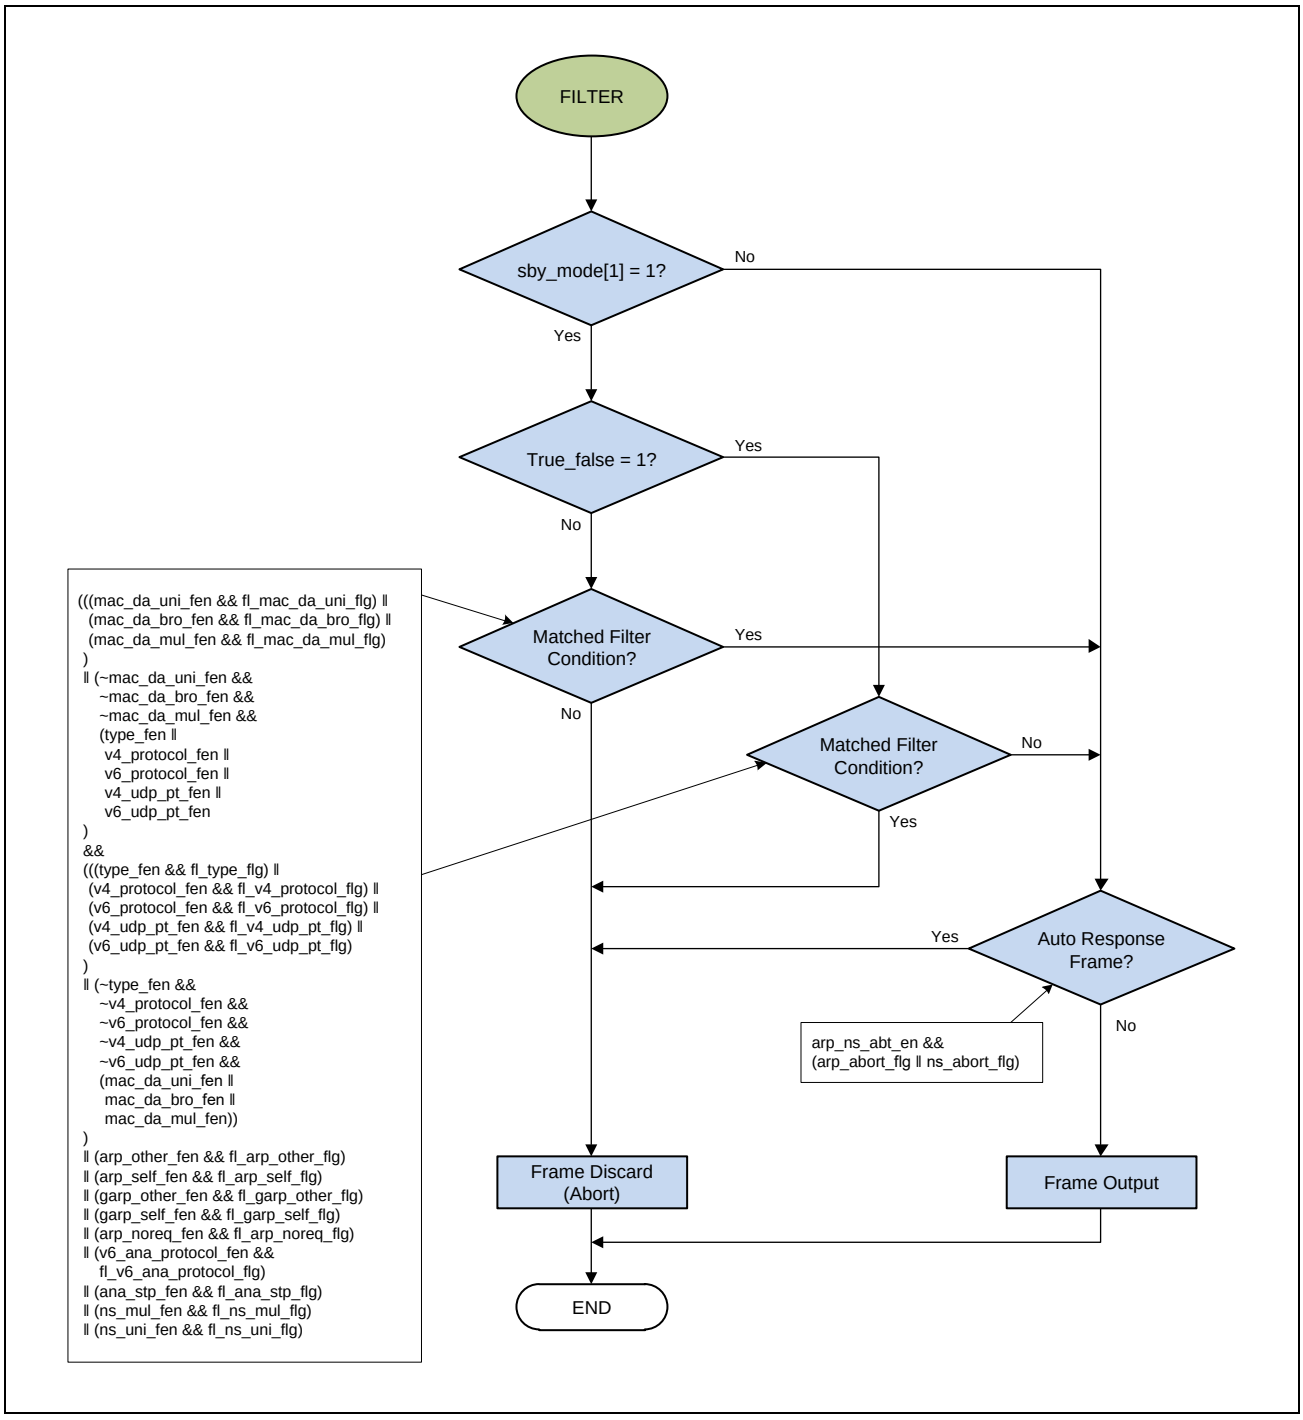

Figure 31.40 Received Frame Filtering Flow (Part7)

31.5.7.3 Filtering and Interrupts

Figure 31.41 is an overview for the function of Filtering and Interrupt.

TOE has flags for each filter conditions. When they match filter configurations of CSFR1*, each flag is set.

CSFR00 controls the action (discard or transmit) for the frames which are configured that Filtering is Enable. The filter condition relationship between “Match/Unmatch” and “Discard/Transmit” is configured by CSFR00.true_false.

The Enable/Disable configuration for discarding frame is controllable in a lump by CSFR00.sby_mode [1:0].

The flag status of each filter’s conditions is indicated to CSFR20 and outputted as interrupt. And the mask control for each interrupt is configured by CSFR21.

TOE has flags of each filter’s conditions for Filtering and Interrupt. The set condition of flags for each function is same. But clear condition is different. (The flags for Filtering are cleared at the top of frame. The flags for Interrupt are cleared by write access to the interrupt status registers.) And TOE also has Interrupt Flag which indicates the Received Frame was transmitted from TOE to DMAC without discarding by filtering conditions.

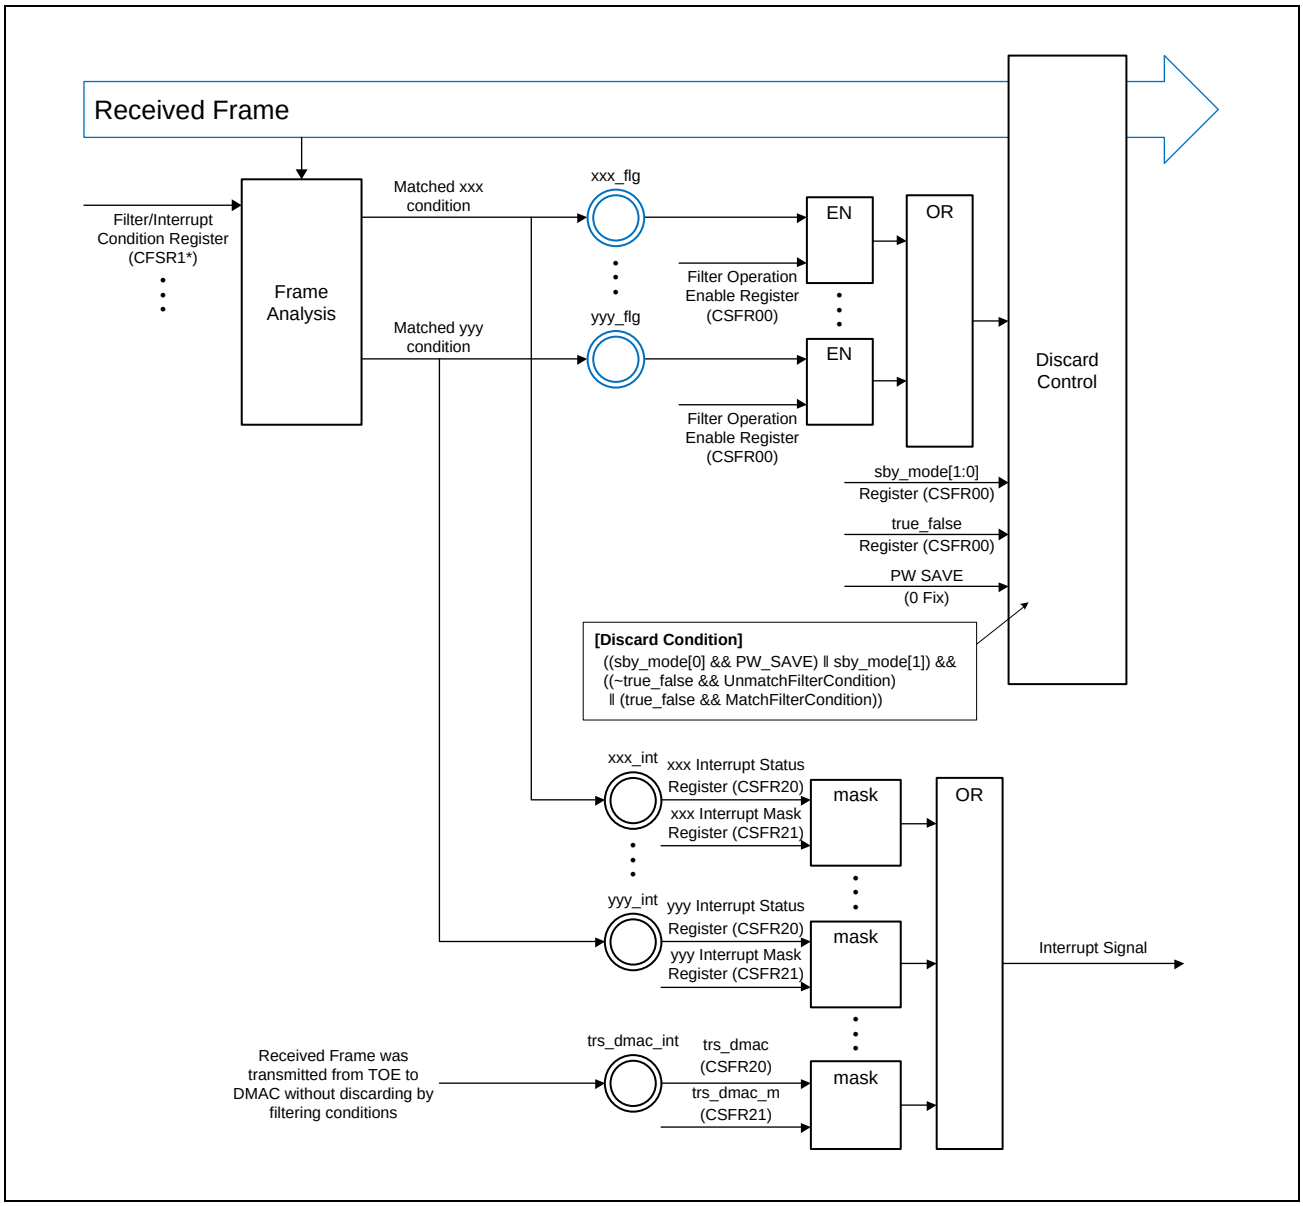

Figure 31.41 Overview of Filtering and Interrupt

31.5.8 Auto Response

TOE has following automatic responding functions.

- When TOE received ARP request for Local Station, it transmits ARP reply automatically.
- When TOE received Neighbor Solicitation for Local Station, it transmits Neighbor Advertisement automatically.

TOE also has following interrupt functions for updating ARP Table/Cache or responding function by software.

- When TOE received ARP request for Local Station, it asserts interrupt and indicates packet's information to registers. (CSFR4*)
- When TOE received Neighbor Solicitation for Local Station, it asserts interrupt and indicates packet's information to registers. (CSFR4*)

31.5.8.1 Auto Response Function for ARP REQ

Table 31.18 is operations for ARP request. See **Figure 31.38** for about the Frame Analysis Flow of ARP REQ.

Table 31.18 Operation after Received ARP REQ

	General Operation		TOE Operation		
ARP REQ	Transmit ARP REPLY	Update Table	REPLY FIFO	REG FIFO	Remarks Column
ARP for Other Station (SourceIP ≠ DestinationIP)	×	×	×	×	ARP REQ for Other Station
ARP for Local Station (SourceIP ≠ DestinationIP)	✓	✓	✓	✓	Operation of ARP for Local Station
GARP for Other Station (SourceIP = DestinationIP)	×	✓	×	✓	Request of updating ARP Table
GARP for Local Station (SourceIP = DestinationIP)	✓	×	✓	×	Response for IP Duplicate Detection

GARP:

REQ which Source IP Address and Destination IP Address are same.

REPLY FIFO:

It stores SourceIP/MAC Address to FIFO and transmits ARP REPLY by Hardware.
The information in this FIFO is cleared after TOE sends ARP REPLY.

REG FIFO:

It stores SourceIP/MAC Address + GARP identification to FIFO and asserts interrupt.
Software is expected to check registers (CSFR4*) and update ARP Table.
The information in this FIFO is cleared by writing "1" to CSRF40.arp_ns. At that time if this FIFO has next information, CSRF40.arp_ns is asserted again and CSFR4* are updated to next information.

Storing to REPLY FIFO and REG FIFO is controlled by followings.

Use followings for Enable/Disable Configuration in a lump.

CSFR00.reply_fifo_en.reg_fifo_en

Use followings for Enable/Disable Configuration of individually

CSFR30.arp_self_reply_en
.garp_self_reply_en
.arp_self_int_en
.garp_other_int_en
.garp_self_int_en

When CSFR00.arp_ns_abt_en = “1”, the ARP frame which was stored to REPLY FIFO or REG FIFO is not transferred to DMAC. It is discarded (aborted).

REPLY FIFO and REG FIFO is used as shared FIFO for the function of “Auto Response for Neighbor Solicitation” which is indicated in the chapter of 4.8.2. And the FIFO capacity is for 8 frames.

If TOE received ARP REQ when FIFO was full, its information is not stored to FIFO and the interrupt is asserted to notify the status of by reg_fifo_full or reply_fifo_full. If one-FIFO is already full and TOE receives ARP REQ which is stored to both FIFO, its information is not stored to both FIFO.

Table 31.19 Operation after Received Neighbor Solicitation

	General Operation		TOE Operation		
Neighbor Solicitations	Transmit Neighbor Advertisements	Update Cache	REPLY FIFO	REG FIFO	Remarks Column
Multicast for Local Station Option Type = 1 (SourceIP ≠ All 0)	✓	✓	✓	✓	—
Unicast for Local Station Option Type = 1 (SourceIP ≠ All 0)	✓	✓	✓	✓	—
Unicast for Local Station Option Type ≠ 1 or Nothing (SourceIP ≠ All 0)	✓	×	×	✓	Transmission of Neighbor Advertisements is executed by software via REG_FIFO.
IP Duplicate Detection for Local Station Option Type ≠ 1 or Nothing (SourceIP = All 0)	✓	×	✓	×	Response for IP Duplicate Detection
Other	×	×	×	×	Invalid

REPLY FIFO:

It stores SourceIP/MAC Address + multicast/unicast identification to FIFO and transmits Neighbor Advertisements by Hardware.
The information in this FIFO is cleared after TOE sends Neighbor Advertisements.

REG FIFO:

It stores SourceIP/MAC Address + multicast/unicast identification + OptionType to FIFO and asserts interrupt to CPU. Software is expected handling followings by interrupt status (CSFR4*).

- Updating cache.

- In the case of Unicast for Local Station(Option Type ≠ 1 or Nothing), transmits Neighbor Advertisements after checking Source MAC Address by referencing cache or Neighbor search.

The information in this FIFO is cleared by writing “1” to CSRF40.arp_ns. At that time, if this FIFO has next information, CSRF40.arp_ns is asserted again and CSFR4* are updated to next information.

TOE does not support anycast address. If anycast address is set to CSFR02_i register, TOE behaves same action the case of received unicast address. But the Random Delay Function for responding Neighbor Advertisement which is be defined in RFC2461 is not supported.

Storing to REPLY FIFO and REG FIFO is controlled by followings.

Use followings for Enable/Disable Configuration in a lump.

CSFR00.reply_fifo_en
.reg_fifo_en

Use followings for Enable/Disable Configuration of individually

CSFR30.ns_mul_reply_en
.ns_uni_reply_en
.ns_dup_reply_en
.ns_mul_int_en
.ns_uni_int_en
.ns_uni_nopt_int_en
.ns_dup_int_en

When CSFR00.arp_ns_abt_en = “1”, the Neighbor Solicitation frame which was stored to REPLY FIFO or REG FIFO is not transferred to DMAC. It is discarded (aborted).

REPLY FIFO and REG FIFO is used as shared FIFO for the function of “Auto Response for ARP REQ” which is indicated in the chapter of 4.8.1. And the FIFO capacity is for 8 frames.

If TOE received Neighbor Solicitation when FIFO was full, its information is not stored to FIFO and the interrupt is asserted to notify the status of by reg_fifo_full or reply_fifo_full. If one-FIFO is already full and TOE receives Neighbor Solicitations which is stored to both FIFO, its information is not stored to both FIFO.

31.5.9 Flow Control

Flow control conforming to the IEEE802.3x is possible during full-duplex operation. There are two methods of transmitting PAUSE frames that are used in flow control as given below.

To use this function, configure CCC.FCE and RCR.RFCL of DMAC.

(1) Auto transmission of PAUSE frame (See bit 16 in CXR20)

A PAUSE frame is automatically transmitted by E-MAC when DMAC notifies that the condition of Reception FIFO reached at Critical Level. The value set in the CXR71 parameter settings register is used as the timer value included in the PAUSE frame. After transmitting a PAUSE frame, if the “Reception FIFO Critical Level Notification” from DMAC is not negated by the time that is indicated in the Timer value, the PAUSE frame is sent again. The number of times of transmitting a PAUSE frame can be set from 1 to 65535 in the CXR81 register, and once the upper limit of the transmission count is reached (value set in CXR81), the PAUSE frame is not transmitted thereafter.

However, if the “Reception FIFO Critical Level Notification” from DMAC is negated, the transmission count counter is reset when the next “Reception FIFO Critical Level Notification” from DMAC is asserted and PAUSE frame transmission begins. It is also possible to not define the transmission count upper limit (transmitting for infinite times).

(2) Manual transmission of PAUSE frame (See CXR72)

The PAUSE frame can be transmitted by software instruction. PAUSE frame transmission is started by setting the Timer value in the CXR72 register. In this case, PAUSE frame is transmitted once only (one frame).

(3) PAUSE Timer value (See bits 19 and 20 in CXR20)

Control can be enabled or disabled for the PAUSE frames having PAUSE Timer value 0

a) Operation during transmission
If control is enabled and the “Reception FIFO Critical Level Notification” from DMAC is negated within the time indicated by the Timer value, the PAUSE frame with Timer value 0 is transmitted.
If control is disabled, the PAUSE frame with Timer value 0 is not transmitted.

b) Operation during reception
If control is enabled, a PAUSE frame with Timer value 0 is received and frame transmission waiting is cancelled.
If control is disabled, a PAUSE frame with Timer value 0 is received and the PAUSE frame is discarded.

(4) PAUSE frame reception (See the bit 17 in CXR20)

When a PAUSE frame is received, the next frame transmission is in wait mode till the time which is considered Timer value of PAUSE frame elapses. The transmission of the frame that is being transmitted continues. In addition, the PAUSE frame reception count is counted (See CXR80).

31.5.10 Low Power Idle (LPI)

E-MAC supports the function of Low Power Idle for 1 Gbps/100 Mbps transfer rate. Since LPI function for 10Mbps is not defined in standard*[1], E-MAC also does not support.

Note 1. Specifically, Standard of 10 BASE-Te whose voltage is lower than 10 BASE-T was defined. But a basic specification except about voltage (such as the rule of Code or Media Access Control Operation) is same as 10 BASE-T. (10 BASE-Te is supported by the cable of Cat5 or more)

(1) Output function of Low Power Idle Code (LPI Code)

When E-MAC does not receive any transmission request during over certain period, E-MAC outputs transmission LPI Code to PHY for notifying request to change into Low Power Mode. If E-MAC receives a transmission request (not includes the request for PAUSE frame) while outputting transmission LPI Code, E-MAC changes output Code from transmission LPI Code to Normal Idle Code. Then E-MAC resumes to transmit Frames after waiting certain period (WakeUp time of PHY).

The following time is configurable by register.
- The time from E-MAC does not receive any transmission request to E-MAC starts outputting transmission LPI Code.
- The time from E-MAC received transmission request to E-MAC starts outputting Normal Idle Code.

(2) Receive function of Low Power Idle Code (LPI Code)

When PHY receives a changing request into Low Power Mode from Link Partner, PHY starts outputting reception LPI Code to E-MAC. If E-MAC receives reception LPI Code, E-MAC does not send this Code to TOE. E-MAC outputs Normal Status to TOE same as receiving Normal Idle Code.

(3) Stop function of transmission clock (Only RGMII Mode)

When RGMII interface is used, E-MAC can stop the RGMII transmission clock (TXC) during outputting transmission LPI Code. This function is configurable by register. But the case of MII interface is used, to stop MII transmission clock (TX_CLK) which PHY outputs is prohibited.

(4) Handling function for stopping reception clock (Both RGMII and MII Mode)

E-MAC can accept to stop RGMII and MII reception clock (RXC/RX_CLK) while receiving reception LPI Code. To stop RGMII and MII reception clock (RXC/RX_CLK) is configurable by register of PHY. (See the datasheet of PHY)

[Simplified Full Duplex Mode]

E-MAC supports Simplified Full Duplex Mode which is used for Low Power Idle Function.

In the Full Duplex Mode, when E-MAC receives transmission request from Upper Module (such as DMAC), E-MAC starts transmitting frames without care of PHY status.

But in the Simplified Full Duplex Mode, E-MAC cares the PHY status and does not transmit any frames to PHY during both PHY status is Low Power Idle and PHY is changing status from Low Power Idle to Normal.

To use E-MAC as Simplified Full Duplex Mode, set ‘1’ to DMP bit and LPM bit of CXR20 register after checking Link Partner supports Low Power Idle Mode by Auto Negotiation*[1].

Note 1. Check PHY and Link Partner support Low Power Idle Mode before setting E-MAC as Low Power Idle Mode. And for the function of Low Power Idle Mode, registers area of PHY was expanded. Therefore, to use Low

Power Idle Mode, software has to be changed for the function of accessing PHY registers, PHY Auto Negotiation and initial setting of E-MAC.

31.5.11 Control of Reference Clock for Ethernet

Gigabit Ethernet Interface IP has a function to notify the status that whether Gigabit Ethernet Interface needs Reference Clock for Ethernet “clk_miitx_gtx_refclk” or not by “ref_clk_stop_en”. And this condition also is notified to CPU by interrupt signal “pif_int_n” (Case of interrupt is indicated on TIS.RCSRF and ISS.RCSRM).

This function is only enabled when the configurations of Gigabit Ethernet Interface are matched following all conditions.

- RGMII is selected as PHY IF.
- This function is enabled by register configuration. (CCC.ERCS = 1)
- E-MAC is configured as LowPowerMode. (CXR20.LPM = 1), Duplex = Full and TransmitSpeed = 1000 M/100 Mbps.

Figure 31.42 is a block diagram of this function.

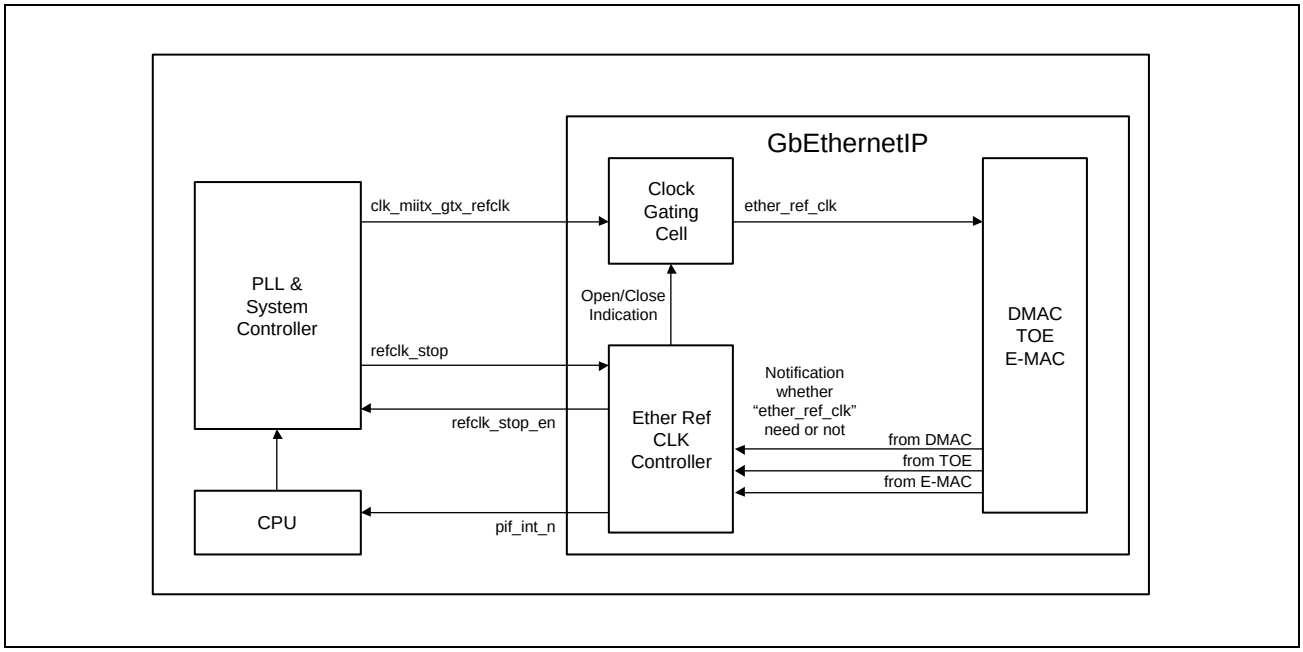

Figure 31.42 Block Diagram

As showing **Figure 31.42**, Gigabit Ethernet Interface has an “Ether Ref CLK Controller” which controls “ref_clk_stop_en”, “pif_int_n” and Open/Close Operation of Internal Clock Gating Cell for “clk_miitx_gtx_refclk”.

The state of Open/Close Operation of Internal Clock Gating Cell is indicated on CSR.RCSI.

NOTE

Whenever “pif_int_n” is asserted by this function, CPU has to instruct PLL & System Controller to stop “clk_miitx_gtx_refclk”.

31.5.11.1 Stop Procedure of Reference Clock for Ethernet

Stop procedure of “clk_miitx_gtx_refclk” is executed by following steps.

1. When DMAC and TOE do not have any Transmission Frames, they do not need “clk_miitx_gtx_refclk” anymore. So, they notify that status to Ether Ref CLK Controller.
2. After outputting Transmission LPI Code during configured time at LPTXG(M)TH4, E-MAC does not need “clk_miitx_gtx_refclk” anymore, So, it notifies that status to Ether Ref CLK Controller.
3. When Ether Ref CLK Controller is received the status that all of DMAC/TOE/E-MAC don’t need “clk_miitx_gtx_refclk” anymore, it asserts “ref_clk_stop_en” to notify about this condition to ETH_PLL & System Controller. Then Gigabit Ethernet Interface closes an internal Clock Gating Cell for “clk_miitx_gtx_refclk” and asserts “pif_int_n” to indicate this condition to CPU.
4. CPU instructs ETH_PLL & System Controller to stop “clk_miitx_gtx_refclk” and writes “0” to TIS.RCSRF to clears “pif_int_n”.
5. After PLL is stopped completely, ETH_PLL & System Controller asserts “ref_clk_stop” notifying PLL status to Ether Ref CLK Controller.

Figure 31.43 is a sequence of stopping “clk_miitx_gtx_refclk”.

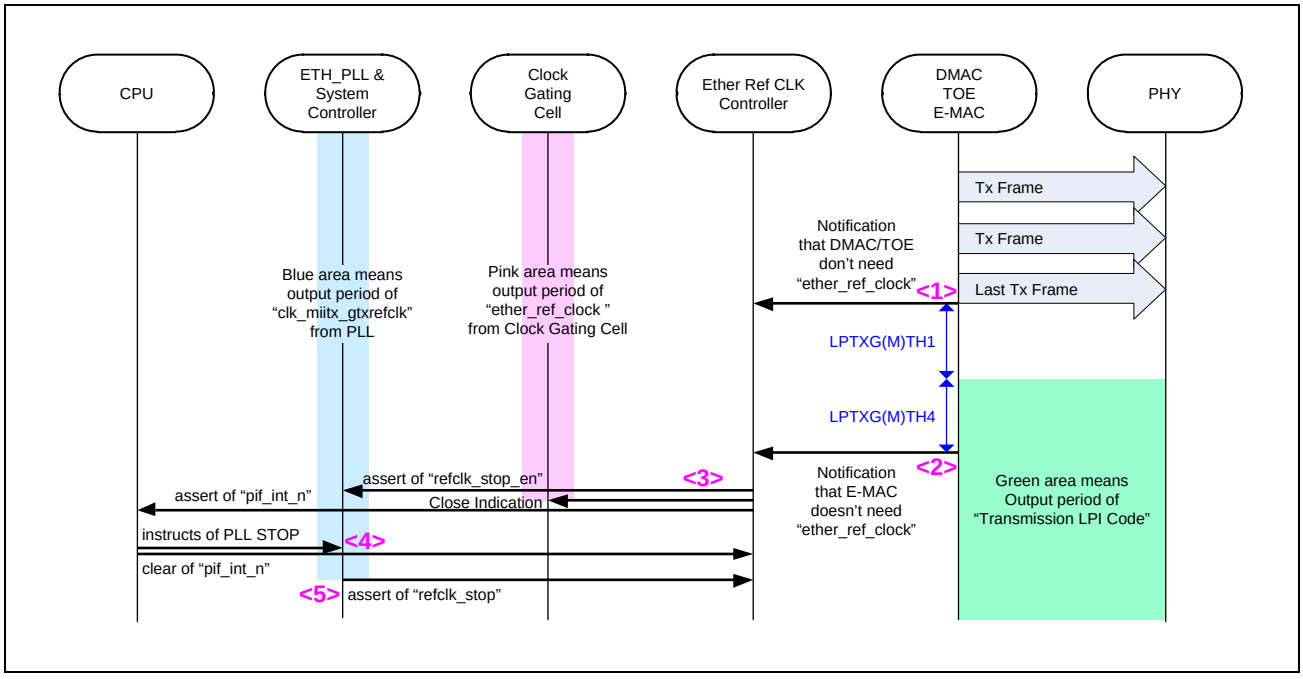

Figure 31.43 Sequence of stopping “clk_miitx_gtx_refclk”

31.5.11.2 Resume Procedure of Reference Clock for Ethernet

Resume procedure of “clk_miitx_gtx_refclk” is executed by following steps.

[Case1] Gigabit Ethernet Interface receives indication from CPU restarting transmission operation.

1. CPU indicates restarting transmitting operation to DMAC.
2. DMAC fetches a new transmission descriptor and gets a Transmission Frame from external Memory. Then, it notifies to Ether Ref CLK Controller that it needs “clk_miitx_gtx_refclk” for transmitting operation.
3. After Ether Ref CLK Controller is notified from DMAC that DMAC needs “clk_miitx_gtx_refclk”, it de-asserts “ref_clk_stop_en” to notify ETH_PLL & System Controller that Gigabit Ethernet Interface needs restart of PLL.
4. ETH_PLL & System Controller tries to restart PLL. After “clk_miitx_gtx_refclk” is resumed completely, it de-asserts “ref_clk_stop” to notify Ether Ref CLK Controller about PLL status.
5. By the change of “ref_clk_stop” from assert to de-assert, Ether Ref CLK Controller opens the internal Clock Gating Cell for ”clk_miitx_gtx_refclk”.
6. Since providing clock is resumed, Transmitting Function of DMAC/TOE/E-MAC is also resumed. Then, E-MAC outputs a Transmission Frame to PHY after outputting IDLE Code during the time which is configured at LPTXG(M)TH3 register.

Figure 31.44 is a sequence of resuming “clk_miitx_gtx_refclk” of Case1.

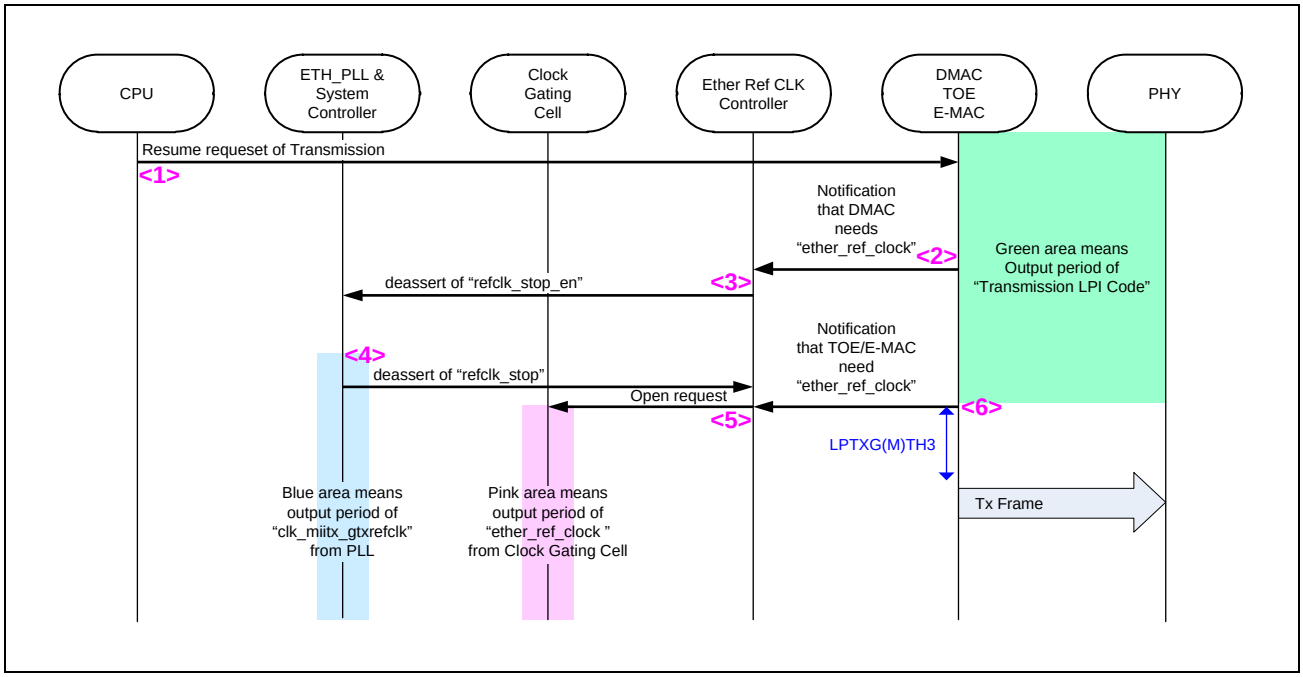

Figure 31.44 Sequence of resuming “clk_miitx_gtx_refclk” of Case1

[Case2] Gigabit Ethernet Interface receives a frame which needs to Automatic Response by H/W.

For about the function of Automatic Response by H/W, see **Section 31.5.8, Auto Response**.

1. Received a frame which needs to Automatic Response by H/W from PHY.
2. After received the frame, TOE notifies to Ether Ref CLK Controller that it needs “clk_miitx_gtx_refclk” for transmitting operation.
3. After Ether Ref CLK Controller is notified from TOE that TOE needs “clk_miitx_gtx_refclk”, it deasserts “ref_clk_stop_en” to notify ETH_PLL & System Controller that Gigabit Ethernet Interface needs restart of PLL.
4. ETH_PLL & System Controller tries to restart PLL. After “clk_miitx_gtx_refclk” is resumed completely, it de-asserts “ref_clk_stop” to notify Ether Ref CLK Controller about PLL status.
5. By the change of “ref_clk_stop” from assert to de-assert, Ether Ref CLK Controller opens the internal Clock Gating Cell for ”clk_miitx_gtx_refclk”.
6. Since providing clock is resumed, Transmitting Function of DMAC/TOE/E-MAC is also resumed. Then, E-MAC outputs an Automatic Response Frame to PHY after outputting IDLE Code during the time which is configured at LPTXG(M)TH3 register.

Figure 31.45 is a sequence of resuming “clk_miitx_gtx_refclk” of Case2.

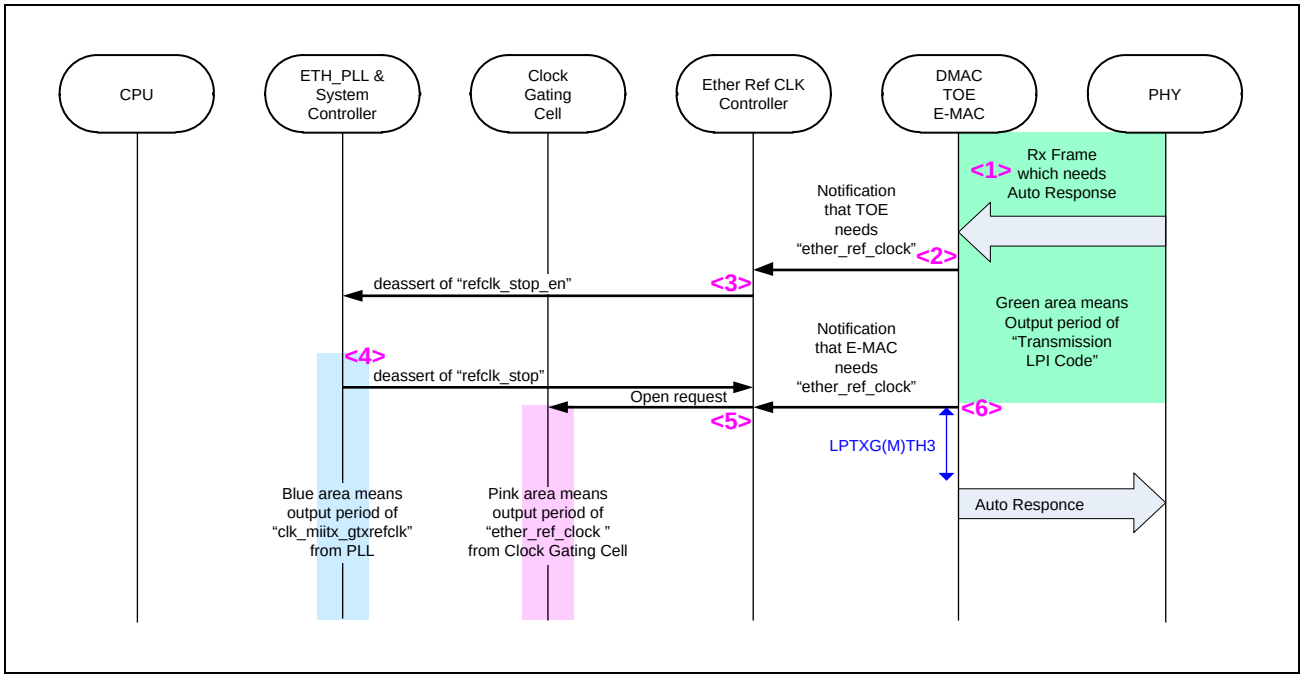

Figure 31.45 Sequence of resuming “clk_miitx_gtx_refclk” of Case2

31.5.12 Interrupts

The DMAC related interrupts include descriptor interrupts, error interrupts, reception interrupts and transmission interrupts. The states of a DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt summary bit in the error interrupt status register (EIS.QFS). This reduces the load on the CPU.

31.5.12.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupts in the receive interrupt status register 0 (RIS0.FRF)
- Descriptor processed interrupts in the receive interrupt status register 3 (RIS3.RDPF)
- Frame transmitted interrupts in the transmit interrupt status register (TIS.FTF)
- Descriptor processed interrupts in the transmit interrupt status register (TIS.TDPF)
- Descriptor processed interrupts in the descriptor interrupt status register (DIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt flag bits in the interrupt summary status register (ISS.DPMi) or the Reception FIFO warning interrupt summary bit (ISS.RFWM).

31.5.12.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Queue error interrupt in the error interrupt status register (EIS.QEF)
- E-MAC and TOE transmission/reception error interrupts in the error interrupt status register (EIS.MTEF, EIS.MREF, EIS.MFFF, EIS.MFFF2)
- Reception FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupts in the receive interrupt status register 2 (RIS2.QFF0)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.EM, ISS.MFWM2, ISS.MFUM2).

31.5.12.3 Other Management Interrupts

The other management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

- Reception FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

- MAC Status FIFO/FIFO2 Warning Flag (TIS.MFWF/TIS.MFWF2)
- MAC status FIFO/FIFO2 Updated Flag (TIS.MFUF/TIS.MFUF2)
- Reference Clock Stop Req Flag (TIS.RCSRF)

The general error interrupt state can be checked by reading the Reception FIFO warning error interrupt status bit in the interrupt summary status register (ISS.RFWM).

31.5.12.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

- PAUSE Frame Retry Interrupt in the E-MAC status register (CXR21.PFRI)
- PHY Interrupt in the E-MAC status register (CXR21.PHYI)
- LINK Interrupt in the E-MAC status register (CXR21.LINKI)
- False Carrier Interrupt in the E-MAC status register (CXR21.FCI)

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MM).

31.5.12.5 TOE Interrupt

The TOE interrupt is issued when the TOE interrupt source is generated.

- Wake Up interrupt in the TOE register (CSFR20)
- ARPREQ/Neighbor Solicitation Receive interrupt in the TOE register (CSFR40, CSFR42_*, CSFR43_*)

31.5.12.6 Interrupt

Table 31.20, **Table 31.21**, and **Table 31.22** shows interrupt for each interrupt status bit. Interrupts of DMAC and E-MAC are merged into the “pif_int_n” of output port. TOE has two independent output ports “int_fil_n” and “int_arp_ns_n”.

Table 31.20 Interrupt of DMAC

Interrupt trigger	Interrupt flag bit	Interrupt enable bit	Interrupt (Output port)
The descriptor in a reception or transmit queue has been processed where DESCR.DIE is i	DIS.DPFi (i = 1 to 15)	DIC.DPEi = 1	pif_int_n
In receive queue a frame is stored, and data is available to be processed by CPU.	RIS0.FRF	RIC0.FRE = 1	
The descriptor in reception queue has been processed where DESCR.DIE is 0001b.	RIS3.RDPF	RIC3.RDPE = 1 & CIE.CRIE = 1	
The descriptor in transmit queue has been processed where DESCR.DIE is 0001b.	TIS.TDPF	TIC.TDPE = 1 & CIE.CTIE = 1	
A frame is transmitted from transmit queue.	TIS.FTF	TIC.FTE = 1	
An error has been detected while processing receive or transmit queue.	EIS.QEF	EIC.QEE = 1	
The E-MAC has detected a fault during transmission.	EIS.MTEF	EIC.MTEE = 1	
The E-MAC has detected a fault during reception.	EIS.MREF	EIC.MREE = 1	
The MAC status FIFO2 is full.	EIS.MFFF2	EIC.MFFE2 = 1	
The MAC status FIFO is full.	EIS.MFFF	EIC.MFFE = 1	
A received frame was not completely stored in the Reception FIFO.	RIS2.RFFF	RIC2.RFFE = 1	
No sufficient space in receive queue to store completely a received frame.	RIS2.QFF0	RIC2.QFE = 1	
The Reception FIFO has reached warning level.	RIS1.RFWF	RIC1.RFWE = 1	
The MAC status FIFO has been reached warning level.	TIS.MFWF	TIC.MFWE = 1	
The MAC status FIFO has been updated.	TIS.MFUF	TIC.MFUE = 1	
The MAC status FIFO2 has been reached warning level.	TIS.MFWF2	TIC.MFWE2 = 1	
The MAC status FIFO2 has been updated.	TIS.MFUF2	TIC.MFUE2 = 1	
Reference Clock Stop Request has been notified	TIS.RCSRF	TIC.RCSRE = 1	

Table 31.21 Interrupt of E-MAC

Interrupt trigger	Interrupt flag bit	Interrupt enable bit	Interrupt (Output port)
PAUSE Frame Retry reached to threshold.	CXR21.PFRI	CXR22.PFRIM	pif_int_n
PHY Interrupt is detected.	CXR21.PHYI	CXR22.PHYIM	
LINK status change is detected.	CXR21.LINKI	CXR22.LINKIM	
False Carrier is detected.	CXR21.FCI	CXR22.FCIM	

Table 31.22 Interrupt of TOE

Interrupt trigger	Interrupt flag bit	Interrupt mask bit	Interrupt main enable bit	Interrupt (Output port)
Transmit Rx Frame to DMAC	CSFR20.trs_dmac	CSFR21. trs_dmac_m	—	int_fil_n
Reception of IEEE Length Frames.	CSFR20.ieee_len	CSFR21. ieee_len_m	—	
Reception of Invalid Neighbor Solicitations.	CSFR20.ns_dis	CSFR21.ns_dis_m	—	
Reception of IP Duplicate Detection Neighbor Solicitations.	CSFR20.ns_dup	CSFR21.ns_dup_m	—	
Reception of unicast Neighbor Solicitations. (Except “Option Type=1” or No “Option Type”)	CSFR20.ns_uni_nopt	CSFR21.ns_uni_nopt_m	—	
Reception of unicast Neighbor Solicitations. (“Option Type=1”)	CSFR20.ns_uni	CSFR21.ns_uni_m	—	
Reception of multicast Neighbor Solicitations.	CSFR20.ns_mul	CSFR21.ns_mul_m	—	
Reception of Un-analyzable Frames.	CSFR20.ana_stp	CSFR21.ana_stp_m	—	
Reception of Un-analyzable IPv6 Protocol No.	CSFR20.v6_ana_protocol	CSFR21.v6_ana_protocol_m	—	
Reception of ARP (Except ARP REQ).	CSFR20.arp_noreq	CSFR21.arp_noreq_m	—	
Reception of GARP REQ for Local Station.	CSFR20.garp_self	CSFR21.garp_self_m	—	
Reception of GARP REQ for Other Station.	CSFR20.garp_other	CSFR21.garp_other_m	—	
Reception of ARP REQ for Local Station.	CSFR20.arp_self	CSFR21.arp_self_m	—	
Reception of ARP REQ for Other Station.	CSFR20.arp_other	CSFR21.arp_other_m	—	
Match of IPv6 UDP Port No.	CSFR20.v6_udp_pt	CSFR21.v6_udp_pt_m	—	
Match of IPv4 UDP Port No.	CSFR20.v4_udp_pt	CSFR21.v4_udp_pt_m	—	
Match of IPv6 Protocol No.	CSFR20.v6_protocol	CSFR21.v6_protocol_m	—	
Match of IPv4 Protocol No.	CSFR20.v4_protocol	CSFR21.v4_protocol_m	—	
Match of Ether Type.	CSFR20.type	CSFR21.type_m	—	
Match of Multicast MAC DA.	CSFR20.mac_da_mul	CSFR21.mac_da_mul_m	—	
Match of Broadcast MAC DA.	CSFR20.mac_da_bro	CSFR21.mac_da_bro_m	—	
Match of Unicast MAC DA.	CSFR20.mac_da_uni	CSFR21.mac_da_uni_m	—	
REPLY_FIFO is full.	CSFR40.reply_fifo_full	CSFR41.reply_fifo_full_m	CSFR00.reply_fifo enable & at least one CSFR30.xx_reply_en	int_arp_ns_n
REG_FIFO is full.	CSFR40.reg_fifo_full	CSFR41.reg_fifo_full_m	CSFR00.reg_fifo_en & at least one CSFR30.xx_int_en	
Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO.	CSFR40.arp_ns	CSFR41.arp_ns_m	CSFR00.reg_fifo_en & at least one CSFR30.xx_int_en	

31.5.13 Configuration Procedure

The following are Configuration Procedures. The meaning of “X” in Write Value, set the appropriate value to each bit for your system.

31.5.13.1 Set Up Procedure

Check the Configuration of Other Station by using Auto Negotiation Function of PHY before setting Transfer Rate (1 Gbps/100 Mbps/10 Mbps), Duplex Mode (Half or Full), Low Power Mode and Flow Control to E-MAC registers.

Action		Address	Write Value	Description
Hardware Reset				
↓				
DMAC.CSR	Read	H’00C	—	Check the read value is same as “H’0000_0001” (Reset Mode).
↓				
DMAC.CCC	Write	H’000	H’0000_0001	Set “Config Mode”
↓				
DMAC.CSR	Read	H’00C	—	Check the read value is same as “H’0000_0002” (Config Mode).
↓				
E-MAC Initial Configuration (Not necessary to change other E-MAC registers)				
E-MAC.CXR35	Write	H’540	H’XXXX_XXXX	Set the appropriate value for your system. And wait the double of your configuration value to this register.
E-MAC.CXR31	Write	H’530	H’0000_000X	Set the appropriate value for your system. (Only if In-Band Status of RGMII will be used)
E-MAC.CXR2C	Write	H’52C	H’0000_000X	Set the appropriate value for your system.
E-MAC.CXR2A	Write	H’508	H’0000_2000	Set Max Frame size as 8 KB.
E-MAC.CXR71	Write	H’554	H’0000_XXXX	Set the appropriate value for your system. (Only if Flow Control Function will be used)
E-MAC.CXR24	Write	H’5C0	H’XXXX_XXXX	Set the appropriate value for your system.
E-MAC.CXR25	Write	H’5C8	H’0000_XXXX	Set the appropriate value for your system.
E-MAC.CXR21	Write	H’510	H’0000_001F	Clear all Interrupt.
E-MAC.CXR22	Write	H’518	H’0000_000X	Set the appropriate value for your system.
E-MAC.CXR2D	Write	H’5B0	H’0000_00X0	Set the appropriate value for your system. (Only if In-Band Status of RGMII will not be used)
E-MAC.CXR2G	Write	H’5BC	H’0000_000X	Set the appropriate value for your system. (Only if Software LINK will not be used)
↓				
TOE Initial Configuration (Not necessary to change other TOE registers).				
TOE.CSR1	Write	H’804	H’0XX0_00XX	Set the appropriate value for your system.
TOE.CSR2	Write	H’808	H’0XX0_00XX	Set the appropriate value for your system.
TOE.CSFR01	Write	H’844	H’XXXX_XXXX	Set the appropriate value for your system.
TOE.CSFR02_i	Write	H’848+4*i	H’XXXX_XXXX	Set the appropriate value for your system. (i = 0 to 3)
TOE.CSFR03_U	Write	H’858	H’0000_XXXX	Set the appropriate value for your system.
TOE.CSFR03_L	Write	H’85C	H’XXXX_XXXX	Set the appropriate value for your system.
TOE.CSFR10_i	Write	H’870+4*i	H’XXXX_XXXX	Set the appropriate value for your system. (i = 0 to 3)
TOE.CSFR10	Write	H’880	H’0000_00XX	Set the appropriate value for your system.
TOE.CSFR11_i	Write	H’884+4*i	H’XXXX_XXXX	Set the appropriate value for your system. (i = 0 to 3)
TOE.CSFR11	Write	H’894	H’0000_XXXX	Set the appropriate value for your system.
TOE.CSFR12_i	Write	H’898+4*i	H’XXXX_XXXX	Set the appropriate value for your system. (i = 0 to 11)
TOE.CSFR12	Write	H’8C8	H’00XX_XXXX	Set the appropriate value for your system.
TOE.CSFR13_U	Write	H’8CC	H’0000_XXXX	Set the appropriate value for your system.

Action		Address	Write Value	Description
TOE.CSFR13_L	Write	H'8D0	H'XXXX_XXXX	Set the appropriate value for your system.
TOE.CSFR14_U	Write	H'8D4	H'0000_XXXX	Set the appropriate value for your system.
TOE.CSFR14_L	Write	H'8D8	H'XXXX_XXXX	Set the appropriate value for your system.
TOE.CSFR15_U_i	Write	H'8DC+8*i	H'0000_XXXX	Set the appropriate value for your system. (i = 0 to 19)
TOE.CSFR15_L_i	Write	H'8E0+8*i	H'XXXX_XXXX	Set the appropriate value for your system. (i = 0 to 19)
TOE.CSFR15	Write	H'97C	H'XX0X_XXXX	Set the appropriate value for your system.
TOE.CSFR20	Write	H'9A0	H'000F_FFFF	Clear all Interrupt.
TOE.CSFR21	Write	H'9A4	H'000X_XXXX	Set the appropriate value for your system.
TOE.CSFR30	Write	H'9B0	H'000X_XXXX	Set the appropriate value for your system.
TOE.CSFR31	Write	H'9B4	H'XX0X_XXXX	Set the appropriate value for your system.
TOE.CSFR00	Write	H'840	H'10XX_XXXX	Enable the appropriate Filter Function for your system. Disable of Auto Response Function.
↓				
DMAC Initial Configuration (Not necessary to change other DMAC registers).				
DMAC.DBAT	Write	H'004	H'XXXX_XXXX	Set the appropriate value for your system.
DMAC.RCR	Write	H'090	H'XXXX_000X	Set the appropriate value for your system.
DMAC.RTC	Write	H'0B4	H'0000_2000	Set Max Reception Frame size as 8 KB.
DMAC.CIE	Write	H'384	H'0000_0X0X	Set the appropriate value for your system.
DMAC.DIE	Write	H'450	H'0000_XXXX	Set the appropriate value for your system.
DMAC.EIE	Write	H'458	H'0000_0X0X	Set the appropriate value for your system.
DMAC.RIE0	Write	H'460	H'0000_000X	Set the appropriate value for your system.
DMAC.RIE1	Write	H'468	H'X000_0000	Set the appropriate value for your system.
DMAC.RIE2	Write	H'470	H'X000_000X	Set the appropriate value for your system.
DMAC.TIE	Write	H'478	H'000X_XX0X	Set the appropriate value for your system.
DMAC.RIE3	Write	H'488	H'0000_000X	Set the appropriate value for your system.
↓				
DMAC.CCC	Write	H'000	H'0X0X_0002	Set bit [1:0] = "10b" (Operation Mode) and bit25 (FCE)/bit18 (ERCS) = "the appropriate value for your system".
↓				
TOE.CSR0	Write	H'800	H'0000_0030	Set TPE and RPE = "1" and TOE FIFO=2 KB.
↓				
E-MAC.CXR20	Write	H'500	H'0XXX_XXXX	Set the appropriate value for your system. (The following are example)
			H'0203_0061	Rx CRC PassThrough, PAUSE, TPE and RPE = '1', Half Duplex (for 100 Mbps/10 Mbps), Promiscuous.
			H'0203_0063	Rx CRC PassThrough, PAUSE, TPE/RPE = '1', Full Duplex (for 10 Mbps), Promiscuous.
			H'0203_0073	Rx CRC PassThrough, PAUSE, TPE/RPE = '1', Simplified Full Duplex (for 1 Gbps/100 Mbps), Promiscuous.
↓				
DMAC.TCCR	Write	H'304	H'000X_0001	Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system".

31.5.13.2 System Mode Change Procedure (Normal -> Network Standby)

Action		Address	Write Value	Description
DMAC.TCCR	Read	H'304	—	Wait until bit0 (TSRQ) will be "0".
↓				
DMAC.CSR	Read	H'00C	—	Wait until bit16 (TPO) and bit20 (RPO) will be "0".
↓				
DMAC.CCC	Write	H'000	H'0X0X_0202	Set bit9 (RDFD) = "1" to stop fetch of Rx Descriptor. Not necessary to change other bits.
↓				
DMAC.CSR	Read	H'00C		Wait until bit9 (RDFDM) will be "1" and re-check bit20 (RPO) is "0".*1
↓				
TOE Configuration to enable Auto Response Function (Not necessary to change other registers)				
TOE.CSFR40	Write	H'9C0	H'0000_0007	Clear all Interrupt.
TOE.CSFR41	Write	H'9C4	H'0000_000X	Set the appropriate value for your system.
TOE.CSFR00	Write	H'840	H'1XXX_XXXX	Enable of the appropriate Auto Response Function for your system. Not necessary to change Filter Function.
↓				
Change System Mode from "Normal" to "Network Standby".				
↓				
Set Tx Descriptor and Tx Frame at Internal SRAM				
↓				
DMAC.DBAT	Write	H'004	H'XXXX_XXXX	Set the appropriate value for your system.
↓				
DMAC.DLR	Write	H'008	H'003F_FFFF	Set bit0 and bit4 = "1" loading DBAT to Tx and Rx queue.
↓				
DMAC.TCCR	Write	H'304	H'000X_0001	Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system".

Note 1. If bit9 (RDFDM) is "0" and bit20 (RPO) is "0", wait bit9 (RDFDM) will be "1" without accessing other registers.
If bit9 (RDFDM) is "1" and bit20 (RPO) is "0", the DMA transfer and fetch of Rx Descriptor have stopped.
So go to next step.
If bit9 (RDFDM) is "0" and bit20 (RPO) is "1", wait bit9 (RDFDM) will be "1" without accessing other registers.
If bit9 (RDFDM) is "1" and bit20 (RPO) is "1", the Reception Frame was stored to Reception FIFO.
So software has to cancel changing System mode. Set DMAC.CCC. bit9 (RDFD) = "0" immediately to resume fetch of Rx Descriptor.

31.5.13.3 System Mode Change Procedure (Network Standby -> Normal)

Action		Address	Write Value	Description
TOE.CSFR00	Write	H'840	H'10XX_XXXX	Disable of the Auto Response Function. Not necessary to change Filter Function.
↓				
DMAC.TCCR	Read	H'304	—	Wait until bit0 (TSRQ) will be "0".
↓				
DMAC.CSR	Read	H'00C	—	Wait until bit16 (TPO) will be "0".
↓				
Change System Mode from "Network Standby" to "Normal".				
↓				
Set Rx/Tx Descriptor and Tx Frame at External SDRAM.				
↓				
DMAC.DBAT	Write	H'004	H'XXXX_XXXX	Set the appropriate value for your system.
↓				
DMAC.DLR	Write	H'008	H'003F_FFFF	Load DBAT to Tx and Rx queue.
↓				
DMAC.CCC	Write	H'000	H'0X0X_0002	Set "bit9 (RDFD) = 0" to start Rx DMA Transfer for Rx Frame. Not necessary to change other bits.
↓				
DMAC.TCCR	Write	H'304	H'000X_0001	Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system".

31.5.13.4 Stop Procedure

Action		Address	Write Value	Description
Make “EOS” in the Tx Descriptor chain and wait until it is used. (Wait the interrupt of DIS.DPFi of this EOS Descriptor.)				
↓				
E-MAC.CXR20	Write	H’500	H’0XXX_XXXX	Set bit6 (RPE) = “0” to stop Rx Function of E-MAC. Not necessary to change other bits.
↓				
Wait following time depending on the Transfer speed mode. (Waiting time that the last Rx Frame is stored to Reception FIFO and the last Tx Frame is transmitted to PHY) • 1 Gbps : Wait 70 µs • 100 Mbps : Wait 700 µs • 10 Mbps : Wait 7 ms				
↓				
DMAC.CSR	Read	H’00C	—	Wait until bit20 (RPO) will be “0” (Wait Reception FIFO will be empty)
↓				
DMAC.CCC	Write	H’000	H’0X0X_0102	Set bit8 (DTSR) = “1” to stop URAM access. Not necessary to change other bits.
↓				
DMAC.CSR	Read	H’00C	—	Wait until bit8 (DTS) will be “1” (URAM access is stopping)
↓				
TOE.CSR0	Write	H’800	H’0000_0000	Set bit5 (RPE) = “0” and bit4 (TPE) = “0” to stop Rx and Tx Function of TOE. Not necessary to change other bits.
↓				
TOE.CSR0	Read	H’800	—	Wait until bit5 (RPE) and bit4 (TPE) will be “0”
↓				
E-MAC.CXR20	Write	H’500	H’0XXX_XXXX	Set bit5 (TPE) = “0” to stop Tx Function of E-MAC. Not necessary to change other bits.
↓				
E-MAC.CXR20	Read	H’500	—	Wait until bit6 (RPE) and bit5 (TPE) will be “0”
↓				
DMAC.CCC	Write	H’000	H’0X0X_0001	Set bit [1:0] = “01b” (Config Mode) and bit8 (DTSR) = “0”

Note: If the system needs software reset, set DMAC.CCC bit [1:0] = “00b” to be RESET Mode after “Stop Procedure” and retry “Set up Procedure”.

31.5.14 Connection to PHY-LSI

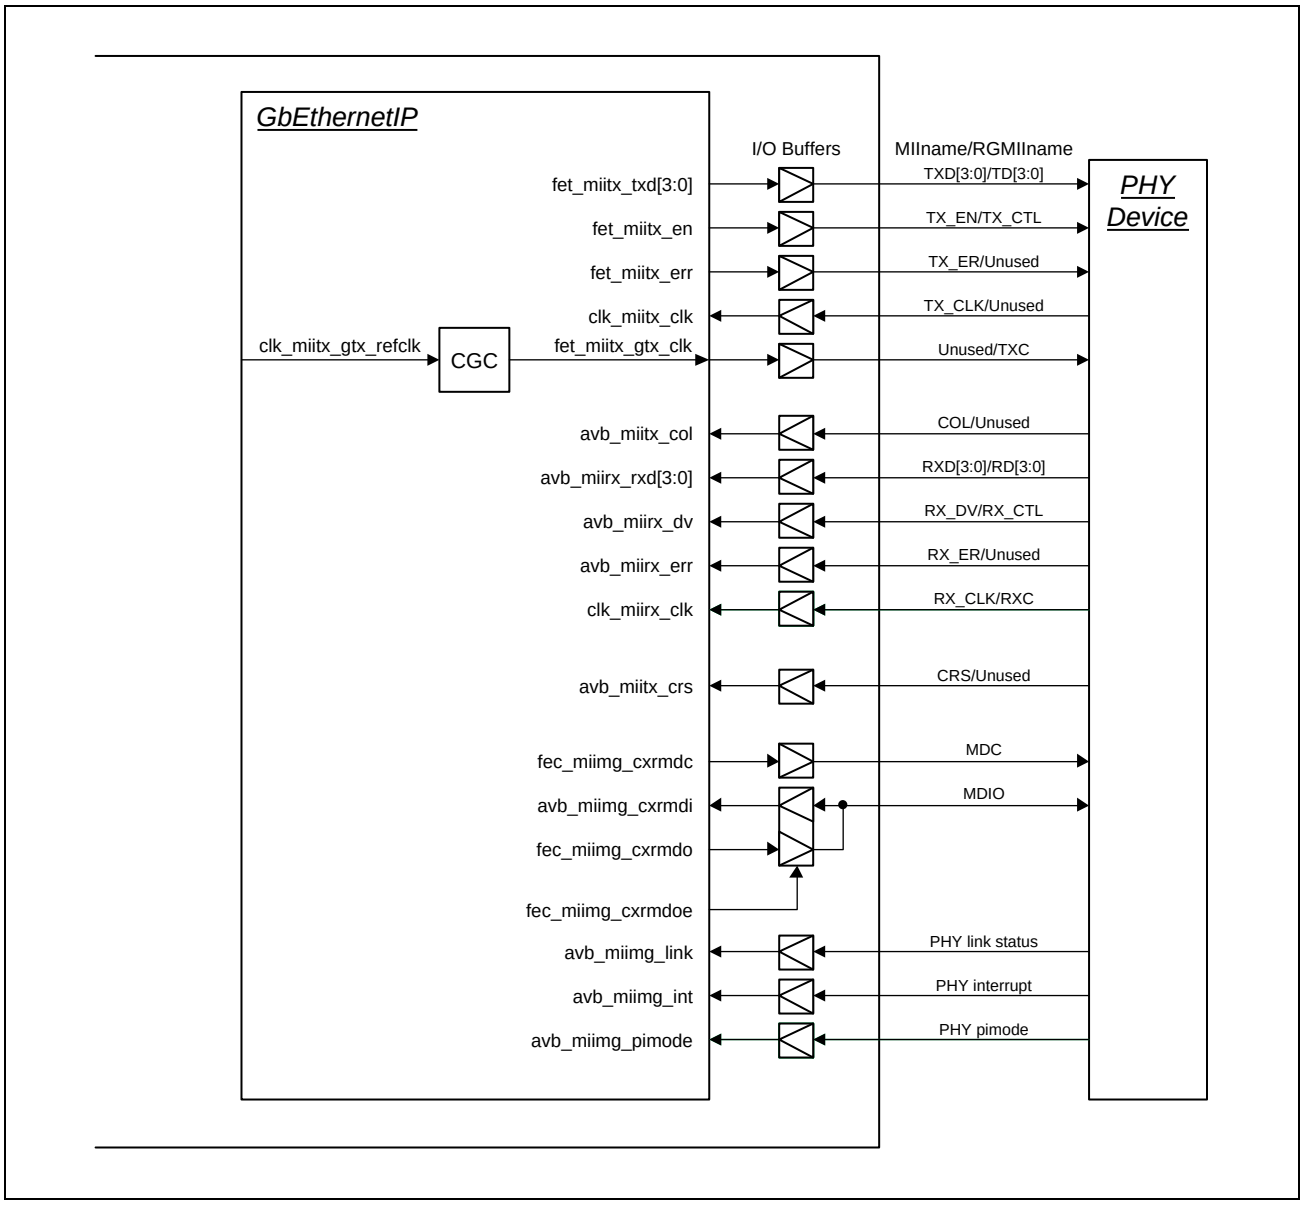

Figure 31.46 Connection to PHY-LSI

31.5.14.1 RGMII Frame Transmission/Reception Timing

Each RGMII frame transmission/reception timing is shown in **Figure 31.47** and **Figure 31.48**.

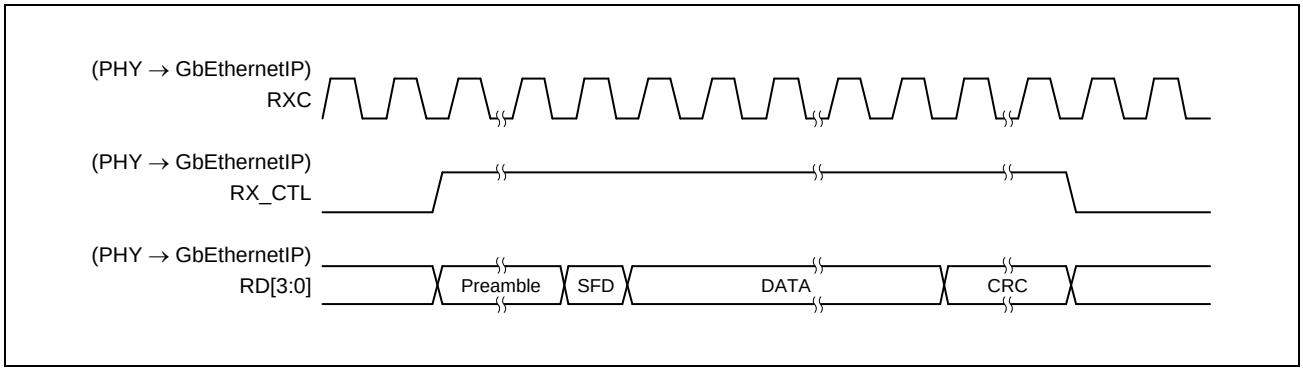

Figure 31.47 Normal Frame Reception Time Chart (RGMII)

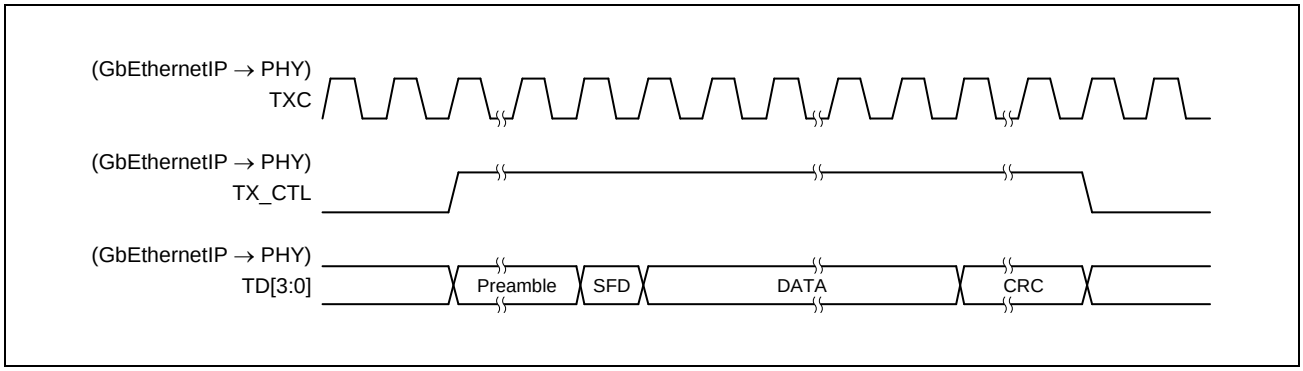

Figure 31.48 Normal Frame Transmission Time Chart (RGMII)

31.5.14.2 MII Frame Reception Timing

Each MII frame transmission/reception timing is shown in **Figure 31.49** and **Figure 31.50**.

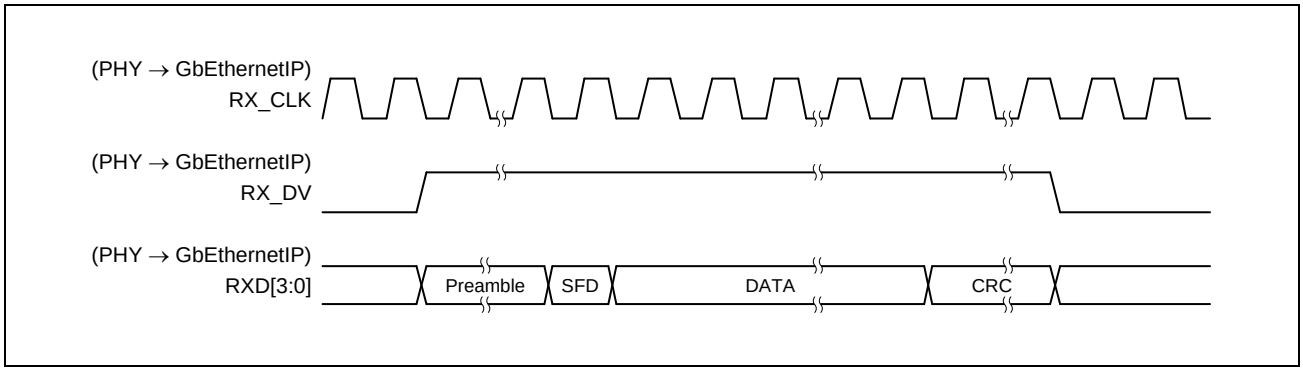

Figure 31.49 Normal Frame Reception Time Chart (MII)

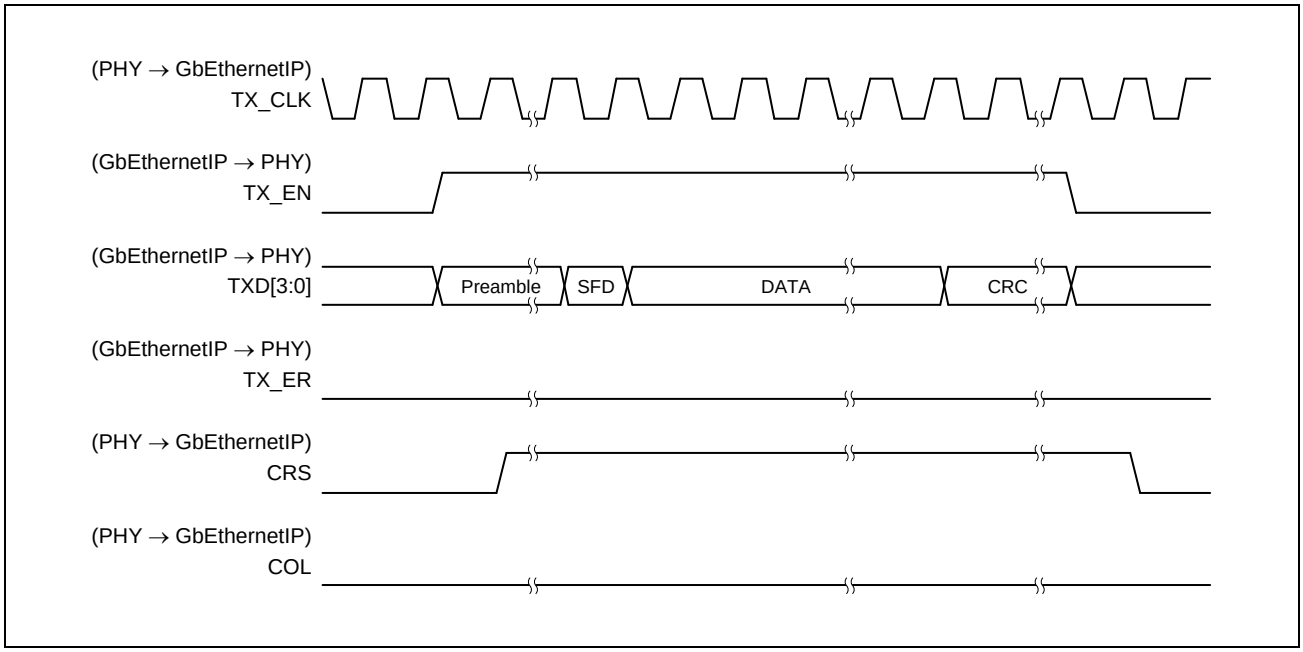

Figure 31.50 Normal Frame Transmission Time Chart (MII)

31.5.14.3 Accessing PHY Registers

There are two methods to access the PHY register: using the E-MAC-MDIOC block and using the CXR23 register.

Which access method to be used can be set using the MDIOMOD register.

(1) PHY Register Access Method (using MDIOC)

To access the PHY register from MDIOC, the SEL_MDIO bit in MDIOMOD register must be set to 0.

The following commands can be used for indirect access using MDIOC.

Table 31.23 List of MDIOC Commands

Command	OP code	Address	Data	Description
WRITE	“01”	A [9:0]	D [15:0]	Write PHY register
READ	“10”	A [9:0]	D [15:0]	Read PHY register

PHY Register Write Access Procedure (Using MDIOC)

The write access procedure for PHY register is given below.

(1) Read MDIOSTS register and confirm that BSY bit = 0.

(2) Set PHY address as (A [9:5]) and register address as (A [4:0]) in MDIOADR register.

(3) Set write data in MDIODAT register.

(4) Set OP field of MDIOCMD register to “01”.
{Here, the hardware sets BSY bit in MDIOSTS register to 1.}

(5) Read MDIOSTS register and wait till BSY bit = 0. After BSY becomes 0, write access is complete.
{After write access to PHY register completes, the BSY bit in MDIOSTS register is cleared to 0 by hardware.}

PHY Register Read Access Procedure (Using MDIOC)

The read access procedure for PHY Register is given below.

(1) Read MDIOSTS register and confirm that BSY bit = 0.

(2) Set PHY address as (A [9:5]) and register address as (A [4:0]) in MDIOADR register.

(3) Set OP field of MDIOCMD register to “10”.
{Here, the hardware sets BSY bit in MDIOSTS register to 1.}

(4) Read MDIOSTS register and wait till BSY bit = 0.
{After read access from PHY register completes and read data becomes available in MDIODAT register, hardware clears BSY bit in MDIOSTS register is cleared to 0 by hardware.}

(5) When the BSY bit in MDIOSTS register is cleared to 0, read data is acquired from MDIODAT register and access is complete.

(2) PHY Register Access Method (Using CXR23)

To access PHY register using CXR23 register, SEL_MDIO bit of MDIOMOD register must be set to 1. (The initial value can be used as is.)

PHY access using CXR23 is done by controlling High and Low of MDC and MDIO signals for every cycle. The relationship between CXR23 register access and MDC and MDIO signals is shown below.

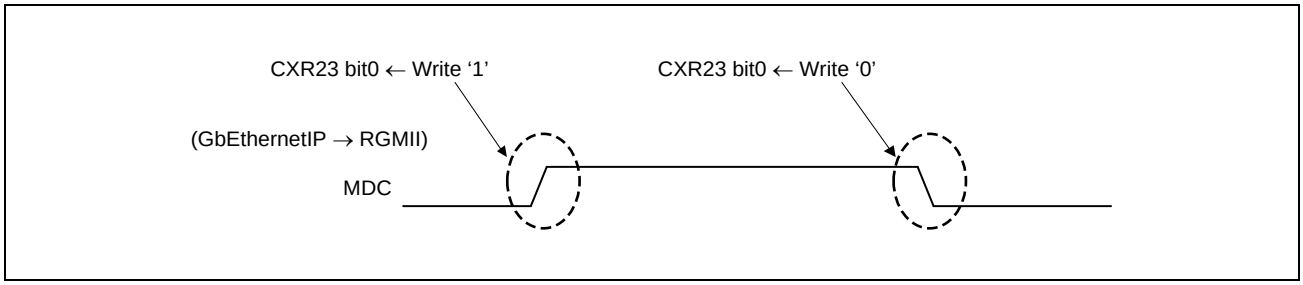

Figure 31.51 Relationship between CXR23 Write and MDC signal

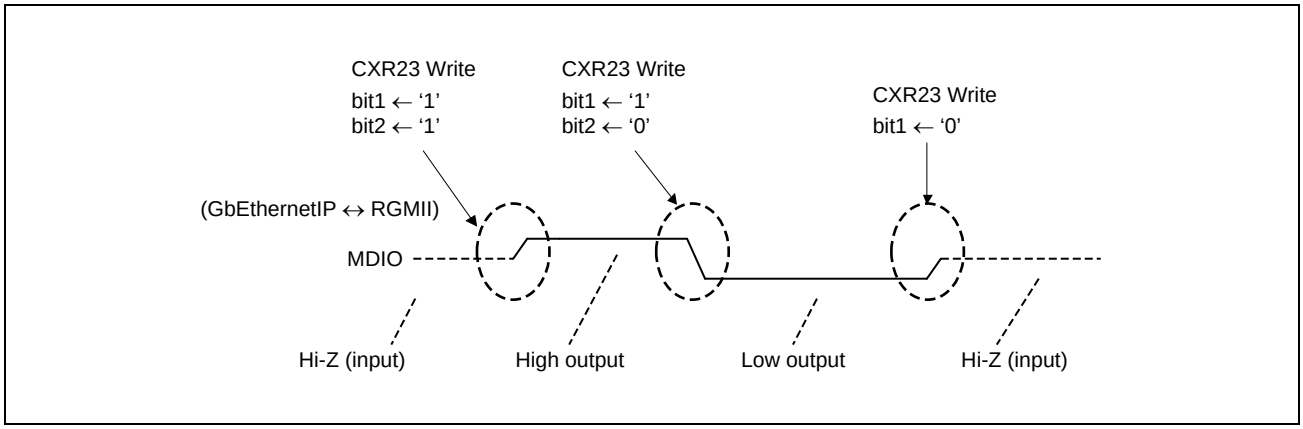

Figure 31.52 Relationship between CXR23 Write and MDIO (output) signal

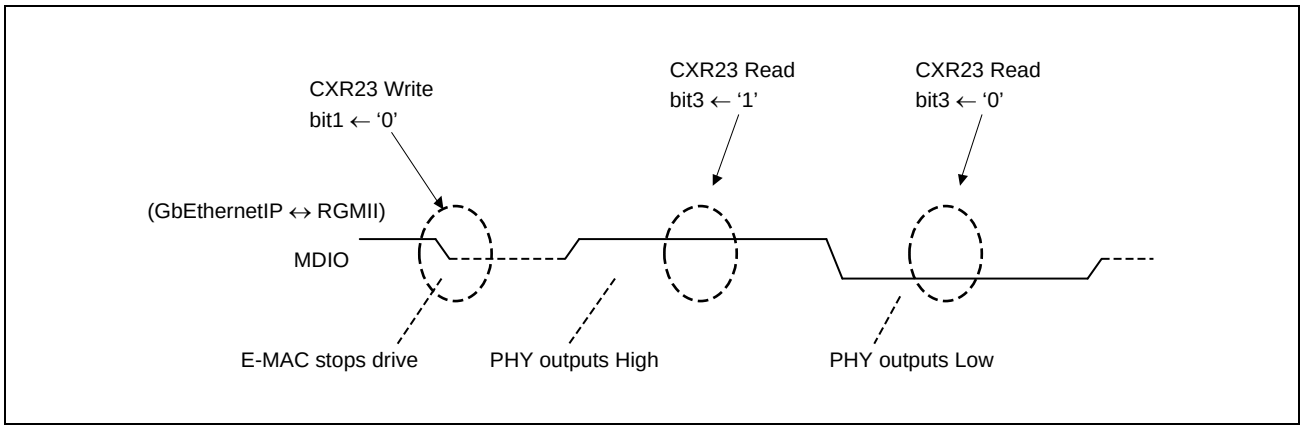

Figure 31.53 Relationship between MDIO input and CXR23 Read Values

PHY Register Write Access Procedure (Using CXR23)

To write PHY chip register, control MDC and MDIO signals based on the format given below.

(1) PHY Write Access Format

Table 31.24 PHY Write Access Format

#	Field name	I/O	Details	Remarks
1	Preamble	O	1 = 32 bits	Preamble
2	ST	O	“01”	Start
3	Op Code (Write)	O	“01”	Operation code for write
4	PHY Address	O	5 bits	PHY address (See data sheet of PHY LSI)
5	Reg Address	O	5 bits	Register address (See data sheet of PHY LSI)
6	Turn Around	O	“10”	Turnaround
7	Data (Write)	O	16 bits	Write data
8	IDLE	—	—	Idle status

(2) PHY Register Write Access Time chart

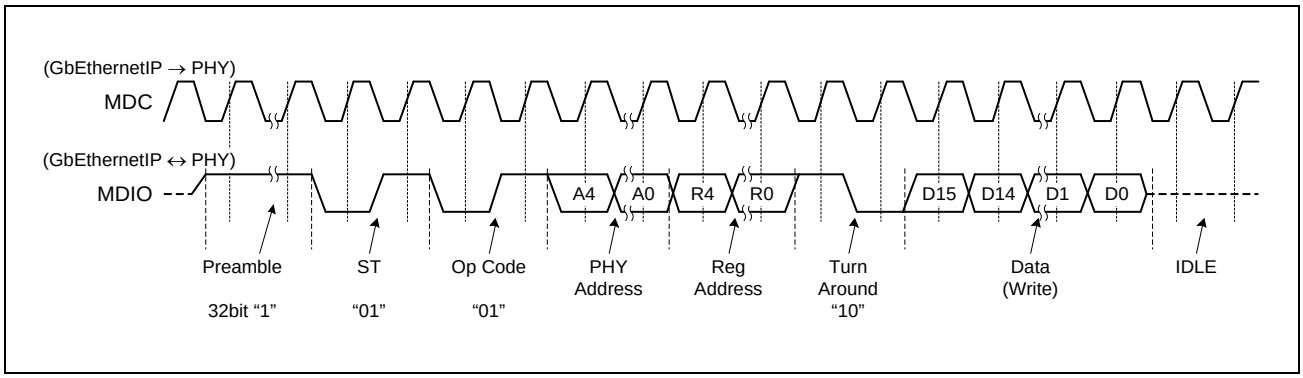

Figure 31.54 PHY Register Write Access Time Chart

(3) PHY Register Write Access Procedure

Table 31.25 PHY Register Write Access Procedure (1/2)

#	CXR23				CXR23 access	Description
	bit 3	bit 2	bit 1	bit 0		
0	0	0	0	0	Initial state	IDLE
1	0	1	1	1	CXR23 WRITE	Start of Write access (MDC rise)
2	0	1	1	0	CXR23 WRITE	Start of Write access (MDC fall)
3	0	1	1	1	CXR23 WRITE	Preamble1
4	0	1	1	0	CXR23 WRITE	
5	0	1	1	1	CXR23 WRITE	Preamble2
6	0	1	1	0	CXR23 WRITE	
7	0	1	1	1	CXR23 WRITE	Preamble3
8	0	1	1	0	CXR23 WRITE	
—	—	—	—	—	—	Repeat
64	0	1	1	0	CXR23 WRITE	
65	0	1	1	1	CXR23 WRITE	Preamble32
66	0	0	1	0	CXR23 WRITE	
67	0	0	1	1	CXR23 WRITE	ST
68	0	1	1	0	CXR23 WRITE	
69	0	1	1	1	CXR23 WRITE	ST
70	0	0	1	0	CXR23 WRITE	
71	0	0	1	1	CXR23 WRITE	Op Code (Write)
72	0	1	1	0	CXR23 WRITE	
73	0	1	1	1	CXR23 WRITE	Op Code (Write)
74	0	A4	1	0	CXR23 WRITE	PHY address A4 bit is output here
75	0	A4	1	1	CXR23 WRITE	PHY Address
76	0	A3	1	0	CXR23 WRITE	
77	0	A3	1	1	CXR23 WRITE	PHY Address
78	0	A2	1	0	CXR23 WRITE	
79	0	A2	1	1	CXR23 WRITE	PHY Address

Table 31.25 PHY Register Write Access Procedure (2/2)

#	CXR23				CXR23 access	Description
	bit 3	bit 2	bit 1	bit 0		
80	0	A1	1	0	CXR23 WRITE	
81	0	A1	1	1	CXR23 WRITE	PHY Address
82	0	A0	1	0	CXR23 WRITE	
83	0	A0	1	1	CXR23 WRITE	PHY Address
84	0	R4	1	0	CXR23 WRITE	REG address A4 bit is output here
85	0	R4	1	1	CXR23 WRITE	REG Address
86	0	R3	1	0	CXR23 WRITE	
87	0	R3	1	1	CXR23 WRITE	REG Address
88	0	R2	1	0	CXR23 WRITE

114	0	D0	1	0	CXR23 WRITE	
115	0	D0	1	1	CXR23 WRITE	Write Data
116	0	0	0	0	CXR23 WRITE	IDLE
117	0	0	0	1	CXR23 WRITE	IDLE
118	0	0	0	0	CXR23 WRITE	IDLE
119	0	0	0	1	CXR23 WRITE	IDLE
120	0	0	0	0	CXR23 WRITE	IDLE
121	0	0	0	1	CXR23 WRITE	IDLE
122	0	0	0	0	CXR23 WRITE	IDLE End of write access

PHY Register Read Access Procedure (Using CXR23)

To read from the PHY chip registers, control MDC and MDIO signals in the format given below

(1) PHY Read Access Format

Table 31.26 PHY Read Access Format

#	Field name	I/O	Details	Remarks
1	Preamble	O	1 = 32 bits	Preamble
2	ST	O	“01”	Start
3	Op Code (read)	O	“10”	Operation code for read
4	PHY Address	O	5 bits	PHY address (See data sheet of PHY LSI)
5	Reg Address	O	5 bits	Register address (See data sheet of PHY LSI)
6	Turn Around	I	“X0”	Turnaround (input/output switching)
7	Data (Read)	I	16 bits	Read data
8	IDLE	—	—	Idle state

(2) PHY Register Read Access Time Chart

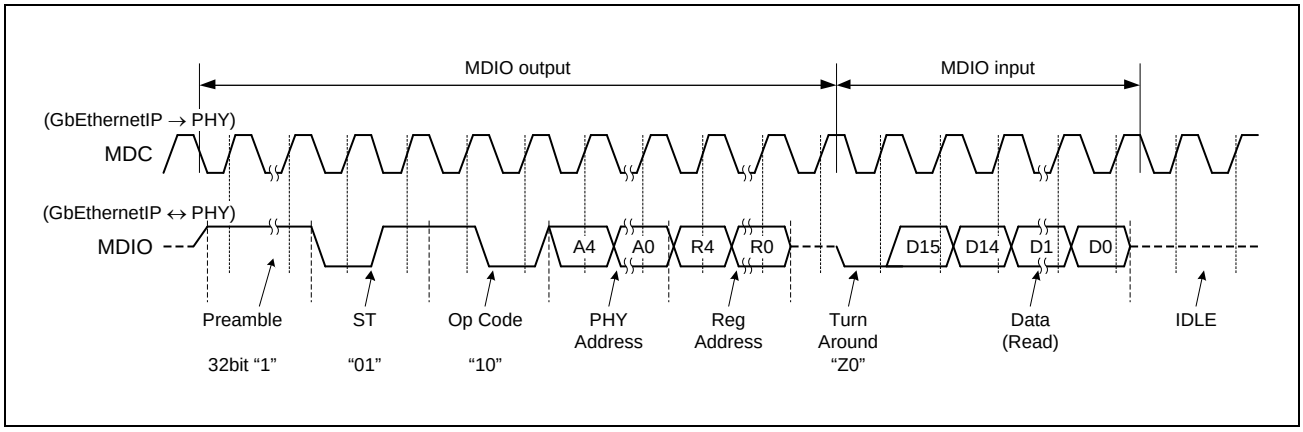

Figure 31.55 PHY Register Read Access Time Chart

(3) PHY Register Read Access Procedure

Table 31.27 PHY Register Read Access Procedure (1/2)

#	CXR23				CXR23 access	Description
	bit 3	bit 2	bit 1	bit 0		
0	0	0	0	0	Initial state	IDLE
1	0	1	1	1	CXR23 WRITE	Start of write access (MDC rise)
2	0	1	1	0	CXR23 WRITE	Start of write access (MDC fall)
3	0	1	1	1	CXR23 WRITE	Preamble1
4	0	1	1	0	CXR23 WRITE

151	0	0	0	1	CXR23 WRITE	IDLE
152	0	0	0	0	CXR23 WRITE	IDLE End of read access

32. USB2.0

This LSI includes 1 channel USB2.0 OTG/DRD (Host/Function) interface and 1 channel USB2.0 Host interface.

This section describes the overview of USB2.0 and USB2.0 PHY control.

The detail function of USB2.0 Host controller and the common function both Host module and Function module are described in **Section 32A, USB 2.0 Host Module**.

The detail function of USB2.0 Function controller is described in **Section 32B, USB 2.0 Function Module**.

32.1 Features

This interface complies the following specifications.

- Universal Serial Bus Specification Revision 2.0
- On-The-Go and Embedded Host Supplement to the USB Revision 2.0 Specification Revision 2.0 plus errata and ecn*1
- Enhanced Host Controller Interface (EHCI) Specification for Universal Serial Bus Revision 1.0
- EHCI v1.1 Addendum*2
- Open Host Controller Interface (OHCI) Specification for USB Release 1.0a
- Battery Charging Specification Revision 1.2*3

Note 1. Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) are not supported.
Note 2. Some EHCI v1.1 feature are not supported. (Refer to **Section 32A, USB 2.0 Host Module** for detail)
Note 3. DCP (Dedicated Charging Port) is not supported as downstream port.

32.1.1 Ch0: USB2.0 OTG/DRD (Host/Function) Interface

The following table shows features of this interface.

Table 32.1 Ch0: USB2.0 OTG/DRD (Host/Function) Interface Features

Function	Description
Host mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps)/Low-Speed (1.5 Mbps) • Support Isochronous/Interrupt/Control/Bulk transfer modes • Support Isochroous/Interrupt high bandwidth transfer
Function mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps) • Isochronous/Interrupt/Control/Bulk transfer • Up to 10 ch PIPE (includes default control PIPE)
Other functions	• OTG function (Rev2.0) • Battery Charging function • DRD (Dual-Role-Device) function (Static switch between Host and Function)

32.1.2 Ch1: USB2.0 HOST Interface

The following table shows features of this interface.

Table 32.2 Ch1: USB2.0 Host Interface Function Features

Features	Description
Host mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps)/Low-Speed (1.5 Mbps) • Support Isochronous/Interrupt/Control/Bulk transfer modes • Support Isochroous/Interrupt high bandwidth transfer
Other function	• Battery Charging function

32.1.3 Block Diagram

The block diagram of USB interface is as follows.

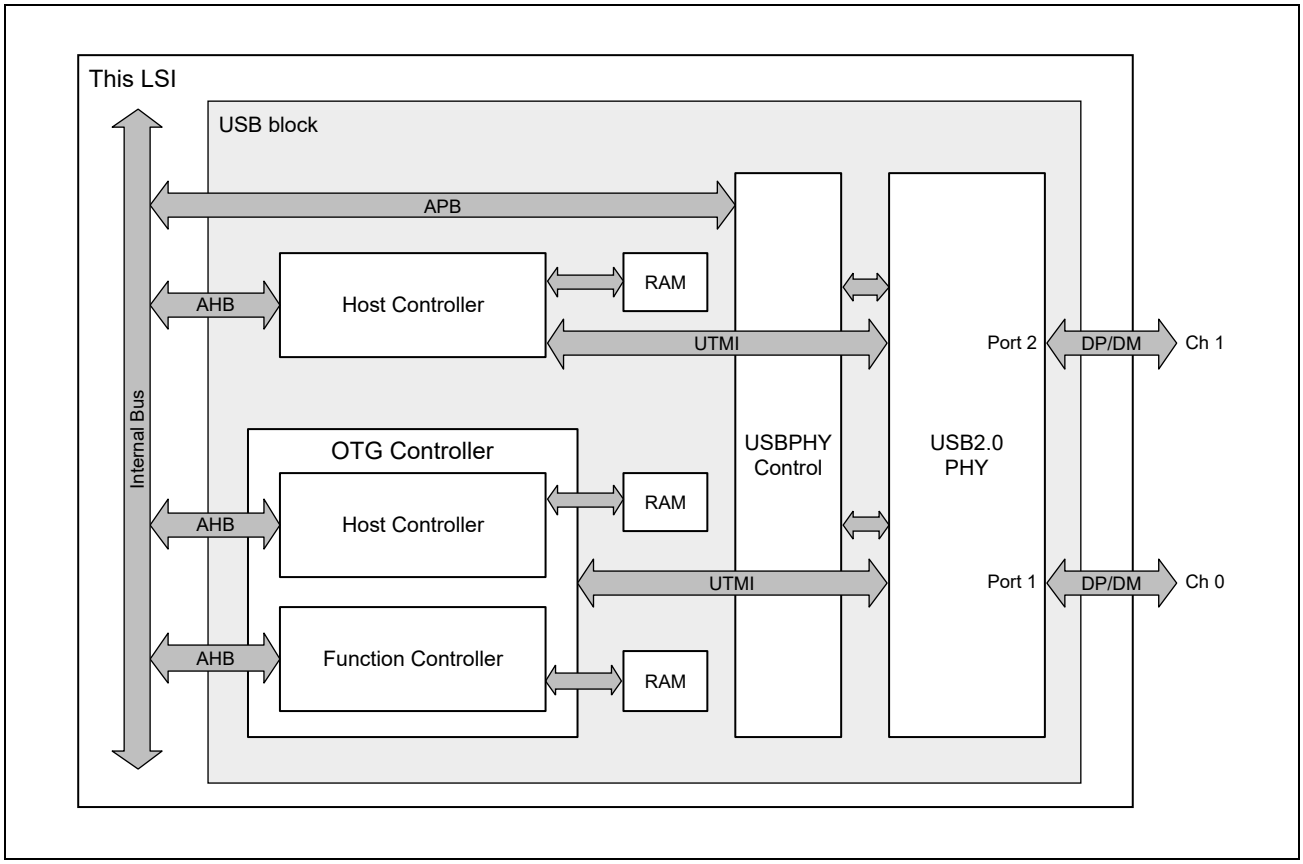

Figure 32.1 USB Interface Block Diagram

32.1.4 External Signal Pins

The following table shows external signal pins for USB block.

Table 32.3 External Signal Pins

Name	I/O	Description	Active Level	Initial Value	Handling in Not Used
USB0_DP	—	USB data pin Data+ (Ch0)	—	—	Open*1
USB0_DM	—	USB data pin Data− (Ch0)	—	—	Open*1
USB0_OVRCUR	I	Over current detection input (Ch0)	L	—	Pull-Up
USB0_VBUSEN	O	VBUS output enable (Ch0)	H	0b	Open
USB0_VBUSIN	I	Peripheral VBUS input (Ch0)	H	—	Pull-Down
USB0_OTG_EXICEN	O	External power IC control (Ch0)	H	0b	Open
USB0_OTG_ID	I	OTG ID input (Ch0)	—	—	Pull-Down
USB1_DP	—	USB data pin Data+ (Ch1)	—	—	Open*1
USB1_DM	—	USB data pin Data- (Ch1)	—	—	Open*1
USB1_OVRCUR	I	Over current detection input (Ch1)	L	—	Pull-Up
USB1_VBUSEN	O	VBUS output enable (Ch1)	H	0b	Open

Note 1. When it is not used permanently, connect to GND via a resistor of 10kΩ.

32.1.5 Power and GND Pins

The following table shows Power and GND pins for USB block.

Table 32.4 Power and GND pins

Name	Description
USB_VDD18	Internal Regulator Power (1.8 V), HS receiver power (1.8 V)
USB_VDD33	IO power (3.3 V)
USB_RREF	Reference voltage
VSS	GND

32.1.6 Interrupt

The following table shows interrupt list for USB block.

Table 32.5 USB Interrupt

Name	Description	Active Level	Type
U2H0_INT	USB2.0 Host AHB Interrupt (Ch0)	H	Level-Sensitive
U2H0_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch0)	H	Level-Sensitive
U2H0_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch0)	H	Level-Sensitive
U2H1_INT	USB2.0 Host AHB Interrupt (Ch1)	H	Level-Sensitive
U2H1_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch1)	H	Level-Sensitive
U2H1_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch1)	H	Level-Sensitive
U2H1_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch1)	H	Level-Sensitive
U2H1_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch1)	H	Level-Sensitive
U2P_IXL_INT	USB2.0 Function controller Interrupt (Ch0)	H	Edge-Triggered
U2P_INT_DMA[1:0]	USB2.0 Function controller DMA transaction complete interrupt (Ch0)	H	Level-Sensitive
U2P_INT_DMAERR	USB2.0 Function controller DMA error response interrupt (Ch0)	H	Level-Sensitive

32.2 Register Configuration

32.2.1 Host Controller Register

Refer to the **Section 32A, USB 2.0 Host Module**.

32.2.2 Function Controller Register

Refer to the **Section 32B, USB 2.0 Function Module**.

32.2.3 USBPHY Control Register

USBPHY Control Register mainly controls reset and power down of the USB/PHY.

Base Address: H'0_11E0_0000 (Cortex-A55 Address Space)
Base Address: H'41E0_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base Address: H'51E0_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

The following table shows USBPHY Control Register list.

Prohibit to write undefined area.

Table 32.6 USBPHY Control Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Reset register	RESET	R/W	H'0000_0133	H'000	32
Clock control register	UCLKCTL	R/W	H'0340_0303	H'018	32
Direct power down setting register	UDIRPD	R/W	H'0000_0000	H'01C	32
VBUSEN control register	VBENCTL	R/W	H'0000_0000	H'03C	32
Connection control register	CON_CTRL	R/W	H'0000_0000	H'020	32
Clock status register	CLK_STAT	R	H'0000_0000	H'104	32

32.3 Register Descriptions

32.3.1 Reset Register (RESET)

This register controls USB/PHY reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	sel_pll reset	—	—	—	pllreset	—	—	sel_p2 reset	sel_p1 reset	—	—	phyrst_2	phyrst_1
Initial Value	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1	1
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	sel_pllreset	0	R/W	Select USB/PHY PLL reset 1: register (by bit8: pllreset) 0: control by host controller (Ch0)
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	pllreset	1	R/W	PLL reset 1: PLL reset 0: deassert PLL reset
7, 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	sel_p2reset	1	R/W	Select USB/PHY Port2 reset 1: register(phyrst_2) 0: Control by host controller (Ch1)
4	sel_p1reset	1	R/W	Select USB/PHY Port1 reset 1: register(phyrst_1) 0: Control by host controller (Ch0)
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	phyrst_2	1	R/W	USB/PHY reset (Port2) 1: USB/PHY reset 0: deassert USB/PHY reset Only when sel_p2reset=1, this bit is valid.
0	phyrst_1	1	R/W	USB/PHY reset (Port1) 1: USB/PHY reset 0: deassert USB/PHY reset Only when sel_p1reset=1, this bit is valid.

32.3.2 Clock Control Register (UCLKCTL)

This register controls USB/PHY clock.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	sel_sleepm	—	—	sleepm_2	sleepm_1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	1	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	sel_suspendm	—	—	suspendm_2	suspendm_1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	1
R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	sel_sleepm	0	R/W	Select SLEEPM control 1: register (controlled by bit 24: sleepm_1 and bit 25: sleepm_2) 0: Control by controller
27, 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	sleepm_2	1	R/W	Sleep control (Port2) 1: Normal mode 0: Sleep mode
24	sleepm_1	1	R/W	Sleep control (Port1) 1: Normal mode 0: Sleep mode
23	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	—	1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19, 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17, 16	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	sel_suspendm	0	R/W	Select SUSPENDM control 1: register (controlled by bit 8: suspendm_1 and bit 9: suspendm_2) 0: control by controller
11, 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
9	suspend_2	1	R/W	Suspend control (Port2) 0: Suspend mode 1: Normal mode
8	suspend_1	1	R/W	Suspend control (Port1) 0: Suspend mode 1: Normal mode
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

32.3.3 Direct Power Down Setting Register (UDIRPD)

This register controls USB/PHY direct power down.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	sel_udirpd	—	—	—	dirpd
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	sel_udirpd	0	R/W	Select dirpd control 1: register (dirpd) 0: Control by host controller (Ch0)
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	dirpd	0	R/W	Power down control to reduce the power consumption of the USB/PHY when not using the USB function. 0: Normal operation 1: Power save

32.3.4 VBUSEN Control Register (VBENCTL)

This register controls VBUSEN connection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	vbus_sel_0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	vbus_sel_0	0	R/W	Select VBUSEN control 0: Port Power bit of the EHCI/OHCI Operational register. 1: VBOUT bit of the VBUS Control register.

32.3.5 Connection Control Register (CON_CTRL)

This register controls USB/PHY connection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	sel_connect	—	—	connect_2	connect_1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	sel_connect	0	R/W	Select USB connection notification control 1: register (controlled by bit0: connect_1 and bit1: connect_2) 0: Control by host controller
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	connect_2	0	R/W	Notice of USB connection (port2) Used to notify UTM + core of USB connection status 0: USB not connected (single end receiver disabled) 1: USB not connected (single end receiver enabled)
0	connect_1	0	R/W	Notice of USB connection (port1) Used to notify UTM + core of USB connection status 0: USB not connected (single end receiver disabled) 1: USB not connected (single end receiver enabled)

32.3.6 Clock Status Register (CLK_STAT)

This register shows USB/PHY clock status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	frclk60 lock	frclk48 lock	phy lock	—	—	plllock_ 2	plllock_ 1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	frclk60_lock	0	R	FRCLK60 LOCK status 0: UNLOCK 1: LOCK
5	frclk48_lock	0	R	FRCLK48 LOCK status 0: UNLOCK 1: LOCK
4	phylock	0	R	PHY PLL LOCK Status (Transceiver) 0: UNLOCK 1: LOCK
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	plllock_2	0	R	PLL LOCK status (port2) 0: UNLOCK 1: LOCK
0	plllock_1	0	R	PLL LOCK status (port1) 0: UNLOCK 1: LOCK

32.4 Operation

32.4.1 USB/PHY Initialization

In the initial state, the reset of USB/PHY Port1 and Port2 is controlled by the register in the USBPHY Control Register, and the reset is asserted, so the control is switched to controller by the following initialization.

Also, in the initial state, the USB/PHY PLL Reset is controlled by the Host Controller in the OTG Controller, but it needs to be switched to controlled by the USBPHY Control Register.

- **Initialization when starting only Port1 of USB/PHY (when Port2 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1022 to release the reset.
  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released. Port1 of USB/PHY is controlled by Host Controller, and Port2 is reset by USBPHY Control Register.)

- **Initialization when starting only Port2 of USB/PHY (when Port1 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1011 to release the reset.
  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released. USB/PHY Port1 is reset by USBPHY Control Register, and port2 is controlled by Host Controller.)

- **Initialization when starting both Port1 and Port2 of USB/PHY**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1000 to release the reset.
  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released. USB/PHY Port1 is controlled by the Host Controller, and Port2 is controlled by the Host Controller.)

The common setting sequence both Host mode and Function mode including USB/PHY initialization is described in **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.

32.4.2 Handling of Permanently Unused Pin

Take the following measures when USB interface is not used permanently.

32.4.2.1 USB/PHY Related Pins

(1) When both Port1 and Port2 are unused

Take the following measures for the USB pins and power supply.

- Connect the USB0_DP/DM and USB1_DP/DM to GND via a resistor of 10kΩ.
- Set the RREF to Open.
- Connect USB_VDD18 to a 1.8 V power supply. However, there is no need to separate the digital and analog power supplies.
- Connect USB_VDD33 to GND.
- Connect VSS to GND.

Also, perform the following control with software.

- Set the direct power down (via UDIRPD register). See **Section 32.4.3, Direct Power Down (DIRPD)** for more information.

(2) When either Port1 or Port2 is unused

Supply all power.

Since USB_VDD18/USB_VDD33 are common to 2 Port PHY, it is necessary to supply power even when one of the ports is not in use.

Make the following settings for unused port.

- Apply Port reset
  - Apply reset to unused USB/PHY port by controlling the Reset register (RESET).
  - Set sel_p1reset = 1 and phyrst_1 = 1 when USB/PHY Port1 is unused.
  - Set sel_p2reset = 1 and phyrst_2 = 1 when USB/PHY Port2 is unused.
- Power down setting
  - Set power down setting to unused USB/PHY port by controlling the Clock control register (UCLKCTL).
  - Set sel_suspendm=1 and suspendm_1=0 when USB/PHY Port1 is unused.
  - Set sel_suspendm=1 and suspendm_2=0 when USB/PHY Port2 is unused.
- Single-ended receiver stop
  - Stop single-ended receiver of unused USB/PHY port by controlling the Connection control register (CON_CTRL).
  - Set sel_connect=1 and connect_1=0 when USB/PHY Port1 is unused.
  - Set sel_connect=1 and connect_2=0 when USB/PHY Port2 is unused.

32.4.2.2 Handling of USB Controller Related Pins

(1) When Host controller is unused

The USB0_VBUSEN pin leaves open and fix the USB0_OVRCUR pin to 1 when USB/PHY port1 is unused.

The USB1_VBUSEN pin leaves open and fix the USB1_OVRCUR pin to 1 when USB/PHY port2 is unused.

(2) Function controller is unused

Fix the USB0_VBUSIN pin to 0 when USB/PHY port1 is unused.

32.4.3 Direct Power Down (DIRPD)

By directly controlling the power down signal of the USB/PHY with the USBPHY Control register, the USB/PHY can be put into a low power state regardless of the state of the controller.

When set to the direct power down state, all USB/PHY functions including the PLL will be stopped. Direct power down can only be used when the USB/PHY is unused (means both ports are unused).

Follow the procedure below to switch to / return to the direct power down mode.

For details on the USBPHY Control Register reset register and direct power down setting register used in the procedure below, refer to **Section 32.3.1, Reset Register (RESET)** and **Section 32.3.3, Direct Power Down Setting Register (UDIRPD)**, respectively.

32.4.3.1 Enter to Direct Power Down Mode

Follow the steps below to switch to direct power down mode.

(1) USB operation stop

Stop the operation of USB.

(2) Assert the direct power down signal.

It is asserted by setting H'0000_0010 in the direct power-down setting register (UDIRPD) and then setting H'0000_0011.

There are no timing restrictions when transitioning to direct power down. Immediately after setting, it shifts to power down mode.

32.4.3.2 Resume from Direct power down mode

Follow the steps below to recover from the direct power down mode.

(1) Assert a USB/PHY PLL reset.

The PLL reset is asserted by setting 1 to sel_pllreset bit of the Reset register (RESET) and then setting 1 to pllreset bit.

The reset period should be 1us or more.

(2) De-assert direct power down signal

Negate the direct power down signal after continuing to assert the PLL reset for more than 1us. It is negated by setting H'0000_0010 in the direct power down setting register (UDIRPD) and then setting H'0000_0000.

After negating the direct power down signal, keep asserting the PLL reset for at least 1µs.

(3) De-assert USB/PHY PLL reset

After negating the direct power down signal, continue to assert the PLL reset for 1us or more, and then negate the PLL reset.

The PLL reset is negated by clearing the pllreset bit in the reset register (RESET) and then clearing the sel_pllreset.

The timing chart when returning from the direct putter down is shown below.

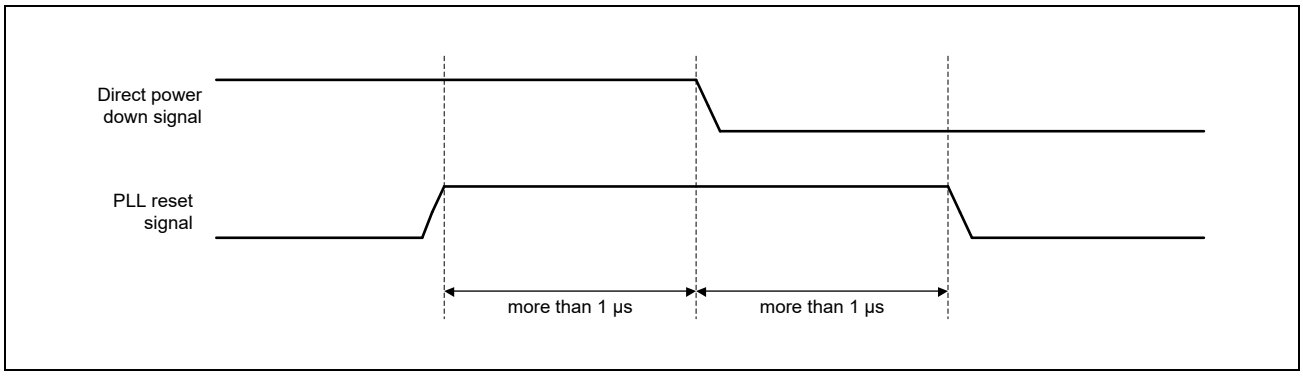

Figure 32.2 Resume from Direct Power Down Mode

32.5 Usage Notes

32.5.1 Precautions in Power Down Mode

When USB interface is unused, it can be set to power-down mode by register setting. For the setting, refer to **Section 32.3.3, Direct Power Down Setting Register (UDIRPD)**.

The precautions for power down mode are as follows.

- Once enter to power down, do not access the interface.
- Move to the power-down state after the USB is in unused state. If USB interface moves power-down state while it is operating, current may continue to flow to the USB side and it may damage device.

32A. USB 2.0 Host Module

32A.1 Overview

32A.1.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

32A.1.2 Features

This module has the following features:

Function	Description
Host function	• Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers • Compliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0a • Compliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1
Other functions	• Battery charging (compliant with Battery Charging Specification Revision 1.2)*2 • Dual-role-device function (static switching between the USB host and USB peripheral functions)

Note 1. Some functions (specifications) are not supported.

Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected. This LSI does not support DCP (Dedicated Charging Port) as a Downstream Port.

32A.1.2.1 EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.

Note, however, that this module supports only the functions marked with a circle "✓" in the table below.

Function Name	Support
Per-Port Change Events	✓
Shorter Periodic Frame List	✓
Hardware Prefetching	—
Link Power Management (LPM)	✓

Of the three features to support, the registers associated with "Per-Port Change Events" and "Shorter Periodic Frame List" are listed below. For more information on each register, refer to the appropriate register specification of the **Section 32A.2, Register Descriptions**.

With regard to "Link Power Management (LPM)", it is described in **Section 32A.1.2.2, Link Power Management (LPM) function**.

Table 32A.1 Per-Port Change Events

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: H'108)	bit 18	Per-Port Change Event Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H'120)	bit 15	Per-Port Change Events Enable	R/W	Per-Port event notification setting. Writing 1b to this bit enables the Per-Port event notification function.
USBSTS (offset: H'124)	bit 16	Port-1 Change Detect	R/W(1)	If a port-1 change event is detected, 1b is written to this bit.
USBINTR (offset: H'128)	bit 16	Port-1 Change Event Enable	R/W	Enable/Disable setting of the above "port-1 Change Detect" field. To reflect the port event on the above field for the port, set corresponding bit to 1b.

Table 32A.2 Shorter Periodic Frame List

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: H'108)	bit 19	32-Frame Periodic List Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H'120)	bit[3:2]	Frame List Size	R/W	This bit determines the Frame List Size. To determine 32-frames, set this field 11b.

32A.1.2.2 Link Power Management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).

When the peripheral device which supports LPM function is connected to this module, the device can be moved to suspend state faster than conventional by using LPM function.

*In using LPM function: 8 to 10 µs

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in **Section 32A.2, Register Descriptions**.

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: H’108)	bit 17	Link Power Management Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H’120)	bit[27:24]	Host-Initiated Resume Duration	R/W	The minimum duration time of K-state drive in resume from LPM state.
PORTSC1 (offset: H’164)	bit[31:25]	Device Address [7:0]	R/W	The device address of the destination of LPM Token. In using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token.
	bit[24:23]	Suspend Status [1:0]	R	The device response to LPM Token.
	bit 9	Suspend using L1	R/W	In using LPM function, set this bit 1b.
	bit 7	Suspend	R/W	When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = H’000”.
PORT_LPM_CTR1 (offset: H’320)	bit[7:4]	NYET_RETRY_CNT_P1[3:0]	R/W	The number of retry for NYET response of device in LPM transaction.
	bit 3	REMOTEWAKE_EN_P1	R/W	Setting of LPM RemoteWakeup permission. 0b: permitted (default) 1b: not permitted
	bit 2	SLEEP_INT_EN_P1	R/W	In LPM transaction, setting to generate an interrupt or not when received a response other than ACK. 0b: not to generate an interrupt (default) 1b: to generate an interrupt
	bit 1	RETRY_ENABLE_NYET_P1	R/W	In LPM transaction, setting to the host behavior when received NYET response from the device. 0b: not to Retry (default) 1b: to Retry
	bit 0	HIRD_SEL_P1	R/W	Setting the duration time of the K-state drive, in resume of LPM state.

32A.1.2.3 OTG function

Detects changing of the USB0_OTG_ID pin by U2H0_OBINT interrupt and switches the Host/Function role. Confirm the IDCHG_STA bit of **Section 32A.2.4.5(2), OTG-BC Interrupt Status Register** and the IDMON bit of **Section 32A.2.4.5(5), Line Control Port 1 Register**.

Host/Function role switching is performed by the OTG_PERI bit of **Section 32A.2.4.5(1), Common Control Register**.

OTG_PERI bit
0 : Host mode
1 : Function mode (Only CH0 can be set)

32A.1.2.4 Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module. The detail of the UCOM register, refer to **Section 32A.2.4.5, UCOM Register**.

32A.1.2.5 Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.

The detail of the register, refer to **Section 32A.2.4.4(6), Suspend Control Register**.

[Relevant register]

Suspend Control Register (offset: H'308)

[Functional specification]

Function		Relevant Bit	
[1]	Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register	bit 31	SUSPENDM_ENABLE
[2]	Function to forcibly assert USBPHY SUSPENDM	bit 0	GLOBAL_SUSPENDM_P1

32A.1.3 Support of USB-Related Specifications

USB-Related Specification or Function			Support
Host function	High Speed	Bulk IN/OUT transfer	✓
		Control IN/OUT transfer	✓
		Isochronous IN/OUT transfer	✓
		Isochronous Highband transfer	✓
		Interrupt IN/OUT transfer	✓
	Full Speed	Bulk IN/OUT transfer	✓

Remarks: ✓: support
×: no support

32A.2 Register Descriptions

32A.2.1 Register Attributes

Table 32A.3 Register Attributes

Register Attribute	Description
R/W	Register bits can be read and written.
R/W(1)	Register bits can be read. A clear bit may be set by writing “1”; writing 0 to R/W(1) bits has no effect.
R/W(0)	Register bits can be read. A clear bit may be set by writing “0”; writing 1 to R/W(0) bits has no effect.
R	Register bits can only be read.
W	Register bits can only be written.
Reserved	Reserved bits are Read Only field.

32A.2.2 Base Address

Table 32A.4 Base Addresses for Each Channel of the USB Host Module

Channel	Base Address	
0	H’0_11E1_0000	(Cortex-A55 Address Space)
	H’41E1_0000	(Cortex-M33/Cortex-M33_FPU Address Space Secure)
	H’51E1_0000	(Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)
1	H’0_11E3_0000	(Cortex-A55 Address Space)
	H’41E3_0000	(Cortex-M33/Cortex-M33_FPU Address Space Secure)
	H’51E3_0000	(Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Note: Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

32A.2.3 Register Overview

Register Name	Abbreviated Name	R/W	Initial Value	Offset Address	Access Size	Remarks
HcRevision	HcRevision	R	H'0000_0000	H'000	32	OHCI Operation Registers

32A.2.4 Description of Registers

32A.2.4.1 OHCI Operational Register

(1) HcRevision Register

Abbreviated name of register: HcRevision

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	Revision							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	Revision	All 0	R	This field indicates the version of HCI specifications implemented in this host controller module. Because this module conforms to OHCI standard 1.0a, H'10 is indicated.

(2) HcControl Register

Abbreviated name of register: HcControl

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RWC	—	HCFS		BLE	CLE	IE	PLE	CBSR	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved The write value should always be 0.
9	RWC	0	R/W	Remote Wakeup Connected This bit indicates whether the host controller supports remote wakeup signaling. Software should set this bit to 1b in the initialization sequence if it is required to support remote wakeup. Note that this bit can be initialized at hardware reset only. 0b: The remote wakeup is not supported. 1b: The remote wakeup is supported
8	—	0	R	Reserved The write value should always be 0.
7, 6	HCFS	All 0	R/W	Host Controller Functional State This field indicates the operating state of the host controller. 00b: USB Reset 01b: USB Resume 10b: USB Operational 11b: USB Suspend When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary. This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume. Note that the reset value of this field differs between hardware reset and software reset. Hardware reset: 00b (USB Reset) Software reset: 11b (USB Suspend)
5	BLE	0	R/W	BulkList Enable This bit sets whether the bulk list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the bulk list, this bit must be 0b. 0b: The processing of the Bulk list is disabled. 1b: The processing of the Bulk list is enabled
4	CLE	0	R/W	ControlList Enable This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the control list, this bit must be 0b. 0b: The processing of the Control list is disabled. 1b: The processing of the Control list is enabled.

Bit	Bit Name	Initial Value	R/W	Description
3	IE	0	R/W	Isochronous Enable This bit sets whether the isochronous ED processing is performed. The setting value of this bit is enabled from the next frame. If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing. 1b: The processing of the isochronous ED is continued. 0b: The periodic list processing is stopped, and the bulk/control list processing is started. 0b: The processing of the isochronous ED is disabled. 1b: The processing of the isochronous ED is enabled.
2	PLE	0	R/W	Periodic List Enable This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. The host controller module checks this bit before starting the periodic list processing. 0b: The processing of the periodic list is disabled. 1b: The processing of the periodic list is enabled.
1, 0	CBSR	All 0	R/W	Control Bulk Service Ratio This field defines the service ratio of the control transfer and bulk transfer. When the periodic list is processed, the service ratio defined in this field is used for transfer.

CBSR	No. of Control EDs Over Bulk EDs Served
00b	1:1
01b	2:1
10b	3:1
11b	4:1

(3) HcCommandStatus Register

Abbreviated name of register: HcCommandStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOC	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BLF	CLF	HCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17, 16	SOC	All 0	R	Scheduling Overrun Count This field counts the number of scheduling overrun. This field is initialized to 00b, and is counted up every time scheduling overrun is detected. After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected.
15 to 3	—	All 0	R	Reserved The write value should always be 0.
2	BLF	0	R/W	BulkList Filled This bit indicates whether TD exists in the bulk list. To add TD to ED in the bulk list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b. When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the bulk list. 1b: TD exists in the bulk list.

Bit	Bit Name	Initial Value	R/W	Description
1	CLF	0	R/W	ControlList Filled This bit indicates whether TD exists in the control list. To add TD to ED in the control list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the control list. If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b. When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the control list. 1b: TD exists in the control list.
0	HCR	0	W	Host Controller Reset This bit is used to start OHCI software reset for the host controller. When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized. When the software reset finishes, the host controller clears this bit to 0b.

(4) HcInterruptStatus Register

Abbreviated name of register: HcInterruptStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSC	FNO	UE	RD	SF	WDH	SO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSC	0	R/W	Root Hub Status Change Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed. When the Root Hub status is changed, the host controller sets this bit to 1b. Writing 1b to this bit clears the interrupt. 0b: The status of root hub has not changed. 1b: The status of root hub has changed.
5	FNO	0	R/W	Frame Number Overflow Interrupt bit that indicates that the MSB in the FrameNumber (FN) field of theHcFmNumber register has changed. When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated. Writing this bit to 1b clears the interrupt. 0b: The overflow of frame number has not occurred. 1b: The overflow of frame number has occurred.
4	UE	0	R/W	Unrecoverable Error Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected. Writing this bit to 1b clears the interrupt. 0b: The unrecoverable error has not occurred. 1b: The unrecoverable error has occurred.
3	RD	0	R/W	Resume Detected Interrupt bit that indicates that Resume has been detected. When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b. This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume. Writing this bit to 1b clears the interrupt. 0b: The host controller has not detected resume signaling (RemoteWakeup). 1b: The host controller has detected resume signaling (RemoteWakeup).

Bit	Bit Name	Initial Value	R/W	Description
2	SF	0	R/W	Start of Frame Interrupt bit that indicates that Hcca Frame Number was updated when each frame started. The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b. Writing this bit to 1b clears the interrupt. 0b: The host controller has not started new frame. 1b: The host controller has started new frame.
1	WDH	0	R/W	Writeback DoneHead Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccDoneHead. The host controller sets this bit to 1b immediately after it updates HccaDoneHead. Note that HccaDoneHead is not updated until this bit is cleared. Writing this bit to 1b clears the interrupt. This bit must be cleared only after the contents of HccaDoneHead are saved. 0b: The write back to HccaDoneHead has not occurred. 1b: The write back to HccaDoneHead has occurred.
0	SO	0	R/W	Scheduling Overrun Interrupt bit that indicates that overrun of the USB schedule occurred. When USB scheduling overrun occurs, the host controller updates HccaFrameNumberl, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented. Writing this bit to 1b clears the interrupt. 0b: The scheduling overrun has not occurred. 1b: The scheduling overrun has occurred.

(5) HcInterruptEnable Register

Abbreviated name of register: HcInterruptEnable

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MIE	OCE	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSCE	FNOE	UEE	RDE	SFE	WDHE	SOE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	MIE	0	R/W	Master Interrupt Enable This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled. If this bit is set to 0b, all OHCI interrupts are masked. To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b. 0b: All interrupts are disabled. 1b: Interrupts that are set to 1b are enabled.
30	OCE	0	R/W	OC (Ownership Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange). To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b. 0b: OC (OwnershipChange) interrupt is disabled. 1b: OC (OwnershipChange) interrupt is enabled.
29 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSCE	0	R/W	RHSC (RootHub Status Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RHSC (RootHub Status Change). To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b. 0b: RHSC (RootHub Status Change) interrupt is disabled. 1b: RHSC (RootHub Status Change) interrupt is enabled.
5	FNOE	0	R/W	FNO (Frame Number Overflow) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow). To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b. 0b: FNO (Frame Number Overflow) interrupt is disabled. 1b: FNO (Frame Number Overflow) interrupt is enabled.
4	UEE	0	R/W	UE (Unrecoverable Error) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error). To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b. 0b: UE (Unrecoverable Error) interrupt is disabled. 1b: UE (Unrecoverable Error) interrupt is enabled.
3	RDE	0	R/W	RD (Resume Detect) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RD (Resume Detect). To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b. 0b: RD (Resume Detect) interrupt is disabled. 1b: RD (Resume Detect) interrupt is enabled.

Bit	Bit Name	Initial Value	R/W	Description
2	SFE	0	R/W	SF (Start of Frame) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SF (Start of Frame). To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b. 0b: SF (Start of Frame) interrupt is disabled. 1b: SF (Start of Frame) interrupt is enabled.
1	WDHE	0	R/W	WDH (Writeback DoneHead) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead). To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b. 0b: WDH (Writeback DoneHead) interrupt is disabled. 1b: WDH (Writeback DoneHead) interrupt is enabled.
0	SOE	0	R/W	SO (Scheduling Overrun) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun). To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b. 0b: SO (Scheduling Overrun) interrupt is disabled. 1b: SO (Scheduling Overrun) interrupt is enabled.

(6) HcInterruptDisable Register

Abbreviated name of register: HcInterruptDisable

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MID	OCD	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W(1)	R/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

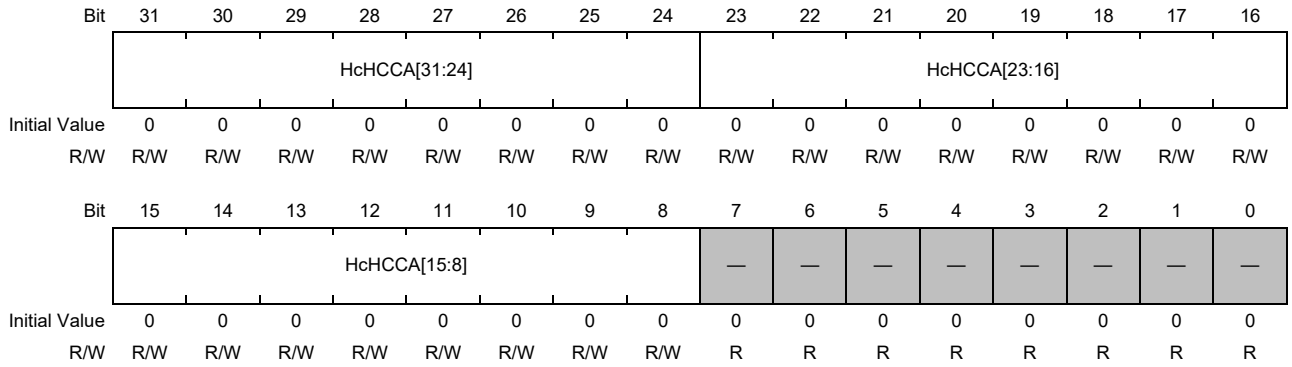
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSCD	FNOD	UED	RDD	SFD	WDHD	SOD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31	MID	0	R/W (1)	Master Interrupt Disable This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled. If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked. Writing 0b to this bit is ignored.
30	OCD	0	R/W (1)	OC (Ownership Change) Interrupt Disable bit. If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
29 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSCD	0	R/W (1)	RHSC (RootHub Status Change) Interrupt Disable bit. If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (RootHub Status Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
5	FNOD	0	R/W (1)	FNO (Frame Number Overflow) Interrupt Disable bit. If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source. Writing 0b to this bit is ignored.
4	UED	0	R/W (1)	UE (Unrecoverable Error) Interrupt Disable bit. If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source. Writing 0b to this bit is ignored.
3	RDD	0	R/W (1)	RD (Resume Detected) Interrupt Disable bit. If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source. Writing 0b to this bit is ignored.
2	SFD	0	R/W (1)	SF (Start of Frame) Interrupt Disable bit. If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source. Writing 0b to this bit is ignored.
1	WDHD	0	R/W (1)	WDH (Writeback DoneHead) Interrupt Disable bit. If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded from the interrupt source. Writing 0b to this bit is ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	SOD	0	R/W (1)	SO (Scheduling Overrun) Interrupt Disable bit. If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source. Writing 0b to this bit is ignored.

(7) HcHCCA Register

Abbreviated name of register: HcHCCA



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	HcHCCA	All 0	R/W	This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area. This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field.
7 to 0	—	All 0	R	Reserved The write value should always be 0.

(8) HcPeriodicCurrentED Register

Abbreviated name of register: HcPeriodCurrentED

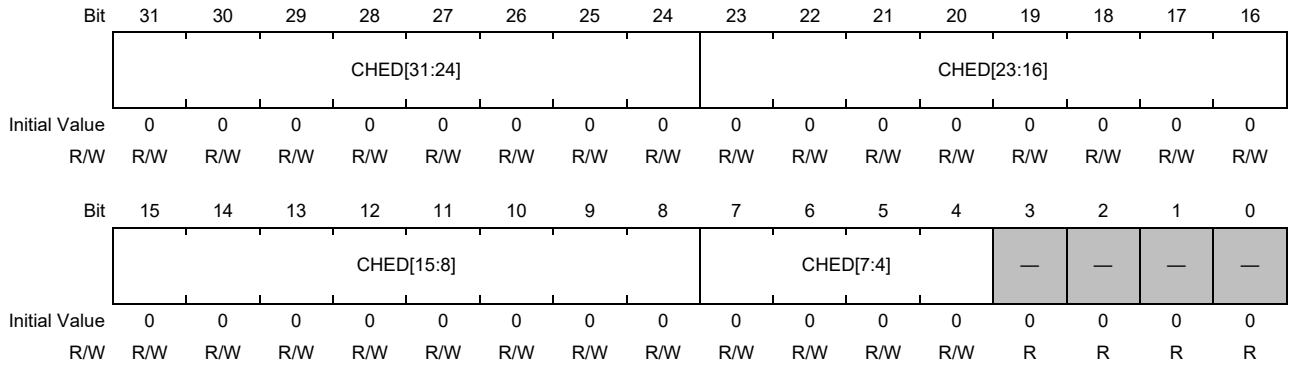
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PECD[31:24]								PECD[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PECD[15:8]								PECD[7:4]				—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	PECD	All 0	R	Period Current ED This pointer indicates the physical address of ED in the periodic list that is currently processed. The host controller updates this pointer when the list processing of the periodic ED finishes.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(9) HcControlHeadED Register

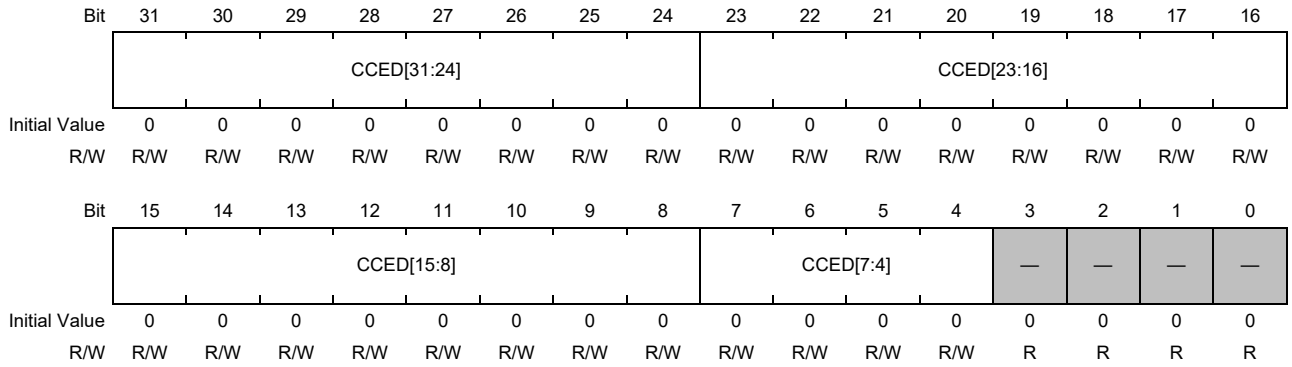
Abbreviated name of register: HcControlHeadED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CHED	All 0	R/W	Control Head ED This field specifies the physical address of the head ED of the control list. These bits must be set for control transfer before the CLE bit of the HcControl register is set. The host controller starts processing of the control list from the HcBulkHeadED pointer.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(10) HcControlCurrentED Register

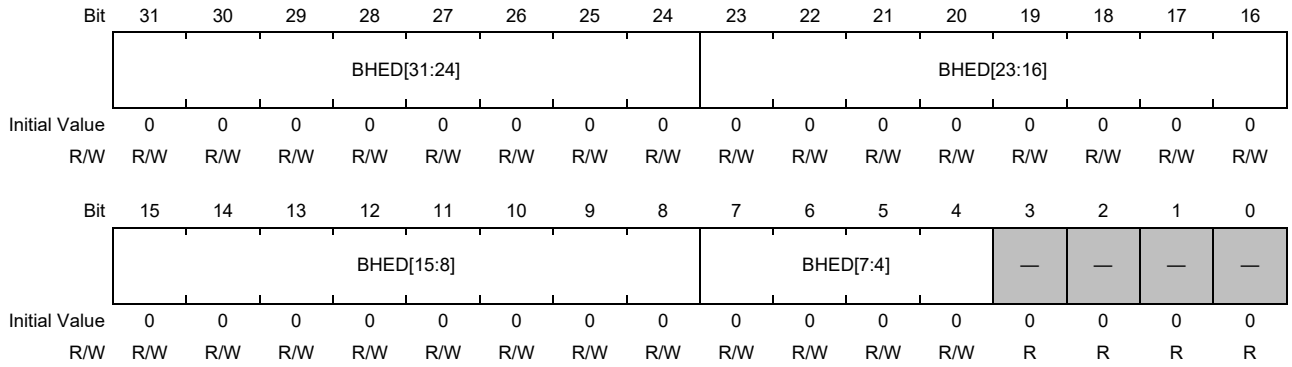
Abbreviated name of register: HcControlCurrentED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CCED	All 0	R/W	Control Current ED This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the control list.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(11) HcBulkHeadED Register

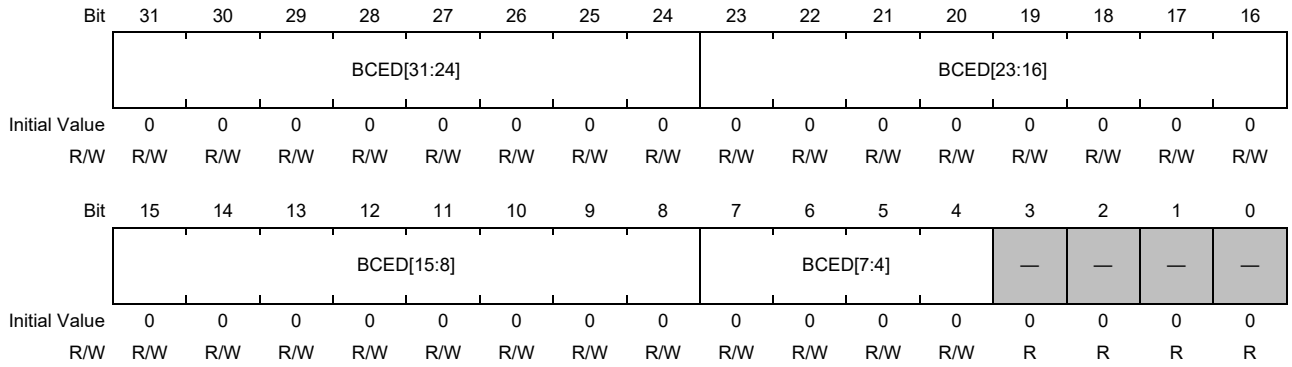
Abbreviated name of register: HcBulkHeadED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BHED	All 0	R/W	BulkHead ED This field specifies the physical address of the head ED of the bulk list. This field must be set for bulk transfer before the BLE bit of the HcControl register is set. The host controller starts the processing of the control list from the HcBulkHeadED pointer.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(12) HcBulkCurrentED Register

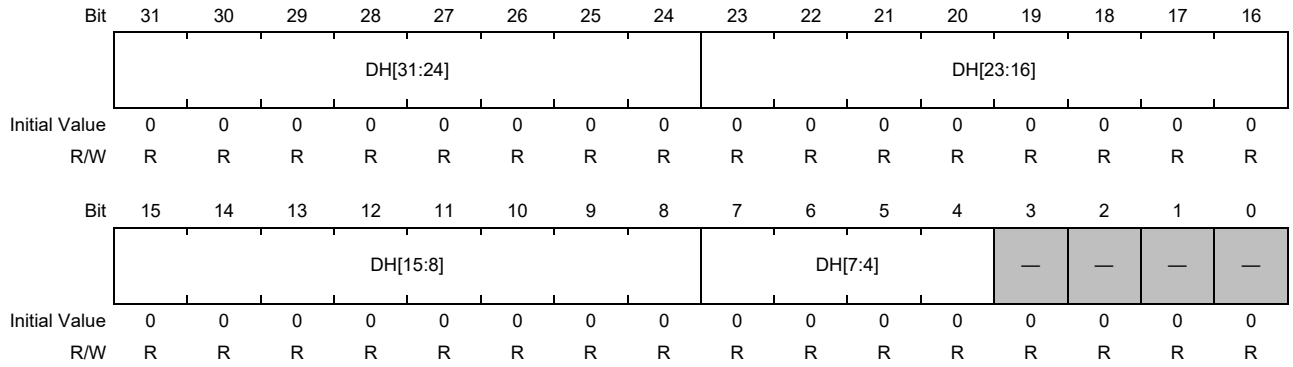
Abbreviated name of register: HcBulkCurrentED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BCED	All 0	R/W	Bulk Current ED This pointer indicates the physical address of the ED that is currently processed in the bulk list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the bulk list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcBulkHeadED field are copied to the HcBulklCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the bulk list.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(13) HcDoneHead Register

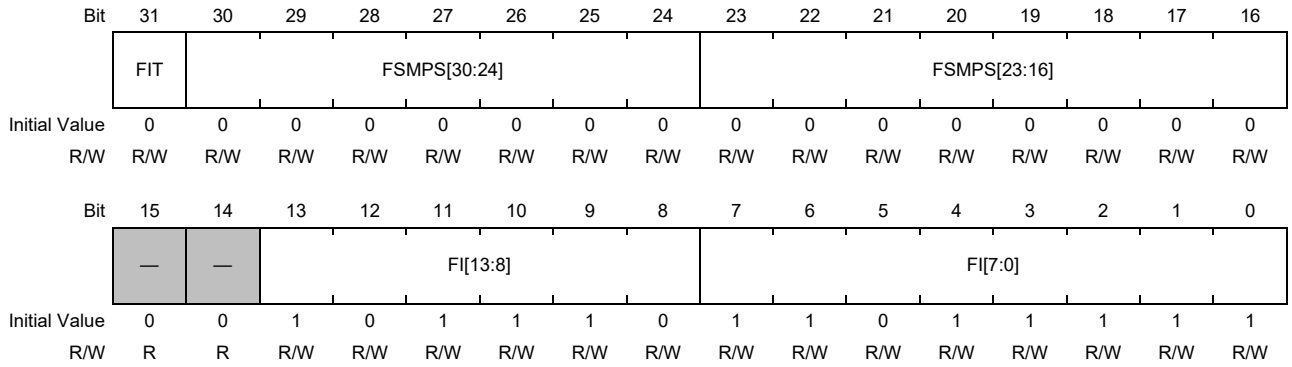
Abbreviated name of register: HcDoneHead



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DH	All 0	R	Done Head This field indicates the physical address of the HcDoneHead of the host controller. The physical address of the TD that lately finished and is added to the Done queue. After the TD processing finishes, the host controller writes the contents of the HcDoneHead to the NextTD field of the TD. At the same time, the host controller overwrites the contents of HcDoneHead with the TD address. After the host controller writes the contents of this register into HCCA, it sets 0b to this register. Then, the WritebackDoneHead bit of the HcInterruptStatus register is set to 1b.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(14) HcFmInterval Register

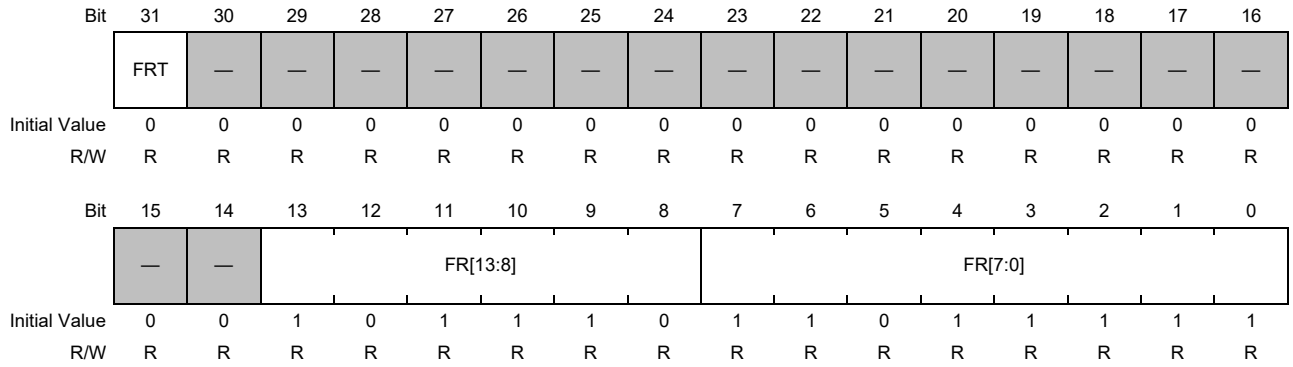
Register abbreviation: HcFmInterval



Bit	Bit Name	Initial Value	R/W	Description
31	FIT	0	R/W	Frame Interval Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register. By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register.
30 to 16	FSMPS	All 0	R/W	FS Largest Data Packet This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun. The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred. This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field. *Note*: The maximum setting value for this field is H'2778. Do not set any value that is larger than H'2778.
15, 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	FI	H'2EDF	R/W	Frame Interval This field is used to set the length of the frame (bit time) used for Full Speed. Set the value of this field to "H'2EDF" so that 1 frame (= 1 ms) of USB standard is satisfied.

(15) HcFmRemaining Register

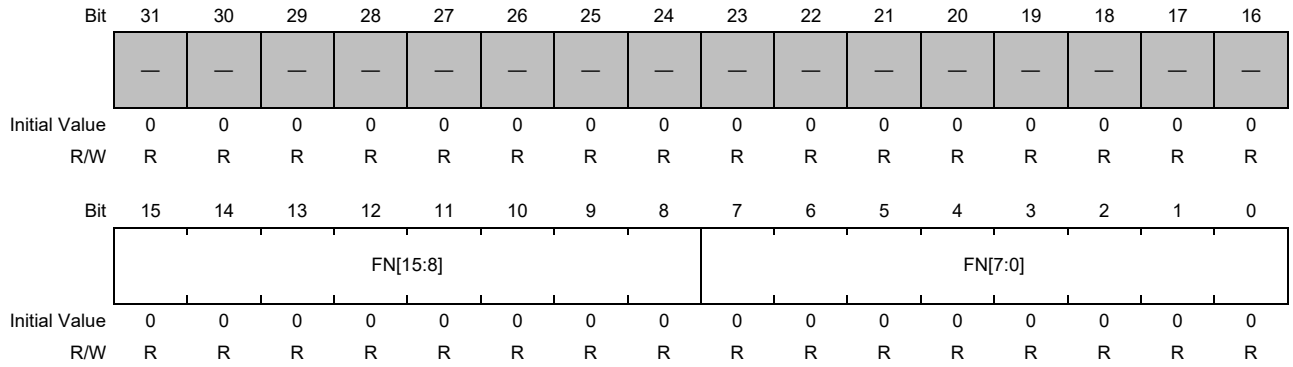
Register abbreviation: HcFmRemaining



Bit	Bit Name	Initial Value	R/W	Description
31	FRT	0	R	Frame Remaining Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to H'0000, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field.
30 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	FR	H'2EDF	R	Frame Remaining This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes H'0000, the value of FI (Frame Interval) of the HcFmInterval register is loaded. When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF.

(16) HcFmNumber Register

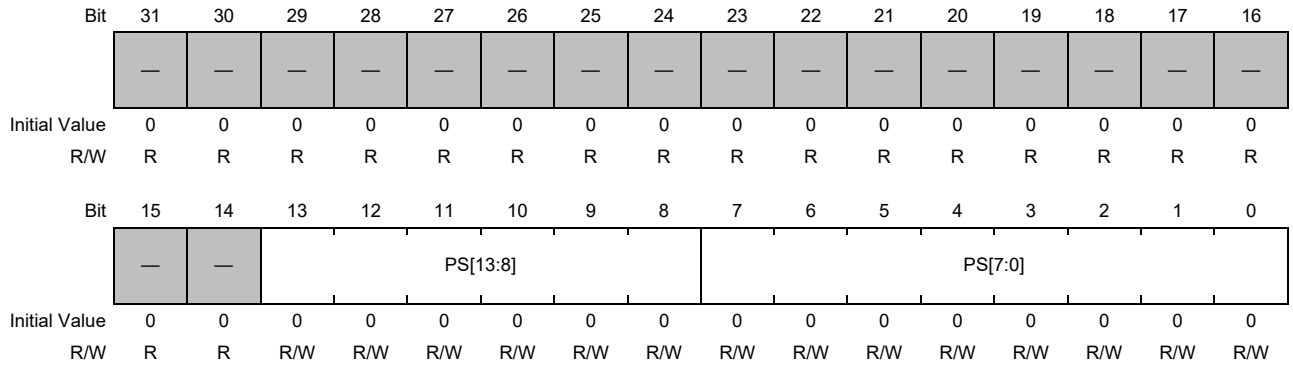
Register abbreviation: HcFmNumber



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 0	FN	All 0	R	Frame Number This field indicates the number of passed frames. When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to H'FFFF, the value is rolled over to H'0000. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame. After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register.

(17) HcPeriodicStart Register

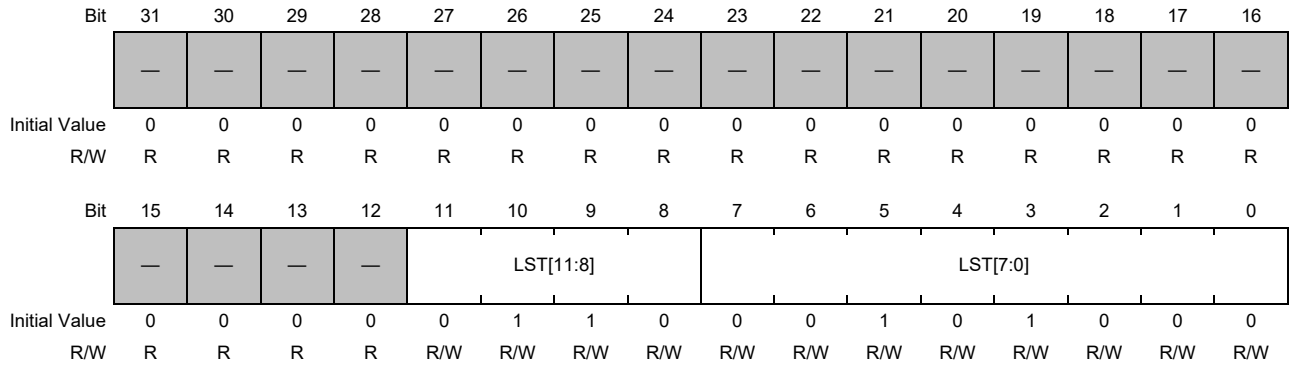
Register abbreviation: HcPeriodicStart



Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	PS	All 0	R/W	Periodic Start This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register. The recommended value is H'2A2F. When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing. Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing.

(18) HcLSThreshold Register

Register abbreviation: HcLSThreshold



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved The write value should always be 0.
11 to 0	LST	H'628	R/W	LS Threshold This field indicates the threshold value of whether transfer is available for the remaining time of the LS transfer frame. If the value of the FR field of the FmRemaining register is larger than the value set to this field, the host controller can start LS transfer.

(19) HcRhDescriptorA Register

Register abbreviation: HcRhDescriptorA

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POTPGT								—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	NOCP	OCPM	DT	NPS	PSM	NDP							
Initial Value	0	0	0	0	1	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	POTPGT	H'0F	R/W	PowerOn To PowerGood Time This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port. The unit of time is 2 ms. Therefore, the wait time is POTPGT × 2 ms.
23 to 13	—	All 0	R	Reserved The write value should always be 0.
12	NOCP	0	R/W	No OverCurrent Protection This bit sets whether the overcurrent function of the root hub is supported. If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit. 0b: The overcurrent state is supported. 1b: The overcurrent state is not supported. If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.
11	OCPM	1	R/W	OverCurrent Protection Mode This bit sets how to report the overcurrent state of the root hub. If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit. This bit is valid only when the NOCP (NoOverCurrent Protection) bit is cleared (0b). 0b: The overcurrent state is collectively reported for all ports. 1b: The overcurrent state is reported for each port.
10	DT	0	R	Device Type This bit indicates that the root hub is not a composite device. This bit is always 0b because the root hub is not allowed to be a composite device.
9	NPS	0	R/W	No Power Switching This bit sets how to control the port power. If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port. 0b: The port power can be switched between on and off. 1b: The power is always on while the host controller is running.
8	PSM	1	R/W	Power Switching Mode This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b. 0b: The power of all ports is collectively controlled. 1b: The power of ports is controlled for each port. If the PPCM (PortPower Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	NDP	H'01	R	Number Downstream Ports This field indicates the number of downstream ports supported by the root hub.

(20) HcRhDescriptorB Register

Register abbreviation: HcRhDescriptorB

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPCM	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DR	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	PPCM	1	R/W	PortPower Control Mask This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set. If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control. If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control. If the PSM bit is 0b, this bit is ignored.
16 to 2	—	All 0	R	Reserved The write value should always be 0.
1	DR	0	R/W	Device Removable This bit indicates whether each port of the root hub is removable. If this bit is 0b, the connected device is removable. If this bit is 1b, the connected device is not removable.
0	—	0	R	Reserved The write value should always be 0.

(21) HcRhStatus Register

Register abbreviation: HcRhStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRWE	—	—	—	—	—	—	—	—	—	—	—	—	—	OCIC	LPSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRWE	—	—	—	—	—	—	—	—	—	—	—	—	—	OCI	LPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CRWE	0	W	Clear RemoteWakeup Enable This bit is used to clear the DRWE bit. If this bit is set to 1b, DRWE (Device RemoteWakeup Enable) bit can be cleared. Writing 0b to this bit has no effect.
30 to 18	—	All 0	R	Reserved The write value should always be 0.
17	OCIC	0	R/W (1)	OverCurrent Indicator Change This bit is used to report the change in the OCI bit. If there is any change in the OCI bit, the host controller sets this bit to 1b. If 1b is written to this bit while this bit is set to 1b, this bit can be cleared. Writing 0b to this bit has no effect. 0b: There is no change in the Overcurrent state. 1b: There is a change in the Overcurrent state.
16	LPSC	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status Change This bit is always read as 0b because the Local Power Status is not supported. [Write] Set Global Power If this bit is set to 1b, the power to the ports is turned on. The ports whose power is turned on are determined by the settings of the PSM (Power Switching Mode) bit and the PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.

written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored
1	0	—	1b is set to the PPS bit.
	1	0	1b is set to the PPS bit.
		1	Setting ignored

Writing 0b to this bit has no effect.

15	DRWE	0	R/W	[Read] Device RemoteWakeup Enable This bit sets whether the RemoteWakeup event includes the CSC (Connect Status Change) bit. If this bit is set to 1b, the CSC bit of the HcRhPortStatus register becomes valid as the Resume event. If the CSC bit is changed to 1b, the state is changed from USB Suspend to USB Resume, and the Resume detection interrupt occurs. 0b: Connect Status Change is not the source of RemoteWakeup. 1b: Connect Status Change is the source of RemoteWakeup. [Write] Set RemoteWakeup Enable This bit is used to set the DRWE bit. Writing 0b to this bit has no effect.

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>14 to 2</td><td>—</td><td>All 0</td><td>R</td><td>Reserved
The write value should always be 0.</td></tr>
<tr><td>1</td><td>OCI</td><td>0</td><td>R</td><td>Over Current Indicator
This bit is used to report the overcurrent state in the global overcurrent detection mode (OCPM bit = 0b).
This bit always indicates 0b when overcurrent for each port is reported (when OPCM bit = 1b).
0b: The port state is normal.
1b: The port is in the overcurrent state.</td></tr>
<tr><td>0</td><td>LPS</td><td>0</td><td>R/W</td><td>The meaning of this bit differs depending on whether the operation is read or write.
[Read] Local Power Status
This bit is always read as 0b because the Local Power Status is not supported.
[Write] Clear Global Power
If this bit is set to 1b, the power to the ports is turned off.
The ports whose power is turned off are determined by the settings of the PSM (Power Switching Mode) bit and PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.
<table>

	—	—	—	—	—	—	LSDA	PPS	—	—	—	PRS	POCI	PSS	PES	CCS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The write value should always be 0.
20	PRSC	0	R/W (1)	Port Reset Status Change This bit indicates that port reset (bus reset) has finished. The host controller sets this bit when 10 ms port reset (bus reset) finishes. 0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed. 1b: Port reset has finished.
19	OCIC	0	R/W (1)	Port OverCurrent Indicator Change This bit is set when the overcurrent state of the port is detected. This bit is set when the host controller changed the POCI bit value. This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b). If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The overcurrent state has not changed. 1b: The overcurrent state has changed (POCI bit changed).
18	PSSC	0	R/W (1)	Port Suspend Status Change This bit indicates that the Resume sequence finished. This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If the PRSC (Port Reset Status Change) bit is set, this bit is cleared. 0b: The Resume sequence has not finished. 1b: The Resume sequence has finished.
17	PESC	0	R/W (1)	Port Enable Status Change This bit indicates that the PES (Port Enable Status) bit was changed. If a hardware event clears the PES bit, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The PES (Port Enable Status) bit has not changed. 1b: The PES (Port Enable Status) bit has changed.

Bit	Bit Name	Initial Value	R/W	Description
16	CSC	0	R/W (1)	Connect Status Change This bit indicates that the CCS (Current Connect Status) bit was changed. If the Connect/Disconnect event occurs, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation. 0b: The CCS (Current Connect Status) bit has not changed. 1b: The CCS (Current Connect Status) bit has changed.
15 to 10	—	All 0	R	Reserved The write value should always be 0.
9	LSDA	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Low Speed Device Attached This bit indicates the speed of the device connected to the port. This bit is valid only when the CCS (Current Connect Status) bit is set. 0b: Full Speed device is connected. 1b: Low Speed device is connected. [Write] Clear Port Power This bit is used to turn off the power of the port when the port is power controlled. Writing 1b to this bit turns off the port power. Writing 0b to this bit has no effect.
8	PPS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Power Status This bit indicates the power status of the port. This bit is cleared when the overcurrent is detected. 0b: Port power is off. 1b: Port power is on. [Write] Set Port Power This bit is used to turn on the power of the port when the port is power controlled. Writing 1b to this bit turns on the port power. Writing 0b has no effect.
7 to 5	—	All 0	R	Reserved The write value should always be 0.
4	PRS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Reset Status This bit indicates the port reset (bus reset) status. When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set. 0b: Not during port reset 1b: During port reset [Write] Set Port Reset This bit is used to issue a port reset (bus reset) to the downstream port. Writing 1b to this bit starts 10 ms of port reset. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to ports to which no device is connected, that port reset was performed.

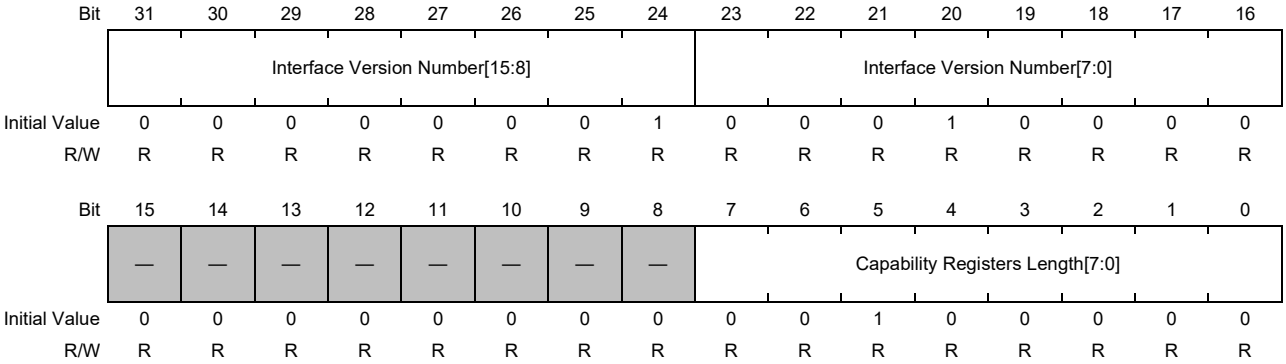
Bit	Bit Name	Initial Value	R/W	Description
3	POCI	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port OverCurrent Indicator This bit indicates that the downstream port is in the overcurrent status. This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b). On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b. 0b: The port is in normal status. 1b: The port is in overcurrent status. [Write] Clear Suspend Status This bit is used to finish the Suspend status and start the Resume sequence. Writing 1b to this bit starts the Resume sequence. Writing 0b has no effect. The Resume sequence starts only when PSS (Port Suspend Status) is set.
2	PSS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Suspend Status This bit indicates that the port status is in Suspend or Resume sequence. 0b: The port is not in Suspend status. 1b: The port is in Suspend status. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is cleared under the following conditions: • When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set • When the port reset finished, and the PRSC (Port Reset Status Change) bit is set • When the host controller is in the USB Resume state [Write] Set Port Suspend This bit is used to change the port status to Suspend. Writing 1b to this bit changes the status to Suspend. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to the ports to which no device is connected that the Suspend command was issued.
1	PES	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Enable Status This bit indicates whether the port status is Enable or Disable. If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (PortEnableStatusChange) bit is set. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is set “when port reset finished and the PRSC bit is set” or “when the port status becomes Suspend and the PRSC bit is set”. 0b: The port status is Disable. 1b: The port status is Enable. [Write] Set Port Enable This bit is used to set the PES bit. Writing 1b to this bit changes the port status to Enable. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable.

Bit	Bit Name	Initial Value	R/W	Description
0	CCS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Current Connect Status The current connection status of the downstream port is applied to this bit. 0b: No device is connected. 1b: A device is connected. [Write] Clear Port Enable This bit is used to clear the PES (Port Enable Status) bit. Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect.

32A.2.4.2 EHCI Controller Capability Register

(1) HCIVERSION/CAPLENGTH Register

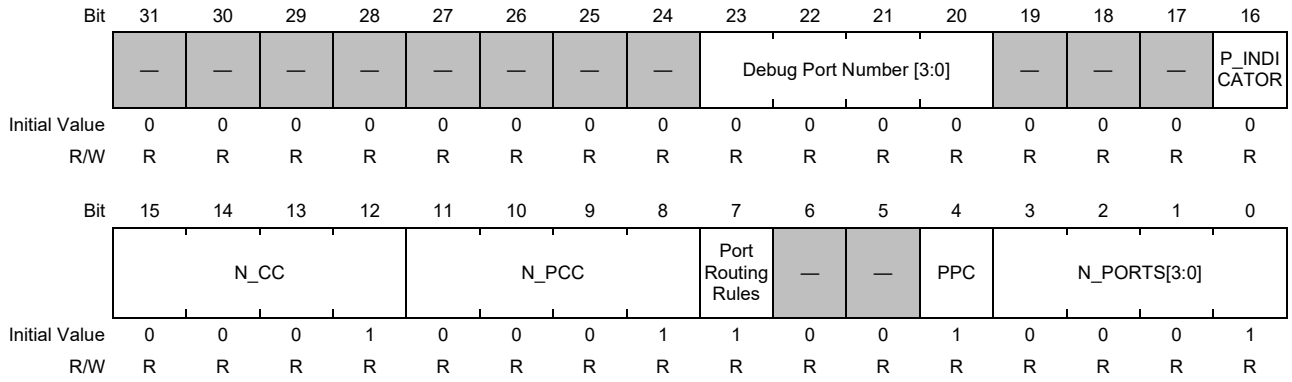
Register abbreviation: CAPL_VERSION



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Interface Version Number	H'0110	R	This field indicates the EHCI version supported by the host controller. H'0110 is indicated because this host controller supports EHCI Rev1.1.
15 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	Capability Registers Length	H'20	R	This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register. H'20 is indicated because the EHCI Operation register of this module starts from H'20.

(2) HCSPARAMS Register

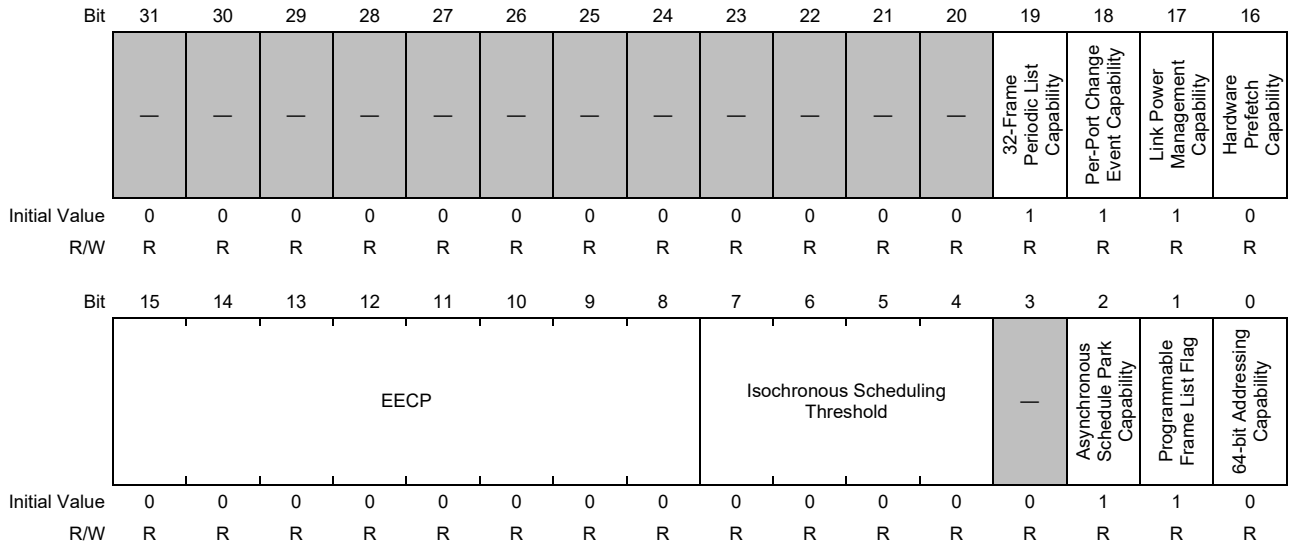
Register abbreviation: HCSPARAMS



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The write value should always be 0.
23 to 20	Debug Port Number	All 0	R	This field indicates that the host controller port is a debug port. 0000b is indicated because this module does not have a debug port.
19 to 17	—	All 0	R	Reserved The write value should always be 0.
16	P_INDICATOR	0	R	Port Indicators This bit indicates whether the host controller supports port indicator control. 0b is indicated because this module does not support port indicator control.
15 to 12	N_CC	H'1	R	Number of Companion Controller This field indicates the number of OHCI host controllers implemented in this module. H'1 is indicated because this module has one OHCI host controller.
11 to 8	N_PCC	H'1	R	Number of Ports per Companion Controller This field indicates the number of ports supported by an OHCI host controller. The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field.
7	Port Routing Rules	1	R	This bit indicates how individual ports are mapped to the OHCI host controller. This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method.
6, 5	—	All 0	R	Reserved The write value should always be 0.
4	PPC	1	R	Port Power Control This bit indicates how the port power of this module is controlled. 0b: The port power is always on. 1b: The PP bit of the PORTSC register controls the port power.
3 to 0	N_PORTS	H'1	R	This field indicates the number of physical downstream ports used by this module. 0001b: 1 Port

(3) HCCPARAMS Register

Register abbreviation: HCCPARAMS



Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved The write value should always be 0.
19	32-Frame Periodic List Capability	1	R	This bit indicates 1b because this module supports 32-Frame Periodic List defined in EHCI V1.1. This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32-Frame Periodic List.
18	Per-Port Change Event Capability	1	R	This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1. This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register. If this bit is 0b, the corresponding fields of the above registers are treated as Reserved.
17	Link Power Management Capability	1	R	This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1. This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register. If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved.
16	Hardware Prefetch Capability	0	R	This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1.
15 to 8	EECP	All 0	R	This field indicates the offset address of the EHCI Extend Capabilities Registers. This field indicates H'00 because this module does not use EHCI Extend Capabilities Registers.
7 to 4	Isochronous Scheduling Threshold	All 0	R	This field indicates H'0 because this module does not support caches with isochronous data structure for the entire frame.
3	—	0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	Asynchronous Schedule Park Capability	1	R	This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule. This bit indicates 1b because this module supports the above function.
1	Programmable Frame List Flag	1	R	This bit indicates the setting for the available frame list size. This bit indicates 1b for this module. If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable.
0	64-bit addressing Capability	0	R	This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer). This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported.

(4) HCSP-PORTROUTE Register

Register abbreviation: HCSP_PORTROUTE

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Companion Port Route[31:24]								Companion Port Route[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

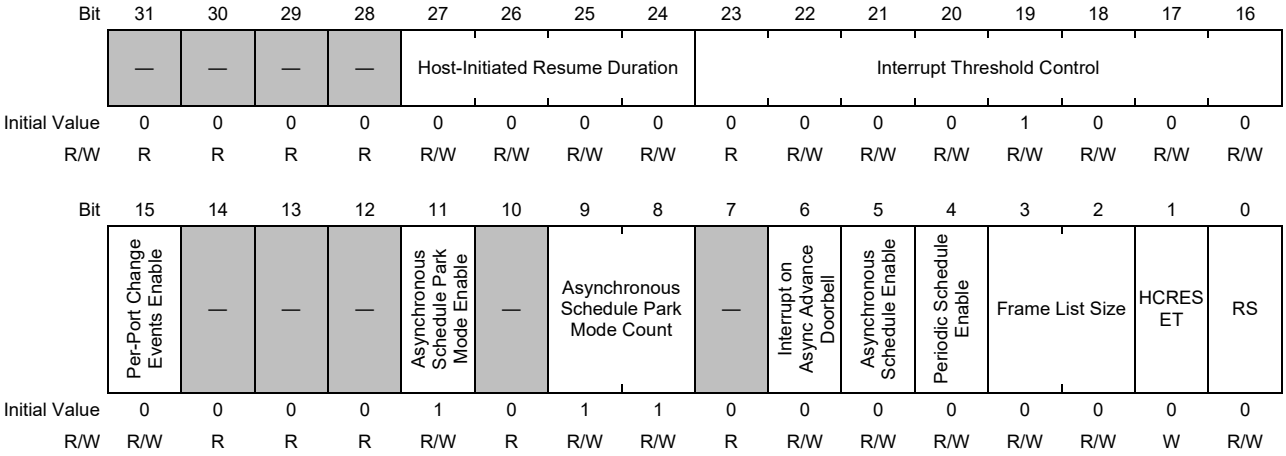
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Companion Port Route[15:8]								Companion Port Route[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Companion Port Route[31:0]	All 0	R	This field indicates the ports controlled by the OHCI host controller. This field indicates 0b for this module because this module has one OHCI host controller.

32A.2.4.3 HCI Operational Register

(1) USBCMD Register

Register abbreviation: USBCMD

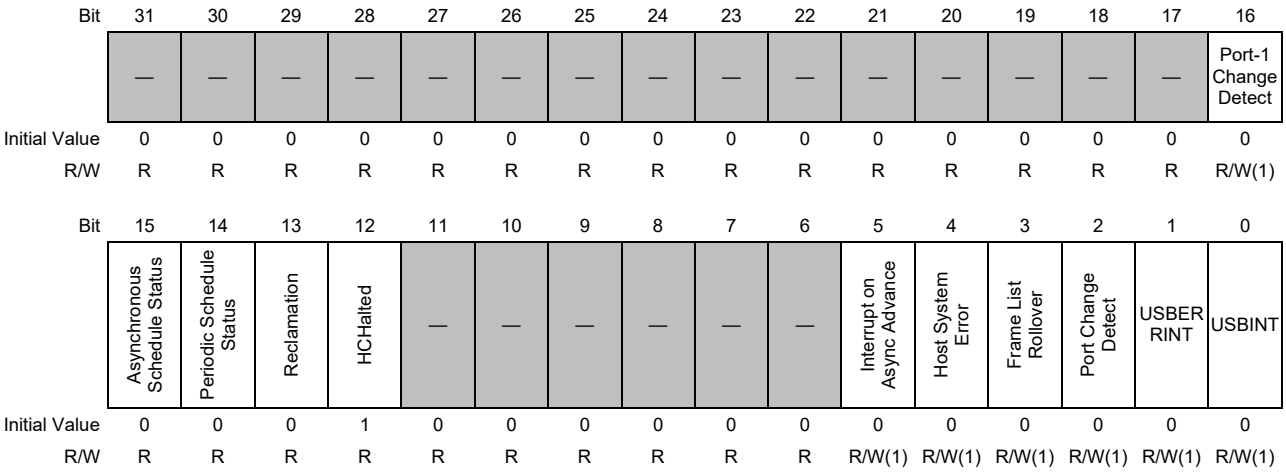


Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The write value should always be 0.
27 to 24	Host-Initiated Resume Duration	All 0	R/W	This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state. The value in this field is sent to the connected device that has the LPM function via the HIDR field in the bmAttributes field of the LPM token. The encoded value of this field is defined as the name of the HIRD field in the LPM Token. Specifically, H'0 means 50 µs, and if the value is incremented by 1, 75 µs is incremented. For example, H'1 means 125 µs, and H'4 means 1175 µs.
23 to 16	Interrupt Threshold Control	H'08	R, R/W	This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed. Value / Maximum Interrupt Interval H'00 Reserved H'01 1 micro-frame H'02 2 micro-frames H'04 4 micro-frames H'08 8 micro-frames (default, equals to 1 ms) H'10 16 micro-frames (2 ms) H'20 32 micro-frames (4 ms) H'40 64 micro-frames (8 ms) Do not set H'00 to this field while the Halted bit is 0b.
15	Per-Port Change Events Enable	0	R/W	This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register. 0b: The event report function of the ports is disabled. 1b: The event report function of the ports is enabled.
14 to 12	—	All 0	R	Reserved The write value should always be 0.
11	Asynchronous Schedule Park Mode Enable	1	R/W	This bit enables or disables the Asynchronous Schedule Park mode. 0b: The Park mode is disabled. 1b: The Park mode is enabled.

Bit	Bit Name	Initial Value	R/W	Description
10	—	0	R	Reserved The write value should always be 0.
9, 8	Asynchronous Schedule Park Mode Count	11b	R/W	This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule. The valid value range is H'1 to H'3. This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b. Do not set H'0 to this field.
7	—	0	R	Reserved The write value should always be 0.
6	Interrupt on Async Advance Doorbell	0	R/W	This bit is used as the doorbell. In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b. After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing. If the asynchronous schedule is disabled, do not write 1b to this bit.
5	Asynchronous Schedule Enable	0	R/W	This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing. 0b: The asynchronous list processing is skipped. 1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing.
4	Periodic Schedule Enable	0	R/W	This bit sets whether the host controller proceeds or skips the periodic list processing. 0b: The periodic list processing is skipped. 1b: Use the PERIODICLISTBASE register to proceed the periodic list processing.
3, 2	Frame List Size	0	R/W	This field specifies the frame list size. The setting value of this field determines the size of the Frame List Current index of the FRINDEX register. Value: 00b — the number of frames in Frame List: 1024 frames (default) 01b: 512 frames 10b: 256 frames 11b: 32 frames
1	HCRESET	0	W	Host Controller Reset This bit is used to initialize the EHCI circuit of the host controller. If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports. Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI. Software must be reset to return the host controller to the operational state. When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit.
0	RS	0	R/W	Run/Stop This bit is used to run or stop the EHCI host controller. If this bit is set to 1b, the host controller starts operation. As long as this bit is set to 1b, the host controller continues running. If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status. If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit.

(2) USBSTS Register

Register abbreviation: USBSTS



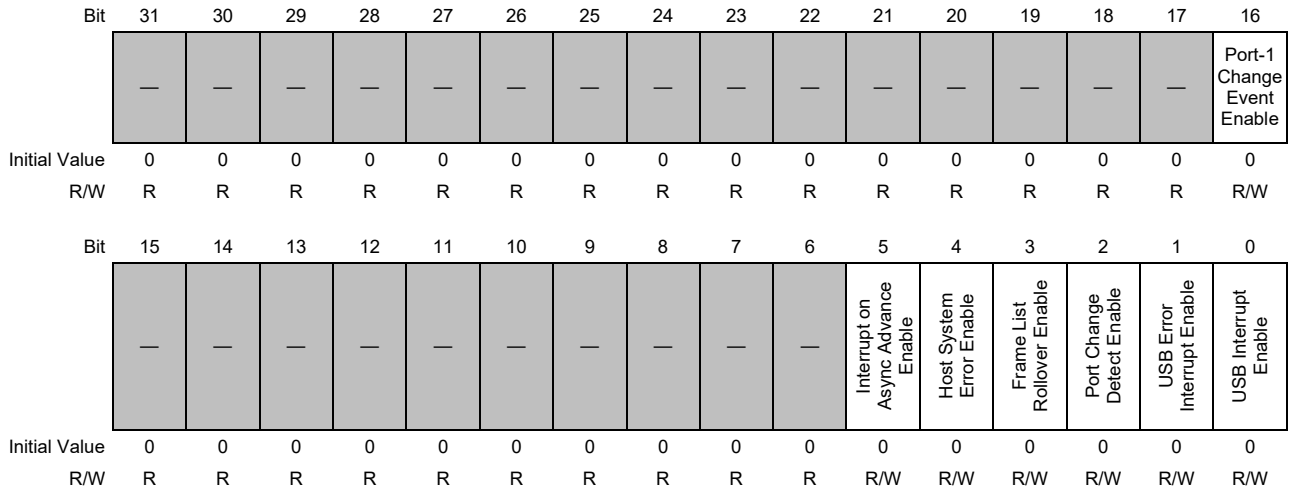
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The write value should always be 0.
16	Port-1Change Detect	0	R/W (1)	If this bit is set to 1b, it indicates that a change in the port status was detected. This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b.
15	Asynchronous Schedule Status	0	R	This bit indicates the current status of the asynchronous schedule. 0b: The asynchronous schedule is disabled. 1b: The asynchronous schedule is enabled. If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b).
14	Periodic Schedule Status	0	R	This bit indicates the current status of the periodic schedule. 0b: The periodic schedule is disabled. 1b: The periodic schedule is enabled. If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b).
13	Reclamation	0	R	This bit is used to detect an empty asynchronous schedule. If this bit is 1b, the asynchronous schedule is empty. After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b. Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b. If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode.
12	HCHalted	1	R	If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b. If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit. 0b: The EHCI host controller is running. 1b: The EHCI host controller is stopped.
11 to 6	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	Interrupt on Async Advance	0	R/W (1)	This bit indicates the Async Advance Interrupt status. After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit. If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect. 0b: Async Advance Interrupt not occurred. 1b: Async Advance Interrupt status is detected.
4	Host System Error	0	R/W (1)	This bit is set to 1b if a serious error occurs in the host controller. If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: No system error occurred. 1b: A system error occurred.
3	Frame List Rollover	0	R/W (1)	If a frame list rollover occurs, the host controller sets this bit to 1b. Specifically, when the Frame Index field of the FRINDEX register is returned to H'000 from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register. For example, if the Frame List Size is 1024 frame, rollover occurs every time FRIMDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles. If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles. Writing 1b to this bit can clears this bit. Writing 0b to this bit has no effect. 0b: The frame list is not returned to H'000. 1b: The frame list is returned to H'000 (rollover occurred).
2	Port Change Detect	0	R/W (1)	This bit indicates that the port status has changed. Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b: • Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0 to 1. • A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0 to 1. • The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0 to 1. • J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0 to 1. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.
1	USBERRINT	0	R/W (1)	USB Error Interrupt This bit indicates that a USB transaction finished with an error. When a USB transaction finishes with an error, the host controller sets this bit to 1b. If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: USB transaction is normal. 1b: USB transaction finished with an error.

Bit	Bit Name	Initial Value	R/W	Description
0	USBINT	0	R/W (1)	USB Interrupt This bit indicates that a USB transfer has finished. The host controller sets this bit to 1b if one of the following conditions is satisfied: • A USB transfer has finished. • A short packet is received. Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: A USB transfer has not finished. 1b: A USB transfer has finished.

(3) USBINTR Register

Register abbreviation: USBINTR

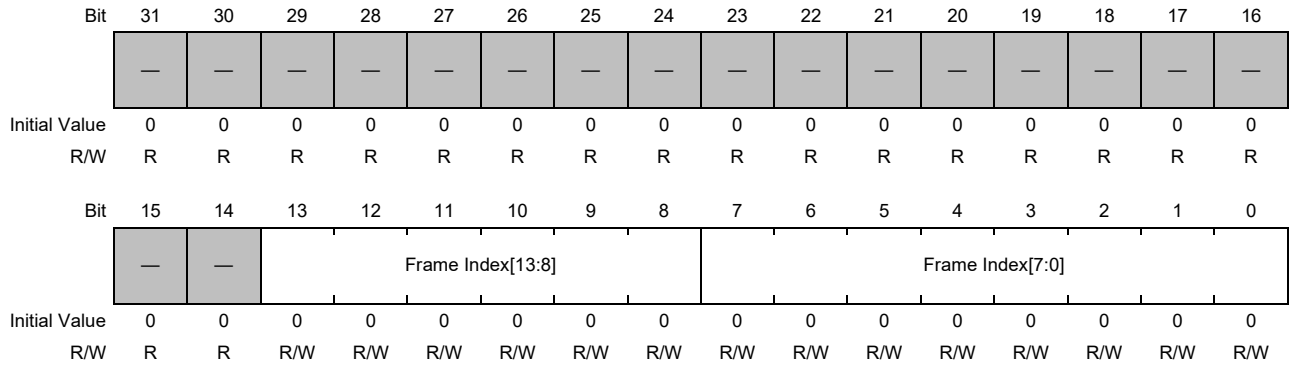


Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The write value should always be 0.
16	Port-1 Change EventEnable	0	R/W	If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt.
15 to 6	—	All 0	R	Reserved The write value should always be 0.
5	Interrupt on Async Advance Enable	0	R/W	This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled. If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the IAA bit).
4	Host System Error Enable	0	R/W	This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the HSE bit).
3	Frame List Rollover Enable	0	R/W	This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled. If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the FLR bit).
2	Port Change Detect Enable	0	R/W	This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the PCD bit).
1	USB Error Interrupt Enable	0	R/W	This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBERRINT bit).

Bit	Bit Name	Initial Value	R/W	Description
0	USB Interrupt Enable	0	R/W	This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled. If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBINT bit).

(4) FRINDEX Register

Register abbreviation: FRINDEX



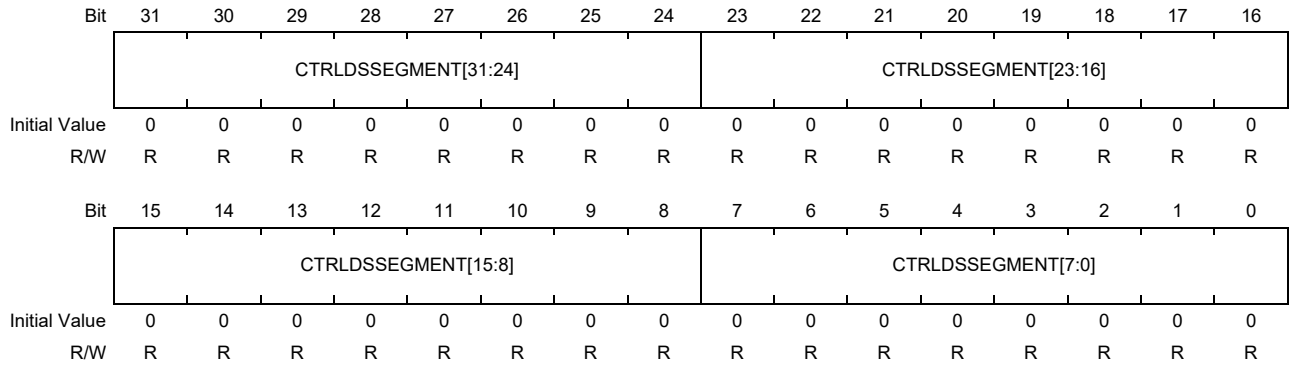
Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	Frame Index[13:0]	All 0	R/W	This field is used by the host controller to add an index to the periodic frame list. The value in this field is incremented at the end of a micro frame. Bit [N:3] of this field is used as the Frame List Current index. This means that, before the next index arrives, the current frame list is accessed 8 times. The value for N is determined, as follows, by the setting value of bit [3:2] (Frame List Size field) of the USBCMD register.

Frame List Size	Number of Frames	N
00b	1024	12
01b	512	11
10b	256	10
11b	32	12

Access this register only when the host controller is in stop status (bit 12 [HCHalted] = 1b). The setting value of this field is applied to the SOF frame number of the SOF token.

(5) CTRLDSSEGMENT Register

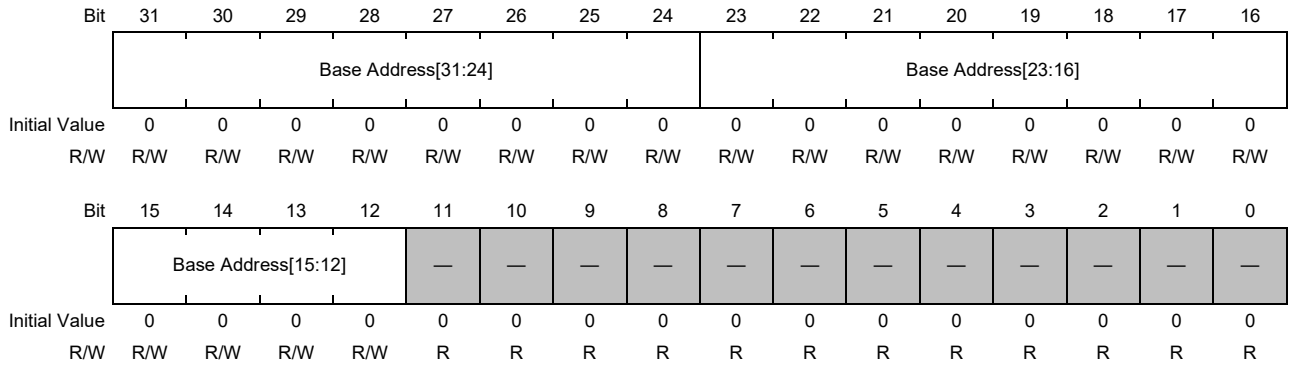
Register abbreviation: CTRLDSSEGMENT



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTRLDSSEGMENT	All 0	R	This register is not used because this module does not support 64-bit address method. Therefore, HCD must not access this register.

(6) PERIODICLISTBASE Register

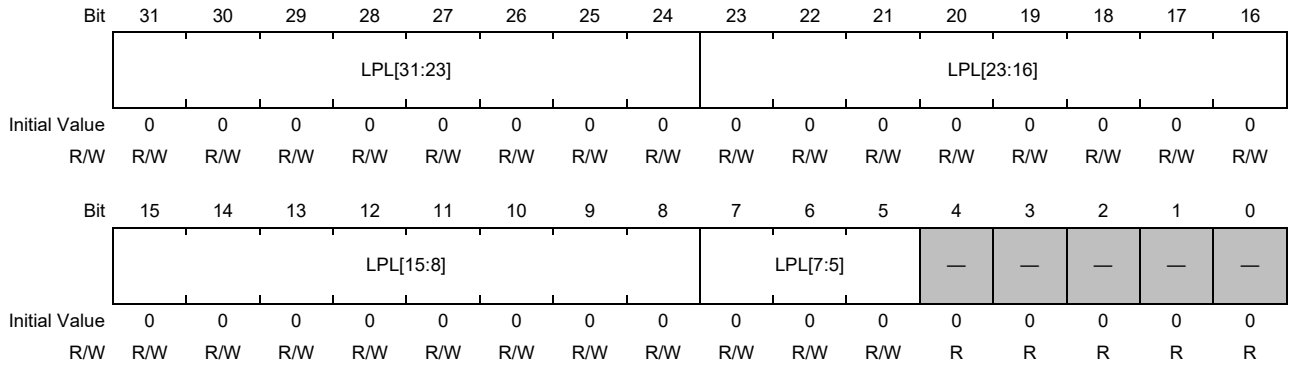
Register abbreviation: PERIODICLISTBASE



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	Base Address	All 0	R/W	This field indicates the head address of the periodic frame list on the system memory. The host controller loads the contents of this register before starting the list processing. The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register. Align the address of the periodic frame list by 4 Kbyte. Normal operation is not guaranteed if any of these bits are changed during operation.
11 to 0	—	All 0	R	Reserved The write value should always be 0.

(7) ASYNCLISTADDR Register

Register abbreviation: ASYNCLISTADDR



Bit	Bit Name	Initial Value	R/W	Description
31 to 5	LPL	All 0	R/W	Link Pointer Low This field indicates the address (on the system memory) of the Asynchronous Queue Head to be processed next time. Align the address of Asynchronous Queue Head by 32 byte.
4 to 0	—	All 0	R	Reserved The write value should always be 0.

(8) CONFIGFLAG Register

Register abbreviation: CONFIGFLAG

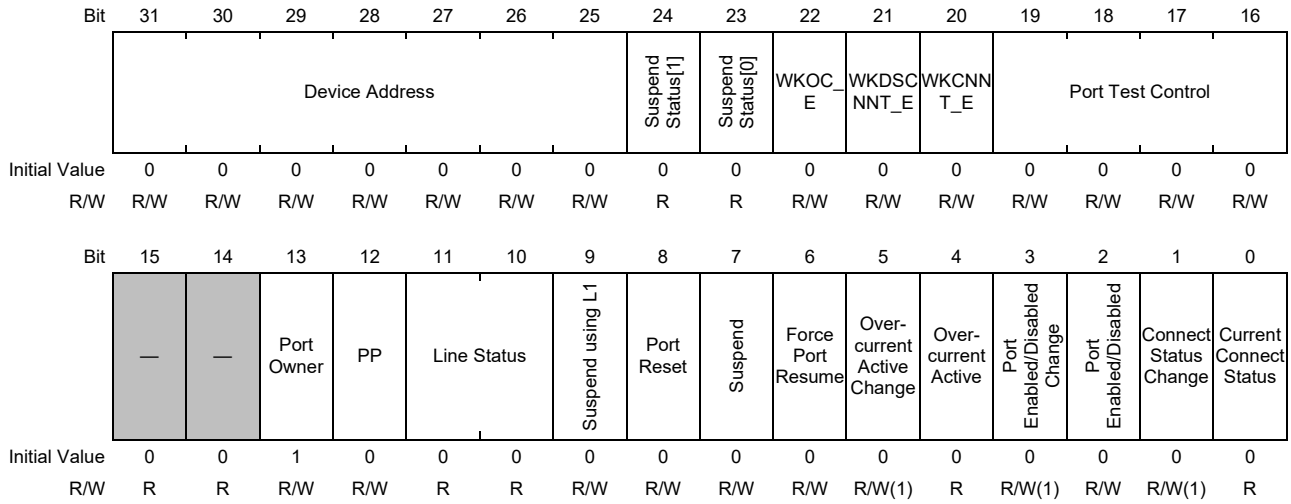
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The write value should always be 0.
0	CF	0	R/W	Configuration Flag This bit controls which of OHCI or EHCI is routed by the port routing control circuit by default. At the end of the host controller configuration, this bit is set to 1b. 0b: The port routing control circuit routes each port to the OHCI host controller by default. 1b: The port routing control circuit routes each port to the EHCI host controller by default.

(9) PORTSC1Register

Register abbreviation: PORTSC1



Bit	Bit Name	Initial Value	R/W	Description
31 to 25	Device Address	All 0	R/W	This field indicates the USB device address (7 bits) of the device connected to the down port. This address is used when the LPM Token is sent. If the value of this filed is H'00, it means that no device that needs to use this field has been connected.
24, 23	Suspend Status	All 0	R	This field indicates the response from the connected device to the LPM Token (L1 transition request). 00b: The device succeeded transition to the L1 state (ACK received from the device). 01b: The device has not changed to the L1 state (NYET received from the device). 10b: The device does not support the L1 state transition (STALL received from the device). 11b: Other response (for example, Timeout error) Change this field only when the Suspend bit is 0b.
22	WKOC_E	0	R/W	Wake on Overcurrent Enable By writing 1b to this bit, the overcurrent state can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
21	WKDSCNNT_E	0	R/W	Wake on Disconnect Enable By writing 1b to this bit, device disconnection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
20	WKCNNT_E	0	R/W	Wake on Connect Enable By writing 1b to this bit, device connection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>19 to 16</td><td>Port Test Control</td><td>All 0</td><td>R/W</td><td>This field is controlled by the test mode.
If the value of this field is other than 0000b, it indicates that this module is running in the test mode.

</table>

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>9</td><td>Suspend using L1</td><td>0</td><td>R/W</td><td>Suspend using L1 (LPM) control bit.
If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state.
Writing to this bit is possible only when the Suspend bit (bit 7) is 0b.
0b: Suspend using L2
1b: Suspend using L1 (LPM)
If this bit is 1b and the Device Address field is other than H’0000, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state.
If this bit is 0b, the host controller operates as L2 Suspend.</td></tr>
<tr><td>8</td><td>Port Reset</td><td>0</td><td>R/W</td><td>This bit indicates the reset status of the port.
0b: The port is not being reset.
1b: The port is being reset.
If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete.
If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b.
If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b.
Note: Even if 1b is written to this bit, the bus reset sequence does not start.
• PP (Port Power) bit = 0b
• Port Owner bit = 1b
• Current Connect Status bit = 0b</td></tr>
<tr><td>7</td><td>Suspend</td><td>0</td><td>R/W</td><td>This bit indicates the Suspend control and status of the port.
This bit and bit 2 (Port Enabled/Disabled bit) indicate the following port status.
<table>
<tr><th>Port Enabled</th><th>Suspend</th><th>Port Status</th></tr>
<tr><td>0b</td><td>—</td><td>Disable</td></tr>
<tr><td>1b</td><td>0b</td><td>Enable</td></tr>
<tr><td></td><td>1b</td><td>Suspend</td></tr>
</table>
To change the port state to L1 or L2 Suspend, set this bit to 1b.
Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit.
In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes.
Writing 0b to this bit has no effect.
This bit can be set to 1b only when all the following conditions are satisfied: “PP (Port Power) bit = 1b”, “Port Owner bit = 0b”, and “Current Connect Status bit = 1b”. If any of the following conditions is satisfied, the host controller clears this bit:
• “Resume is complete” is detected.
• The PR bit is set to 1b when PR (Port Reset) bit is 0b.
• The port owner is 1b (OHCI).
• The PP (Port Power) bit is set to 0b.
• The Port Enabled/Disabled bit is set to 0b.</td></tr>
</table>

Bit	Bit Name	Initial Value	R/W	Description
6	Force Port Resume	0	R/W	This bit indicates that the Resume state of the port is detected. 0b: Resume signal is not detected or output. 1b: Resume (K-state) is detected or output. When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b. If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus. For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b. On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register. If the Port Power (PP) bit is 0b, this bit becomes 0b.
5	Over-current Change	0	R/W (1)	This bit indicates that bit 4 (Over-current Active bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: Over-current Active bit has not changed. 1b: Over-current Active bit has changed.
4	Over-current Active	0	R	This bit indicates the overcurrent status of the port. If the host controller detects overcurrent, it disables the port, and set this bit to 1b. After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b. 0b: The port is not in overcurrent state. 1b: The port is in overcurrent state.
3	Port Enable/ Disable Change	0	R/W (1)	This bit indicates that the host controller detected frame babble. If the Host Controller detects frame babble, it disables the port and sets this bit to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: Frame babble has not occurred. 1b: Frame babble is detected.
2	Port Enabled/ Disabled	0	R/W	This bit indicates the Enable/Disable status of the port. The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b. If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit. If the port is disabled, data transfer to the downstream port is blocked except for port reset. If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The port is disabled. 1b: The port is enabled.
1	Connect Status Change	0	R/W (1)	This bit indicates that bit 0 (Current Connect Status bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The Current Connect Status bit has no change. 1b: The Current Connect Status bit has changed.

Bit	Bit Name	Initial Value	R/W	Description
0	Current Connect Status	0	R	This bit indicates the connection status of the port. If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected. On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b. If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b. 0b: No device is connected to the port. 1b: A device is connected to the port.

32A.2.4.4 AHB Bridge Register

(1) INT_ENABLE Register

Abbreviated name of register: INT_ENABLE

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	WAKEON_INTEN	UCOM_INTEN	USBH_INTBEN	USBH_INTAEN	AHB_INTEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved The write value should always be 0.
4	WAKEON_INTEN	0	R/W	This bit enables or disables bit 4 (WAKEON_INT) of the INT_STATUS register. 0b: disable 1b: enable
3	UCOM_INTEN	0	R/W	This bit enables or disables bit 3 (UCOM_INT) of the INT_STATUS register. 0b: disable 1b: enable
2	USBH_INTBEN	0	R/W	This bit enables or disables bit 2 (USBH_INTB) of the INT_STATUS register. 0b: disable 1b: enable
1	USBH_INTAEN	0	R/W	This bit enables or disables bit 1 (USBH_INTA) of the INT_STATUS register. 0b: disable 1b: enable
0	AHB_INTEN	0	R/W	This bit enables or disables bit 0 (AHB_INT) of the INT_STATUS register. 0b: disable 1b: enable

(2) INT_STATUS Register

Abbreviated name of register: INT_STATUS

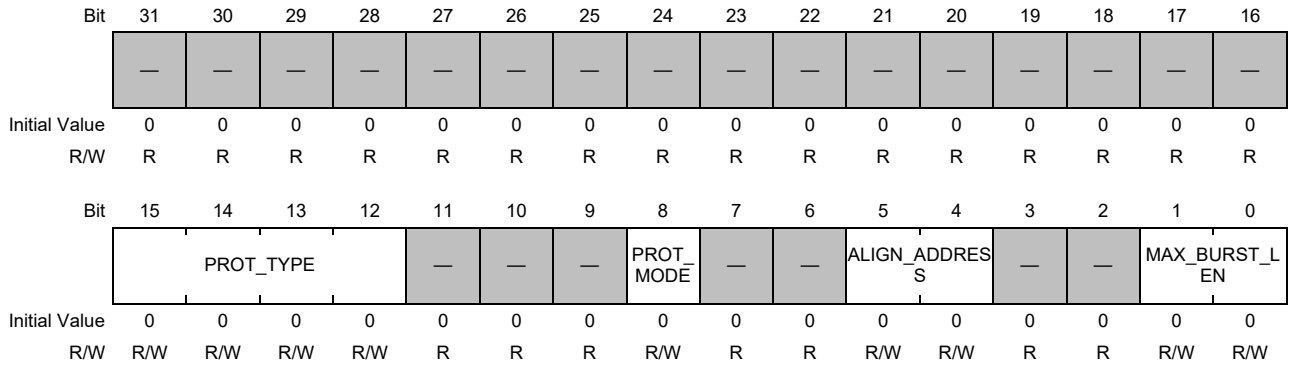
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	WAKEON_INT	UCOM_INT	USBH_INTB	USBH_INTA	AHB_INT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R	R	R	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved The write value should always be 0.
4	WAKEON_INT	0	R/W (1)	This bit indicates the state of WAKEON interrupt from the HOST module. Writing 1b to this bit can clear this bit. 0b: No WAKEON interrupt 1b: WAKEON interrupt
3	UCOM_INT	0	R	This bit indicates the state of interrupt from the UCOM register. To clear the interrupt, use the UCOM2 Register. 0b: No UCOM register interrupt 1b: UCOM register interrupt
2	USBH_INTB	0	R	This bit indicates the state of EHCI interrupt. To clear the interrupt, use the USBSTS Register (of the EHCI Operational Register). 0b: No INTB interrupt 1b: INTB interrupt
1	USBH_INTA	0	R	This bit indicates the state of OHCI interrupt. To clear the interrupt, use the HcInterruptStatus Register (of the OHCI Operational Register). 0b: No INTA interrupt 1b: INTA interrupt
0	AHB_INT	0	R/W (1)	This bit indicates that a BUS Master error occurred. Writing 1b to this bit can clear this bit. 0b: No bus error occurred. 1b: A bus error occurred.

(3) AHB_BUS_CTR Register

Abbreviated name of register: AHB_BUS_CTR



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 12	PROT_TYPE	All 0	R/W	This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request. bit 15 0b: Cache disabled. 1b: Cache enabled. bit 14 0b: Buffer disabled. 1b: Buffer enabled. bit 13 0b: User access 1b: Privileged access bit 12 0b: Operation code 1b: Data
11 to 9	—	All 0	R	Reserved The write value should always be 0.
8	PROT_MODE	0	R/W	This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request. 0b: The value of PROT_TYPE is output as MHPROT [3:0]. 1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed.
7, 6	—	All 0	R	Reserved The write value should always be 0.
5, 4	ALIGN_ADDRESS	All 0	R/W	This field sets the address boundary used when the BUS Master interface issues a burst transfer. 00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary. 01b: A burst transfer is issued so that not to exceed 64-byte boundary. 10b: A burst transfer is issued so that not to exceed 32-byte boundary. (The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.) 11b: A burst transfer is issued so that not to exceed16 byte boundary. (The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.)
3,2	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	MAX_BURST_LEN	All 0	R/W	This field selects the maximum burst length used when the BUS Master interface issues a transfer request. 00b: INCR16 01b: INCR8 10b: INCR4 11b: SINGLE

(4) USBCTR Register

Abbreviated name of register: USBCTR

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DIRPD	PLL_RST	USBH_RST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The write value should always be 0.
2	DIRPD	0	R/W	USBPHY Standby Mode Control 0b: USBPHY normal operating mode 1b: USBPHY standby mode *Note*: When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module. Only set it to 1 when the USB module is not in use. In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 µs before the transition.
1	PLL_RST	1	R/W	This bit controls resetting of the USBPHY module. 0b: The USBPHY reset is released. 1b: The USBPHY module is reset.
0	USBH_RST	0	W	Software reset to this module. Setting this bit to 1b resets this module entirely. This bit is always read as 0b. *Note*: Set this bit only when the BUS Master interface of this module is not running. Access to this module becomes valid 10 CLK (internal bus clock [P1ϕ]) after this bit is written. 0b: Nothing occurs. 1b: Reset is issued to this module.

(5) Register Enable/Clock Gating Control Register

Abbreviated name of register: REGEN_CG_CTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NONUSE_CLK_MSK	—	HOST_CLK_MSK	PERI_CLK_MSK	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	NONUSE_CLK_MSK	0	R/W	This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register. 0b: Do not mask the clock. 1b: Mask the clock. For details, see **Section 32A.3.1.2, Specifications of NONUSE_CLK_MSK operation**.
30	—	0	R	Reserved The write value should always be 0.
29	HOST_CLK_MSK	0	R/W	This bit is used to forcibly mask clock supply to the host controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **Section 32A.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
28	PERI_CLK_MSK	0	R/W	This bit is used to forcibly mask the clock supply to the peripheral controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **Section 32A.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
27 to 24	—	All 0	R	Reserved The write value should always be 0.
23 to 0	—	All 0	R	Reserved The write value should always be 0.

(6) Suspend Control Register

Abbreviated name of register: SPD_CTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SUSPENDM_ENABLE	SLEEPM_ENABLE	—	—	—	—	—	—	WKCNNT_ENABLE	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

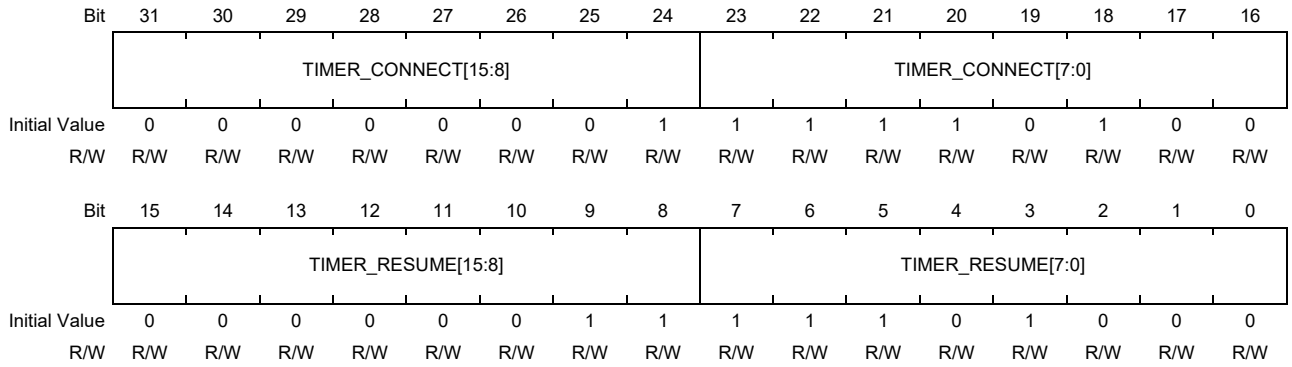
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GLOBAL_SUSPENDM_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SUSPENDM_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode. If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status. [This function is valid for the following OHCI/EHCI Operational registers] EHCI: bit [7] (Suspend bit) of the PORTSC1 register OHCI: bit [2] (PSS bit) of the HcRhPortStatus register OHCI: bit [7:6] (HCFS field) of the HcControl register
30	SLEEPM_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.) This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b. [This function is valid for the following OHCI/EHCI Operational register] EHCI: bit [7] (Suspend bit) of the PORTSC1 register
29 to 24	—	All 0	R	Reserved The write value should always be 0.
23	WKCNNT_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b). If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released. This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b. *Note*: To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEPM_ENABLE bit (bit 30), as the general rule, set this bit to 1b. If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs.
22 to 1	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	GLOBAL_SUSPENDM_P1	0	R/W	The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register. This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped). If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller. *Note*: – Do not set this bit to 1b during data transfer. We recommend that you set this bit to 1b after “stopping the EHCI/OHCI list processing” and “placing the port in the disabled status”. – If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b.

(7) Suspend/Resume Timer Setting Register

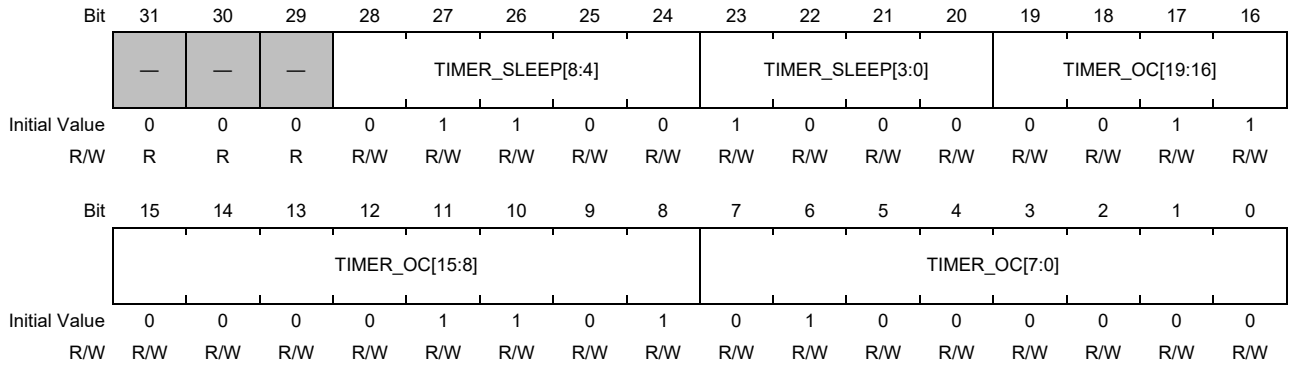
Abbreviated name of register: SPD_RSM_TIMSET



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TIMER_CONNECT[15:0]	H'01F4	R/W	This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 2.5 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: At least H'FA
15 to 0	TIMER_RESUME[15:0]	H'03E8	R/W	This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 5 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: At least H'1F4

(8) Overcurrent Detection/Sleep Timer Setting Register

Abbreviated name of register: OC_SLP_TIMSET



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The write value should always be 0.
28 to 20	TIMER_SLEEP[8:0]	H'0C8	R/W	This field indicates the timer value used by USBPHY when the SLEEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated). When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes 1 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: H'064
19 to 0	TIMER_OC[19:0]	H'30D40	R/W	This field indicates the timer value used for overcurrent detection. If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred. According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (µs). (Setting guideline) For 100 MHz and 1 ms: At least H'1_86A0

(9) SBRN_FLADJ_PORTWAKECAP Register

Abbreviated name of register: SBRN_FLADJ_PW

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PORTWAKECAP[15:8]								PORTWAKECAP[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLADJ[7:0]								SBRN[7:0]							
Initial Value	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PORTWAKECAP[15:0]	H'0003	R/W	This field is used to mask the ports (of the connected device) that are used for Wakeup event. Operation on this field has no effect on the operation of the HOST module.
15 to 8	FLADJ[7:0]	H'20	R, R/W	This field adjusts the length of one micro frame by 16HS bit time unit. The initial value indicates H'20 (60000d HS bit time).
7 to 0	SBRN[7:0]	H'20	R	This field indicates the Serial Bus Release Number. The fixed value "H'20" is indicated.

(10) PORT_LPM_CTR1 Register

Abbreviated name of register: PORT_LPM_CTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	NYET_RETRY_CNT_P1[3:0]				REMOTEWAKE_EN_P1	SLEEP_INT_EN_P1	RETRY_ENABLE_NYET_P1	HIRD_SEL_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 4	NYET_RETRY_CNT_P1[3:0]	All 0	R/W	This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b. 0000b: No retry. 0001b to 1111b: Retries the set number of times. (MAX: 15 retries)
3	REMOTEWAKE_EN_P1	0	R/W	This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token. 0b: RemoteWakeup is supported. 1b: RemoteWakeup is not supported.
2	SLEEP_INT_EN_P1	0	R/W	This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction. The Per-Port Change interrupt can occur. 0b: No interrupt occurs. 1b: An interrupt occurs.
1	RETRY_ENABLE_NYET_P1	0	R/W	This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction. 0b: No retry. 1b: Retries are made.

Bit	Bit Name	Initial Value	R/W	Description
0	HIRD_SEL_P1	0	R/W	This bit sets the time for K drive for when recovered from the Sleep state. Based on the setting values of this bit and EHCI USBCMD Register bit [27:24], the K drive time is determined as follows.

USBCMD Register	HIRD_SEL_P1 (Setting value of this bit)	
bit [27:24]	0b	1
0000b	75 µs	50 µs
0001b	100 µs	125 µs
0010b	150 µs	200 µs
0011b	250 µs	275 µs
0100b	350 µs	350 µs
0101b	450 µs	425 µs
0110b	950 µs	500 µs
0111b	1950 µs	575 µs
1000b	2950 µs	650 µs
1001b	3950 µs	725 µs
1010b	4950 µs	800 µs
1011b	5950 µs	875 µs
1100b	6950 µs	950 µs
1101b	7950 µs	1025 µs
1110b	8950 µs	1100 µs
1111b	9950 µs	1175 µs

32A.2.4.5 UCOM Register

(1) Common Control Register

Abbreviated name of register: COMMCTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTG_PERI	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	OTG_PERI	1	R/W	This bit specifies whether this module is set to the host mode or function mode. 0b: Host mode 1b: Function mode (Only CH0 can be set)
30 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.

(2) OTG-BC Interrupt Status Register

Abbreviated name of register: OBINTSTA

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPMONCHG_STA	DMMONCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHGDETCHG1_STA	—	PDDETCHG1_STA	—	—	OCINT_STA	IDCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R/W(1)	R	R/W(1)	R	R	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	DPMONCHG_STA	0	R/W (1)	This bit is set if the DPMON bit of the LINECTRL1 register has changed. 0b: The DPMON bit of the LINECTRL1 register has not changed. 1b: The DPMON bit of the LINECTRL1 register has changed.
16	DMMONCHG_STA	0	R/W (1)	This bit is set if the DMMON bit of the LINECTRL1 register has changed. 0b: The DMMON bit of the LINECTRL1 register has not changed. 1b: The DMMON bit of the LINECTRL1 register has changed.
15 to 7	—	All 0	R	Reserved The write value should always be 0.
6	CHGDETCHG1_STA	0	R/W (1)	This bit is set if the CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The CHGDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b 1b: The CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
5	—	0	R	Reserved The write value should always be 0.
4	PDDETCHG1_STA	0	R/W (1)	This bit is set if the PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The PDDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b. 1b: The PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
3	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OCINT_STA	0	R/W (1)	This bit is set if the OVRCUR pin is asserted. 0b: The OVRCUR pin is not asserted (and remains 1b). 1b: The OVRCUR pin is asserted (and became 0b).
0	IDCHG_STA	1	R/W (1)	This bit is set if the input value from the OTG_ID pin has changed. 0b: There is no change in the OTG_ID pin. 1b: There is a change in the OTG_ID pin. *Note*: The initial value is 1. Before using this bit, clear the status.

(3) OTG-BC Interrupt Enable Register

Abbreviated name of register: OBINTEN

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPMONCHG_EN	DMMONCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHGDETCHG1_EN	—	PDDETCHG1_EN	—	—	OCINT_EN	IDCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	DPMONCHG_EN	0	R/W	DPMONCHG_STA bit interrupt enable 0b: Interrupt via the DPMONCHG_STA bit is disabled. 1b: Interrupt via the DPMONCHG_STA bit is enabled.
16	DMMONCHG_EN	0	R/W	DMMONCHG_STA bit interrupt enable 0b: Interrupt via the DMMONCHG_STA bit is disabled. 1b: Interrupt via the DMMONCHG_STA bit is enabled.
15 to 7	—	All 0	R	Reserved The write value should always be 0.
6	CHGDETCHG1_EN	0	R/W	CHGDETCHG1_STA bit interrupt enable 0b: Interrupt via the CHGDETCHG1_STA bit is disabled. 1b: Interrupt via the CHGDETCHG1_STA bit is enabled.
5	—	0	R	Reserved The write value should always be 0.
4	PDDETCHG1_EN	0	R/W	PDDETCHG1_STA bit interrupt enable 0b: Interrupt via the PDDETCHG1_STA bit is disabled. 1b: Interrupt via the PDDETCHG1_STA bit is enabled.
3	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OCINT_EN	0	R/W	OCINT_STA bit interrupt enable 0b: Interrupt via the OCINT_STA bit is disabled. 1b: Interrupt via the OCINT_STA bit is enabled.
0	IDCHG_EN	0	R/W	IDCHG_STA bit interrupt enable 0b: Interrupt via the IDCHG_STA bit is disabled. 1b: Interrupt via the IDCHG_STA bit is enabled.

(4) VBUS Control Register

Abbreviated name of register: VBCTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VGPUO	—	—	—	VBOUT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved The write value should always be 0.
29	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
28 to 22	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
21	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
20 to 17	—	All 0	R	Reserved The write value should always be 0.
16	—	1	R	Reserved The write value should always be 1.
15 to 5	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
4	VGPUO	0	R/W	The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin. This bit is used, for example, for control of the external power IC.
3 to 1	—	All 0	R	Reserved The write value should always be 0.
0	VBOUT	0	R/W	This bit is one of the VBUSEN control bits. This bit is used to assert VBUS by controlling the external power IC. 0b: VBUS output disable 1b: VBUS output enable If overcurrent occurs, this bit is automatically cleared to 0.

(5) Line Control Port 1 Register

Abbreviated name of register: LINECTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	DPRPU_EN	DP_RPU	DPRPD_EN	DP_RPD	DMRPD_EN	DM_RPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DPMON	DMMON	—	IDMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved
25, 24	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23, 22	—	All 0	R	Reserved
21	DPRPU_EN	0	R/W	This bit enables the DP_RPU (bit 20) setting for pullup control of D+ in port 1. 0: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is disabled. 1: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is enabled.
20	DP_RPU	0	R/W	This bit controls pullup of D+ in port 1. This control is enabled only when DPRPU_EN (bit 21) = 1. Note that if this bit is cleared to 0 when DPRPU_EN (bit 21) = 1, D+ is in the floating state while no device drives the USB bus. Note also that setting DPRPD_EN (bit 19) and DP_RPD (bit 18) to enabled is prohibited while this bit is set to enabled - that is, enabling both pullup and pulldown of D+ together is prohibited. 0: Pullup of D+ in port 1 is disabled. 1: Pullup of D+ in port 1 is enabled.
19	DPRPD_EN	0	R/W	This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resister. 0b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is disabled. 1b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is enabled.
18	DP_RPD	0	R/W	This bit controls USB bus (DP) 15 kΩ Pulldown resister when DPRPD_EN (bit 19) = 1b. 0b: DP-side 15 kΩ Pulldown resister is OFF. 1b: DP-side 15 kΩ Pulldown resister is ON.
17	DMRPD_EN	0	R/W	This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resister. 0b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is disabled. 1b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is enabled.
16	DM_RPD	0	R/W	This bit controls USB bus (DM) 15 kΩ Pulldown resister when DMRPD_EN (bit 17) = 1b. 0b: DM-side 15 kΩ Pulldown resister is OFF. 1b: DM-side 15 kΩ Pulldown register is ON.
15 to 4	—	All 0	R	Reserved The write value should always be 0.
3	DPMON	0	R	This bit indicates the value of USB bus DP.
2	DMMON	0	R	This bit indicates the value of USB bus DM.
1	—	0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	IDMON	0	R	This bit indicates the value of the OTG_ID pin.

(6) BC Control Port 1 Register

Abbreviated name of register: BCCTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PDDETSTS	CHGDETSTS	—	—	DCPMODE	VDMSRCE	IDPSINKE	VDPSRCE	IDMSINKE	IDPSRCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	H'00_C000	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
9	PDDETSTS	0	R	This bit indicates the USBPHY Portable Device Detect signal state.
8	CHGDETSTS	0	R	This bit indicates the USBPHY Charging Downstream Port Detect signal state.
7, 6	—	All 0	R	Reserved The write value should always be 0.
5	DCPMODE	0	R/W	If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b.
4	VDMSRCE	0	R/W	This bit controls the USBPHY built-in VDM_SRC circuit. If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven.
3	IDPSINKE	0	R/W	This bit controls the USBPHY built-in Portable Device Detect circuit. If this bit is set to 1b, Portable Device detection is enabled.
2	VDPSRCE	0	R/W	This bit controls the USBPHY built-in VDP_SRC circuit. If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven.
1	IDMSINKE	0	R/W	This bit controls the USBPHY built-in Charging Downstream Port Detect circuit. If this bit is set to 1b, Charging Downstream Port detection is enabled.
0	IDPSRCE	0	R/W	This bit controls the USBPHY built-in IDP_SRC circuit. If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven.

32A.3 Clock Signals

32A.3.1 Clock Gating Specifications

32A.3.1.1 Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.

Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the “circuits that do not require clock supply temporarily.”

The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]

Register Enable/Clock Gating Control Register (offset:H’304)

[Functional specification]

bit	Symbol	Functional specification
31	NONUSE_CLK_MSK	Gating clocks for unused host controller or peripheral controller.
29	HOST_CLK_MSK	Gating clocks for host controller.
28	PERI_CLK_MSK	Gating clocks for peripheral controller.

32A.3.1.2 Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.

This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: H’800).

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
1	0	0	0		✓
			1	✓	

[Note on using the NONUSE_CLK_MSK bit]

If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.

If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

32A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.

The following table shows the operating specifications of this function.

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
0	1	0	—	✓	
	0	1	—		✓
	1	1	0	✓	✓

Note: If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set t0 1b, the effect of clock gating becomes logical OR of each bit.

32A.4 Interrupt Sources

32A.4.1 Interrupt Signals

This module has the five interrupt signals listed below.

Interrupt Source Name	Interrupt Type	Pulse/ Level	Active Level
U2H_INT	BUS Master interrupt signal. This signal is asserted when a bus error occurs in the BUS Master. Interrupt control is performed by the AHB Bridge Register.	Level	H
U2H_OHCI_INT	OHCI interrupt signal This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the OHCI Operational Register.	Level	H
U2H_EHCI_INT	EHCI interrupt signal. This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_WAKEON_INT	EHCI Wakeup interrupt signal. This signal is asserted by an EHCI Wakeup event. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_OBINT	OTG/Battery Charging interrupt signal. This signal is asserted by OTG or Battery Charging related event. Interrupt control is performed by the UCOM2 Register.	Level	H

32A.4.2 Interrupt Sources and Control

32A.4.2.1 U2H_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[0] (AHB_INTEN)

[Interrupt source]

A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H'204) bit[0] (AHB_INT)

32A.4.2.2 U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset:H'010) bit[31], bit[6:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting							
			HcInterruptEnable						
		USBH_INTAEN	bit [31] MIE	bit [6] RHSCE	bit [5] FNOE	bit [3] ROE	bit [2] SFE	bit [1] WDHE	bit [0] SOE
1	Device connection is detected.	✓	✓	✓					
2	Device disconnection is detected.	✓	✓	✓					
3	Port power is OFF (excluding overcurrent detection).	✓	✓	✓					
4	Babble error is detected during a USB transfer.	✓	✓	✓					
5	Resume is complete.	✓	✓	✓					
6	Overcurrent is detected.	✓	✓	✓					
7	Bus reset is complete.	✓	✓	✓					
8	When the HcRhDescritorB Register DR bit is 1b, OHCI becomes "USB Operational" (HCFS[1:0] bit = 10b) or "USB Suspend" (HCFS[1:0] bit = 11b).	✓	✓	✓					
9	When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓					
10	When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓					
11	When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register.	✓	✓	✓					
12	When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register.	✓	✓	✓					
13	When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register.	✓	✓	✓					
14	When no device is connected (CCS bit = 1b), the port power is turned off.	✓	✓	✓					
15	The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed.	✓	✓		✓				
16	RemoteWakeup signal (Resume signal) is detected from a device.	✓	✓			✓			
17	HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.)	✓	✓				✓		
18	A transfer finishes (including an error), and the host module updated HccaDoneHead.	✓	✓					✓	
19	USB schedule overrun occurred for the frame.	✓	✓						✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset:H'00C) bit[6:0]

32A.4.2.3 U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset:H'128) bit[16], bit[5:0]*1

Note 1. Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset:H'120) bit[15], bit[6]

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting								
			USBCMD		USBINTR					
			bit [15]	bit [6]	bit [16]	bit [5]	bit [3]	bit [2]	bit [1]	bit [0]
		USBH_INTBEN	Per-Port Change Event	Doorbell	Port-1 Change Event	Async Advance	Frame List Rollover	Port Change Detect	USB ERRINT	USB INT
[1]	Device connection is detected.	✓						✓		
[2]	Device disconnection is detected.	✓						✓		
[3]	Overcurrent is detected.	✓						✓		
[4]	RemoteWakeup signal (Resume Signal) is detected from a device.	✓								
[5]	Babble status of the USB bus is detected.	✓						✓		
[6]	USB transfer with "qTD IOC = 1b" normally finishes.	✓								✓
[7]	Short packet is received.	✓								✓
[8]	USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.)	✓							✓	
[9]	The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b.	✓		✓		✓				
[10]	The FRINDEX Register FrameIndex bit returned from the maximum value to H'000 (rollover detected).	✓					✓			
[11]	The Port Change Detect event (interrupt source 1 to 5) was detected.	✓	✓		✓					

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset:H'124) bit[16], bit[5:0]

32A.4.2.4 U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[4] (WAKEON_INTEN)

EHCI Operational Register PORTSC[1:2] Register (offset:H'164/H'168) bit[22:20]*1

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting			
			PORTSC		
		WAKEON_INTEN	bit [22] WKOC_E	bit [21] WKDSCNNT_E	bit [20] WKCNNT_E
1	Device connection is detected.	✓			✓
2	Device disconnection is detected.	✓		✓	
3	Overcurrent is detected.	✓	✓		
4	RemoteWakeup signal (Resume Signal) is detected from a device.	✓			

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H'204) bit[4] (WAKEON_INT)

32A.4.2.5 U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset:H'808) bit[17:16], bit[6], bit[4], bit[1:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source	Registers That Require Interrupt Enable Setting		
		OTG-BC Interrupt Enable	
		bit [17]	bit [16]
	UCOM_INTEN	DPMONCHG_EN	DMMONCHG_EN
1 The DP pin has changed.	✓	✓	
2 The DM pin has changed.	✓		✓

Interrupt Source	Registers That Require Interrupt Enable Setting		
		OTG-BC Interrupt Enable	
		bit [6]	bit [4]
	UCOM_INTEN	CHGDETCHG1_EN	PDDETCHG1_EN
1 The portable device detection signal has changed.	✓		✓
2 The charging port detection signal has changed.	✓	✓	

Interrupt Source	Registers That Require Interrupt Enable Setting		
		OTG-BC Interrupt Enable	
		bit [1]	bit [0]
	UCOM_INTEN	OCINT_EN	IDCHG_EN
1 Overcurrent is detected. (The change of the OVRCUR pin from 1 to 0b is detected.)	✓	✓	
2 The OTG_ID pin has changed.	✓		✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset:H'804) bit[17:16], bit[6], bit[4], bit[1:0]

32A.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

32A.5 Power-Saving Function

This module controls power consumption by using the following two methods:

1. Controlling the SUSPENDM/SLEEPM pin of USBPHY
2. Using clock gating to stop the clock to the host controller or peripheral controller.

32A.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USBPHY:

- Reducing the power consumption by the USBPHY
- Reducing the power consumption by the host core by stopping the clocks from the USBPHY

As described at **Section 32A.1.2.5, Suspend extension function**, by default, the SUSPENDM and SLEEPM pins of the USBPHY are not asserted even when EHCI and OHCI are put into the Suspended state.

See **Section 32A.2.4.4(6), Suspend Control Register** and control the relevant registers appropriately.

32A.5.2 Controlling the Clock-Gating Function

See **Section 32A.2.4.4(5), Register Enable/Clock Gating Control Register** and **Section 32A.3.1, Clock Gating Specifications**, then control the relevant registers appropriately.

32A.6 Battery Charging

32A.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.

Charging ports can be generally classified by function as described below.

Type	Function
CDP (Charging Downstream Port)	Downstream port that can supply power in compliance with the Battery Charging Specification. This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host).
DCP (Dedicated Charging Port)	Port that provides only power supply function in compliance with the Battery Charging Specification. This type of charging port does not operate as the usual host.
SDP (Standard Downstream Port)	Standard Downstream Port that is not compliant with the Battery Charging Specification. This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host.

32A.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.

32A.7 Bus Master

32A.7.1 Functional specifications of the bus master

32A.7.1.1 Supported bus master functions

Function as the BUS MASTER	Status
Residual burst after an error response is received	The transfer is not stopped.
1 Kbyte boundary processing	The fixed length burst (INCRx) across 1 Kbyte boundary is not performed.

32A.7.1.2 Issuing requests for different types of bus transfer

MHTRANS[1:0]	MHSIZE[2:0]	MHWRITE	MHBURST[2:0]	Reply	Remarks
IDLE (00b)	—	—	—	—	—
BUSY (01b)	—	—	—	—	Not issued.
NONSEQ (10b)	32-bit (010b)	WRITE	SINGLE INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ			
	8-bit (000b) 16-bit (001b)	WRITE	SINGLE	OKAY/ERROR	8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt.
	other than the above	—	—	—	Not issued.
SEQ (11b)	32-bit (010b)	WRITE	INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ		OKAY/ERROR	
	other than the above	—	—	—	Not issued.

32A.7.1.3 Supported responses

Response type	Response	Remarks
OKAY	Enable	Supported.
ERROR	Enable	A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed.

32A.7.1.4 Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: H'208).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

32A.7.1.5 Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: H'208). The maximum burst length is common to reading and writing.

32A.7.1.6 Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: H'208).

32A.7.1.7 Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

ALIGN_ADDRESS Setting	Fixed length Start Address of INCR Burst		
	INCR4	INCR8	INCR16
00b (Aligned at the 1-Kbyte boundary)	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3D0 H'3D4 H'3D8 H'3DC H'3E0 H'3E4 H'3E8 H'3EC H'3F0	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3C8 H'3CC H'3D0 H'3D4 H'3D8 H'3DC H'3E0	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3B8 H'3BC H'3C0
01b (Aligned at the 16-byte boundary)	MHADDR[3:0] = H'0	-- (Not issued)	-- (Not issued)
10b (Aligned at the 32-byte boundary)	MHADDR[4:0] = H'00 H'04 H'08 H'0C H'10	MHADDR[4:0] = H'00	-- (Not issued)
11b (Aligned at the 64-byte boundary)	MHADDR[5:0] = H'00 H'04 H'08 H'0C H'10 H'14 H'18 H'1C H'20 H'24 H'28 H'2C H'30	MHADDR[5:0] = H'00 H'04 H'08 H'0C H'10 H'14 H'18 H'1C H'20	MHADDR[5:0] = H'00

32A.8 Overcurrent Control and VBUS Control

32A.8.1 OVRCUR/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

This module pin	Input/Output	Level	Description
OVRCURI	Input	L	Overcurrent status was detected.
		H	Overcurrent status was not detected.
VBUSEN	Output	L	Port Power (VBUS) OFF
		H	Port Power (VBUS) ON

32A.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCUR pin remains asserted (0b) for a set period.

The period over which assertion of the OVRCUR pin is required (“vercurrent detection time”) can be set in the following register.

Register	Overcurrent detection/sleep timer setting register (offset: H’310)
Bits	TIMER_OC[19:0]
Initial value	H’3_0D40

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (P1ϕ) cycle.

Therefore, set the value of the above register at initial configuration, considering “the internal bus clock (P1ϕ) frequency to be used” and “the overcurrent detection time you want to specify”.

32A.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the VBUSEN control (VBENCTL) register in USBPHY Control. Refer to **Section 32.3.4, VBUSEN Control Register (VBENCTL)**. When using as Function, VBUSEN should be 0.

The following table describes control examples by the Port Power bit of the EHCI/OHCI Operational register.

Situation		Register		bit
EHCI control		PORTSC1 (offset: H'164)		bit 12 (PP)
OHCI control	Global control*1	ON setting	HcRhStatus Register (offset: H'050)	bit 16 (Set Global Power)
		OFF setting		bit 0 (Clear Port Status)
	Selective control*2	ON setting	HcRhPortStatus1 Register (offset: H'054)	bit 8 (Set Port Power)
		OFF setting		bit 9 (Clear Port Power)

Note 1. Global control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 0b
or
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 0b

Note 2. Selective control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCUR pin's status.

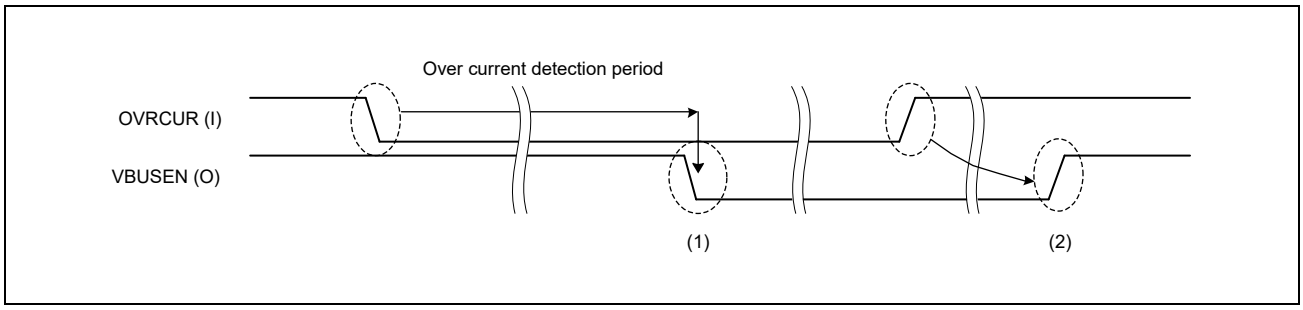
Specify the settings as necessary (for example, your system needs that VBUS is always ON).

EHCI Operational	OHCI Operational				
HCSPARAMS (offset: H'104)	HcRhDescriptorA (offset: H'048)			HcRhDescriptorB (offset: H'04C)	Pin Operation
PPC (bit 4)	NOCP (bit 12)	NPS (bit 9)	PSM (bit 8)	PPCM[1] (bit 17)	When the OVRCUR pin is asserted (0b)
0	—	—	—	—	Fixed to 1b
—	1	—	—	—	Fixed to 1b
—	—	1	—	—	Fixed to 1b
1	0	0	0	—	0b
			1	0	
				1	

32A.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCUR and VBUSEN pins signals at overcurrent detection and recovery.

Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see **Section 32A.8.3, Port Power (VBUS) control specifications**) have not been made.



1. When the OVRCUR pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).
2. After the overcurrent status has been resolved, and de-assertion of the OVRCUR pin (1b) is confirmed, 1b is written to the Port Power bit described in **Section 32A.8.3, Port Power (VBUS) control specifications** to turn on the Port Power (Vbus).

NOTE

Before the Port Power bit is set by firmware, be sure to check that the OVRCUR pin has been deasserted.

32A.9 Procedure for Setting this Module

32A.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

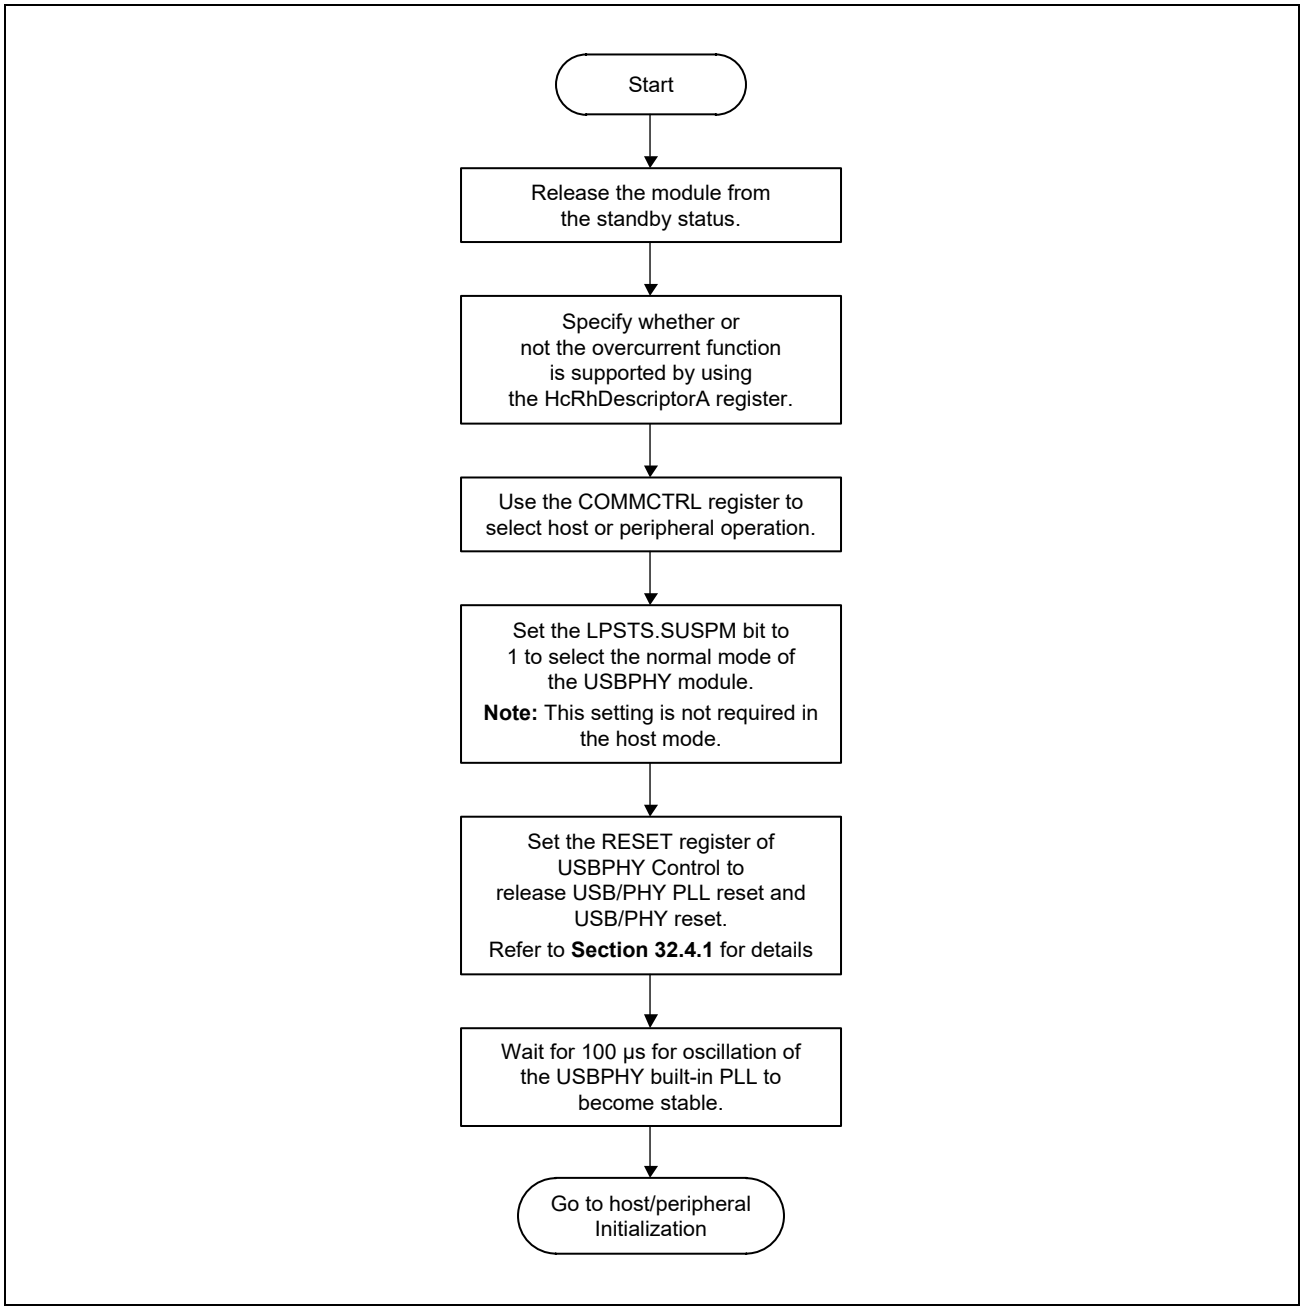


Figure 32A.1 Sequence Common to Both Host and Peripheral Modes

32A.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

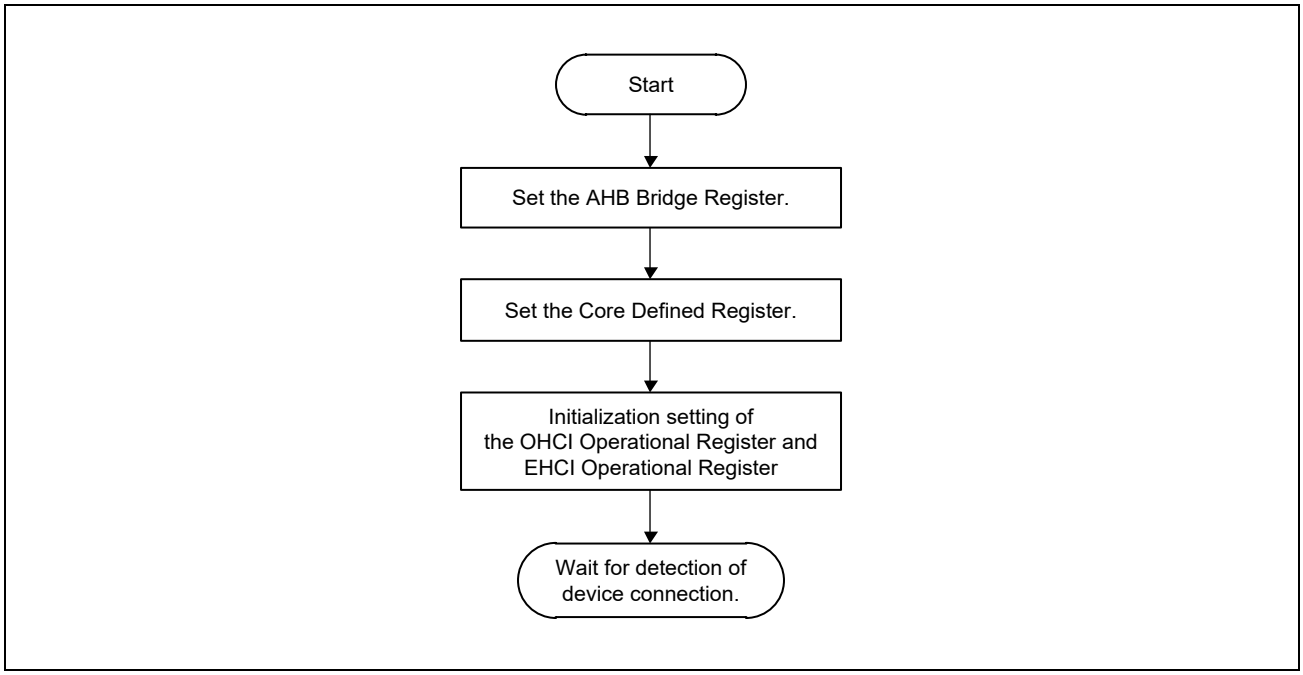

Figure 32A.2 Initialization Sequence

32A.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: H'120) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: H'008) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

32B. USB 2.0 Function Module

32B.1 Overview

32B.1.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This chapter describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see **Section 32A, USB 2.0 Host Module**.

This module is a universal serial bus (USB) controller that has peripheral functions.

This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 10 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

32B.1.2 Features

32B.1.2.1 Peripheral controller supporting high-speed USB

(1) On-chip peripheral USB controller

32B.1.2.2 Support of all types of USB transfer

(1) Supporting all types of USB transfer, including isochronous transfer

(2) Control transfer

(3) Bulk transfer

(4) Interrupt transfer (high-bandwidth transfers not supported)

(5) Isochronous transfer (high-bandwidth transfers not supported)

32B.1.2.3 Bus interface

(1) Includes a two-channel DMA interface

32B.1.2.4 Pipe configuration

(1) 8 Kbytes of buffer memory for USB communications for each channel

(2) Up to 10 pipes (including the default control pipe) selectable for each channel

(3) Programmable pipe configuration

(4) Any endpoint number assignable to pipes other than pipe 0

Table 32B.1 Pipe Settings

PIPE	Transfer Type	Double buffer	Continuous transfer mode	Buffer size
PIPE0	Control	—	—	Fixed to 64 bytes/ 256 bytes (CNTMD = 1)
PIPE1	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE2	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE3	Bulk	✓	✓	Up to 2 Kbytes
PIPE4	Bulk	✓	✓	Up to 2 Kbytes
PIPE5	Bulk	✓	✓	Up to 2 Kbytes
PIPE6	Int	—	—	Fixed to 64 bytes
PIPE7	Int	—	—	Fixed to 64 bytes
PIPE8	Int	—	—	Fixed to 64 bytes
PIPE9	Int	—	—	Fixed to 64 bytes

32B.1.2.5 Features of peripheral functions

(1) Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)

(2) Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake

(3) Control transfer stage monitoring function

(4) Device state monitoring function

(5) Automatic response to SET_ADDRESS request

(6) NAK response interrupt (NRDY)

(7) SOF interpolation

32B.1.2.6 Features of DMA transfer

DMA transaction mode: Fetching in both register and link modes are supported.

Interrupt: Level is supported.

Transfer size: A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination.

Skip (scatter/gather) function: The access size and skip size can be specified separately for the transfer source and destination.

Suspend function: A running DMA transaction can be suspended temporarily.

Interval function: The interval of DMA transfers can be specified to control the bus occupancy.

32B.1.2.7 Other functions

(1) Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)

(2) Transfer ending function using a transaction counter

(3) SOF pulse output function

(4) BRDY interrupt event notification timing change function (BFRE)

(5) Function (SHTNAK) to set NAK in the response PID when transfer ends

(6) Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

32B.1.3 Overview of Functions

32B.1.3.1 Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

(1) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

(a) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

(b) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

32B.1.3.2 USB event

This module notifies the event in USB operation by issuing an interrupt.

You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

32B.1.3.3 USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:

(1) One pipe dedicated to control transfer

(2) Four pipes dedicated to interrupt transfer

(3) Three pipes dedicated to bulk transfer

(4) Two pipes selectively used for bulk or isochronous transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

32B.1.3.4 SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

32B.1.4 Restriction matter and Notes

32B.1.4.1 Restriction matter

(1) Restrictions on the USB specifications

It’s no support About below of USB 2.0 specification

- HighBandWidth transfer is no support

(2) Restrictions on DMA Master

- DAD = 1 (destination address fixed) and cannot use skip transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and cannot use skip transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- DAD = 1 (destination address fixed), and cannot use the beat unalign transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and cannot use beat unalign transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- When REQD =1, SBE = 1 (sweep mode) and compulsion discharge function cannot use.

32B.1.4.2 Notes

(1) DMA transfer and passing problem of interrupt signal in DMA Master construction.

(a) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

(b) Plan to avoid

A plan to avoid the above problem is indicated below.

Plan to avoid 1) HPROT is set as non bufferable.

According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

(2) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

32B.2 Registers

How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset “Power on Reset” indicates the initial state at power-on reset.
The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.
Significant points regarding reset operation are indicated in notes.
“—” indicates that a user’s setting is retained without this module operation having been performed. “X” indicates that the value is undefined.

(4) Access condition: The condition to be met when this module accesses the register for an operation.

R: Reading only
W: Writing only
R/W: Reading or writing
R(0): 0-reading only
W(1): 1-writing only

(5) Name: Bit symbol and bit name

(6) Function: Description of functions.

<Example of description>

(1) Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	A bit	B bit	C bit	—	—	—	—	—	—	—	—	—	—	—	—
(2) Initial Value	X	0	0	0												
R/W	X	0	—	—												

Bit	Bit Name	Initial Value	R/W	Description
15	—			Nothing is assigned. Fix this bit to 0.
14	A bit		R/W	AAA enable 0: Disables operation 1: Enables operation
13	B bit		R	BBB operation 0: Outputs low-level signal 1: Outputs high-level signal
12	C bit		R(0)/ W(1)	CCC control 0: ..... 1: .....
	(5)		(4)	(6)

32B.2.1 Base Address

Table 32B.2 Base addresses for each channel of the USB function module

Channel number	Base address
0	H'0_11E2_0000 (Cortex-A55 Address Space)
	H'41E2_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
	H'51E2_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Note: Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

32B.2.2 List of Registers

Table 32B.3 lists the registers of this module.

Table 32B.3 List of Registers (1/3)

Address	Symbol	Name	Access unit
000	SYSCFG0	System Configuration Control Register 0	16-bit
002	SYSCFG1	System Configuration Control Register 1	16-bit
004	SYSSTS0	System Configuration Status Register	16-bit
008	DVSTCTR0	Device Control Register 0	16-bit
00C	TESTMODE	Test Mode Register	16-bit
014	CFIFO	CFIFO Port Register	8-/16-/32-bit
016			
020	CFIFOSEL	CFIFO Port Select Register	16-bit
022	CFIFOCTR	CFIFO Port Control Register	16-bit
028	D0FIFOSEL	D0FIFO Port Select Register	16-bit
02A	D0FIFOCTR	D0FIFO Port Control Register	16-bit
02C	D1FIFOSEL	D1FIFO Port Select Register	16-bit
02E	D1FIFOCTR	D1FIFO Port Control Register	16-bit
030	INTENB0	Interrupt Enable Register 0	16-bit
036	BRDYENB	BRDY Interrupt Enable Register	16-bit
038	NRDYENB	NRDY Interrupt Enable Register	16-bit
03A	BEMPENB	BEMP Interrupt Enable Register	16-bit
03C	SOFCFG	SOF Output Configuration Register	16-bit
040	INTSTS0	Interrupt Status Register 0	16-bit
046	BRDYSTS	BRDY Interrupt Status Register	16-bit
048	NRDYSTS	NRDY Interrupt Status Register	16-bit
04A	BEMPSTS	BEMP Interrupt Status Register	16-bit
04C	FRMNUM	Frame Number Register	16-bit
04E	UFRMNUM	Micro Frame Number Register	16-bit
050	USBADDR	USB Address Register	16-bit
054	USBREQ	USB Request Type Register	16-bit
056	USBVAL	USB Request Value Register	16-bit
058	USBINDX	USB Request Index Register	16-bit
05A	USBLENG	USB Request Length Register	16-bit
05C	DCPCFG	DCP Configuration Register	16-bit

Table 32B.3 List of Registers (2/3)

Address	Symbol	Name	Access unit
05E	DCPMAXP	DCP Max. Packet Size Register	16-bit
060	DCPCTR	DCP Control Register	16-bit
064	PIPESEL	Pipe Window Select Register	16-bit
068	PIPECFG	Pipe Configuration Register	16-bit
06A	PIPEBUF	Pipe Buffer Setting Register	16-bit
06C	PIPEMAXP	Pipe Max. Packet Size Register	16-bit
06E	PIPEPERI	Pipe Cycle Control Register	16-bit
070	PIPE1CTR	PIPE1 Control Register	16-bit
072	PIPE2CTR	PIPE2 Control Register	16-bit
074	PIPE3CTR	PIPE3 Control Register	16-bit
076	PIPE4CTR	PIPE4 Control Register	16-bit
078	PIPE5CTR	PIPE5 Control Register	16-bit
07A	PIPE6CTR	PIPE6 Control Register	16-bit
07C	PIPE7CTR	PIPE7 Control Register	16-bit
07E	PIPE8CTR	PIPE8 Control Register	16-bit
080	PIPE9CTR	PIPE9 Control Register	16-bit
090	PIPE1TRE	PIPE1 Transaction Counter Enable Register	16-bit
092	PIPE1TRN	PIPE1 Transaction Counter Register	16-bit
094	PIPE2TRE	PIPE2 Transaction Counter Enable Register	16-bit
096	PIPE2TRN	PIPE2 Transaction Counter Register	16-bit
098	PIPE3TRE	PIPE3 Transaction Counter Enable Register	16-bit
09A	PIPE3TRN	PIPE3 Transaction Counter Register	16-bit
09C	PIPE4TRE	PIPE4 Transaction Counter Enable Register	16-bit
09E	PIPE4TRN	PIPE4 Transaction Counter Register	16-bit
0A0	PIPE5TRE	PIPE5 Transaction Counter Enable Register	16-bit
