32B.2.3 System Configuration Control Registers

32B.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: H'000>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNEN	HSE	—	DRPD	DPRPU	—	—	—	USBE
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	CNEN	0	R/W	This bit prohibits or enables single-ended receiver operation. 0: Single-ended receiver operation prohibited 1: Single-ended receiver operation enabled
7	HSE	0	R/W	This bit prohibits or enables High-Speed operation. 0: High-Speed operation prohibited (Full-Speed) 1: High-Speed operation enable (The controller detects the communication speed.)
6	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
5	DRPD	1	R/W	D+/D- line resistor control Set this bit to 0 to use this module. For details, see Control of USB Data Bus Resistors.
4	DPRPU	0	R/W	D+ line resistor control This bit prohibits or enables D+ line pull-up for the peripheral controller function. For details, see Control of USB Data Bus Resistors. 0: Pull Up prohibited 1: Pull Up enabled
3 to 1	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
0	USBE	0	R/W	USB block operation prohibited This bit prohibits or enables USB block operation. 0: USB block operation prohibited 1: USB block operation enabled

Note: Data can be written to and read from this register even while the UTMI+PHY clock is stopped. However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function takes effect after the oscillation of UTMI+PHY clock starts.

(1) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.

Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

(2) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

- When the HSE bit is 0, this module performs a full-speed operation.
- When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

(3) D+/D- line resistor control (DRPD or DPRPU) bit

Table 32B.4 shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 32B.4 Control of USB Data Bus Resistors

Setting		Control of USB Data Bus Resistors		
DRPD	DPRPU	D- Line	D+ Line	Remarks
0	0	Open	Open	
0	1	Open	Pull-Up	Specify the settings as shown in the left.
1	0	Pull-Down	Pull-Down	Initial state (When power on reset is canceled)
1	1	Pull-Down	Pull-Up	Setting prohibited

(a) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V. Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

(4) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.

When this bit is changed from 1 to 0, this module initializes the bits shown in **Table 32B.5**.

Table 32B.5 Register Bits That Are Initialized by Writing 0 to the USBE Bit

Register Name	Bit Name
SYSSTS0	LNST
DVSTCTR0	RHST
INTSTS0	DVSQ
USBADDR	USBADDR
USBREQ	bRequest bmRequestType
USBVAL	wValue
USBINDX	wIndex
USBLENG	wLength

Note: Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

32B.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: H'002>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT					
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	—	H'F	R	Nothing is assigned to these bits. Fix these bits to 0.
7, 6	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
5 to 0	BWAIT	H'0F	R/W	CPU bus access wait specification These bits specify the number of wait cycles for the access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (default) : 111111: 63 wait cycles (65 access cycles)

(1) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.

The following restriction is placed on the cycle of the access to the registers at address H'04 or after of this module: Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock (P1ϕ) frequency.

The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:

MBW = 10 (32-bit access width): Max 60 MBytes/sec
MBW = 01 (16-bit access width): Max 30 MBytes/sec
MBW = 00 (8-bit access width): Max 15 MBytes/sec

32B.2.4 System Configuration Status

32B.2.4.1 System Configuration Status Register (SYSSTS0) <Address: H'004>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LNST	
Initial Value	—	—	0	0	0	0	0	0	0	0	0	0	0	—	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	See above	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	LNST	All 0	R	USB Line status monitor The USB line status is displayed. *Note*: See the detailed description.

(1) Line status monitor (LNST) bits

Table 32B.6 shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 32B.6 Line Status of USB Data Bus

LNST [1]	LNST [0]	Full-Speed operation	High-Speed operation	Chirp operation
0	0	SE0	Squelch	Squelch
0	1	J State	Unsquelch	Chirp J
1	0	K State	Invalid	Chirp K
1	1	SE1	Invalid	Invalid

Note: Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
Squelch: SE0 or idle state
Unsquelch: High-speed J or high-speed K state
Chirp J: Chirp J State
Chirp K: Chirp K State

32B.2.5 USB Signal Control Registers

32B.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: H'008>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	—	—	—	—	—	RHST		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	0	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W(1)	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
14 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	WKUP	0	R/W (1)	Remote wakeup output This bit prohibits or enables Remote wakeup (resume signal output). 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output.
7 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	RHST	All 0	R	Reset handshake This bit indicates the reset handshake status. *Note*: See the detailed description.

(1) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.

This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.

The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.

When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 µs, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

(2) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. **Table 32B.7** lists the results of reset handshake.

Table 32B.7 Reset Handshake Status

Bus State	Value of RHST Bit
Powered or disconnected state	000
Reset handshake in process	100
Full-speed connection	010
High-speed connection	011

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

32B.2.6 Test Mode Register

32B.2.6.1 USB Test Mode Register [TESTMODE] <Address: H'00C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UTST			
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	—	0	R	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11	—	0	R	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10 to 4	—	H'10	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	UTST	All 0	R/W	Test mode See the detailed description.

(1) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.

Table 32B.8 lists the test modes of this module.

Table 32B.8 List of test mode operation

Test mode	Value of UTST Bits
Normal operation	0000
Test_J	0001
Test_K	0010
Test_SE0_NAK	0011
Test_Packet	0100
Test_Force_Enable	—
Reserved	0101 to 0111

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication. When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.

To perform a normal USB communication after setting a test mode, perform Power on reset.

32B.2.7 FIFO Port Registers

32B.2.7.1 CFIFO Port Register [CFIFO] <Address: H'014>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIFOPORT (Low)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

32B.2.7.2 CFIFO Port Register [CFIFO] <Address: H'016>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FIFOPORT (High)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT	All 0	R/W	FIFO port These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer.

(1) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

1. The CFIFO port must be used to access the FIFO buffer through the DCP.
2. When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
3. The registers configured for a FIFO port do not affect any other FIFO ports.
4. The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

(2) FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).

The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in **Table 32B.9** to **Table 32B.11**.

Table 32B.9 Endian Operation in 32-Bit Access (When MBW = 10)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	N + 3 address	N + 2 address	N + 1 address	N + 0 address
1	N + 0 address	N + 1 address	N + 2 address	N + 3 address

Table 32B.10 Endian Operation in 16-Bit Access (When MBW = 01)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1		even-numbered address	odd-numbered address
1	even-numbered address	odd-numbered address	Writing: invalid Reading: prohibited*1	

Table 32B.11 Endian Operation in 8-Bit Access (When MBW = 00)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1			Writing: valid Reading: valid
1	Writing: valid Reading: valid	Writing: invalid Reading: prohibited*1		

Note 1. Reading words or bytes from an invalid register is prohibited.

32B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H'020>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	—	—	MBW		—	BIGEND	—	—	ISEL	—	CURPIPE			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R(0)/W	R	R	R/W	R/W	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read count mode This bit specifies DTLN read mode for the CFIFOCTR register. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.
14	REW	0	R(0)/W	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11, 10	MBW	All 0	R/W	CFIFO port access bit width This bit specifies the bit width for access to the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited
9	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
8	BIGEND	0	R/W	FIFO port byte endian control This bit specifies the byte endian of the CFIFO port. 0: Little endian 1: Big endian
7, 6	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
5	ISEL	0	R/W	FIFO port access direction with DCP selected This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits. 0: Selects reading of buffer memory. 1: Selects writing of buffer memory.
4	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
3 to 0	CURPIPE	All 0	R/W	FIFO port access pipe specification This bit specifies the pipe number used for accessing the CFIFO port. 0000: DCP 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.

If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.

Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.

For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.

When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.

Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

(4) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.

For details see **Section 32B.2.7.2(1), FIFO port control bits (for FIFOPORT)**.

(5) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

Set this bit simultaneously with setting of the CURPIPE bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

32B.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address:H'028>
D1FIFO Port Select Register [D1FIFOSEL] <Address:H'02C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	DCLRM	DREQE	MBW		—	—	—	—	—	—	CURPIPE			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R(0)/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read count mode This bit specifies Dx_FIFOCTR DTLN read mode. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.
14	REW	0	R(0)/W	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.
13	DCLRM	0	R/W	Automatic buffer memory clear mode after reading data through the specified pipe This bit prohibits or enables automatic buffer memory clear after data is read through the specified pipe. 0: Automatic FIFO buffer clear prohibited 1: Automatic FIFO buffer clear enabled
12	DREQE	0	R/W	UCL_Dx_DREQ output enable This bit prohibits or enables the output of the UCL_Dx_DREQ signal. 0: Output prohibited 1: Output enabled
11, 10	MBW	All 0	R/W	DxFIFO port access bit width This bit specifies the bit width for access to the DxFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited
9 to 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	CURPIPE	All 0	R/W	FIFO port access pipe specification 0000: No specification 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the DxFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the DxFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the “BCLR = 1” processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.

Always clears this bit when you use this module with the BRDYM bit set.

(4) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.

When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits. When changing the value of the CURPIPE bits, change the value always after clearing this bit.

(5) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port. For details, see **Section 32B.2.7.3(3), CFIFO port access bit width (MBW) bits**.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

32B.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: H'022>
D0FIFO Port Control Register [D0FIFOCTR] <Address: H'02A>
D1FIFO Port Control Register [D1FIFOCTR] <Address: H'02E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAL	BCLR	FRDY	—	DTLN											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W(1)	R(0)/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0	R/W(1)	Buffer memory valid flag Specify 1 for this bit when writing to the FIFO buffer on the CPU side through the pipe specified in CURPIPE (current pipe) ends. 0: Invalid 1: Writing complete
14	BCLR	0	R(0)/W(1)	CPU buffer clear Specify 1 for this bit to clear the FIFO buffer on the CPU side of the current pipe. 0: Invalid 1: CPU buffer memory clear
13	FRDY	0	R	FIFO port ready This bit indicates whether the FIFO port can be accessed. 0: The FIFO port cannot be accessed. 1: The FIFO port can be accessed.
12	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
11 to 0	DTLN	All 0	R	Receive data length These bits indicate the length of receive data.

(1) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases descried below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

(1) To send short packets, set this bit when data writing ends.

(2) To send zero length packets, set this bit before writing data to the FIFO buffer.

(3) Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.

When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.

Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit. Do not set this bit when the specified pipe is in the receiving direction.

(2) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.

Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to “NAK”.

When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

(3) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.

In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

(1) A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.

(2) A short packet has been received and data reading has ended while the BFRE bit is 1.

(4) Receive data length (DTLN) bits

These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

(1) When the RCNT bit is 0:
This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.

(2) When the RCNT bit is 1:
This module decrements the value of these bits each time the CPU reads data.
(The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.

When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.

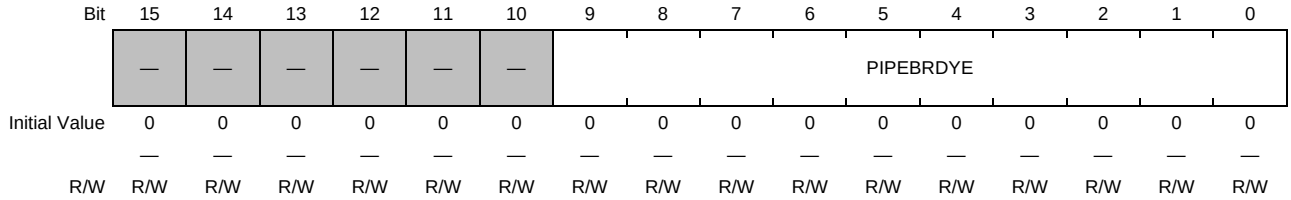
32B.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB)

32B.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: H'030>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0	R/W	VBUS Interrupt Enable This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
14	RSME	0	R/W	Frame number update interrupt enable Resume interrupt enable This bit prohibits or enables a USB interrupt when a RESM interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
13	SOFE	0	R/W	This bit prohibits or enables a USB interrupt when a SOF interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
12	DVSE	0	R/W	Device state transition interrupt enable This bit prohibits or enables a USB interrupt when a DVST interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
11	CTRE	0	R/W	Control transfer stage transition interrupt enable This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer empty interrupt enable This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer not ready response interrupt enable This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer ready interrupt enable This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

32B.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: H'036>



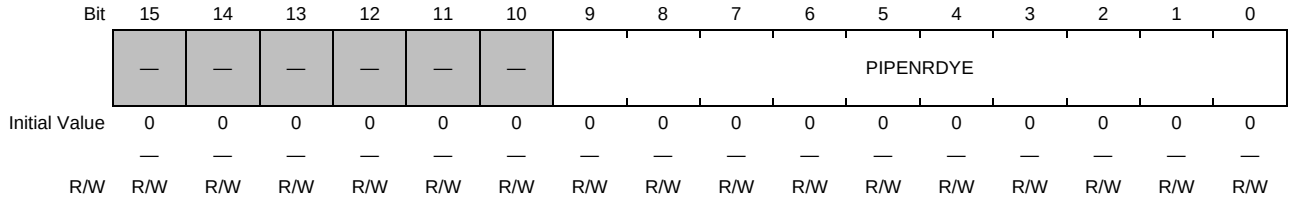
Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBRDYE	All 0	R/W	Pipe BRDY interrupt enable These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled

(1) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

32B.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: H'038>



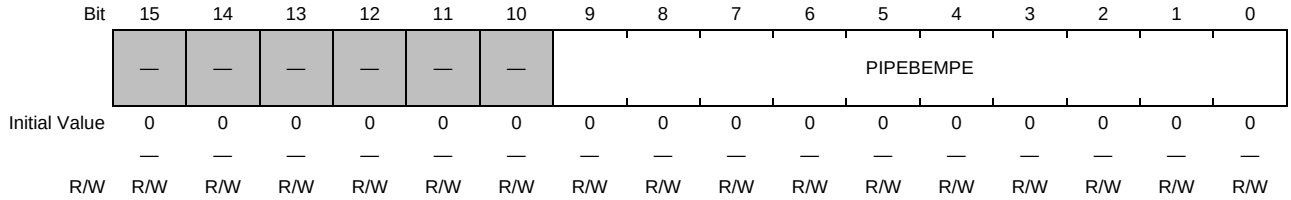
Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPENRDYE	All 0	R/W	Pipe NRDY interrupt enable These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled

(1) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

32B.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: H'03A>



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBEMPE	All 0	R/W	Pipe BEMP interrupt enable These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected 0: Interrupt output prohibited 1: Interrupt output enabled

Note: Bit numbers correspond to pipe numbers.

(1) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

32B.2.9 SOF Control Register

32B.2.9.1 SOF Pin Configuration Register [SOFCFG] <Address: H'03C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	BRDYM	—	—	SOFM		—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6	BRDYM	0	R/W	PIPEBRDY interrupt status clear timing This bit specifies the timing at which the PIPEBRDY interrupt is to be cleared. 0: Software clears the status. 1: Hardware clears the status by reading from or writing to the FIFO buffer. This bit can be set only during initialization (before communication). The setting cannot be changed after communication.
5, 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3, 2	SOFM	All 0	R/W	SOF function setting These bits are used to select SOF pulse output mode. 00: SOF output disabled 01: SOF output in units of 1 ms 10: µSOF output in units of 125 µs 11: Reserved
1, 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

32B.2.10 Interrupt Status

32B.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: H'040>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ			VALID	CTSQ		
Initial Value	0	0	0	0	0	0	0	0	—	0	0	0	0	0	0	0
	—	—	—	1	—	—	—	—	—	0	0	1	—	—	—	—
R/W	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R	R	R	R	R	R	R	R/W(0)	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W(0)	Change detection interrupt status This bit indicates the VBUS change detection interrupt status. 0: No VBUS interrupt is generated. 1: A VBUS interrupt is generated.
14	RESM	0	R/W(0)	Resume interrupt status This bit indicates the resume detection interrupt status. 0: No resume interrupt is generated. 1: A resume interrupt is generated.
13	SOFR	0	R/W(0)	Frame number update interrupt status This bit indicates the frame number update interrupt status. 0: No SOF interrupt is generated. 1: A SOF interrupt is generated.
12	DVST	0	R/W(0)	Device state transition interrupt status This bit indicates the device state transition interrupt. 0: No device state transition interrupt is generated. 1: A device state transition interrupt is generated.
11	CTRT	0	R/W(0)	Control transfer stage transition interrupt status This bit indicates the status of a control transfer stage transition interrupt. 0: No control transfer stage transition interrupt is generated. 1: A control transfer stage transition interrupt is generated.
10	BEMP	0	R	BEMP interrupt status This bit indicates the BEMP interrupt status. 0: No BEMP interrupt is generated. 1: A BEMP interrupt is generated.
9	NRDY	0	R	NRDY interrupt status This bit indicates the NRDY interrupt status. 0: No NRDY interrupt is generated. 1: An NRDY interrupt is generated.
8	BRDY	0	R	BRDY interrupt status This bit indicates the BRDY interrupt status. 0: No BRDY interrupt is generated. 1: A BRDY interrupt is generated.
7	VBSTS	—	R	VBUS input status This bit indicates the VBUS pin input status. 0: The VBUS pin is at the low level. 1: The VBUS pin is at the high level.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	DVSQ	All 0	R	Device state These bits indicate the device state. 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state
3	VALID	0	R/W(0)	USB request reception This bit indicates whether USB request reception is detected. 0: Not detected 1: A setup packet is received.
2 to 0	CTSQ	All 0	R	Control transfer stage These bits indicate the control transfer stage. 000: Idle or setup stage 001: Control reading data stage 010: Control reading status stage 011: Control writing data stage 100: Control writing status stage 101: Control writing (No Data) status stage 110: Control transfer sequence error 111: Reserved

Note: When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 to only the bit to be cleared and 1 to other bits. Do not write 0 to any status bit that is currently 0.

Note: This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

(1) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

(2) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XXb) and detects a falling edge of the signal at the DP pin.

(3) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:

This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)

This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

(4) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

(5) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.

When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

(6) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).

For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.

This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.

Cannot clear this bit even by writing 0.

(7) Buffer not-ready interrupt status (NRDY) bit

This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).

For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.

This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.

Software cannot clear this bit even by writing 0.

(8) Buffer ready interrupt status (BRDY) bit

This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).

For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.

This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.

Software cannot clear this bit even by writing 0.

32B.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: H'046>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIPEBRDY									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	— R/W	— R/W	— R/W	— R/W	— R/W	— R/W	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)	— R/W(0)

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBRDY	All 0	R/W(0)	Pipe BRDY interrupt status These bits indicate the BRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0, write 0 to only the bit to be cleared and 1 to other bit.

Note: When the BRDYM bit is 0, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

(1) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

(a) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.

Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction

(a) When the DIR bit changes from 0 to 1

(b) When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.

(c) When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.

(d) When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.

(e) When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction

(a) When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
No request trigger is generated for the transaction that involves a data PID mismatch.
In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
In that case, the request trigger is generated even if the FIFO buffer has a free space.

(b) When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes.

Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

(b) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:

1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to “0” by writing “0” to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.

If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

(c) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.

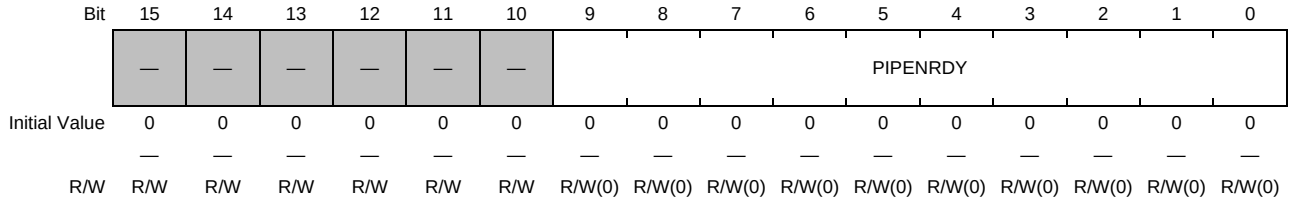
(a) For the pipe in the sending direction
This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.
The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.

(b) For the pipe in the receiving direction
This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).
If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

32B.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: H'048>



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPENRDY	All 0	R/W(0)	Pipe NRDY interrupt status These bits indicate the NRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal NRDY interrupt request for individual pipes under the conditions described below. This module does not issue any interrupt request at the status stage of a control transfer.

(a) For the pipe in the sending direction

(1) When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data
When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero- length packet, and sets the OVRN bit.

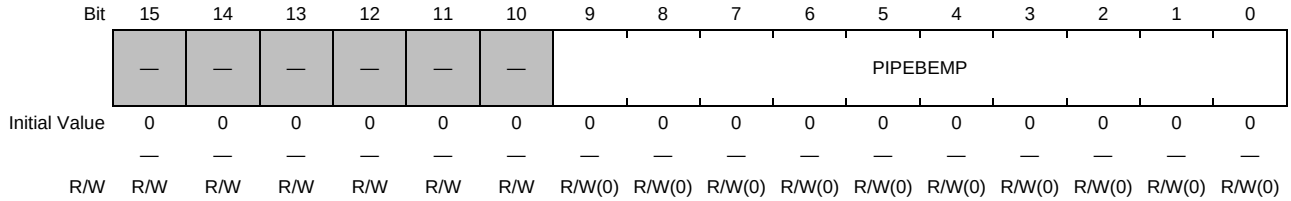
(b) For the pipe in the receiving direction

(1) When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.
If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.
Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).
This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.

(2) When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

(3) When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame
When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

32B.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: H'04A>



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBEMP	All 0	R/W(0)	Pipe BEMP interrupt status These bits indicate the BEMP interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

1. When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty
   In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends

(b) When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit

(c) During an IN transfer (sending zero-length packets) at the status stage of a control transfer

2. For the pipe in the receiving direction
   When the data larger than the specified maximum packet size has been received normally
   In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).
   Then, this module returns a STALL packet.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When a CRC or bit stuff error has been detected in the received data

(b) When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.

Writing 1 to this bit causes no effect.

32B.2.11 Frame Number Registers (FRMNUM, UFRMNUM)

32B.2.11.1 Frame Number Register [FRMNUM] <Address: H'04C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—	FRNM										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W(0)	R/W(0)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W(0)	Overrun/underrun detection status This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.
14	CRCE	0	R/W(0)	CRC error detection status This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 0	FRNM	All 0	R	Frame number These bits indicate the latest frame number.

Note: The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

(1) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.

When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see **Section 32B.2.10.3(1), Pipe NRDY interrupt status (PIPENRDY) bit**.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write H'40.

When the peripheral controller function is selected

This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

(2) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.

Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write H’80.

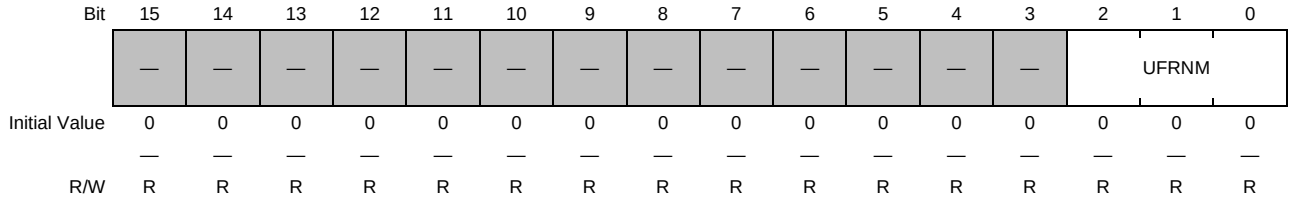
When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see **Section 32B.2.10.3(1), Pipe NRDY interrupt status (PIPENRDY) bit**.

(3) Frame number (FRNM) bits

This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.

When reading these bits, read them twice and check for consistency.

32B.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: H'04E>



Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to these bits. Fix these bits to 0.
14 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	UFRNM	All 0	R	Micro frame These bits indicate the micro frame number.

(1) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes H'00 to these bits.

When reading these bits, read them twice and check for consistency.

32B.2.12 USB Address

32B.2.12.1 USB Address Register [USBADDR] <Address: H'050>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 8	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
7	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
6 to 0	USBADDR	All 0	R	USB address These bits indicate the USB address allocated by the host.

(1) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.

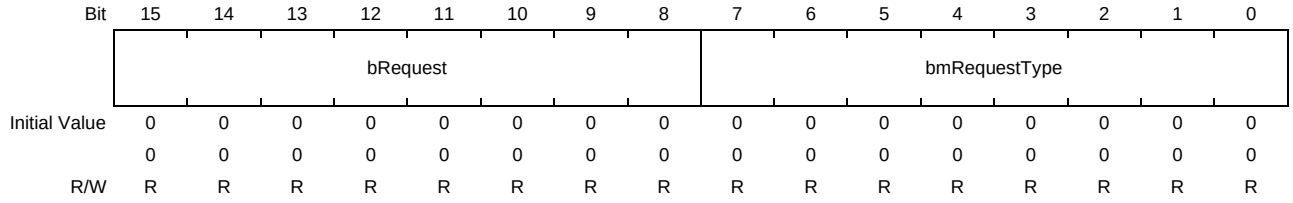
When this module detects a USB bus reset, this module writes H'00 to these bits.

32B.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.

These registers store the values set in the received USB requests.

32B.2.13.1 USB Request Type Register [USBREQ] <Address: H'054>



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	bRequest	All 0	R	Request Value of USBRequestbRequest
7 to 0	bmRequestType	All 0	R	Request type Value of USBRequestbmRequestType

(1) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(2) USB request type (bRmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.13.2 USB Request Value Register [USBVAL] <Address: H'056>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wValue															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wValue	All 0	R	Value Value of the wValue field in a USB request

(1) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.

These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.13.3 USB Request Index Register [USBINDX] <Address: H'058>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wIndex															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wIndex	All 0	R	Index Value of the wIndex field in a USB request

(1) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.

These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.13.4 USB Request Length Register [USBLENG] <Address: H'05A>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wLength															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wLength	All 0	R	Length Value of the wLength field in a USB request

(1) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.

These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.14 DCP Configuration

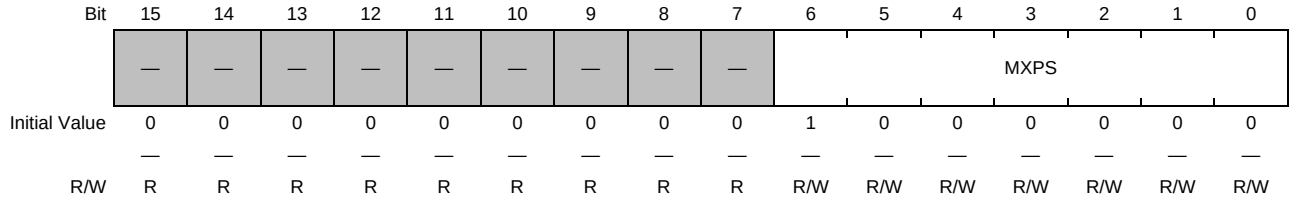
When performing a data communication by a control transfer, use the default control pipe (DCP).

32B.2.14.1 DCP Configuration Register [DCPCFG] <Address: H'05C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNTMD	SHTNAK	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	— R	— R	— R	— R	— R	— R	— R	— R/W	— R/W	— R	— R	— R	— R	— R	— R	— R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	CNTMD	0	R/W	Continuous transfer mode This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode
7	SHTNAK	0	R/W	Pipe disable at transfer end When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends 1: Disables the pipe when the transfer ends
6 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

32B.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: H’05E>



Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6 to 0	MXPS	H’40	R/W	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the DCP.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.

The default is H’40 (64 bytes).

The value of the MXPS bits must conform to the USB Specification.

Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits. If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

32B.2.14.3 DCP Control Register [DCPCTR] <Address: H'060>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	—	—	—	—	—	—	SQCLR	SQSET	SQMON	PBUSY	—	—	CCPL	PID	
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W	R	R	R	R	R	R	R	R(0)/W(1)	R(0)/W(1)	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the accessibility status of the DCP FIFO buffer. 0: Buffer access is not possible. 1: Buffer access is possible.
14 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	SQCLR	0	R(0)/W(1)	Toggle bit clear This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA1 specified
6	SQMON	1	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: DATA0 1: DATA1
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2	CCPL	0	R/W	Control transfer end enable Setting this bit permits the status stage of the control transfer to end. 0: Does not permit the control transfer to end. 1: Permits the control transfer to end.
1, 0	PID	All 0	R/W	Response PID These bits control responses from this module in control transfer. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

1. When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
2. When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

(2) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(4) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module. When a transaction ends normally, this module toggles this bit.

This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).

This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

(5) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(6) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.

In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.

When a new SETUP packet is received, this module changes this bit from 1 to 0.

When the VALID bit is 1, software cannot set this bit.

(7) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

1. This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
2. When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
3. This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
4. This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

32B.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI)

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

32B.2.15.1 Pipe Window Select Register [PIPESEL] <Address: H'064>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	PIPESEL	All 0	R/W	Pipe window select These bits specify a pipe for registers at addresses H'68 to H'6E. 0000: No selection 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9

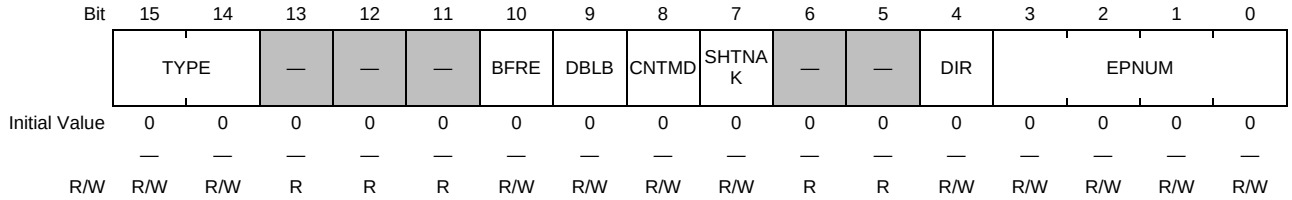
Note: When the PIPESEL bits are 0000, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000, writing to the registers at addresses H'68 to H'6E is ignored.

(1) Pipe Window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses H'68 to H'6E. After a pipe is selected by these bits, the values set in the areas at addresses H'68 to H'6E are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses H'68 to H'6E. Then, writing to the areas at addresses H'68 to H'6E is ignored.

32B.2.15.2 Pipe Configuration Register [PIPECFG] <Address: H'068>



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TYPE		—	—	—	BFRE	DBLB	CNTMD	SHTNAK	—	—	DIR	EPNUM			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TYPE	All 0	R/W	Transfer type These bits specify the transfer type of the pipe specified in the PIPESEL bit. 00: The pipe cannot be used. 01: Bulk transfer 10: Interrupt transfer 11: Isochronous transfer
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	BFRE	0	R/W	BRDY interrupt operation specification This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe. 0: A BRDY interrupt is notified when data is sent or received. 1: A BRDY interrupt is notified when reading of data is completed.
9	DBLB	0	R/W	Double-buffer mode This bit specifies a single or double FIFO buffer to be used by the specified pipe. 0: Single buffer 1: Double buffer
8	CNTMD	0	R/W	Continuous transfer mode This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode
7	SHTNAK	0	R/W	Pipe disable at transfer end When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends. 1: Disables the pipe when the transfer ends.
6, 5	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
4	DIR	0	R/W	Transfer direction This bit specifies the transfer direction of the specified pipe. 0: Receiving direction 1: Sending direction
3 to 0	EPNUM	All 0	R/W	Endpoint number These bits specify the endpoint number of the specified pipe.

(1) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.

Table 32B.12 lists pipes and the transfer types specifiable in these bits.

Table 32B.12 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

Selected Pipe	TYPE Bits	USB Transfer Type
PIPE1 or PIPE2	01 or 11	Bulk or isochronous transfer
PIPE3 to PIPE5	01	Bulk transfer
PIPE6 to PIPE9	10	Interrupt transfer

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

The value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(2) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.

If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.

For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(4) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5, and the transfer type of the selected pipe is bulk transfer.

This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in **Table 32B.13**.

Table 32B.13 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer According to the Value of the CNTMD Bit

CNTMD Bit Setting Value	How to Determine Whether Reading or Sending is Enabled
0	Condition for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): This module receives one packet
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): Either of the following conditions (1) and (2) is met: (1) Data for the maximum packet size is written to the FIFO buffer. (2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.
1	Conditions for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): (1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes ((BUFSIZE + 1) * 64). (2) This module receives a short packet other than a zero-length packet. (3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data. (4) Packets are received as many times as the value of the transaction counter set for the selected pipe.
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): One of the following conditions (1) to (3) is met: (1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe. (2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. (3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) PIPE disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 and is in the receiving direction.

When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

(1) This module has normally received short packet data (including zero-length packets).

(2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

(6) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Endpoint number (EPNUM) bits

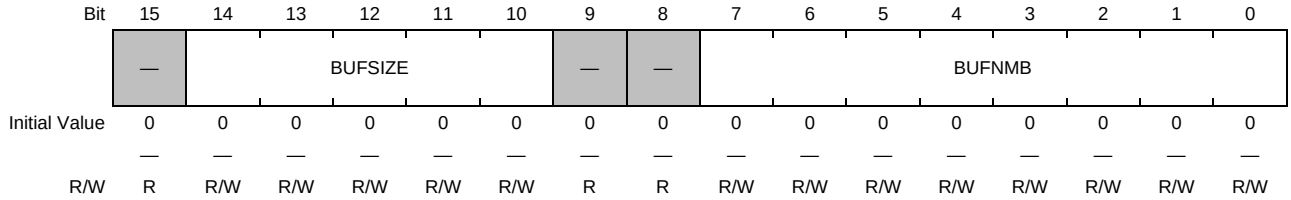
These bits are used to specify the endpoint number of the endpoint of a selected pipe. Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting "EPNUM = 000" [the selected pipe is not used] can be duplicated for multiple pipes.)

32B.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: H'06A>



Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14 to 10	BUFSIZE	All 0	R/W	Buffer size These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit. H'00: 64 bytes H'01: 128 bytes ... (H'1F: 2 Kbytes)
9, 8	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
7 to 0	BUFNMB	All 0	R/W	Buffer number These bits specify the FIFO buffer number of the specified pipe. (H'4 to H'7F)

Note: Changing values of these register bits for a selected pipe must be done when sets the PID of the selected pipe to NAK, and specifies no pipe in the CURPIPE bits.

Note: If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the values of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe. Specify the FIFO buffer size in units of blocks. One block has 64 bytes.

When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

The following value can be specified in these bits:

(1) Any value from H'0 to H'1F when the selected pipe is PIPE1 to PIPE5.

(2) H'0 only when the selected pipe is PIPE6 to PIPE9.

In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

(2) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe. This module allocates the following blocks of FIFO buffer to the selected pipe:

Block with block number “BUFNMB” to the block with block number “BUFNMB + (BUFSIZE + 1) × (DBLB + 1) - 1”

The value of these bits must be H’04 to H’7F. Note, however, that the following rules must be observed: Value " H’00" is exclusively used for DCP.

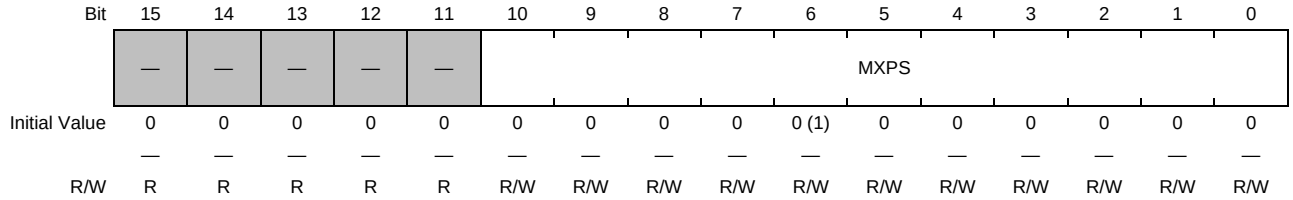
Value “H’04” is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’04 in the BUFNMB bits for PIPE6.

Value “H’05” is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’05 in the BUFNMB bits for PIPE7.

Value “H’06” is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’06 in the BUFNMB bits for PIPE8.

Value “H’07” is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’07 in the BUFNMB bits for PIPE9.

32B.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: H’06C>



Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 0	MXPS	*Note	R/W	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the specified pipe. For PIPE6 to PIPE8, a value from H’1 to H’40 (bytes) can be set.

Note: The initial value of the MXPS bits is H’000 when no pipe is specified in the PIPESEL bits in the PIPESEL register or H’040 when a pipe is specified in the PIPESEL bits.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.

The initial value of these bits is H’40 (64 bytes).

- For PIPE1 and PIPE2, a value from H’1 (1 byte) to H’400 (1024 bytes) can be specified.
- For PIPE3 to PIPE5, H’8 (8 bytes), H’10 (16 bytes), H’20 (32 bytes), H’40 (64 bytes), or H’200 (512 bytes) can be specified. (Bits [2:0] are excluded.)
- For PIPE6 to PIPE9, a value from H’1 (1 byte) to H’40 (64 bytes) can be specified.

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

32B.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: H'06E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
12	IFIS	0	R/W	Isochronous IN buffer flush This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer. 0: Does not perform a buffer flush. 1: Performs a buffer flush.
11 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	IITV	All 0	R/W	These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

(1) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.

In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.

This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token hag to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

(2) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.

For PIPE3 to PIPE5 these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5.

You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

(a) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.

This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.

When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

(a) When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	OUT	DATA0
Setting of PID bits	NAK	NAK	BUF			BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			0		
Start of interval counting			↑					

Figure 32B.1 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 0

(b) When IITV is not 0: Interval counting starts at the end of the first normal reception of data packet after the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0
Setting of PID bits	NAK	BUF	BUF			BUF	BUF			BUF	BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			—	0			—	0		
Start of interval counting			↑										

Figure 32B.2 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

(b) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.

This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.

This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:

(1) This module is reset (then, also the IITV bits are cleared).

(2) The ACLRM bit is set.

(3) This module detects a USB bus reset.

32B.2.16 Pipe Control Registers (PIPExCTR)

32B.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: H'070>
PIPE2 Control Register [PIPE2CTR] <Address: H'072>
PIPE3 Control Register [PIPE3CTR] <Address: H'074>
PIPE4 Control Register [PIPE4CTR] <Address: H'076>
PIPE5 Control Register [PIPE5CTR] <Address: H'078>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	INBUFM	—	—	—	ATREPM	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0: Buffer access is not possible. 1: Buffer access is possible.
14	INBUFM	0	R	Transmit buffer monitor When the specified pipe is in the sending direction, this bit indicates the FIFO buffer status of the specified pipe. 0: The FIFO buffer does not contain data that can be sent. 1: The FIFO buffer contains data that can be sent.
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	ATREPM	0	R/W	Automatic response mode This bit prohibits or enables automatic response of the specified pipe. 0: Automatic response prohibited 1: Automatic response enabled. (A zero-length packet response is sent during transmission. For reception, an NAK response is sent and an NRDY interrupt is generated.)
9	ACLRM	0	R/W	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Prohibited 1: Enabled (all buffers are initialized)
8	SQCLR	0	R(0)/W(1)	Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Writing disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1. 0: Writing disabled 1: DATA1 specified
6	SQMON	0	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	PID	All 0	R/W	Response PID These bits specify the response method for the next transaction in the specified pipe. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 32B.14 BSTS Bit Operations

DIR bit Setting Value	BFRE bit Setting Value	DCLRM bit Setting Value	Meaning of the BSTS Bit
0	0	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
		1	Setting prohibited
	1	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished.
		1	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
1	0	0	This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

(2) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

(3) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.

When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.
   Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA- PID).
   This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

(4) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 32B.15 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 32B.16 shows the cases that require this processing.

Table 32B.15 Buffer Contents This Core Clears When the ACLRM Bit is Set

No.	Contents to be Cleared by Setting the ACLRM Bit
(1)	Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared)
(2)	If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared.

Table 32B.16 Cases Requiring the ACLRM Bit to be Set

No.	Cases when Data Clear is Required
(1)	The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared.
(2)	The interval count value needs to be reset.
(3)	The value of the BFRE bit is changed.
(4)	The value of the DBLB bit is changed.
(5)	Forced termination of the transaction count function is performed.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(6) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

(8) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(9) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.

The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting muse be changed to BUF. For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see **Table 32B.17**.

If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check, that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

1. When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
2. When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
3. If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits. To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.

To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits. To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 32B.17 Core Operations Depending on the PID Setting

PID bit Setting Value	Transfer Type (TYPE Bit Setting Value)	Transfer Direction (DIR Bit Setting Value)	Operation of This Core
00 (NAK)	Bulk ("TYPE = 01"), or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a NAK response for a token from the USB host.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	Does not respond to a token from the USB host.
		Sending direction ("DIR = 1")	Sends a zero-length packet for a token from the USB host.
01 (BUF)	Bulk ("TYPE = 01")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response. For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Interrupt ("TYPE = 10")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data.
		Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet.
10 (STALL) or 11 (STALL)	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a STALL response for a token from the USB host.
	Isochronous ("TYPE = 11")	Independent of the setting value	Does not respond to a token from the USB host.

32B.2.16.2 PIPE6 Control Register [PIPE6CTR] <Address: H'07A>
PIPE7 Control Register [PIPE7CTR] <Address: H'07C>
PIPE8 Control Register [PIPE8CTR] <Address: H'07E>
PIPE9 Control Register [PIPE9CTR] <Address: H'080>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	—	—	—	—	—	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0
R/W	R	R	R	R	R	R	R/W	R(0)/W(1)	R(0)/W(1)	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0: Buffer access is not possible. 1: Buffer access is possible.
14 to 10	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
9	ACLRM	0	R/W	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Automatic buffer clear mode prohibited 1: Automatic buffer clear mode enabled (all buffers are initialized)
8	SQCLR	0	R(0)/W(1)	Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1 0: Disabled 1: DATA1 specified
6	SQMON	0	R	Toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	PID	All 0	R/W	Response PID These bits specifies the response method for the next transaction in the specified pipe 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

See **Section 32B.2.16.1(2), Transmit buffer monitor (INBUFM) bit**.

(2) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 32B.18 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 32B.19 shows the cases that require this processing.

Table 32B.18 Buffer Contents This Core Clears when the ACLRM Bit is Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	All contents of the FIFO buffer allocated to the selected pipe

Table 32B.19 Cases Requiring the ACLRM Bit to be Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	When clearing contents of the FIFO buffer allocated to the selected pipe
(2)	When resetting the interval counter
(3)	When the value of the BFRE bit is changed
(4)	When the transaction count function is terminated forcibly

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit clear (SQCLR) bit

See **Section 32B.2.16.1(5), Sequence toggle bit clear (SQCLR) bit**.

(4) Sequence toggle bit set (SQSET) bit

See **Section 32B.2.16.1(6), Sequence toggle bit set (SQSET) bit**.

(5) Sequence toggle bit monitor (SQMON) bit

See **Section 32B.2.16.1(7), Sequence toggle bit monitor (SQMON) bit**.

(6) Pipe busy (PBUSY) bit

See **Section 32B.2.16.1(8), Pipe busy (PBUSY) bit**.

(7) Response PID (PID) bits

See **Section 32B.2.16.1(9), Response PID (PID) bits**.

32B.2.17 Transaction Counters (PIPExTRE)

32B.2.17.1 PIPE1 Transaction Counter Enable Register [PIPE1TRE] <Address: H'090>
PIPE2 Transaction Counter Enable Register [PIPE2TRE] <Address: H'094>
PIPE3 Transaction Counter Enable Register [PIPE3TRE] <Address: H'098>
PIPE4 Transaction Counter Enable Register [PIPE4TRE] <Address: H'09C>
PIPE5 Transaction Counter Enable Register [PIPE5TRE] <Address: H'0A0>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R/W	R(0)/W(1)	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
9	TRENB	0	R/W	Transaction counter enable This bit enables or disables the transaction counter. 0: Disables the transaction counter. 1: Enables the transaction counter.
8	TRCLR	0	R(0)/W(1)	Transaction counter clear This bit clears the transaction counter to 0. To clear the counter, write 1 to this bit. 0: Invalid 1: Clears the current transaction counter.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

Note: Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is NAK.
If you change the value of a bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of the bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Transaction counter enable (TRENB) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.

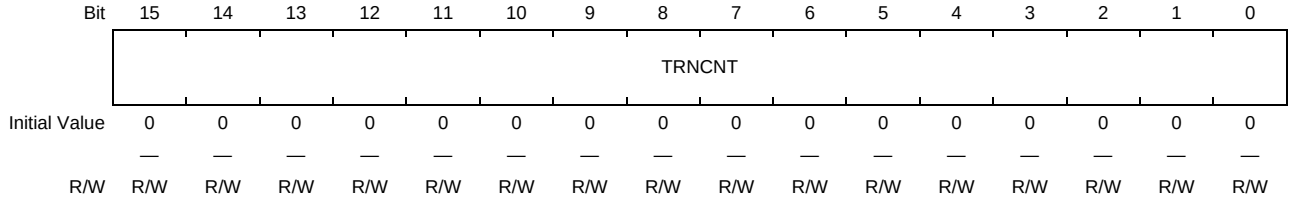
For the pipe in the sending direction, write 0 to this bit (TRENB bit). When not using the transaction count function, write 0 to this bit.

When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

(2) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

32B.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: H'092>
PIPE2 Transaction Counter Register [PIPE2TRN] <Address: H'096>
PIPE3 Transaction Counter Register [PIPE3TRN] <Address: H'09A>
PIPE4 Transaction Counter Register [PIPE4TRN] <Address: H'09E>
PIPE5 Transaction Counter Register [PIPE5TRN] <Address: H'0A2>



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT	All 0	R/W	When writing: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When reading: Indicates the specified number of transactions if TRENB is 0. Indicates the number of the currently counted transaction if TRENB is 1.

(1) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in **Section 32B.2.17.1(1), Transaction counter enable (TRENB) bit**.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions (a) to (c):

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is not equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions (a) to (c) are met:

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is equal to "current count + 1. "

(c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions (a) and (b) are met:

(a) The TRENB bit is 1.

(b) A short packet has been received.

(3) The following condition is met:

(a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits). When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENB bit is 0.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENB bit.

32B.2.18 Low Power Control Register

32B.2.18.1 Low Power Control Register [LPCTRL] <Address: H'100>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HWUPM	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved Nothing is assigned to these bits. Fix these bits to 0.
7	HWUPM	0	R/W	0: Resumes the PHY from the low-power mode while the internal bus clock (P1ϕ) is operating. 1: Enables resume from the low-power mode while the internal bus clock (P1ϕ) is stopped.
6 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (P1ϕ) is stopped.

0: Disables resumption while the internal bus clock (P1ϕ) is stopped.

1: Enables resumption while the internal bus clock (P1ϕ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (P1ϕ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (P1ϕ) is stopped, set both this bit and the L1EXTMD bit.

32B.2.19 Low Power Status Register

32B.2.19.1 Low Power Status Register [LPSTS] <Address: H'102>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSPM	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	SUSPM	0	R/W	USBPHY Suspend M control This bit controls the Suspend M signal to the USBPHY. 0: USBPHY suspend mode 1: USBPHY normal mode
13 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) USBPHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USBPHY. By default, the value of this bit is 0 and the USBPHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in **Table 32B.20**.

Table 32B.20 Registers That Allow Writing when the SUSPM Bit is 0

Address	Register Name
H'000	SYSCFG0
H'002	BUSWAIT
H'100	LPCTRL
H'102	SUSPMODE

Note that the values written to the SYSCFG0 register while the USBPHY clock is stopped (SUSPM = 0) will be applied after the USBPHY clock starts (SUSPM = 1).

When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

32B.2.20 PHY Function Control Register

32B.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: H'104>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	L1EXTMD	0	R/W	USBPHY control mode on resumption from the L1 state This bit controls the USBPHY resume operation on resumption from the L1 state. 0: Does not set the Suspend M bit when the Host K signal is received. 1: Sets the Suspend M bit when the Host K signal is received
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	HIRDTHR[3:0]	All 0	R/W	L1 response negotiation threshold HIRD threshold to be used for the L1NEGOMD bit The format is the same as the HIRD field of the HL1CTRL register.
7	DVSQ[3]	0	R	DVSQ extension bit This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state. 0000b: Powered state 0001b: Default state 0010b: Address state 0011b: Configured state 01xxb: Suspended state 10xxb: L1 state
6 to 4	DVSQ[2:0]	All 0	R	These bits mirror the DVSQ[2:0] bits in INTSTS0.
3	L1NEGOMD	0	R/W	L1 response negotiation control This bit sets the negotiation function using for the HIRD value. 0: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. 1: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. This bit is valid only when the value of the L1RESPMD[1:0] bit is 11b.
2, 1	L1RESPMD[1:0]	All 0	R/W	L1 response mode These bits specify how to respond to an LPM token. 00b: NYET 01b: ACK 10b: STALL 11b: Response according to the value of the L1NEGOMD bit
0	L1RESPEN	0	R/W	L1 response enable This bit enables an L1 response. 0: Does not support LPM. 1: Supports LPM.

(1) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USBPHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.

1: Sets the SuspendM bit when this module is resumed from the L1 state.

NOTES

1. The Host K period lasts a minimum of 50 µs. Therefore, the USBPHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
2. For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.
3. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

(2) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit.

The format of the value is the same as that of the HIRD field in the HL1CTRL register.

(3) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.

0000b: Powered state

0001b: Default state

0010b: Address state

0011b: Configured state

01xxb: Suspended state

10xxb: L1 state

(4) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

(5) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.

0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 11b.

(6) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module respond to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.

00b: NYET

01b: ACK

10b: STALL

11b: Response according to the value of L1NEGOMD bit

(7) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

32B.2.23 Peripheral L1 Control Register 2

32B.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: H'146>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
12	RWEMON	0	R/W	This bit reflects the value of the RWE bit in the LPM token received last.
11 to 8	HIRDMON[3:0]	All 0	R/W	These bits reflect the value of the HIRD field in the LPM token received last.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.

This bit reflects the value of the RWE bit in the LPM token received last.

(2) HIRD value monitor (HIRDMON) bits

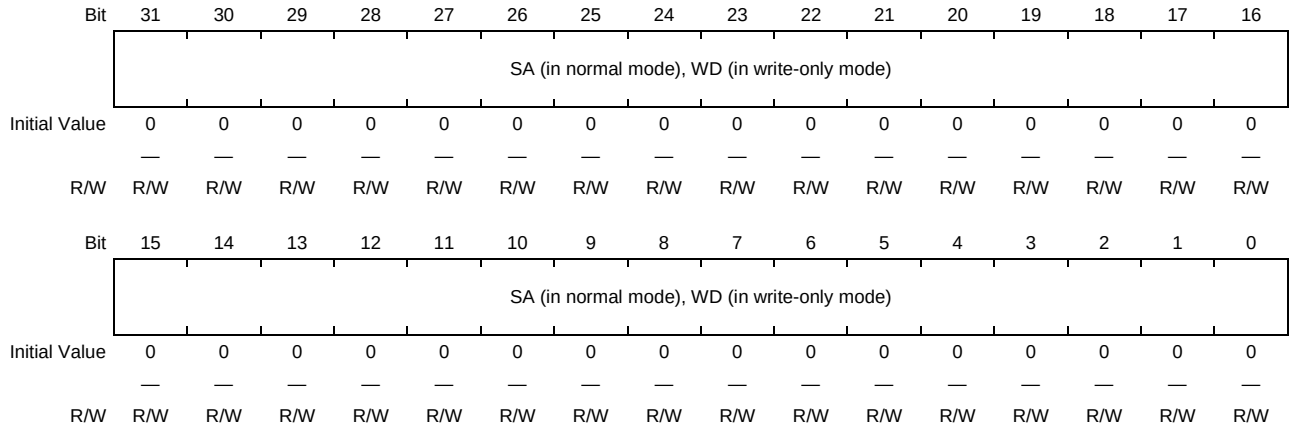
These bits are referenced to monitor the value of the HIRD field in a received LPM token.

These bits reflect the value of the HIRD field in the LPM token received last.

32B.3 Next Register Set

32B.3.1 Next Source Address Register n

32B.3.1.1 Next0 Source Address Register ch0 [N0SA_0] <Address: H'400>
Next1 Source Address Register ch0 [N1SA_0] <Address: H'40C>
Next0 Source Address Register ch1 [N0SA_1] <Address: H'440>
Next1 Source Address Register ch1 [N1SA_1] <Address: H'44C>

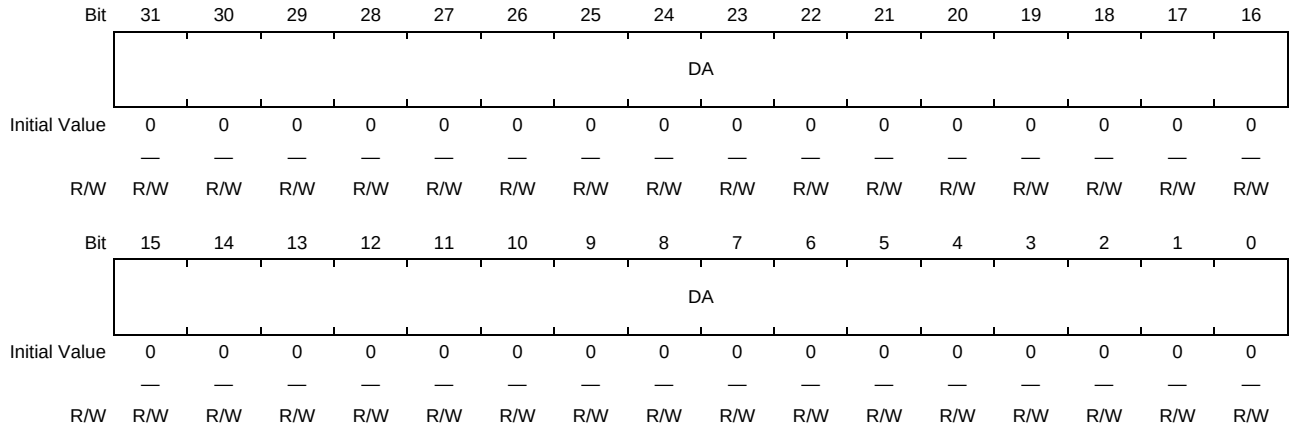


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA (in normal mode)	All 0	R/W	Source Address These bits specify the start address of the DMA transfer source.
	WD (in write-only mode)	All 0	R/W	Write Data These bits specify the write data in write-only mode.

Note: In a transfer in link mode, the data in the N0SA_n register is overwritten with descriptor read data.

32B.3.2 Next Destination Address Register n

32B.3.2.1 Next0 Destination Address Register ch0 [N0DA_0] <Address: H'404>
Next1 Destination Address Register ch0 [N1DA_0] <Address: H'410>
Next0 Destination Address Register ch1 [N0DA_1] <Address: H'444>
Next1 Destination Address Register ch1 [N1DA_1] <Address: H'450>

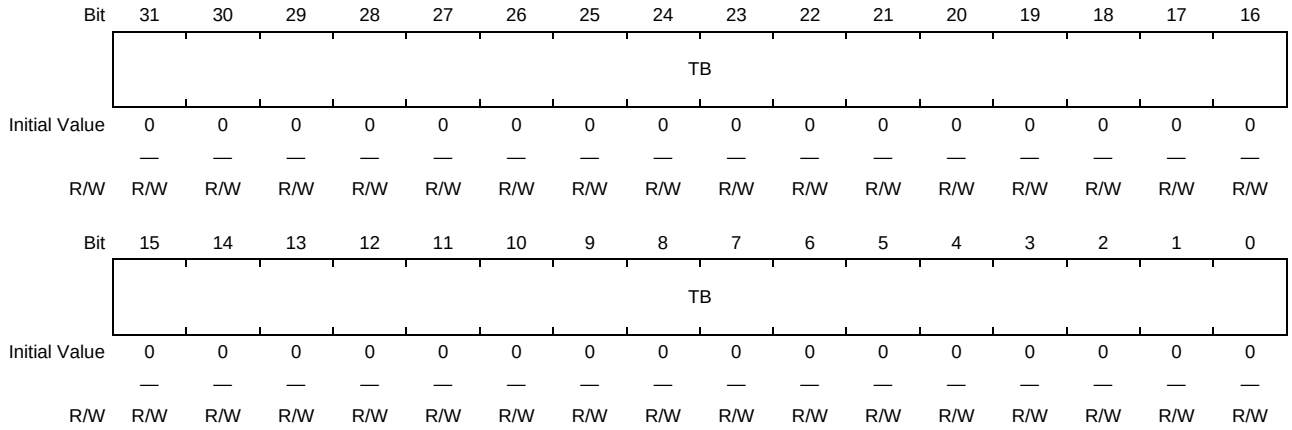


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA	All 0	R/W	Destination Address These bits specify the start address of the DMA transfer destination.

Note: In a transfer in link mode, the data in the N0DA_n register is overwritten with descriptor read data.

32B.3.3 Next Transaction Byte Register n

32B.3.3.1 Next0 Transaction Byte Register ch0 [N0TB_0] <Address: H'408>
Next1 Transaction Byte Register ch0 [N1TB_0] <Address: H'414>
Next0 Transaction Byte Register ch1 [N0TB_1] <Address: H'448>
Next1 Transaction Byte Register ch1 [N1TB_1] <Address: H'454>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB	All 0	R/W	Transaction Byte These bits specify the total number of transfer bytes. *Note*: Do not start a DMA transaction with 0 set in these bits.

Note: The N0TB_n register is overwritten by the descriptor read data during link mode transfer.

32B.4 Current Register Set

32B.4.1 Current Source Address Register

32B.4.1.1 Current Source Address Register ch0 [CRSA_0] <Address: H'418>
Current Source Address Register ch1 [CRSA_1] <Address: H'458>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRSA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRSA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA	All 0	R	Current Source Address Register This register indicates the read address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the SAD bit in the CHCFG_n register is 1, the value of this register is fixed. When the WONLY bit in the CHCFG_n register is 1, the value of this register is undefined.) The initial value of this register is loaded from the following register: In register mode: A transfer source address is loaded from the Next0/1 Register Set. In link mode: A transfer source address is loaded from the descriptor. (The descriptor read data is input to the N0SA_n register, and is loaded into the CRSA_n register when a transfer starts.) The value of this register is incremented when a read transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

32B.4.2 Current Destination Address Register

32B.4.2.1 Current Destination Address Register ch0 [CRDA_0] <Address: H'41C>
Current Destination Address Register ch1 [CRDA_1] <Address: H'45C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA	All 0	R	Current Destination Address Register This register indicates the write address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the DAD bit in the CHCFG_n register is 1, the value of this register is fixed.) The initial value of this register is loaded from the following register: In register mode: A transfer destination address is loaded from the Next0/1 Register Set. In link mode: A transfer destination address is loaded from the descriptor. (The descriptor read data is input to the N0DA_n register, and is loaded into the CRDA_n register when a transfer starts.) The value of this register is incremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

32B.4.3 Current Transaction Byte Register

32B.4.3.1 Current Transaction Byte Register ch0 [CRTB_0] <Address: H'420>
Current Transaction Byte Register ch1 [CRTB_1] <Address: H'460>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB	All 0	R	Current Transaction Byte Register This register indicates the remaining number of transfer bytes in the ongoing DMA transaction. The value of this register is decremented automatically while the DMA transaction is in process. The initial value of this register is loaded from the following register: In register mode: The number of transfer bytes is loaded from the Next0/1 Register Set. In link mode: The number of transfer bytes is loaded from the descriptor. (The descriptor read data is input to the N0TB_n register, and is loaded into the CRTB_n register when a transfer starts.) The value of this register is decremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

32B.5 Channel Register Set

32B.5.1 Channel Status Register n

32B.5.1.1 Channel Status Register ch0 [CHSTAT_0] <Address: H'424>
Channel Status Register ch1 [CHSTAT_1] <Address: H'464>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DNUM								—	—	—	—	—	SWPRQ	DMARQM	INTM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DNUM	All 0	R	Data Number These bits indicate the amount of valid data in the buffer. The indicated amount of data is the amount of the data that was read from the source but has not yet been written to the destination. (Unit: byte) Incrementing condition: • A DMA read transfer ends. Decrementing condition: • A DMA write transfer ends. Clearing conditions: • A condition for clearing the EN bit is met. • "1" is written to the SWRST bit in the CHCTRL_n register.
23 to 19	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
18	SWPRQ	0	R	Sweep Request This bit indicates the state of sweep request. This bit indicates the state of software sweep request (which has been activated by the SETSSWPRQ bit in the CHCTRL_n register). 1: The sweep request signal has been asserted. 0: The sweep request signal has not been asserted. Setting condition: • The SETSSWPRQ bit in the CHCTRL_n register is asserted. Clearing conditions: • The buffer becomes empty because of sweep. • "1" is written to the CLRHSWPRQM bit in the CHCTRL_n register. • "1" is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
17	DMARQM	0	R	DMAREQ Mask This bit indicates the state of temporary masking of the DMA transfer request from the USB control. 1: The request is temporarily masked. 0: The request is released from temporary masking. Setting condition: ● The SETDMARQM bit in the CHCTRL_n register is set. Clearing conditions: ● “1” is written to the CLRDMARQM bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
16	INTM	0	R	Interrupt Mask This bit indicates the state of temporary masking of the output from the USBFDMAmn interrupt. 1: The output is temporarily masked. 0: The output is released from temporary masking. Setting condition: ● “1” is written to the SETINTM bit in the CHCTRL_n register. Clearing conditions: ● “1” is written to the CLRINTM bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
15 to 12	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
11	MODE	0	R	DMA Mode This bit indicates the DMA mode. The indicated value is the value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode
10	DER	0	R	Descriptor Error This bit indicates whether the data read from the descriptor is invalid (LV = 0) (regardless of the value of the DIM bit in the CHCFG_n register). 0: No descriptor error has occurred. 1: A descriptor error has occurred. Setting condition: ● In link mode, when the DRRP bit in the CHCFG_n register is 0, the LV bit value read from the descriptor is 0. Clearing conditions: ● “1” is written to the CLRDER bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
9	DW	0	R	Descriptor WriteBack This bit indicates whether data is being written back to the descriptor. If a bus error occurs during write-back to the descriptor, this bit retains 1. 0: Status other than write-back to the header in link mode 1: (When the ER bit in the CHSTAT_n register is 0) Data is being written back to the header in link mode. (When the ER bit in the CHSTAT_n register is 1) A bus error has occurred during write-back to the header in link mode. Setting condition: ● Write-back to the header is started in link mode. Clearing conditions: ● Write-back to the header in link mode ends with an OK response. ● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0	R	Descriptor Load This bit indicates whether data is being read from the descriptor. If a bus error occurs during descriptor reading, this bit retains 1. 0: Status other than descriptor reading 1: (When the ER bit is 0) Descriptor reading is in process in link mode. (When the ER bit is 1) A bus error has occurred during descriptor reading in link mode. Setting condition: ● Descriptor reading is started in link mode. Clearing conditions: ● Descriptor reading in link mode ends with an OK response. ● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.
7	SR	0	R	Selected Register Set In register mode, this bit indicates the register set that is selected. 0: Next0 Register Set 1: Next1 Register Set Setting condition: ● The RSEL bit in the CHCFG_n register is set. Clearing condition: ● The RSEL bit in the CHCFG_n register is cleared.
6	TC	0	R	Terminal Count This status bit indicates whether the DMA transaction has ended. This bit is set only when the TCM bit in the CHCFG_n register is 0. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: ● In register mode, transfer of the total number of transfer bytes specified in the CRTB bits ends. ● In link mode, when the WBD bit in the header of the descriptor is 1, transfer of the total number of transfer bytes specified in the CRTB bits ends. ● In link mode, when the WBD bit in the header of the descriptor is 0, write-back to the descriptor ends. Clearing conditions: ● “1” is written to the CLRTC bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
5	END	0	R	USBFDMAmn Interrupted This bit indicates whether the DMA transaction has ended and an USBFDMAmn interrupt has occurred. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: ● The condition for setting the TC bit is met, and the DEM bit in the CHCFG_n register is 0. ● In link mode, when the descriptor is read, the LV bit in the header is 0, and the DRRP and DIM bits in the CHCFG_n register are 0. Clearing conditions: ● “1” is written to the CLREND bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
4	ER	0	R	Error This bit indicates whether an error response has been received and a DMAERR interrupt has occurred during the DMA transfer. 0: No error response has been received. 1: An error response has been received. Setting condition: ● An error response is received in a bus cycle. Clearing condition: ● “1” is written to the SWRST bit in the CHCTRL_n register.
3	SUS	0	R	Suspend This bit indicates whether the channel is suspended. For details, see **Section 32B.9.13.8(2), Suspension**. 0: Channel_n is not suspended. 1: Channel_n is suspended. Setting condition: ● “1” is written to the SETSUS bit in the CHCTRL_n register during the DMA transfer using channel_n, and, thereby, the inside of the channel is suspended. Clearing conditions: ● “1” is written to the CLRSUS bit in the CHCTRL_n register. ● “1” is written to the CLREN bit in the CHCTRL_n register. ● A condition for clearing the EN bit in the CHSTAT_n register.
2	TACT	0	R	Transaction Active This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see **Section 32B.9.13.8, Transfer state**. 0: The DMA in channel_n is stopped. 1: The DMA in channel_n is operating. Setting condition: ● “1” is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request). Clearing condition: ● The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended).
1	RQST	0	R	Request This bit indicates whether a transfer request has been received. 0: No DMA transfer request has been received. 1: A DMA transfer request has been received. Setting conditions: ● “1” is written to the STG bit in the CHCTRL_n register. ● A DMA transfer request is received from the USB control. Clearing conditions: ● “1” is written to the SWRST bit in the CHCTRL_n register. ● “1” is written to the CLRRQ bit in the CHCTRL_n register. ● In single transfer mode (the TM bit in the CHCFG_n register is 0), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register ● In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0). ● In link mode, the DMA transfer of the last descriptor (LE = 1) ends. ● In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). ● In link mode, when the DEM bit in the CHCFG_n register is 0, a DMA transaction ends. ● The master interface receives a bus error signal.

Bit	Bit Name	Initial Value	R/W	Description
0	EN	0	R	Enable This bit indicates whether the operation of DMA channel n is enabled or stopped. 0: Operation is stopped. 1: Operation is enabled. Setting conditions: • “1” is written to the SETEN bit in the CHCTRL_n register. Clearing conditions: • “1” is written to the SWRST bit in the CHCTRL_n register. • “1” is written to the CLREN bit in the CHCTRL_n register. • An error response is received during transfer. • In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0). • In link mode, DMA transfer of the last descriptor (the LE bit is 1) ends (if the WBD bit is 0, write- back to the descriptor ends). • In link mode, reading of a descriptor is stopped (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0).

Note 1. When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.

Note 2. To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see **Section 32B.9.13.8(3), Transfer suspension**.)

Note 3. If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that takes effect cannot be identified. Therefore, design the system so that only one type of transfer requests is used.

Note 4. When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

32B.5.2 Channel Control Register n

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read
19	CLRDMARQM	0	R/W	Clear DMAREQ Mask Writing 1 to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1 to this bit also clears the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Releases the DNA transfer requests from masking set by using the SETDMARQM bit. 0: Has no effect on operation.
18	SETDMARQM	0	R/W	SET DMAREQ Mask Writing 1 to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1 to this bit also sets the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the DMA transfer requests from the USB control. 0: Has no effect on operation.
17	CLRINTM	0	R/W	Clear Interrupt Mask Writing 1 to this bit releases the USBFDMAmn interrupt from masking. Writing 1 to this bit also clears the INTM bit in the CHSTATn register. Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1 activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0.) When this bit is read, 0 is read. 1: Releases the pin output from masking set by using the SETINTM bit. 0: Has no effect on operation.
16	SETINTM	0	R/W	SETINTMSet Interrupt Mask Writing 1 to this bit temporarily masks the USBFDMAmn interrupt. Writing 1 to this bit also sets the INTM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the USBFDMAmn interrupt. 0: Has no effect on operation.
15	—	0	R	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.

Bit	Bit Name	Initial Value	R/W	Description
14	SETSSWPRQ	0	R/W	Set Software Sweep Request Writing 1 to this bit sweeps out the data stored in the buffer to the destination (see **Section 32B.9.13.3(1), Forced software sweeping request**). When this bit is read, 0 is read. 1: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination. 0: Has no effect on operation. If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used.
13	—	0	R	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.
12	SETREN	0	R/W	Set Register Set Enable Writing 1 to this bit sets the REN bit in the CHCFG_n register. When this bit is read, 0 is read. 1: Sets the REN bit in the CHCFG_n register. 0: Has no effect on operation.
11, 10	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
9	CLRSUS	0	R/W	Clear Suspend Writing 1 to this bit when the SUS bit in the CHSTAT_n register is 1 releases the ongoing DMA transfer from the suspended state. When this bit is read, 0 is read. 1: Releases the ongoing DMA transfer from the suspended state. 0: Has no effect on operation.
8	SETSUS	0	R/W	Set Suspend Writing 1 to this bit when the EN bit in the CHSTAT_n register is 1 suspends the ongoing DMA transfer. When this bit is read, 0 is read. 1: Suspends the ongoing DMA transfer. 0: Has no effect on operation.
7	CLRDER	0	R/W	Clear DER Writing 1 to this bit clears the DER bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the DER bit. 0: Has no effect on operation.
6	CLRTC	0	R/W	Clear TC Writing 1 to this bit clears the TC bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the TC bit. 0: Has no effect on operation.
5	CLREND	0	R/W	Clear End Writing 1 to this bit clears the END bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the END bit. 0: Has no effect on operation.
4	CLRRQ	0	R/W	Clear Request Writing 1 to this bit clears the RQST bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the RQST bit in the CHSTAT_n register. 0: Has no effect on operation.

Bit	Bit Name	Initial Value	R/W	Description
3	SWRST	0	R/W	Software Reset Writing 1 to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0. When this bit is read, 0 is read. 1: Clears individual bits in the CHSTAT_n register. 0: Has no effect on operation.
2	STG	0	R/W	Software Trigger Writing 1 to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority. When this bit is read, 0 is read. 1: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register). 0: Has no effect on operation.
1	CLREN	0	R/W	Clear Enable Writing 1 to this bit clears the EN bit in the CHSTAT_n register (for details, see **Section 32B.9.13.8(3) Transfer suspension**). When this bit is read, 0 is read. 1: Disables DMA transfers (clears the EN bit in the CHSTAT_n register). 0: Has no effect on operation.
0	SETEN	0	R/W	Set Enable Writing 1 to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start. When this bit is read, 0 is read. 1: Enables DMA transfers (sets the EN bit in the CHSTAT_n register). 0: Has no effect on operation.

Note: Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

32B.5.3 Channel Configuration Register

32B.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: H'42C>
Channel Configuration Register ch1 [CHCFG_1] <Address: H'46C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMS	REN	RSW	RSEL	SBE	DIM	TCM	DEM	WONLY	—	DAD	SAD	DDS			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDS				DRRP	—	—	—	—	—	—	—	REQD	—	—	SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0	R/W	DMA Mode Select This bit specifies the DMA mode to be used. 0: Register mode (default) 1: Link mode
30	REN	0	R/W	Register Set Enable This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode. 0: Does not perform the DMA transaction successively. 1: Performs the DMA transaction successively. Setting conditions: • "1" is written to this bit. • "1" is written to the SETREN bit in the CHCTRL_n register. Clearing conditions: • "0" is written to this bit. • The REN bit is 1, and a DMA transaction ends. To re-set the REN bit during a transaction, we recommend to use the SETREN bit in the CHCTRL_n register.
29	RSW	0	R/W	Register Select Switch This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode. 0: Does not invert the RSEL bit after a DMA transaction ends. (Default) 1: Inverts the RSEL bit after a DMA transaction ends.
28	RSEL	0	R/W	Register Set Select This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode. When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction. 0: Uses the Next0 Register Set. (Default) 1: Uses the Next1 Register Set. Transition condition: A DMA transaction ends with the RSW bit set.

Bit	Bit Name	Initial Value	R/W	Description
27	SBE	0	R/W	Sweep Buffer Enable This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction. The sweep mode can be used only when the REQD bit is 0. 0: Stops transfer without sweeping out the buffer. (Default) 1: Stops transfer after sweeping out the buffer.
26	DIM	0	R/W	Descriptor Interrupt Mask This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Mask the USBFDMAmn interrupt.
25	TCM	0	R/W	DMATC Mask This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control. When this bit is 1 at the time the DMATC signal is to be output, the DMATC signal is not asserted. Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically. Use this bit when you control DMA transfers by software. 0: Does not mask the DMATC signal. (Default) 1: Masks the DMATC signal. Clearing condition: A DMA transaction ends with the TCM bit set.
24	DEM	0	R/W	USBFDMAmn Mask When this bit is 1 at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Masks the USBFDMAmn interrupt. Clearing condition: A DMA transaction ends with the DEM bit set.
23	WONLY	0	R/W	Write Only Mode This bit is used to switch the transfer operation mode to the write-only mode (see **Section 32B.9.12.2, Write only mode**). 0: Normal operation (default) 1: Write-only mode
22	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
21	DAD	0	R/W	Destination Address Direction This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.
20	SAD	0	R/W	Source Address Direction This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer source uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	DDS[3:0]	All 0	R/W	Destination Data Size These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 32B.21**.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited
15 to 12	SDS[3:0]	All 0	R/W	Source Data Size These bits specify the size of DMA transfer data. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 32B.21**.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited
11	DRRP	0	R/W	Descriptor Read Repeat This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0. (See **section 32B.9.12.1(2)(a), Operation flow of link mode**.) • 0: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default) • 1: This module keeps reading the same descriptor until the LV value changes to 1, and, when the LV value becomes 1, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register.
10 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6, 5	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 1.
4	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
3	REQD	0	R/W	Request Direction This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side. 0: The USB control is on the transfer source side. (Default) 1: The USB control is on the transfer destination side.
2, 1	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
0	SEL	0	R/W	Terminal Select This bit selects the FIFO channel to be used on the USB control side. 0: D0FIFO 1: D1FIFO

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 32B.21 Range of Sizes That Can Be Specified in SDS and DDS Bits

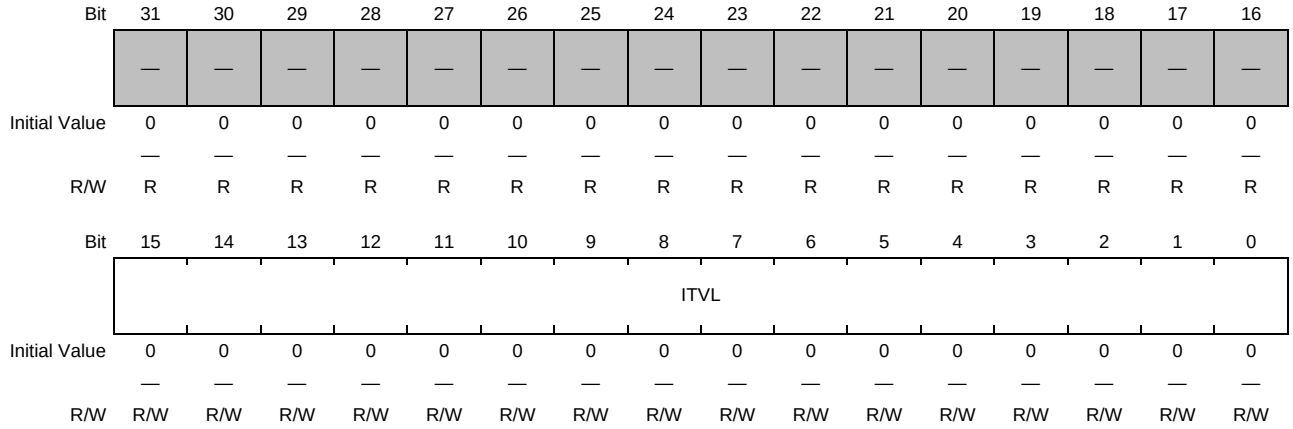
Transfer Address	REQD	SDS[2:0]	DDS[2:0]
Beat aligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)
	1	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.
Beat unaligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)
	1	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.

Note: When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits.
Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned.
If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

32B.5.4 Channel Interval Register n

For details, see **Section 32B.9.13.6, Interval Count Function**.

32B.5.4.1 Channel Interval Register ch0 [CHITVL_0] <Address: H'430>
Channel Interval Register ch1 [CHITVL_1] <Address: H'470>



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
15 to 0	ITVL	All 0	R/W	Interval These bits specify the DMA transfer interval.

32B.5.5 Channel Extension Register n

32B.5.5.1 Channel Extension Register ch0 [CHEXT_0] <Address: H'434>
Channel Extension Register ch1 [CHEXT_1] <Address: H'474>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DPR				—	—	—	—	SPR			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	DPR	All 0	R/W	Destination PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer. The initial value of these bits is H'0.
7 to 4	—	All 0	R/W	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	SPR	All 0	R/W	Source PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer. The initial value of these bits is H'0.

32B.6 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

32B.6.1 Next Link Address Register n (NXLA_n)

32B.6.1.1 Next Link Address Register ch0 [NXLA_0] <Address: H'438>
Next Link Address Register ch1 [NXLA_1] <Address: H'478>

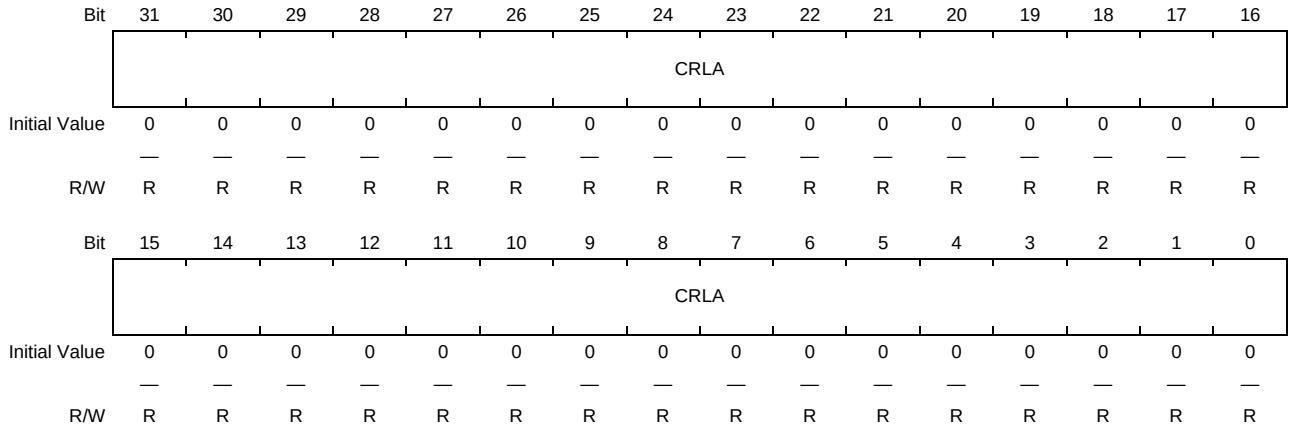
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	NXLA	All 0	R/W	Next Link Address
1, 0		All 0	R	These bits specify the link-destination address. Upper two bits are fixed to 0, and only the address aligned with a word boundary can be set.

32B.6.2 Current Link Address Register n (CRLA_n)

32B.6.2.1 Current Link Address Register ch0 [CRLA_0] <Address: H'43C>
Current Link Address Register ch1 [CRLA_1] <Address: H'47C>



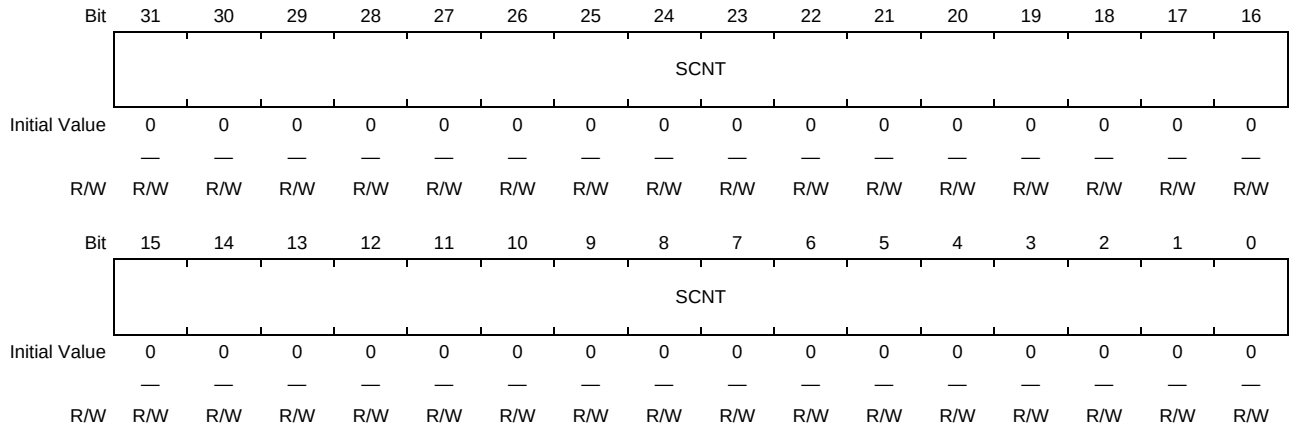
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA	All 0	R	Current Link Address These bits indicate the address of the descriptor being used for current transaction.

32B.7 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

32B.7.1 Source Continuous Register n

32B.7.1.1 Source Continuous Register ch0 [SCNT_0] <Address: H'600>
Source Continuous Register ch1 [SCNT_1] <Address: H'620>

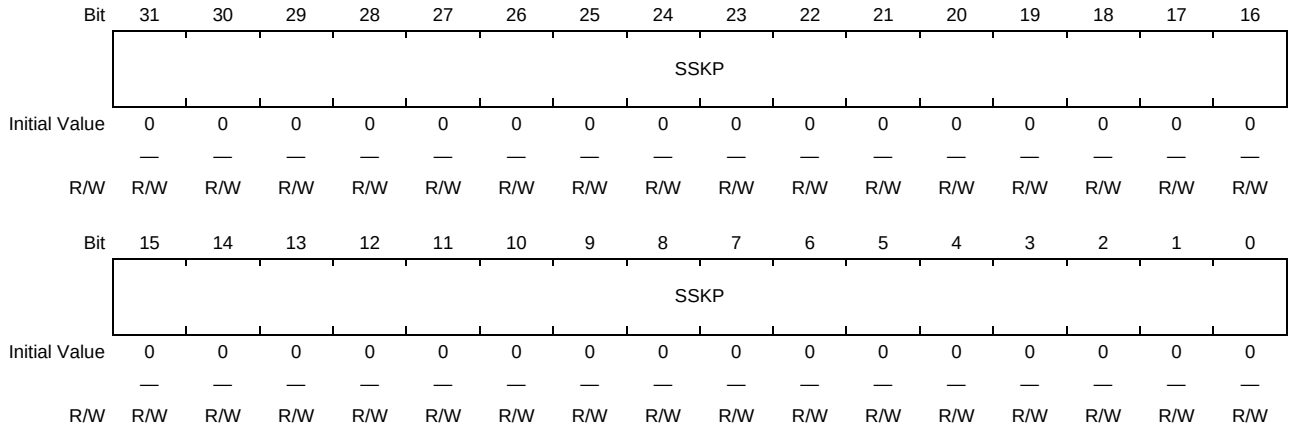


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SCNT	All 0	R/W	Source Continuous These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte)

Note: This register is used in pair with the SSKP_n register (see **Figure 32B.3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the SCNT bits set to 0.

32B.7.2 Source Skip Register n

32B.7.2.1 Source Skip Register ch0 [SSKP_0] <Address: H'604>
Source Skip Register ch1 [SSKP_1] <Address: H'624>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSKP	All 0	R/W	Source Skip These bits specify the size of area to be skipped in a source address access. (Unit: byte)

Note: This register is used in pair with the SCNT_n register (see **Figure 32B.3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1 (Fixed).

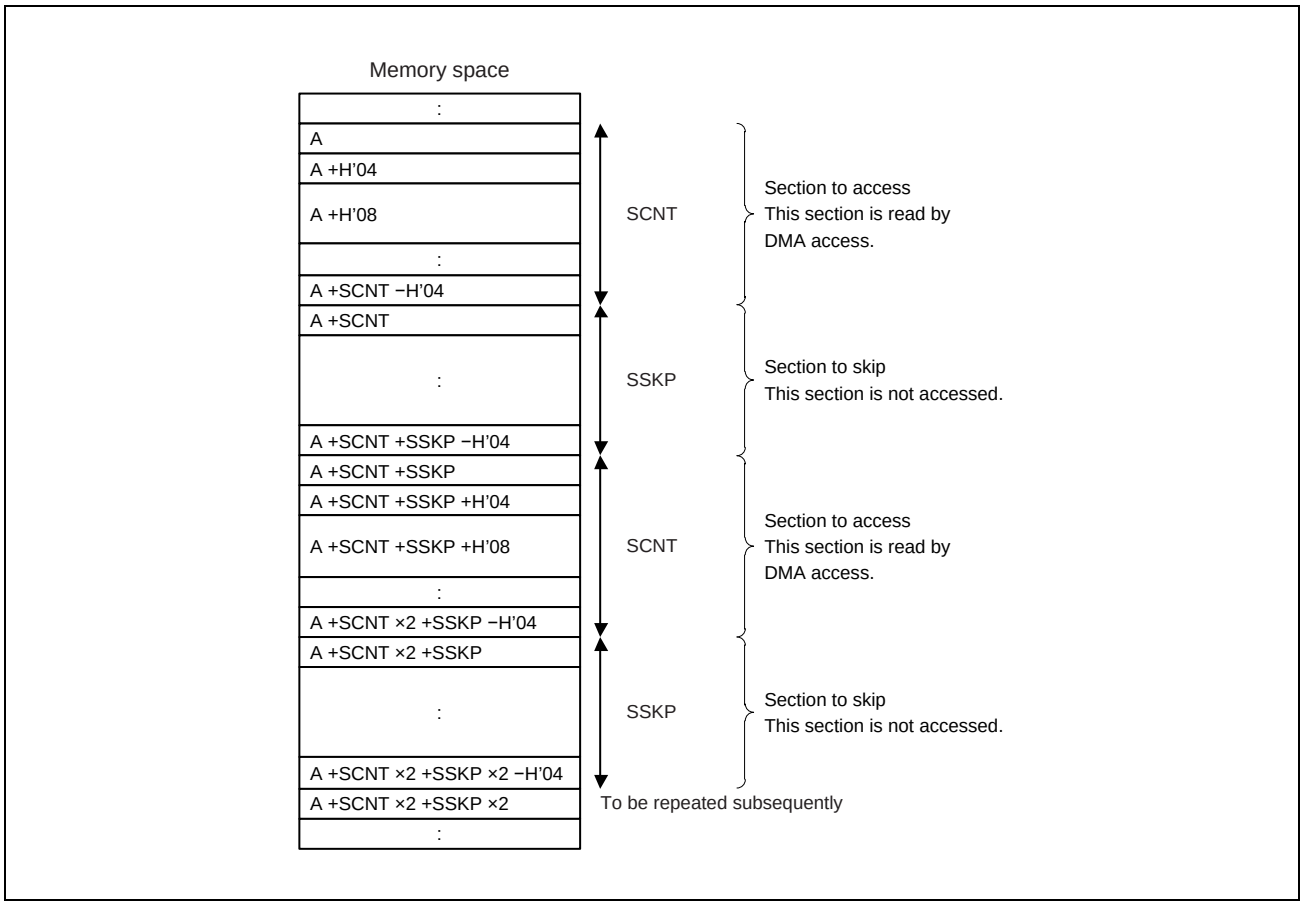


Figure 32B.3 Relationship between SSKP and SCNT

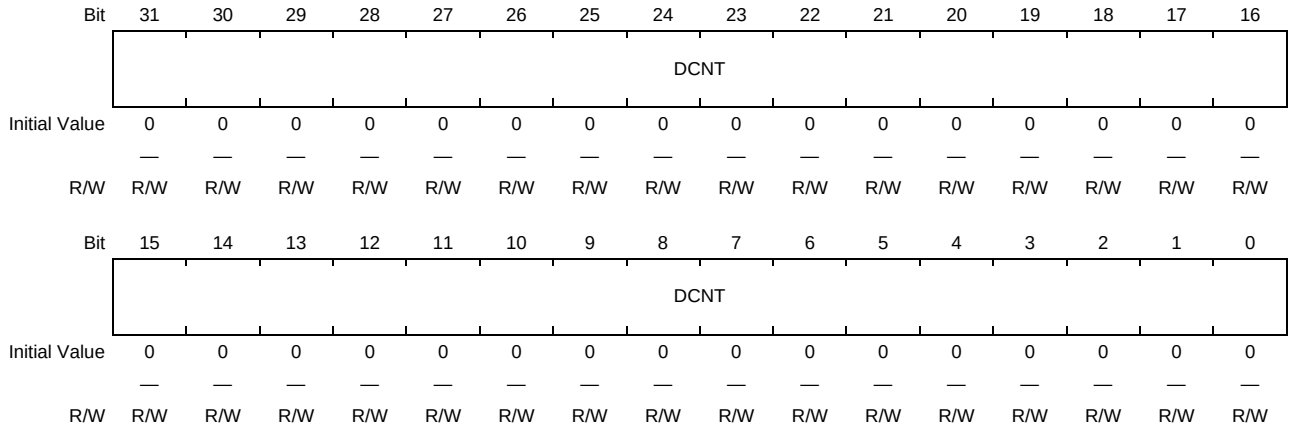
You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see **Section 32B.9.14.1(1), Read access**).

32B.7.3 Destination Continuous Register n

32B.7.3.1 Destination Continuous Register ch0 [DCNT_0] <Address: H'608>
Destination Continuous Register ch1 [DCNT_1] <Address: H'628>

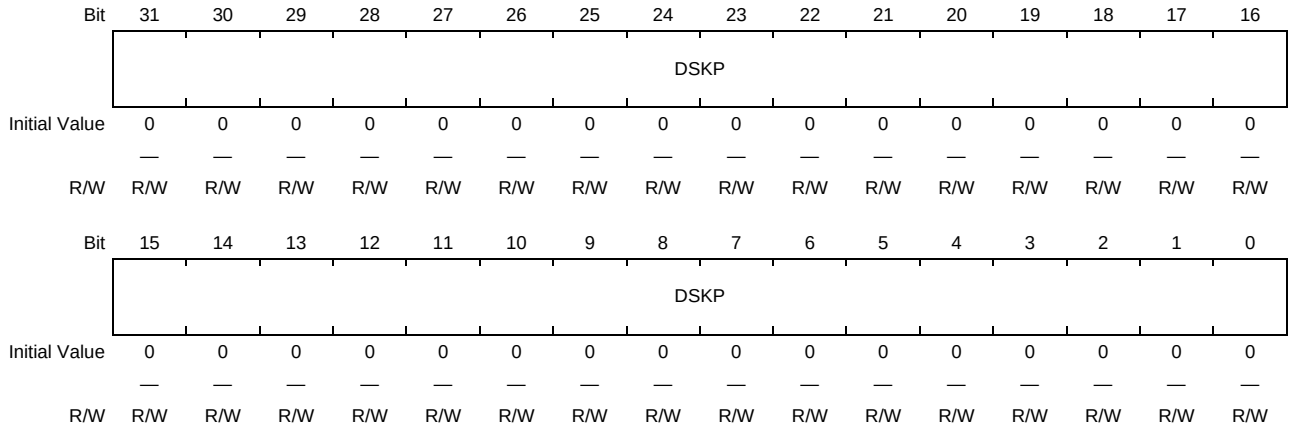


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DCNT	All 0	R/W	Destination Continuous These bits specify the size of the space to be accessed continuously by destination address access. (Unit: byte)

Note: This register is used in pair with the DSKP_n register (see **Figure 32B.4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the DCNT bits set to 0.

32B.7.4 Destination Skip Register n

32B.7.4.1 Destination Skip Register ch0 [DSKP_0] <Address: H'60C>
Destination Skip Register ch1 [DSKP_1] <Address: H'62C>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSKP	All 0	R/W	Destination Skip These bits specify the size of area to be skipped in a destination address access. (Unit: byte)

Note: This register is used in pair with the DCNT_n register (see **Figure 32B.4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed).

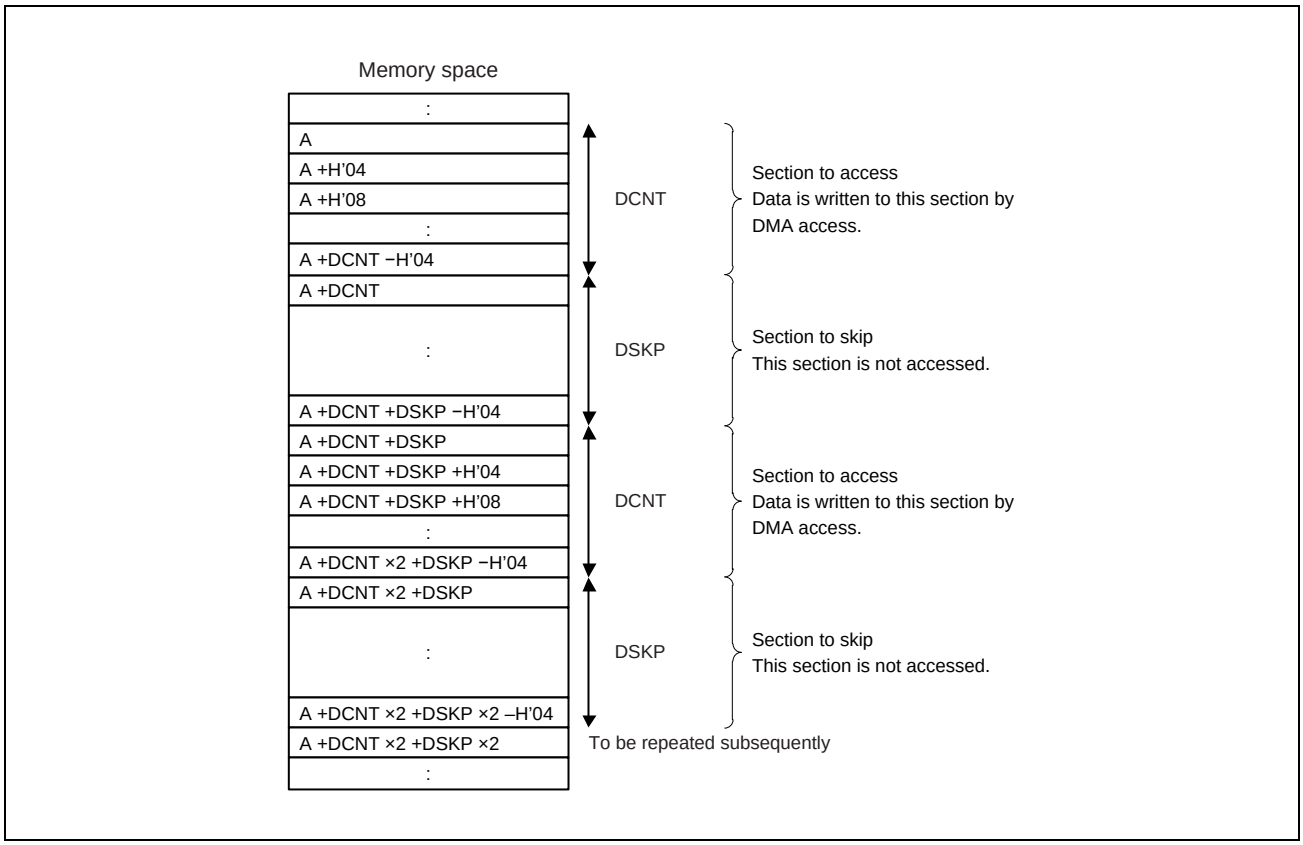


Figure 32B.4 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see **Section 32B.9.14.1(1), Read access**).

32B.8 DMA Register Set

The registers described below are shared by all channels.

32B.8.1 DMA Control Register

32B.8.1.1 DMA Control Register [DCTRL] <Address: H'700>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	LWPR				—	—	—	—	LDPR

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
27 to 24	LWPR	All 0	R/W	Link WriteBack PROT These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode.
23 to 20	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
19 to 16	LDPR	All 0	R/W	Link Descriptor PROT These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode.
15 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	LVINT	0	R/W	Level Interrupt To use this module, be sure to set this bit to 1.
0	PR	0	R/W	Priority This bit specifies the transfer priority control mode (see **Section 32B.9.13.2, DMA channel priority control**). 0: Fixed priority mode 1: Round-robin mode

32B.8.2 Descriptor Interval Register n

32B.8.2.1 Descriptor Interval Register [DSCITVL] <Address: H'704>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	SUS0	0	R	This bit indicates the state of the SUS bit for DMA channel 0.

32B.9 Functions

32B.9.1 System Control and Oscillation Control

This chapter describes register manipulations required to perform initial setup of this module. This chapter also describes the registers required to control power consumption.

For the parts of the sequence that are required in both host and peripheral modes, see **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.

32B.9.1.1 USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USBPHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.

Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

32B.9.2 Interrupt Function

32B.9.2.1 Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as U2P_IXL_INT. Check the status register to identify the interrupt factor. The interrupt from this module is not asserted when the supply of the internal bus clock (P1ϕ) is stopped.

Table 32B.22 List of Interrupt functions

Bit	Interrupt name	Interrupt factor	Related status
VBINT	VBUS interrupt	The status change of the VBUS input pin is detected. (Changes from L to H and from H to L are detected.)	VBSTS
RESM	Resume interrupt	In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0).	—
SOFR	Frame number update interrupt	If SOFRM is 0: An SOF packet with a different frame number is received. If SOFRM is 1: An SOF with µframe number 0 cannot be received due to a problem such as packet corruption.	—
DVST	Device state transition interrupt	A transition of a device state is detected. USB bus reset detected Suspended state detected Set Address request received Set Configuration request received	DVSQ
CTRT	Control transfer stage transition interrupt	A transition of a control transfer stage is detected. Setup stage completed ControlWrite transfer status stage transition ControlRead transfer status stage transition Control transfer completed Control transfer sequence error	CTSQ
BEMP	Buffer empty interrupt	All data in the buffer memory is sent and the buffer becomes empty. A packet exceeding the maximum packet size is received.	PIPEBEMP
NRDY	Buffer not ready interrupt	A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data. A CRC error or bit stuff error occurs when data is received in isochronous transfer. An interval error occurs when data is received in isochronous transfer.	PIPENRDY
BRDY	Buffer ready interrupt	The buffer becomes ready (available for reading or writing data).	PIPEBRDY

The following shows the relationship between interrupts of this module.

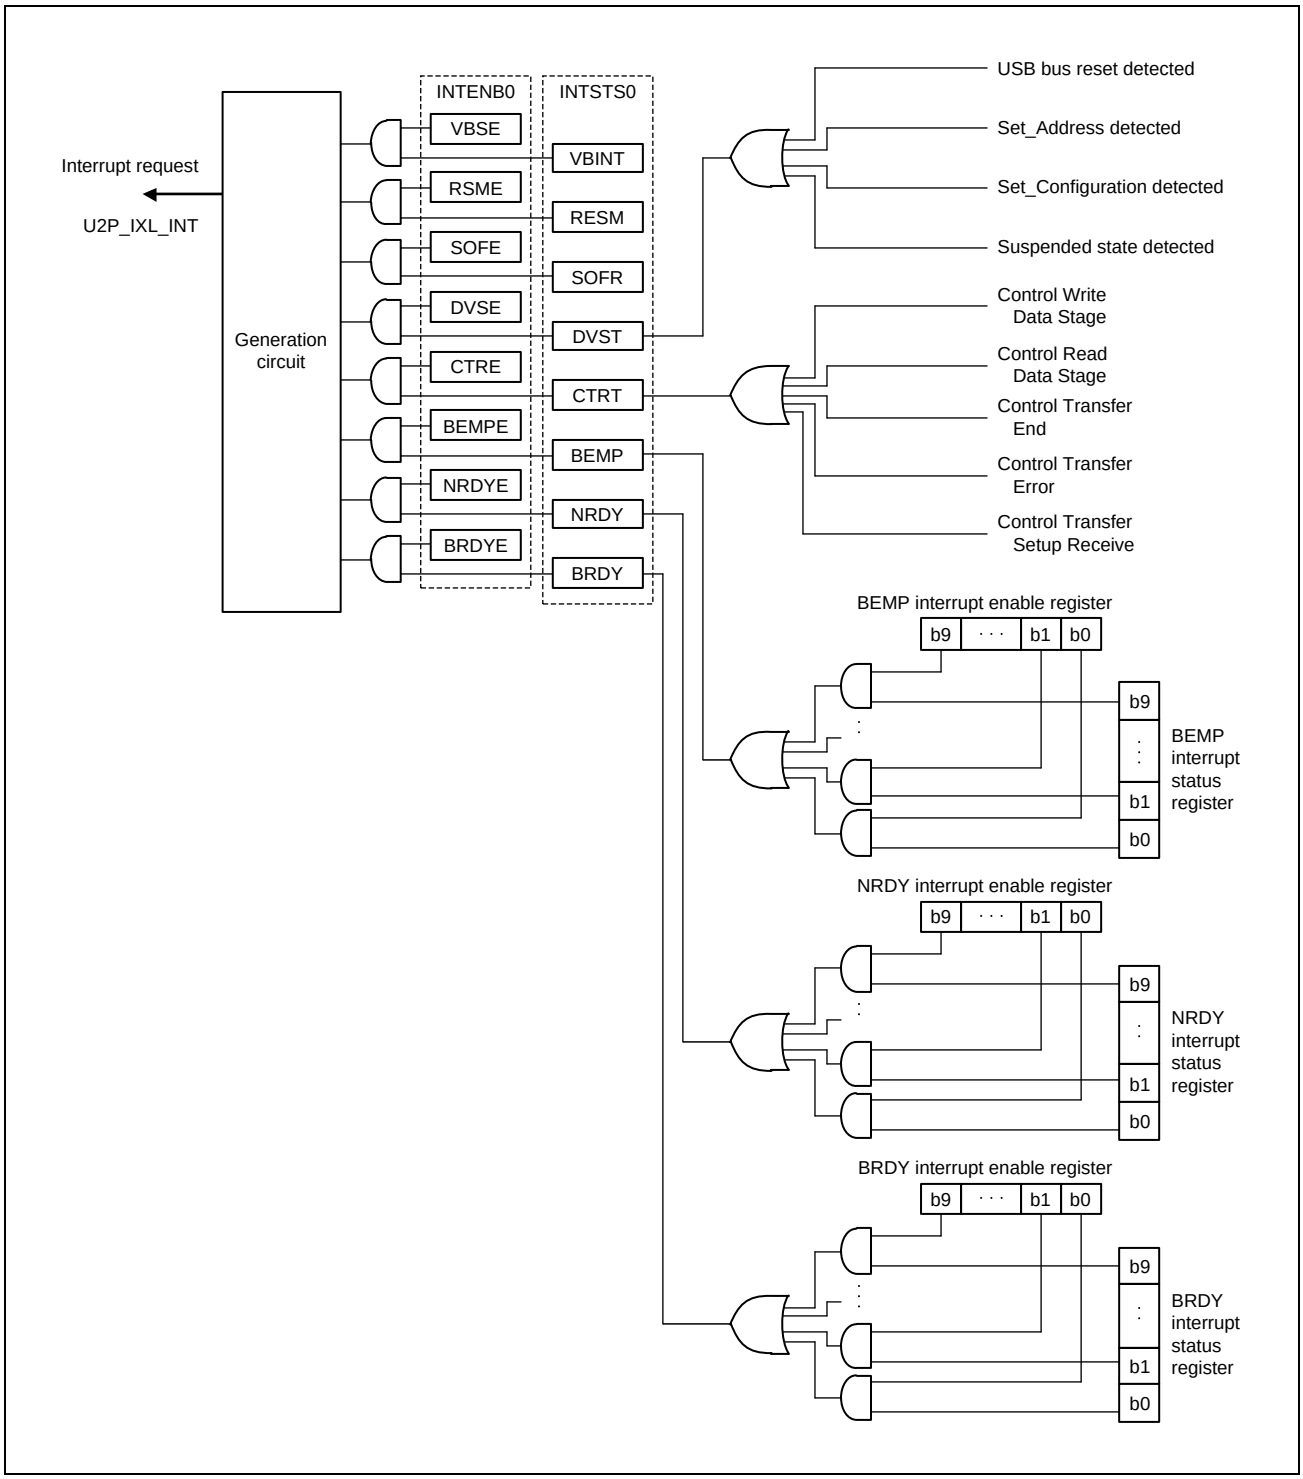

Figure 32B.5 Interrupt Association Diagram

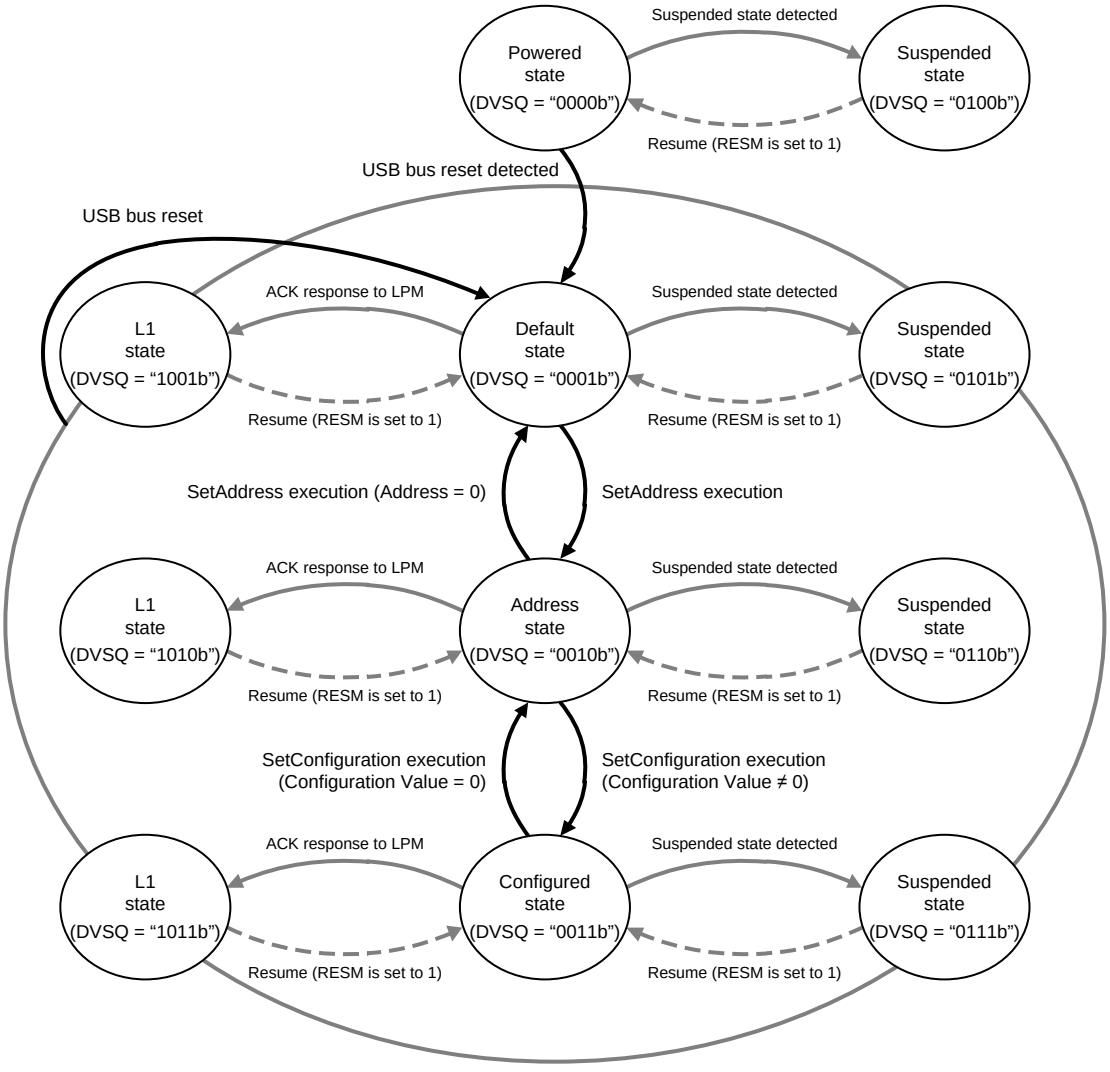
32B.9.2.2 Device State Transition Interrupts

Figure 32B.6 shows the device state transition diagram of this module.

This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.

To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.



Note: When a transition indicated by a solid line occurs, the DVST bits are set to 1.
When a transition indicated by a broken line occurs, the RESM bit is set to 1.

Figure 32B.6 Device State Transition Diagram

32B.9.2.3 Control Transfer Stage Transition Interrupts

Figure 32B.7 shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer. If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

(1) For Control Read transfer

(a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.

(b) An IN token is received in the status stage.

(c) A data packet "DATAPID = DATA0" is received in the status stage.

(2) For Control Write transfer

(a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.

(b) The first data packet ”DATAPID = DATA0” is received in the data stage.

(c) An OUT or PING token is received in the status stage.

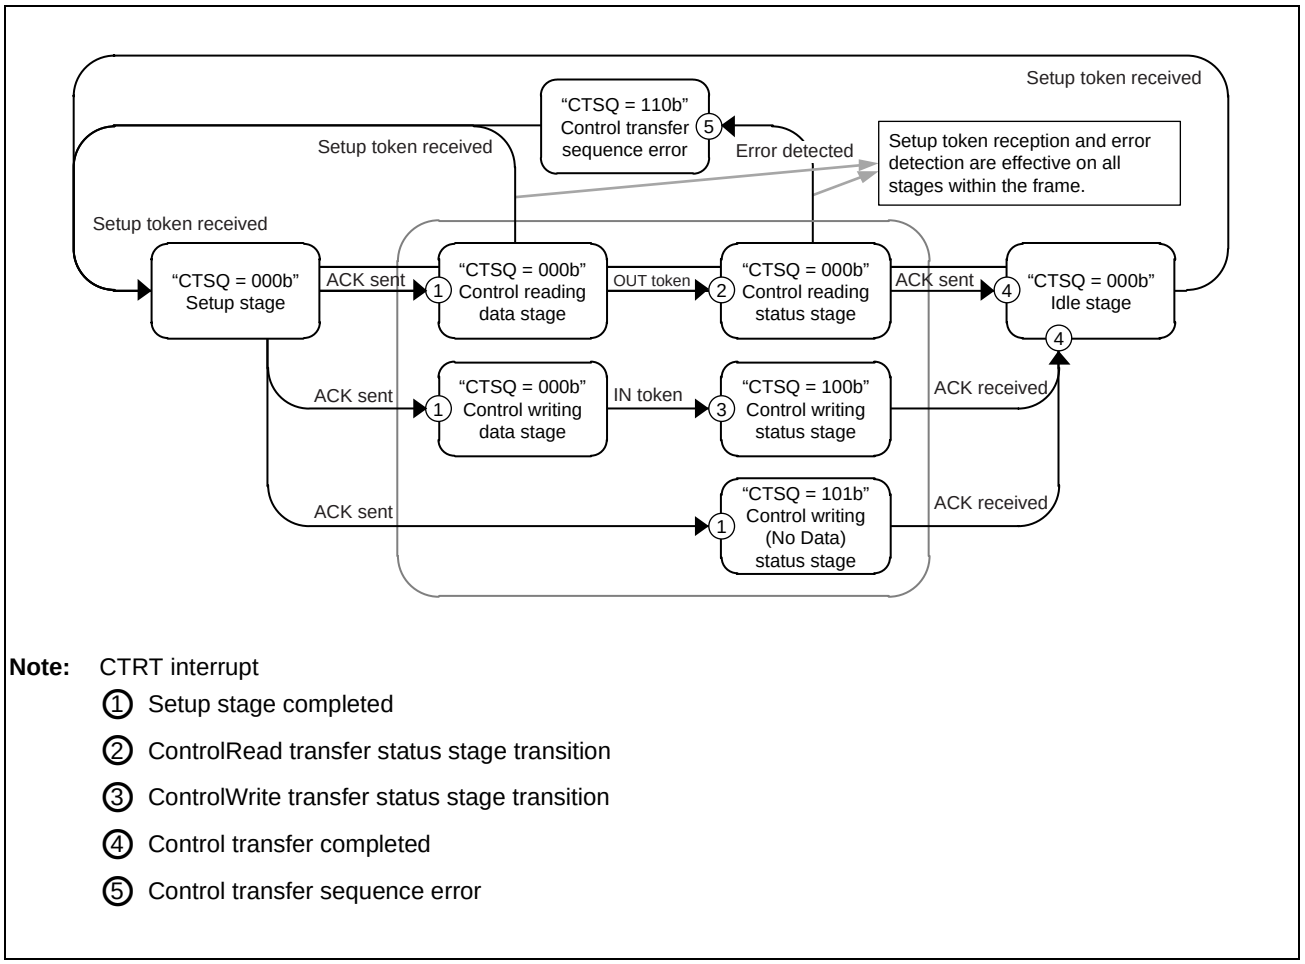
(3) For Nodata Control transfer

(a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.

Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)



Note: CTRT interrupt

① Setup stage completed

② ControlRead transfer status stage transition

③ ControlWrite transfer status stage transition

④ Control transfer completed

⑤ Control transfer sequence error

Figure 32B.7 Control Transfer Stage Transition Diagram

32B.9.2.4 Interrupts Relating to DMA Master

Table 32B.23 List of Interrupts

Interrupt Name	Interrupt Type
USBFDMAmn (m, n = 0, 1)	A DMA transaction ends.
	An invalid descriptor is read in link mode.
USBFDMAERRm (m = 0, 1)	An error response is returned for a transfer issued by the master interface.

This module has two types of DMA interrupts USBFDMAmn and USBFDMAERRm.

(1) USBFDMAmn interrupt (m, n = 0, 1)
This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.
An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

(2) USBFDMAERRm interrupt
This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAmn interrupt output can be temporarily masked by setting a register.

Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.

On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

32B.9.3 Pipe Control

Table 32B.24 lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 32B.24 PIPE Settings

Register Name	Bit Name	Setting	Comment
DCPCFG	TYPE	Specifies the transfer type.	Pipes 1 to 9: Settable
PIPECFG	BFRE	Selects BRDY interrupt mode.	Pipes 1 to 5: Settable
	DBLB	Selects double-buffer configuration.	Pipes 1 to 5: Settable
	CNTMD	Selects continuous transfer or non-continuous transfer.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5: Settable
	DIR	Selects transfer direction.	Settable to IN or OUT
	EPNUM	Endpoint number	Pipes 1 to 9: Settable Set to a value other than “0000” when a pipe is in use.
	SHTNAK	Disables pipes when transfer is completed.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5 Settable
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes) Pipes 1 to 5: Settable (up to 2 Kbytes specifiable) Pipes 6 to 9: Unsettable (fixed to 64 bytes)
	BUFNMB	Buffer memory number	DCP: Unsettable (fixed to area 0 to 3 hex) Pipes 1 to 5 Settable (area 8 to 87 hex specifiable) Pipes 6 to 9: Unsettable (fixed to area 4 to 7 hex)
DCPMAXP PIPEMAXP	MXPS	Maximum packet size	Setting conforming to the USB specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
	IITV	Interval counter	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
DCPCTR PIPExCTR	BSTS	Buffer status	DCP state switched between receive and transmit buffer by ISEL bit
	INBUFM	IN buffer monitor	Available only for pipes 3 to 5
	ACLRM	Auto buffer clear	Pipes 1 to 9: Settable
	SQCLR	Sequence clear	Clears data toggle bit.
	SQSET	Sequence set	Sets data toggle bit.
	SQMON	Sequence monitor	Monitors data toggle bit.
	PBUSY	Pipe busy monitor	
	PID	Response PID	
DCPCTR PIPExCTR	ATREPM	Auto response mode	Pipes 1 to 5: Settable
PIPExTRE	TRENB	Transaction count enable	Pipes 1 to 5: Settable
	TRCLR	Current transaction counter clear	Pipes 1 to 5: Settable
PIPExTRN	TRNCNT	Transaction counter	Pipes 1 to 5: Settable

32B.9.3.1 Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting “PID = BUF”).

DCP: Set 64 for high-speed operation.

DCP: Set 8, 16, 32, or 64 for full-speed operation. Pipes 1 to 5: Set 512 for high-speed bulk transfer.

Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.

Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.

Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.

Pipes 6 to 9: Set 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

32B.9.3.2 Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPExCTR registers.

(1) Response PID setting
The response PID specifies the response to a transaction from the host.

a) NAK: Always sends a NAK response to a generated transaction.

b) BUF: Responds to a transaction in accordance with the buffer memory state.

c) STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result. This module writes data to the PID bits in the following cases:

a) NAK:

(A) The SETUP token is received normally (for the DCP only).

(B) If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.

(C) If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.

b) BUF:

This module does not write "BUF".

c) STALL:

(A) When a maximum packet size over error is detected in a received data packet

(B) When a control transfer sequence error is detected

32B.9.3.3 Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK).

Figure 32B.8 shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registered that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:

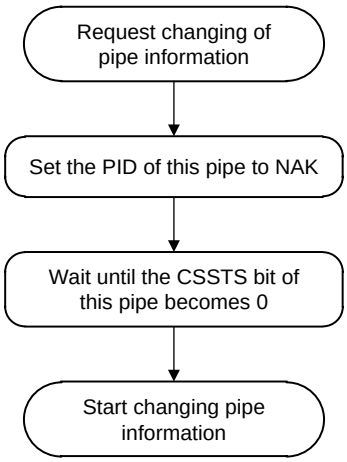
(1) All bits in the DCPCFG and DCPMAXP registers

(2) SQCLR and SQSET bits in the DCPCTR register

(3) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(4) ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register

(5) All bits in the PIPExTRE and PIPExTRN registers



Note: If the pipe is detached during a USB transaction, the PBUSY bit might remain 1.

Figure 32B.8 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

(6) All bits in the DCPCFG and DCPMAXP registers

(7) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(8) ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

32B.9.3.4 Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with “PID = DATA1” without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

32B.9.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.

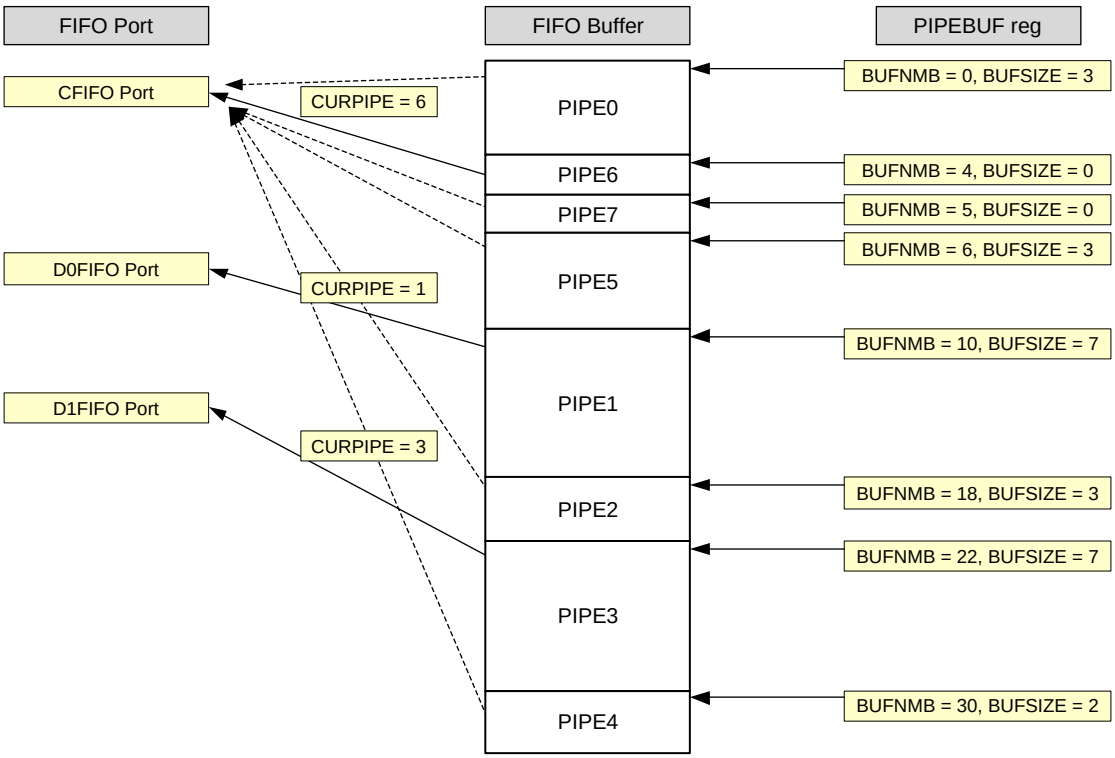
32B.9.4.1 FIFO buffer allocation

Figure 32B.9 shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPExCFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPExCFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPExCTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/ DxFIFOCTR register.



Note: If pipes 8 and 9 are not in use: Settings such as BUFSIZE are unspecified.

Figure 32B.9 Example of FIFO Buffer Memory Mapping

32B.9.4.2 Clearing FIFO buffers

Table 32B.25 lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 32B.25 List of FIFO Buffer Clearing Modes

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR register DxFIFOCTR register	DxFIFOSEL register	PIPExCTR register
Function	The FIFO buffer on the CPU side is cleared.	The FIFO buffer is automatically cleared after the data is read from the specified pipe.	The buffer is automatically cleared to discard all the received packets.
Clearing method	Write “1” to clear.	1: Mode enabled 0: Mode disabled	1: Mode enabled 0: Mode disabled

32B.9.5 FIFO Port Functions

This section describes FIFO port functions. **Table 32B.26** shows the FIFO port function settings for this module.

If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/ DxFIFOCTR register must be used to set write end.

To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.

When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.

The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 32B.26 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
C/DxFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Rewinds buffer memory (re-read, re-write)	
	DCLRM	Reads received data of the specified pipe, and then automatically clears the received data	DxFIFO only
	DREQE	Asserts DREQ signal	DxFIFO only
	MBW	Specifies FIFO port access bit width	
	BIGEND	Selects FIFO port endian	CFIFO only
	ISEL	Specifies FIFO port access direction	DCP only
	CURPIPE	Selects current pipe	
C/DxFIFOCTR	BVAL	Finishes buffer memory write	
	BCLR	Clears CPU-side buffer memory	
	FRDY	Monitors FIFO port ready	
	DTLN	Confirms received data length	

32B.9.5.1 FIFO port selection

Table 32B.27 lists pipes that can be selected for each FIFO port.

Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

Figure 32B.10 shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pile (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPExCFG register determines the buffer memory access direction.

Table 32B.27 FIFO Port Access for Each Pipe

Pipe	Access Method	Usable Port
DCP	CPU access	CFIFO port register
Pipes 1 to 9	CPU access	CFIFO port register
	DMA access	DxFIFO port register

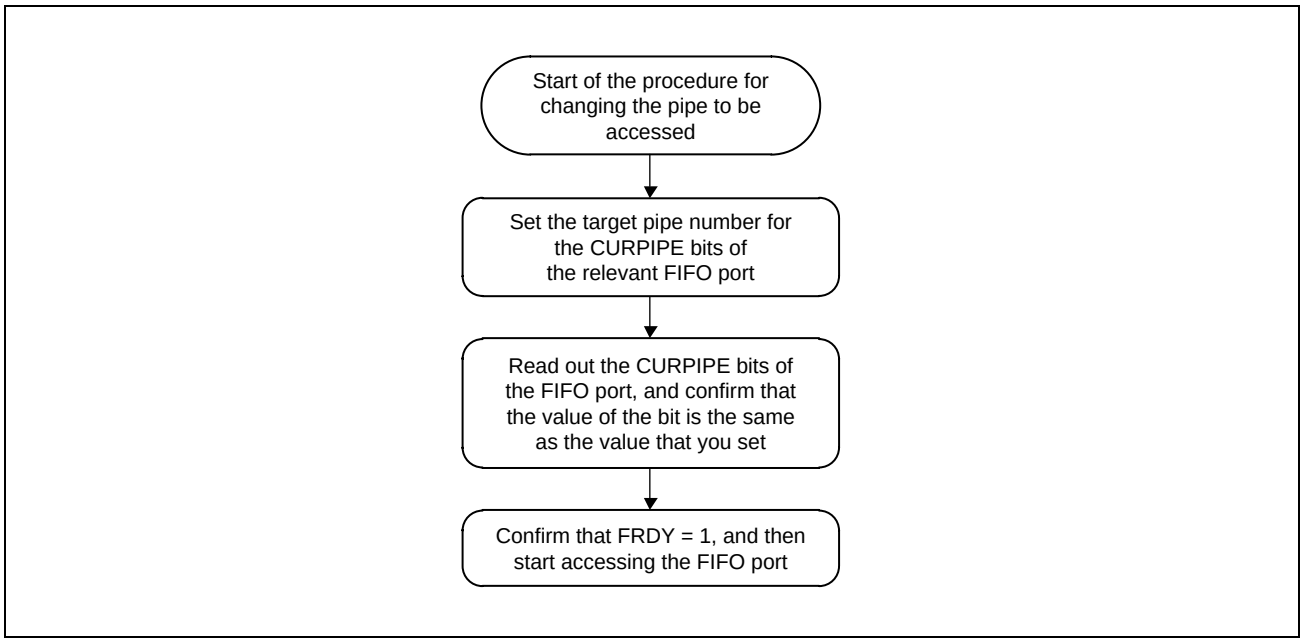


Figure 32B.10 Pipe Switching Procedure for FIFO Port Access

32B.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

Table 32B.28 shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.

As shown in **Table 32B.28**, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 32B.28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

	Register Setting			
	DCLRM = 0		DCLRM = 1	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Clearing unnecessary		Clearing unnecessary	
Zero-length packet received	Clearing necessary			
Normal short packet received	Clearing unnecessary	Clearing necessary		
Transaction count end				

32B.9.5.3 BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The “last data” here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

Table 32B.29 shows when this module generates a BRDY interrupt.

Table 32B.29 BRDY Interrupt Generation Timing

	Register Setting	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1
Buffer full (normal packet received)	When packet is received	No interrupt generated
Zero-length packet received	When packet is received	When packet is received
Normal short packet received	When packet is received	When received data has been read from the buffer memory
Transaction count end	When packet is received	When received data has been read from the buffer memory

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

32B.9.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

32B.9.6.1 Control transfer

(1) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
   (a) VALID bit in the INTSTS0 register: 1
   (b) PID bit in the DCPCTR register: NAK
   (c) CCPL bit in the DCPCTR register: 0

2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.

By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (ControlRead, ControlWrite, or NodataControl) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see **Figure 32B.7**.

(2) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.

A transaction is executed by setting the PID bit in the DCPCTR register to BUF.

The end of data transfer is detected with a BRDY or BEMP interrupt. For ControlWrite transfer, use a BRDY interrupt. For ControlRead transfer, use a BEMP interrupt.

For ControlWrite transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

(3) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.

After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

(a) For ControlRead transfer

Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

(b) For ControlWrite or NodataControl transfer

This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

(4) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

(a) bmRequestType ≠ “H’00”

(b) wIndex ≠ “H’00”

(c) wLength ≠ “H’00”

(d) wValue > “H’7F”

(e) DVSQ = “011 (Configured) ”

Software must respond to all requests other than SET_ADDRESS.

32B.9.7 Bulk Transfer (Pipes 1 to 5)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

32B.9.7.1 NYET handshake control

Table 32B.30 lists responses to tokens received in a bulk or control transfer.

When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 32B.30 List of Responses to Received Tokens

PID bit value	Buffer memory state*1	Received token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	Receives data packet when OUT token is received*1
	RCV-BRDY	OUT	NYET	Receives data packet*2
	RCV-BRDY	OUT (Short)	ACK	Receives data packet*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/1	Sends data packet
	TRN-NRDY	IN	NAK	

Note: Details are described below.
RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.
RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.
RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.
TRN-BRDY: Buffer memory has sent data when an IN token is received.
TRN-NRDY: Buffer memory has no send data when an IN token is received.

32B.9.8 Interrupt Transfer (Pipes 6 to 9)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.

Note that this module does not support high-bandwidth interrupt transfers.

32B.9.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

1. Notification of error information about isochronous transfers
2. Interval counter (IITV bit)
3. Data setup control for isochronous IN transfers (IDLY function)
4. Buffer flush function for isochronous IN transfers (IFIS bit)
5. SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

32B.9.9.1 Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.

Table 32B.31 and **Table 32B.32** describe the error checking procedure and interrupts that are generated.

1. PID error
   The PID of the received packet is invalid.
2. CRC error and bit stuffing error
   The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
   The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
   (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
   (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
   An interval error occurs in the following cases:
   (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
   (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 32B.31 Error Detection during Transmission/Reception of Token

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	No interrupt is generated (ignored as a corrupted packet).
3	Overrun error, underrun error	An NRDY interrupt is generated and the OVRN bit is set. A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token.
4	Interval error	An NRDY interrupt is not generated.

Table 32B.32 Error Detection during Reception of Data Packet

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	An NRDY interrupt is generated and the CRCE bit is set.
3	Packet size error (too large packet)	A BEMP interrupt is generated and the PID bit is set to STALL.

32B.9.9.2 DATA-PID

This module does not support high-bandwidth transfers.

The following shows actions that can be taken in response to a received PID.

1. IN direction:

(a) DATA0: Used to send packets.

(b) DATA1: Not used to send packets.

(c) DATA2: Not used to send packets.

(d) mDATA: Not used to send packets.

2. OUT direction (in full-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are ignored.

(d) mDATA: Packets are ignored.

3. OUT direction (in high-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are received normally.

(d) mDATA: Packets are received normally.

32B.9.9.3 Interval counter

(1) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer. The interval counter enables the functions listed in **Table 32B.33**.

Table 32B.33 Functions of the Interval Counter

Transfer Direction	Function	Detecting Condition
IN	Transmit buffer flush function	An IN token cannot successfully be received within the interval frame during isochronous IN transfer.
OUT	Notification of unreceived token	An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer.

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2n (micro) frames, where n is the value of the IITV bit.

(2) Interval counter initialization

This module initializes the interval counter under the following conditions:

(a) Power on reset
The IITV bit is initialized.

(b) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.

(c) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:

1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.

2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

(a) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.

(b) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

32B.9.9.4 Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called “send data setup for isochronous transfer”.

This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

Figure 32B.11 shows examples of sending using the send data setup function for isochronous transfer by setting “IITV = 0” (each frame) in this module.

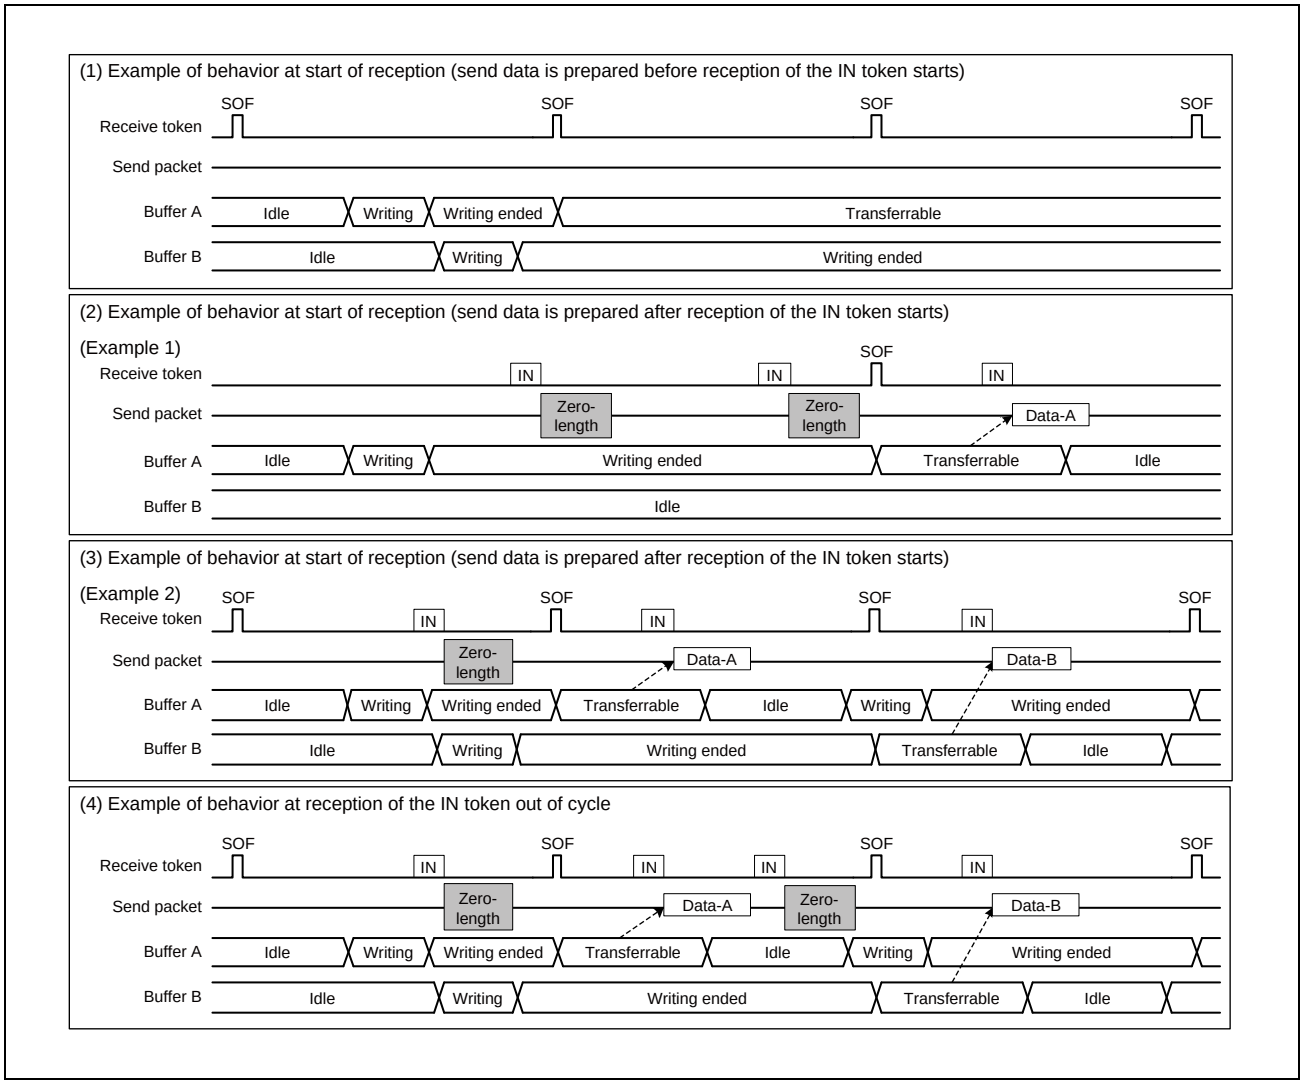

Figure 32B.11 Examples of Data Setup Function Behavior

32B.9.9.5 Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.

At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

1. If IITV is 0
   Buffer flush operation is performed from the first frame after the pipe is enabled.
2. If IITV is not 0
   Buffer flush operation is performed after the first successful transaction.

Figure 32B.12 shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

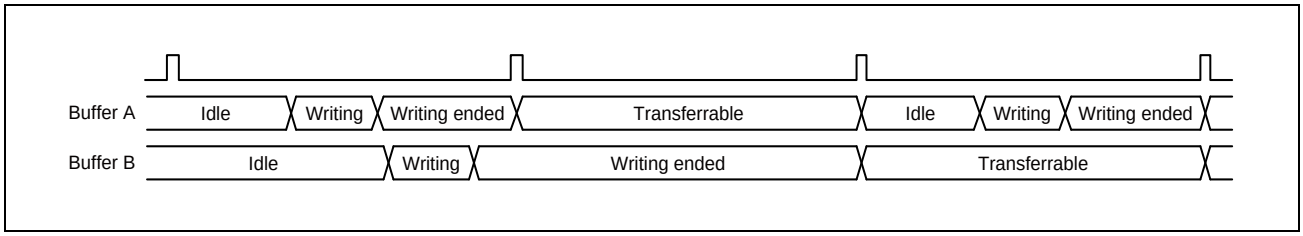

Figure 32B.12 Example of Buffer Flush Function Behavior

Figure 32B.13 shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.

If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.

Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.

In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

1. IN direction:

(a) If the buffer is ready to transfer data, data is transferred and a normal response is returned.

(b) If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.

2. OUT direction:

(a) If the buffer is ready to receive data, data is received and a normal response is returned.

(b) If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

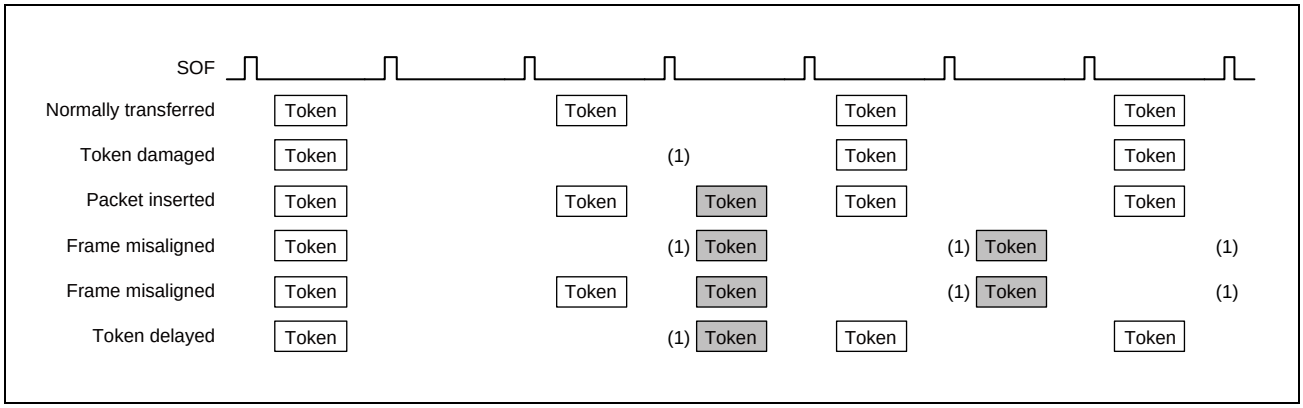

Figure 32B.13 Example of Occurrence of Interval Error (when IITV is 1)

32B.9.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 µs (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:

(1) Power on reset

(2) USB bus reset

(3) Suspended state detected

The SOF interpolation operates according to the following specifications:

(1) Frame interval (125 µs or 1 ms) is based on the results of the reset handshake protocol.

(2) The interpolation function does not operate until an SOF packet is received.

(3) After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 µs or 1 ms.

(4) After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.

(5) Interpolation is not performed in the suspended state or while a USB bus reset is being received.
(If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:

(1) Updating of frame number or micro-frame number

(2) SOFR interrupt and micro SOF lock

(3) SOF pulse output

(4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.

If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.

However, if a micro SOF packet for which “micro-FRNM = 000” is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which “micro-FRNM = 000” is not set are successfully received.

32B.9.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.

The table below compares the features of the L2 (suspend) state and L1 state.

Table 32B.34 Comparison Between Suspend (L2) State and L1 State

Item	L1	Suspend (L2)
Transition	LPM Transaction	3-ms idle period
Host-activated resumption	(Host) Minimum drive period specifiable by the host. Specified between 75 µs to 1.175 ms (Device) 10-µs K drive	(Host) Min. 20-ms K drive (Device) 10-ms K drive
Device-activated resumption	(Device) 50-µs K drive (Host) 60- to 990-µs K drive (Device) 10-µs K drive	(Device) 1-ms to 15-ms K drive (Host) Min. 20-ms K drive (Device) 10-ms K drive
Signaling	Low and Full Speed Idle	Low and Full Speed Idle

The following describes the processing for transition to and resumption from the L1 state.

32B.9.11.1 Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.

Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 32B.35 Relationship between LPM Response and Descriptor

LPM Response	bcdUSB	Presence of USB 2.0 Ex.Desc	USB 2.0 Ex.Desc LPM	Response When LPM Is Received	Remarks
Not respond	0200	Not present	—	Not Respond	Standard action in the case where this module does not respond to LPM
	0201	Present	LPM = 0	STALL	This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response.
Respond	0201	Present	LPM = 1	ACK or NYET	Standard action in the case where this module responds to LPM

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.

When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.

When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.

When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

32B.9.11.2 Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with “No response”, “ACK”, “NYET”, or “STALL” according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 μs after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.

For 2, both retransmission control and transition to the L1 state are processed by the hardware. Transition to the L1 state can be identified through a DVST interrupt.

For 3, a RESM interrupt occurs on detection of host K in the L1 state.

For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software. The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

32B.9.11.3 HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

NOTE

This HIRD value negotiation function must also be supported on the host side.

32B.9.12 DMA Mode

32B.9.12.1 Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 32B.36 DMA mode settings

DMS (CHCFG)	Mode	Description
0	Register mode	Performs DMA transfer based on the values set by Next Register Set.
1	Link mode	Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing.

(1) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.

Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

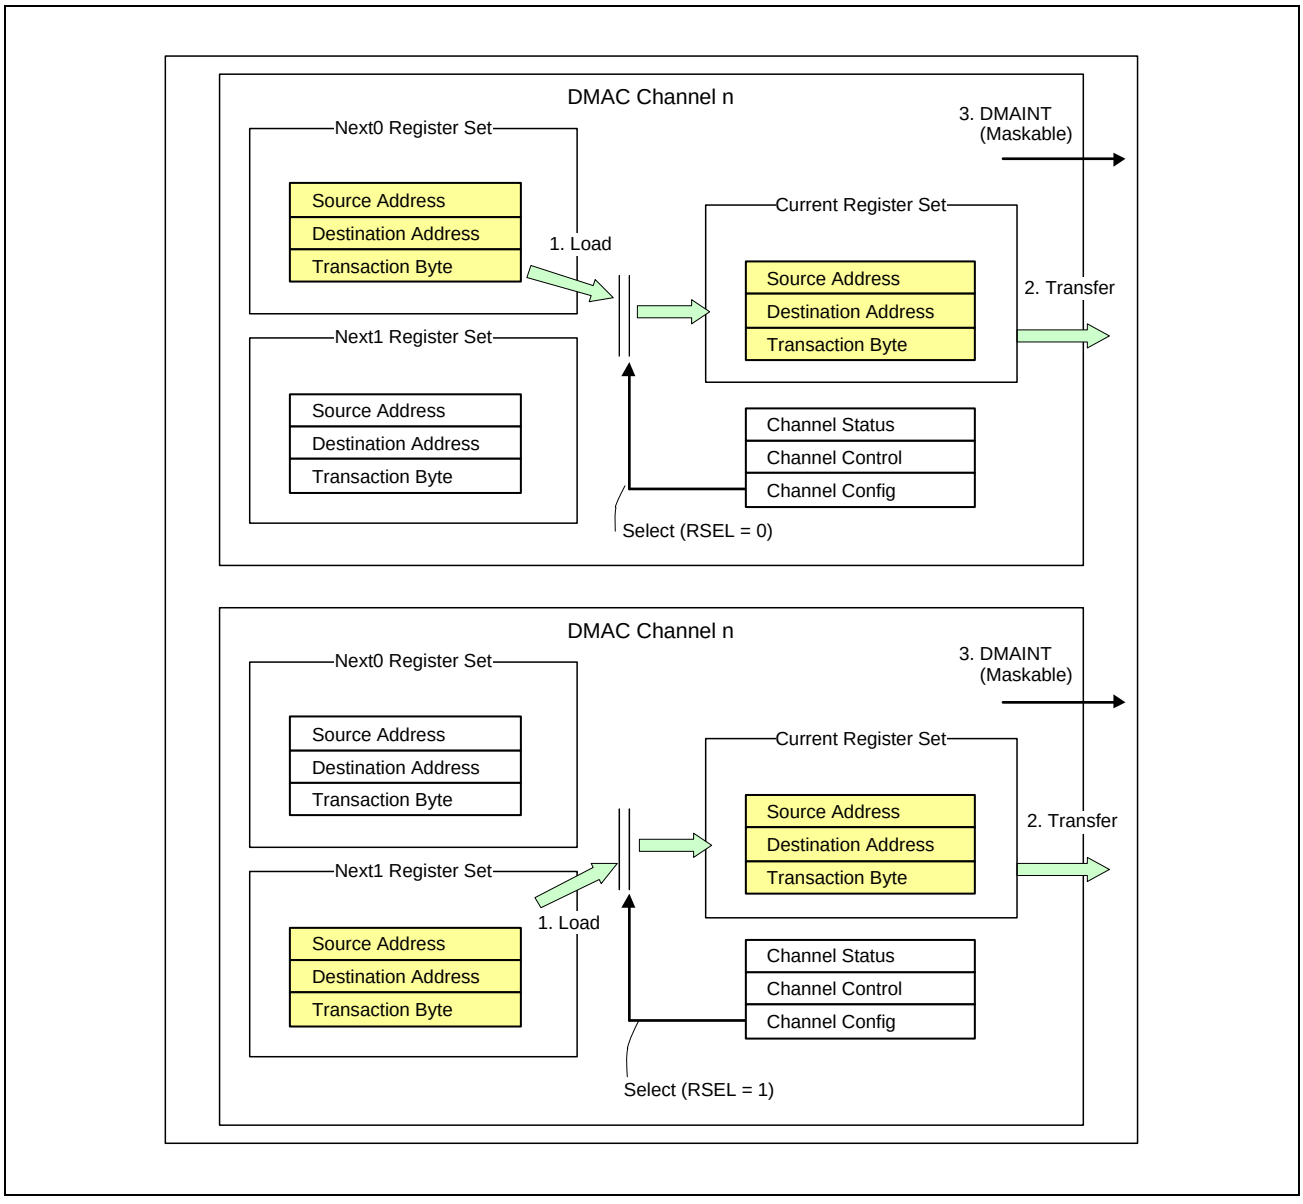

Figure 32B.14 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

(a) Operation flow of register mode

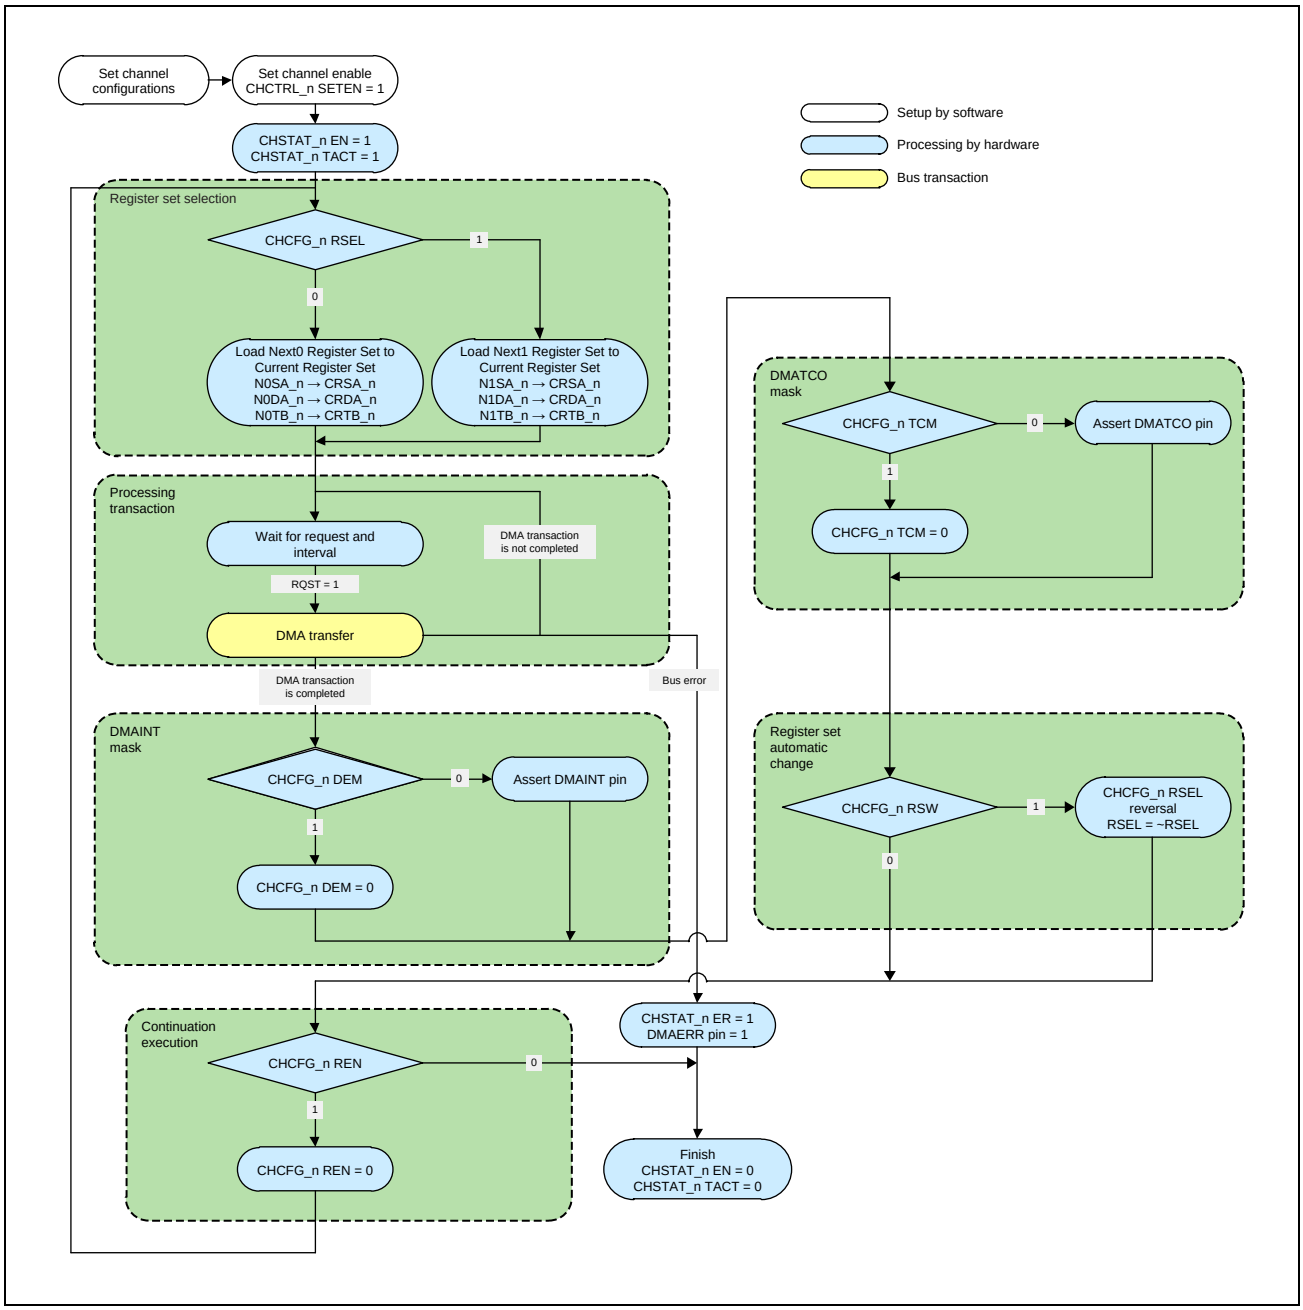

Figure 32B.15 Register Mode Operation Flow

Description of the register mode operation flow:

1. Channel setting
   The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.
   No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.
   (see **Section 32B.9.13, DMA Transfer**).

2. Register set selection
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.

3. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, **Section 32B.9.13, DMA Transfer**.

4. The USBFDMAmn masking
   The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.

5. DMATC masking
   DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.

6. Automatic register set switchover
   Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.

7. Continuation of execution
   Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

(b) Register mode setting

- Register mode setting

  The register set to be processed is selected.

Table 32B.37 Register Mode Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Processes Next0 Register Set.
	1	Processes Next1 Register Set.

- USBFDMAmn masking

  The USBFDMAmn interrupt can be masked.

Table 32B.38 USBFDMAmn Mask Setting

DEM (CHCFG_n)	Description
0	Asserts the USBFDMAmn interrupt when the DMA transaction is completed.
1	Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed. After the DMA transaction is completed, the DEM bit is cleared to 0.

- DMATC mask setting

  DMATC from DMAC control to USB control can be masked.

Table 32B.39 DMATC Mask Setting

DEM (CHCFG_n)	Description
0	Asserts DMATC when the DMA transaction is completed.
1	Does not assert DMATC even when the DMA transaction is completed. After the DMA transaction is completed, the TCM bit is cleared to 0.

- Automatic transaction execution for a register set

  After a DMA transaction finishes, another DMA transaction can be executed.

Table 32B.40 Automatic Execution Setting for a Register Set

REN (CHCFG_n)	Behavior	Remarks
0	The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes.	Use this setting to execute a DMA transaction only once.
1	After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful.	Use this setting to continue processing of register set contents.

- Automatic register set switchover setting

  After a DMA transaction finishes, the next register set to be processed can be switched.

Table 32B.41 Automatic Execution Setting for a Register Set

RSW (CHCFG_n)	Behavior	Remarks
0	The register set is not switched when a DMA transaction finishes.	Use this setting to use only one register set.
1	When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set.	Use this setting to switch the register set.

(c) Example of setting the register mode

- Example of setting the register mode when using only the Next0 register set

Table 32B.42 Register Mode Setting Example

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0	0	0	0	0	0
(register mode)	(Next0)	(not masked)	(not masked)	(not switched)	(continuous execution disabled)

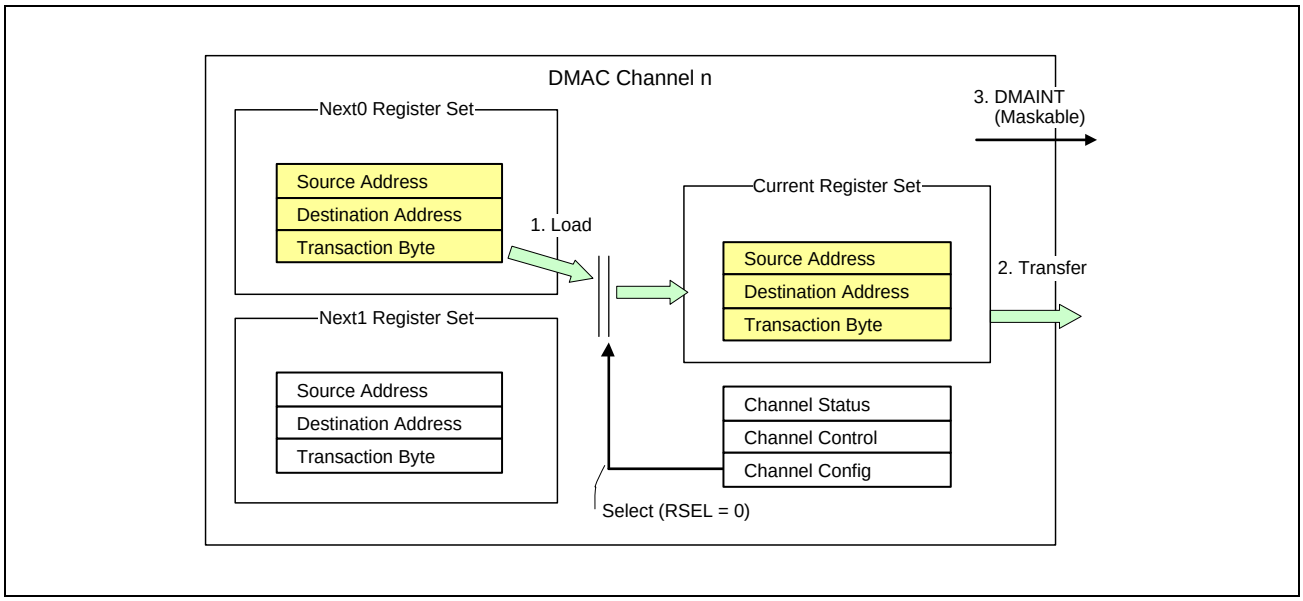

Figure 32B.16 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Example of setting the register mode when using two register sets continuously

Table 32B.43 Automatic Register Set processing Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	1 (masked)	0 (not masked)	1 (switched)	1 (continuous execution enabled)

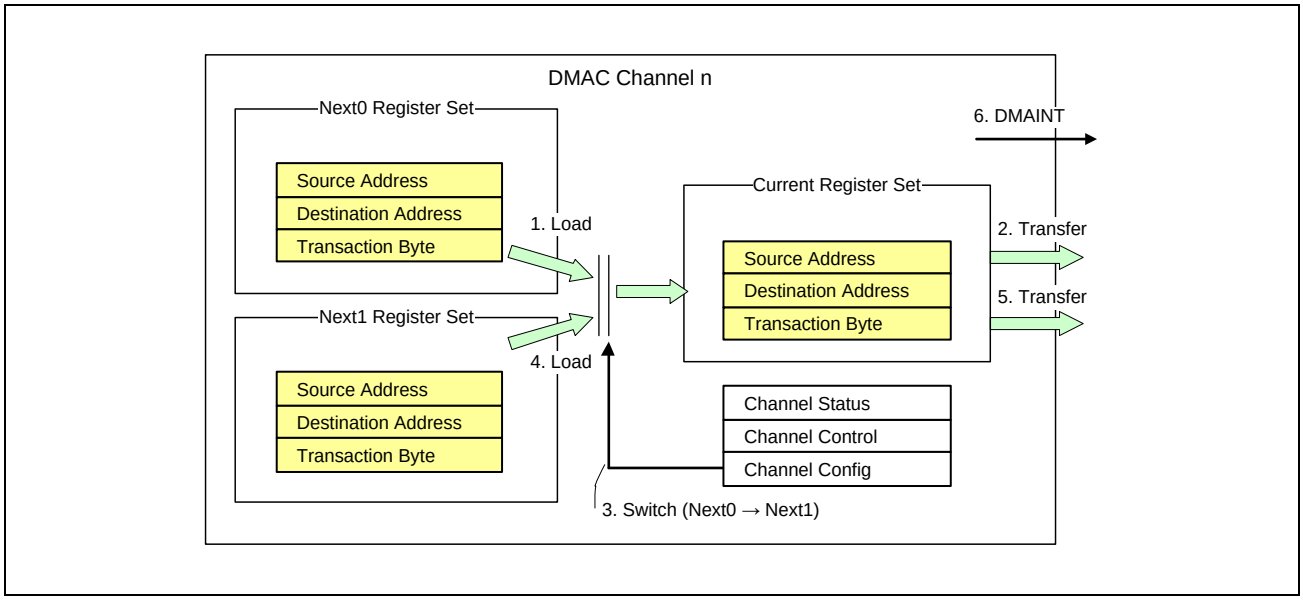

Figure 32B.17 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAmn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(2) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

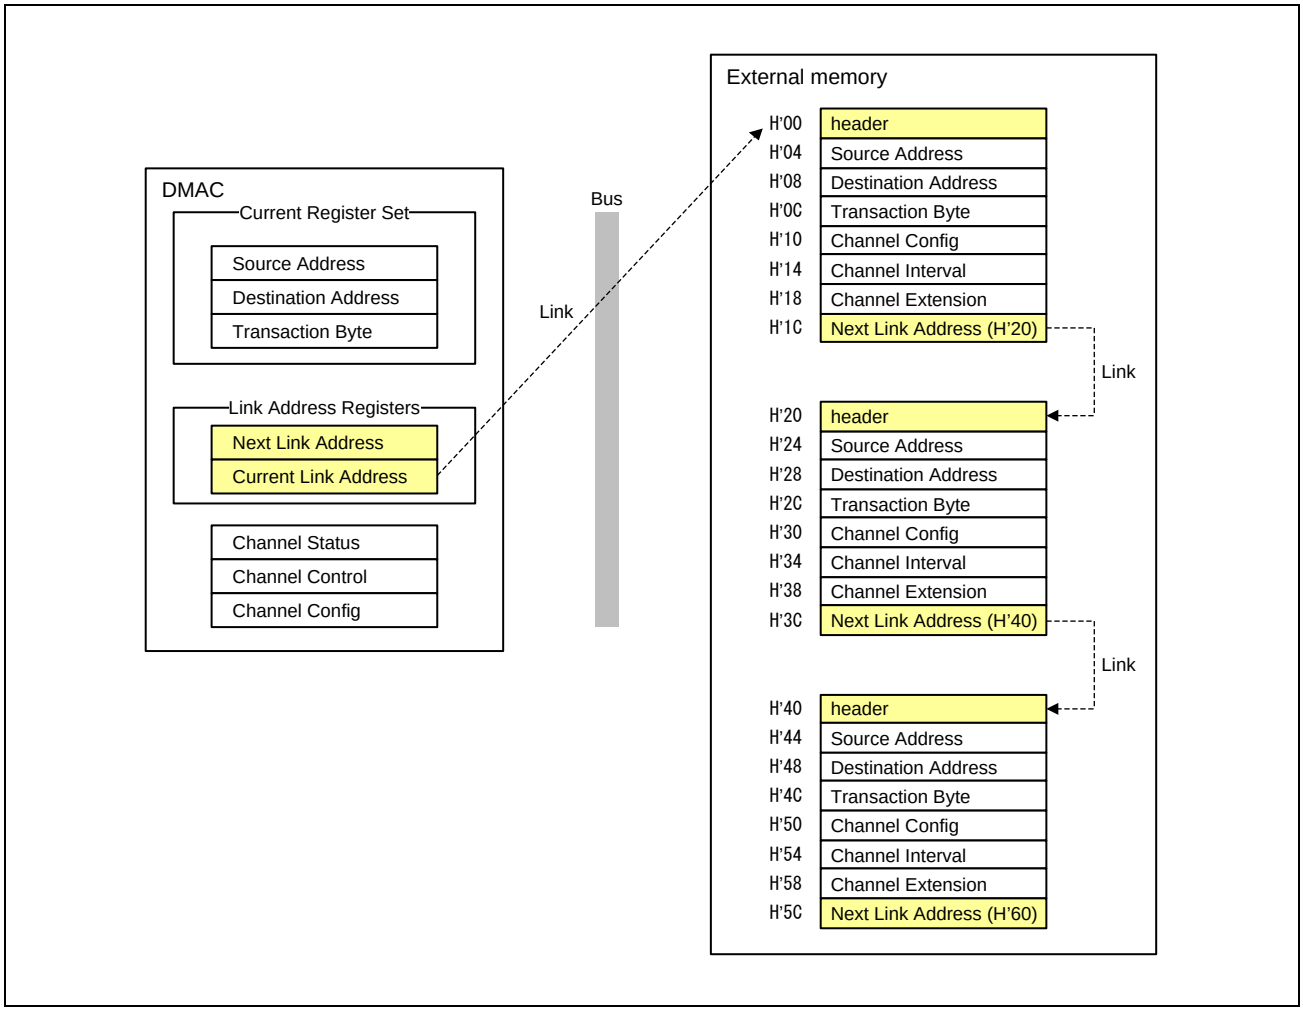

Figure 32B.18 Overview of Link Mode

(a) Operation flow of link mode

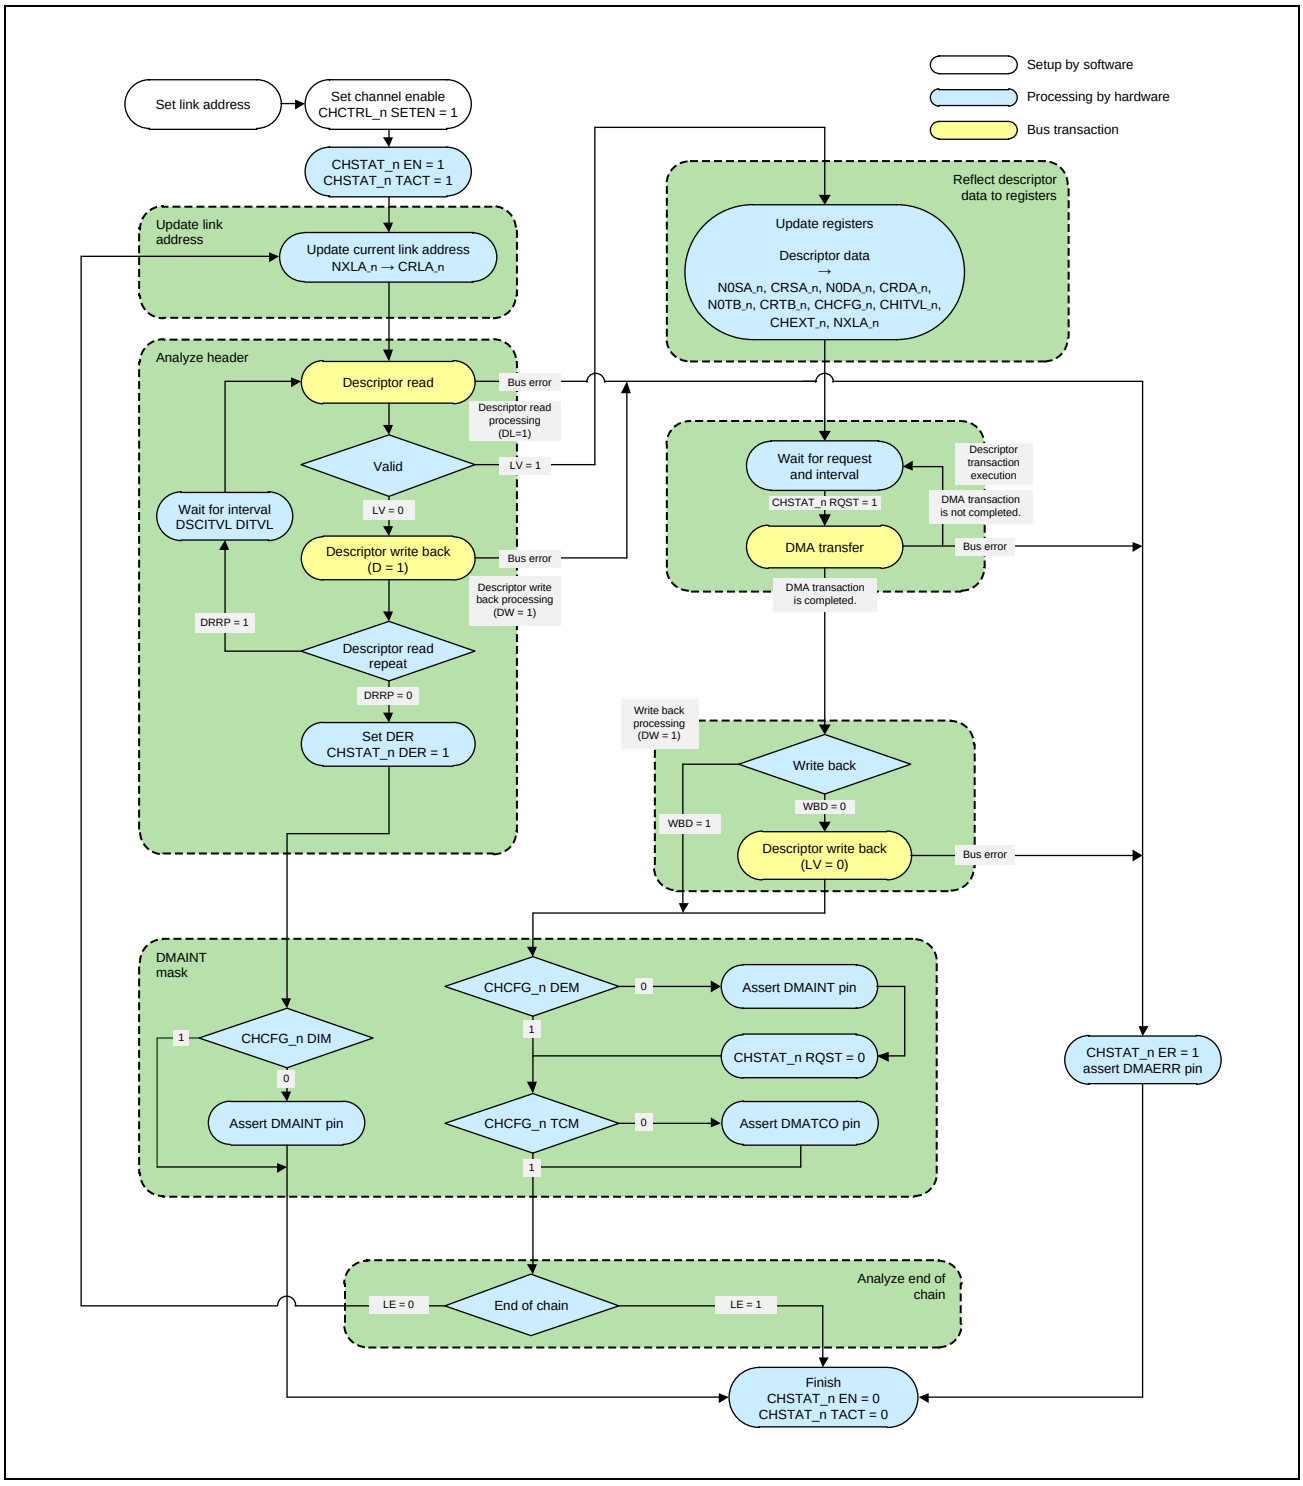

Figure 32B.19 Link Mode Operation Flow

Description of the link mode operation flow:

1. Channel setting
   The beginning address of the link destination is set in the NXLA_n register.

2. Link address updating
   If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.

3. Descriptor reading and header judgment
   A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

4. Descriptor setting
   If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.

5. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, see **Section 32B.9.13, DMA Transfer**.

6. Header write-back
   If WBD of header is 0, DMAC writes LV = 0 to the header area.

7. USBFDMAmn masking
   If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

8. DMATC masking
   If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.

9. Link end judgment
   If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

(b) Register setting

- Link mode setting

  To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 32B.44 Link Mode Setting

DMS (CHCFG_n)	Description
1	This module operates in link mode. The setting of this bit cannot be changed by using a descriptor.

- Link address setting

  The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target. Before starting link mode, set the link target in the NXLA_n register.
  After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 32B.45 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n)	This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register.
Current Link Address Register (CRLA_n)	This register is used to display the link target that is being executed. This is a read-only register.

(c) Descriptor setting

DMAC supports multiple descriptor formats.

A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.

The following table shows the relationship between DSCFM values and descriptor formats.

Table 32B.46 Descriptor Formats

DSCFM	Descriptor Size	Next Link Address	Channel Extension	Channel Interval	Channel Config	Transaction Size	Destination Address	Source Address	header
3	4 words	✓	— (reload)	— (reload)	— (reload)	— (header)	✓	✓	✓ (with STS)
1	8 words	✓	✓	✓	✓	✓	✓	✓	✓ (no STS)
Other than the above	If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3.								

Table 32B.47 Explanation of the Marks in **Table 32B.46**

Field	Mark	Description	Remarks
Header	✓ (with STS)	The STS field of bits [15:0] in the header is valid. The value set in the STS field is used as the total number of transfer bytes (Transaction Size).	—
	✓ (no STS)	The STS field of bits [15:0] in the header is invalid. The value of "Transaction Size" in the descriptor is used as the total number of bytes.	
Source Address	✓	Specify the source address.	—
Destination Address	✓	Specify the destination address.	—
Transaction Size	✓	Specify the transaction size.	—
	— (header)	Omit the transaction size. The value set in the STS field is used as the total number of transfer bytes (Transaction Size)	Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set.
Channel Config Channel Interval Channel Extension	✓	Specify Channel Config, Channel Interval, and Channel Extension.	—
	— (reload)	Omit Channel Config, Channel Interval, and Channel Extension. The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited.	—
Next Link Address	✓	Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor.	—

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by "✓" in **Table 32B.46** on memory.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 32B.48 Example of Placing Descriptors

DSCFM	Address							
	Link Address + H'1C	Link Address + H'18	Link Address + H'14	Link Address + H'10	Link Address + H'0C	Link Address + H'08	Link Address + H'04	Link Address + H'00
H'3	—	—	—	—	Next Link Address	Destination Address	Source Address	header
H'1	Next Link Address	Extension	Interval	Config	Transaction Byte	Destination Address	Source Address	header

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

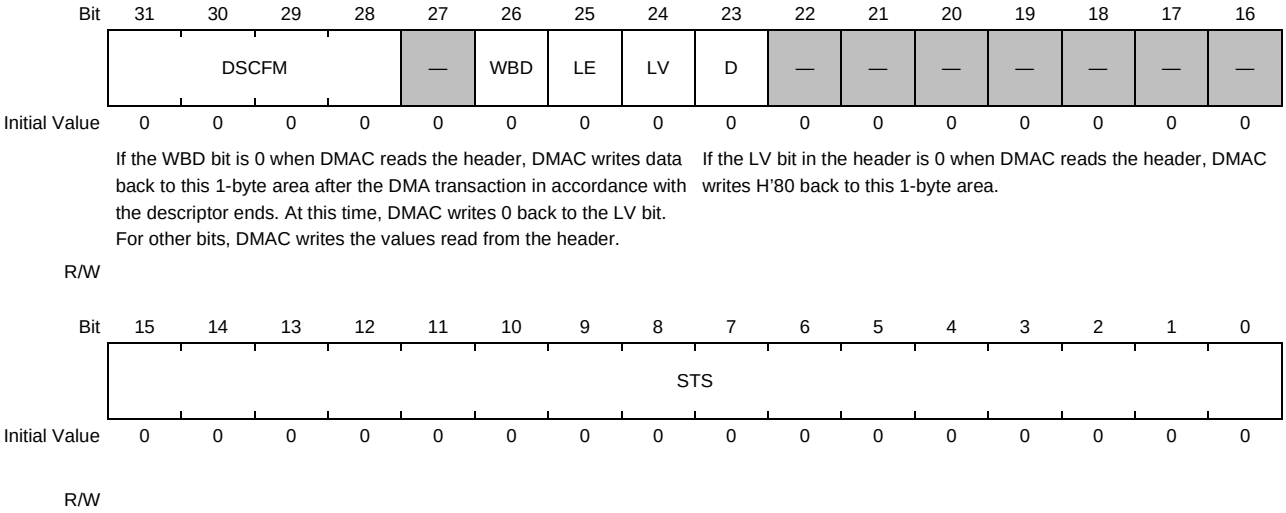

Figure 32B.20 Header Area

Table 32B.49 Header Area (1/2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM			Descriptor Format Specifies the descriptor format (length and combination of descriptors). For details see **Table 32B.46**.
27	—			Reserved area. Set 0.
26	WBD			Write Back Disable Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation. 0: Writes 0 back to the LV bit. 1: Does not perform a write-back operation for the LV bit.
25	LE			Link End Indicates that the link will end with the DMA transaction for this descriptor. Set this bit to 1 to indicate the end of link. 0: The link continues. 1: The link ends.

Table 32B.49 Header Area (2/2)

Bit	Bit Name	Initial Value	R/W	Description
24	LV			Link Valid Indicates that this descriptor is valid. If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit. 0: This descriptor is invalid. 1: This descriptor is enabled.
23	D			Descriptor Error Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit. 0: A descriptor error has not occurred. 1: LV was 0 when the descriptor was read.
22 to 16	—			Reserved area. Set 0.
15 to 0	STS			Short Transaction Size If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535. If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed.

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

  The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

  The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

  The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

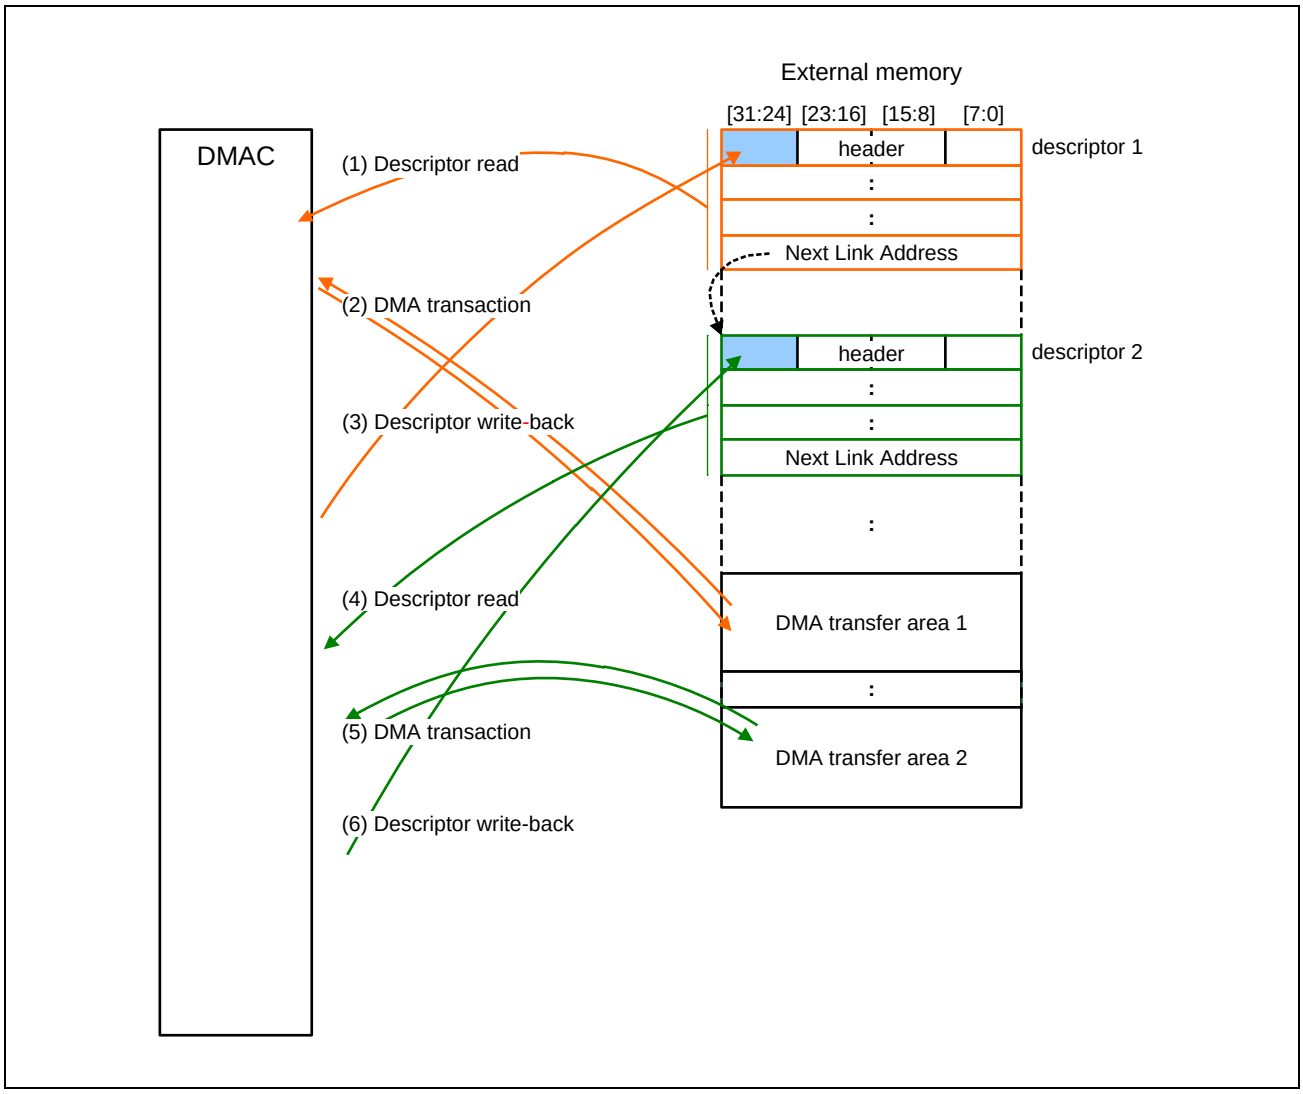

Figure 32B.21 Overview of Descriptor Areas and DMA Transfer Areas

(1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).

(2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte size basis.

(4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.

(5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte size basis.

(Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.

If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).

If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors
  - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
  - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
  - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
  - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
  - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

(d) Link configuration example

In link mode, descriptors can be configured as shown below.

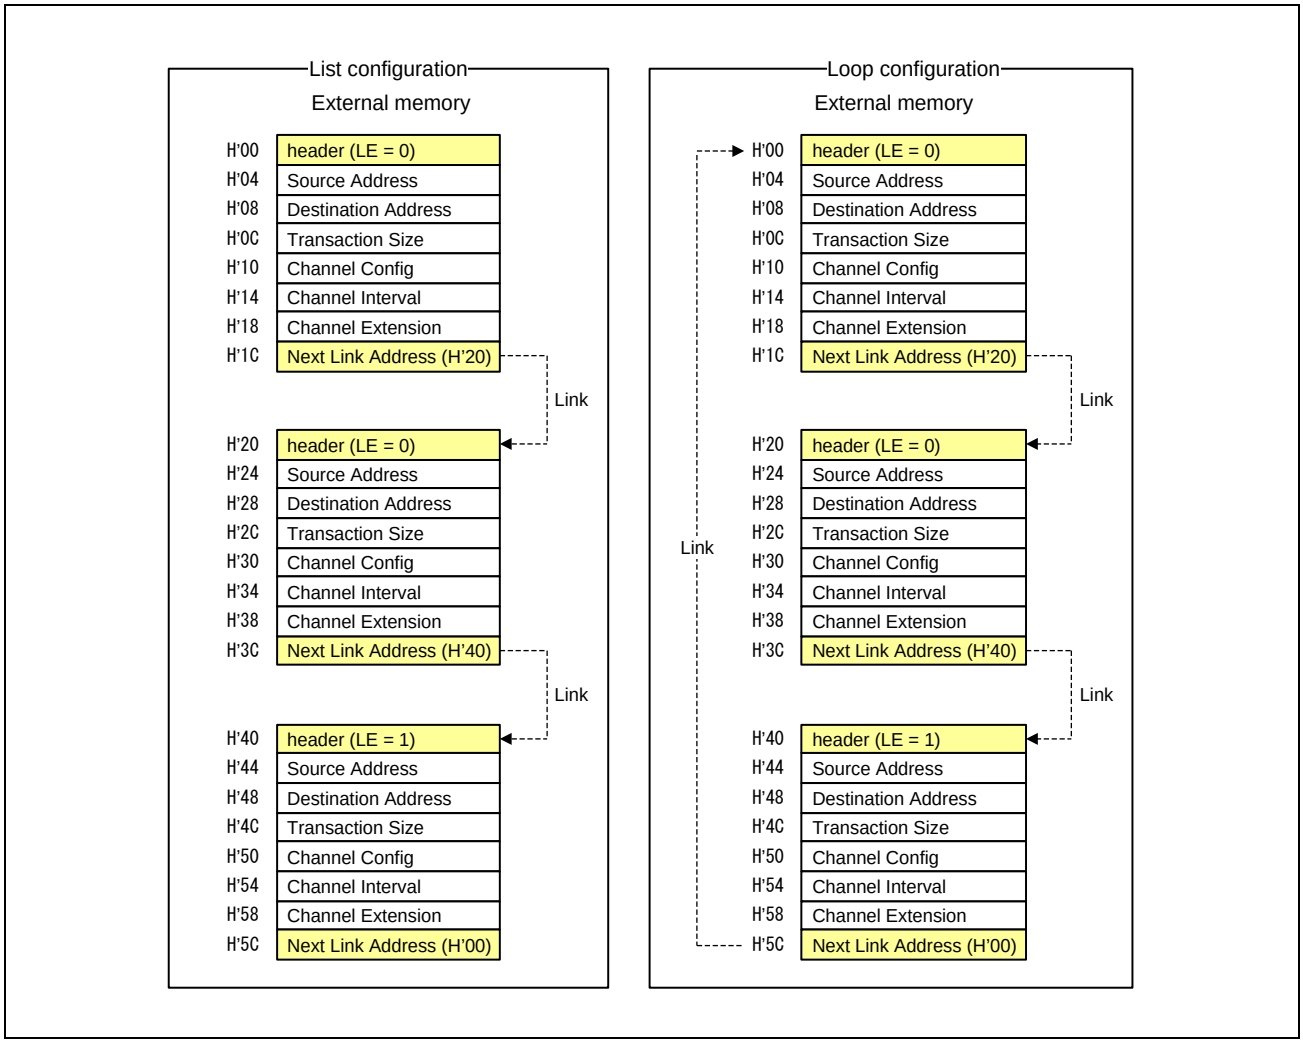

Figure 32B.22 Link Mode Configuration Example

- List configuration

  The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

  A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

32B.9.12.2 Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 32B.50 Write-Only Mode Setting

WONLY (CHCFG)	Mode	Description
0	Normal mode	A DMA transfer is performed using the values set in Next Register Set.
1	Write-only mode	A DMA write transfer is performed without performing a DMA read transfer.

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.

Use this mode to, for example, initialize the memory area.

32B.9.13 DMA Transfer

This chapter describes the basic operation of DMA transfer.

32B.9.13.1 Transfer modes

DMAC supports only single transfer mode.

Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).

The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see **Section 32B.9.13.7, Operational difference depending on the transfer size**.

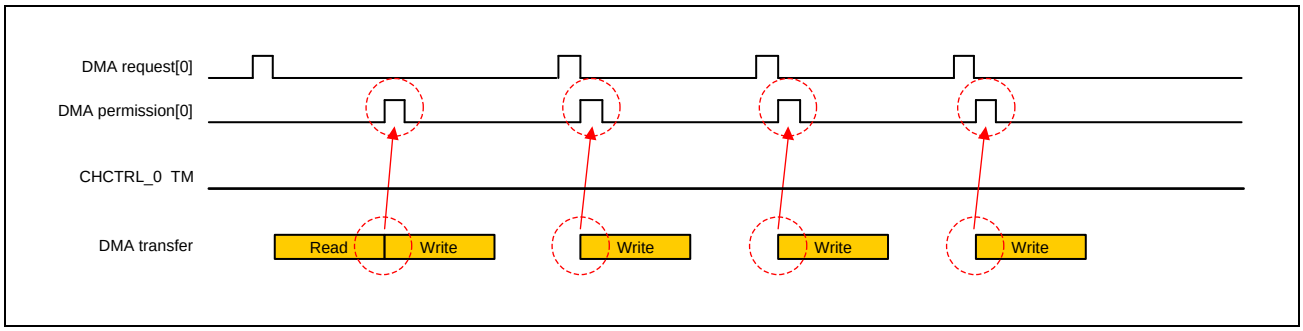

Figure 32B.23 Single Transfer Mode (REQD = 1, SDS > DDS)

32B.9.13.2 DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 32B.51 Priority Control Setting

Mode	PR (DCTRL)	Description	Remarks
Fixed-priority	0	Controls requests based on fixed priority (CH0 > CH1 > ...).	Use this mode if channels have priority.
Round-robin	1	Controls requests in a round-robin manner.	Use this mode to execute requests equally.

(1) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

(2) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.

In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

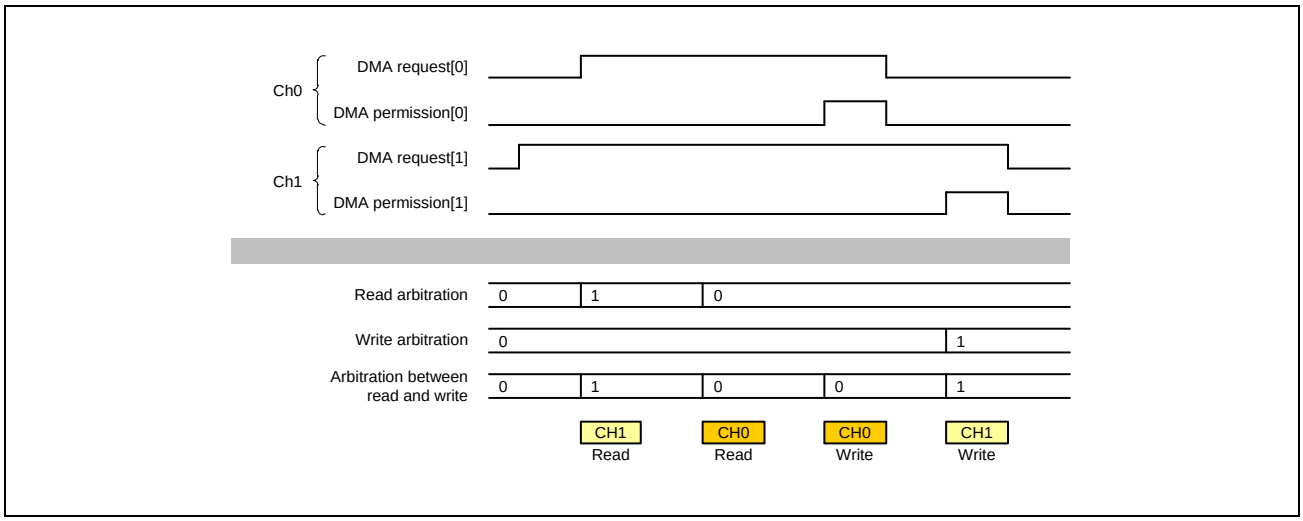

Figure 32B.24 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

32B.9.13.3 Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

(1) If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.

(2) If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.

(3) The difference from ordinary sweeping mode described in **Section 32B.9.13.8(3)(b), Transfer suspension (buffer sweeping enabled: SBE = 1)** (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

(1) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

32B.9.13.4 DMA transfer completion interrupt (USBFDMAmn)

USBFDMAmn (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn (m, n = 0, 1) interrupt.
(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 32B.52 USBFDMAmn Assertion Conditions

Cause	Condition	INT_DMA[n] mask signal
DMA transaction ended	A transfer of data by the number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes)	DEM bit in the CHCFG_n register
Descriptor was invalid	LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG_n register are both 0 in link mode	DIM bit in the CHCFG_n register

32B.9.13.5 DMA error interrupt (USBFDMAERRm)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERRm interrupt is asserted.

The USBFDMAERRm signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

32B.9.13.6 Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.

The following shows an operation example.

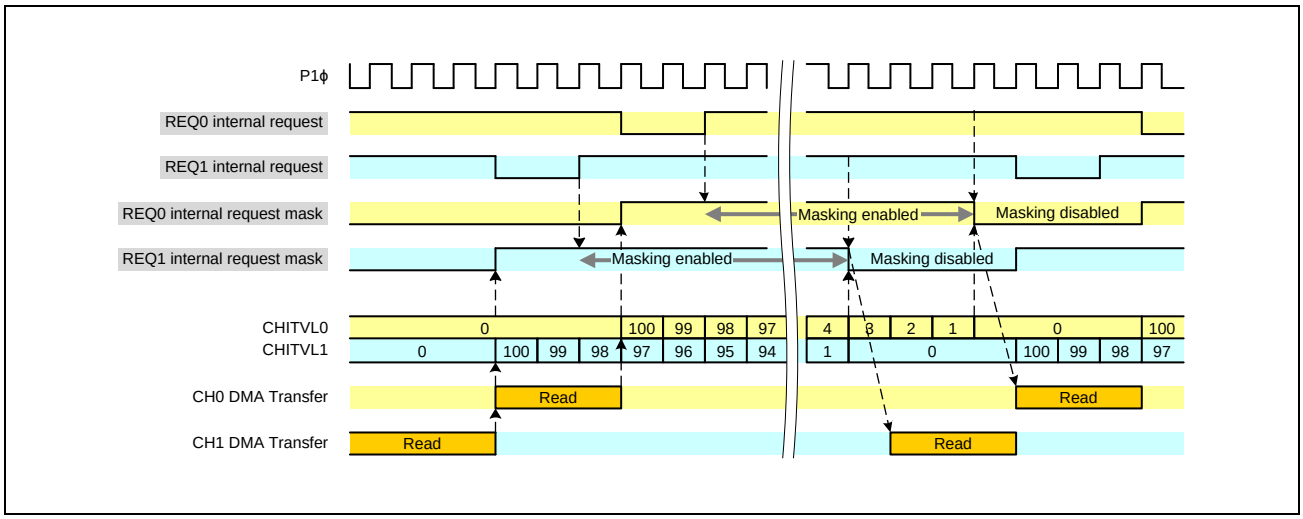

Figure 32B.25 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

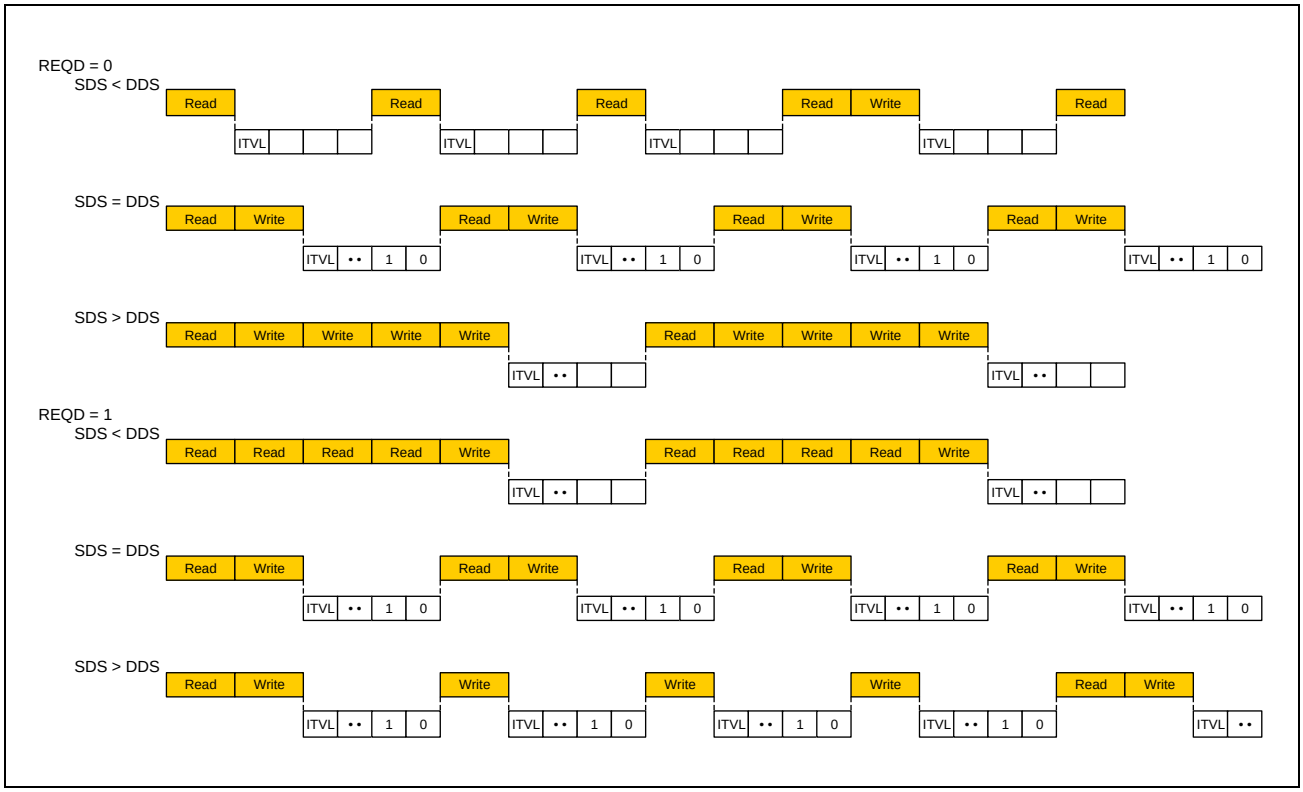

Figure 32B.26 DMA Transfer Settings and Interval Count

32B.9.13.7 Operational difference depending on the transfer size

(1) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.

The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

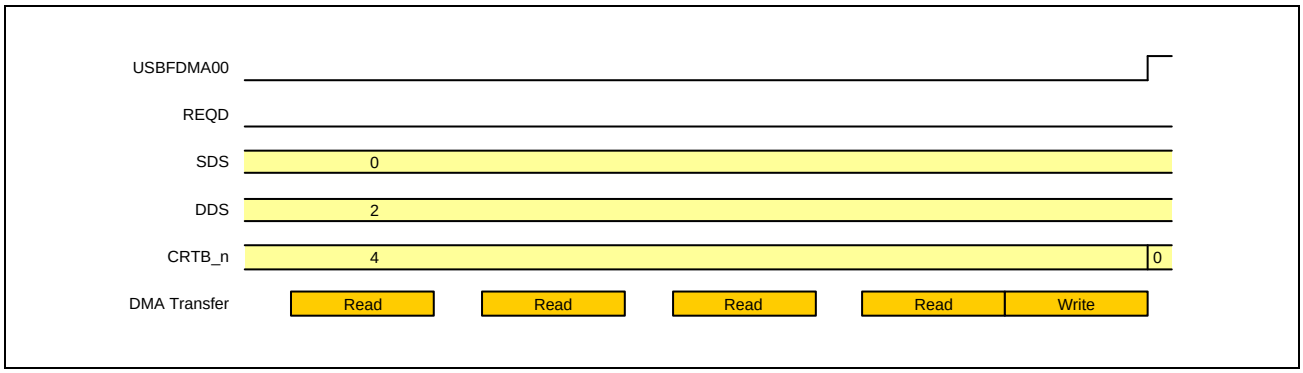

Figure 32B.27 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

(2) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

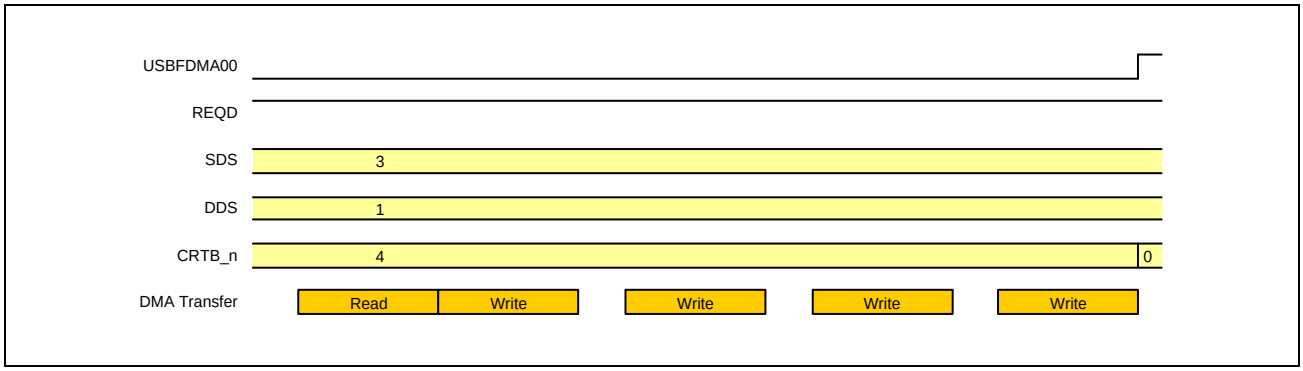

Figure 32B.28 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

(3) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.

The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

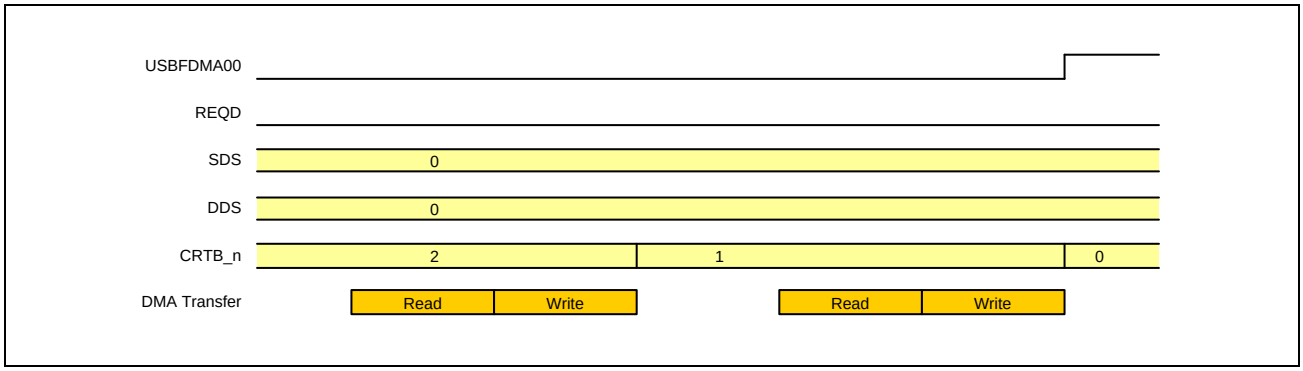

Figure 32B.29 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

32B.9.13.8 Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

(1) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see **Section 32B.4.1, Current Source Address Register**) and the DMA transfer ends.

If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

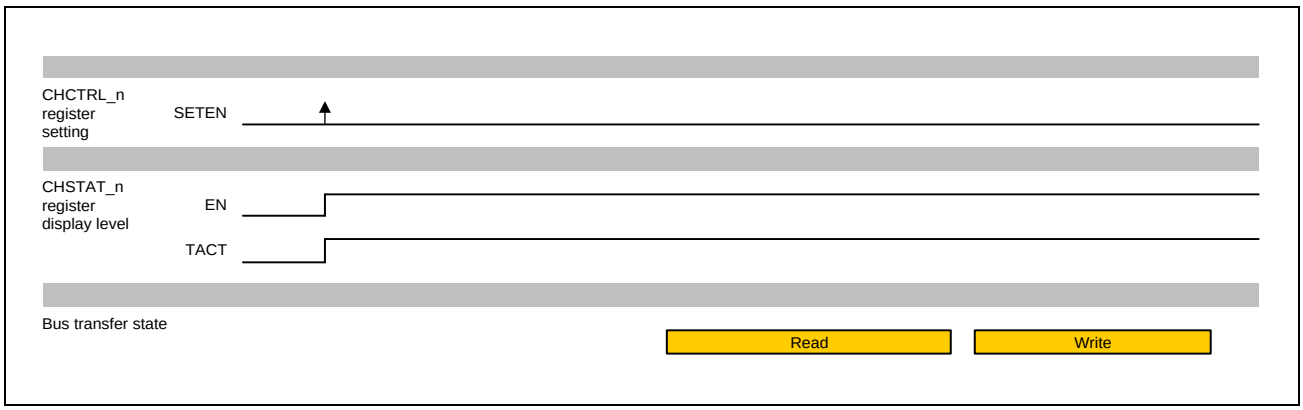

Figure 32B.30 DMAC State Example 1 (Hardware Request)

(2) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

(3) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).

If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

(a) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.

If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.

If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

(b) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.

After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

(c) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

(d) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

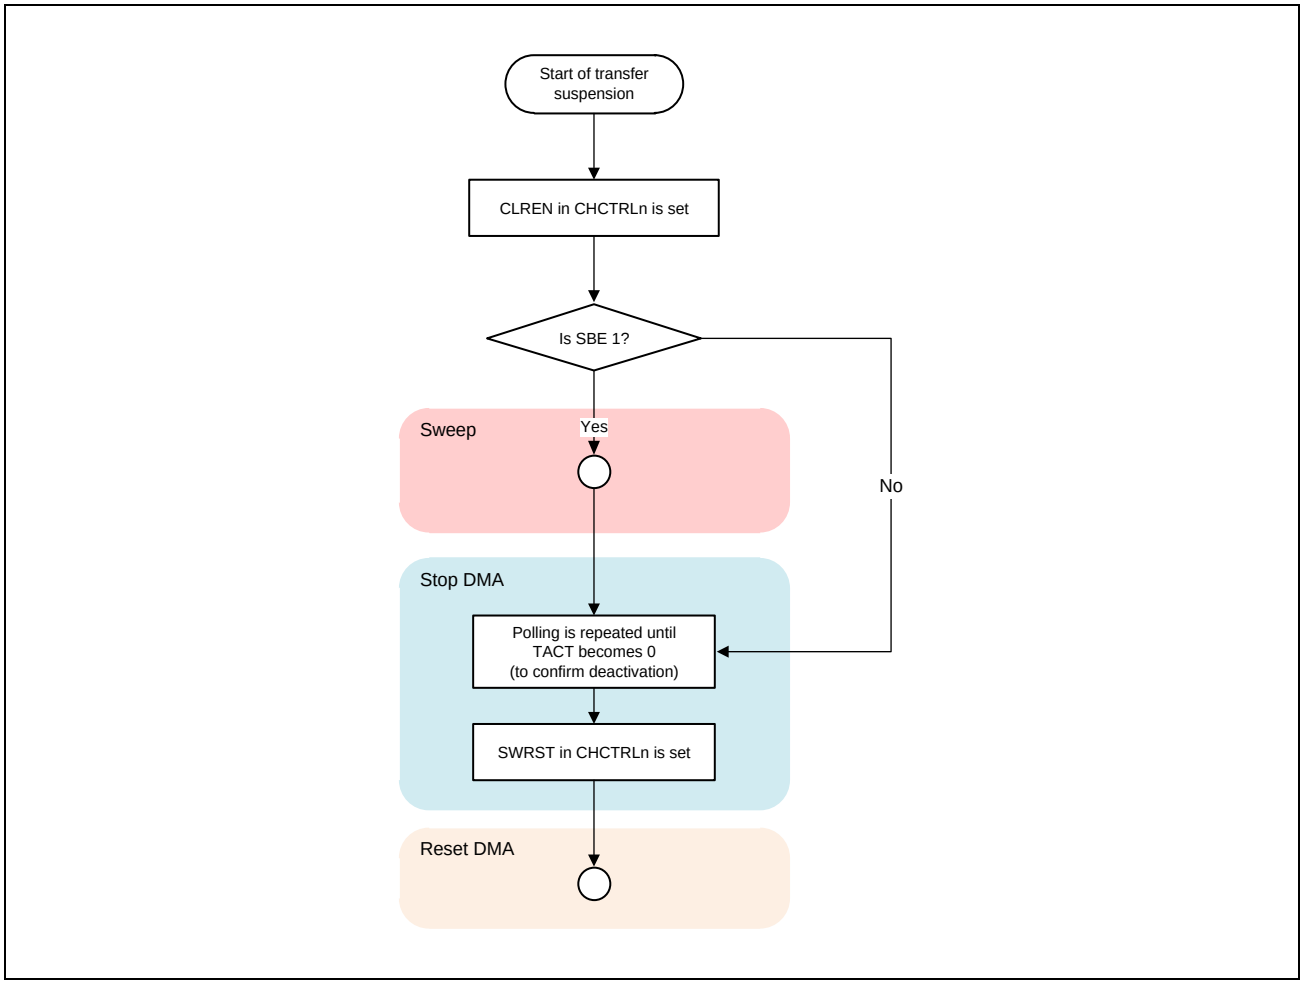

Figure 32B.31 Transfer Suspension Flowchart

32B.9.14 Access Type

32B.9.14.1 DMA master transfer combination list

(1) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.
- The size and burst length are determined based on the value set in the SDS[2:0] field.
  If the value set in the SDS[2:0] field is equal to or less than the bus width
  Size: Value set in SDS[2:0]
  Burst type: SINGLE
  If the value set in the SDS[2:0] field is larger than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 32B.53 DMA Read Transfer Combination List

SDS	Source Address	AHB transfer					
		First transfer			Second transfer		
		Address	Data Size	Burst Type	Address	Data Size	Burst Type
0 (8 bits)	-	addr	8	SINGLE			
1 (16 bits)	2 byte align	{addr[31:1], 0b}	16	SINGLE			
	2 byte unalign				{addr[31:1], 0b} + H'2	16	SINGLE
2 (32 bits)	4 byte align	{addr[31:2], 00b}	32	SINGLE			
	4 byte unalign				{addr[31:2], 00b} + H'4	32	SINGLE
4 (128 bits)	16 byte align	{addr[31:4], H'0}	32	INCR4			
	16 byte unalign				{addr[31:4], H'0} + H'10	32	INCR4
5 (256 bits)	32 byte align	{addr[31:5], H'00}	32	INCR8			
	32 byte unalign				{addr[31:5], H'00} + H'20	32	INCR8
6 (512 bits)	64 byte align	{addr[31:6], H'00}	32	INCR16			
	64 byte unalign				{addr[31:6], H'00} + H'40	32	INCR16

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.
- The size and burst length are determined based on the value set in the DDS[2:0] field.
  If the value set in the DDS[2:0] field is equal to or less than the bus width
  Size: Value set in DDS[2:0]
  Burst type: SINGLE
  If the value set in the DDS[2:0] field is greater than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)
- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.
  - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
  - An access specified in the DDS field will be across the SKIP boundary.
  - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

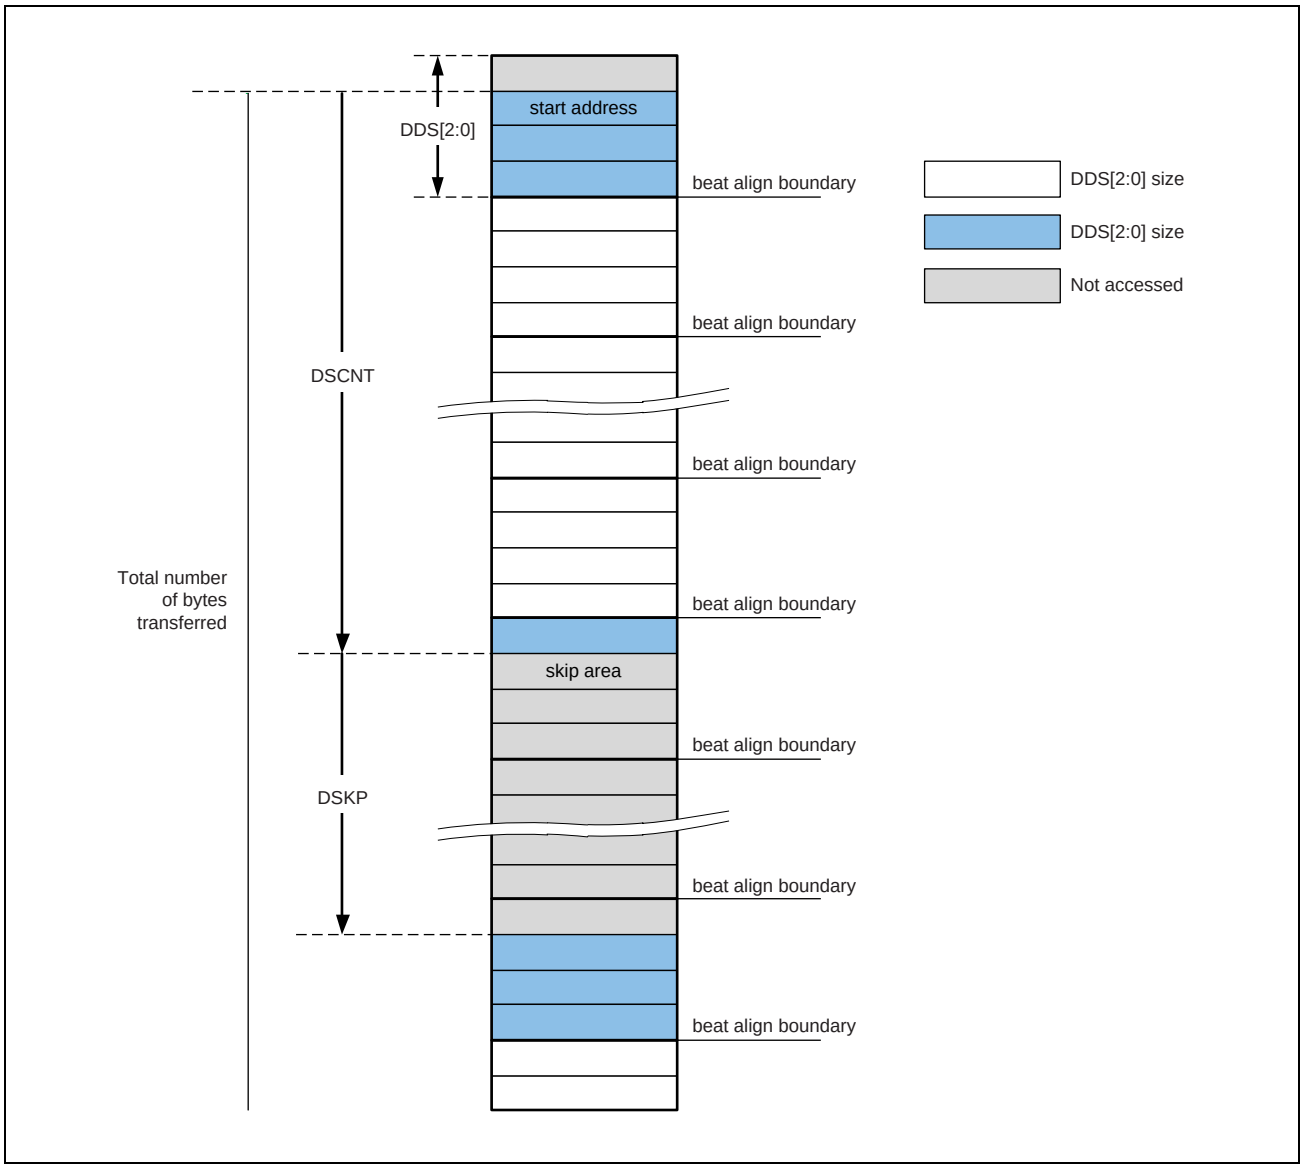

Figure 32B.32 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 32B.54 DMA Write Transfer Combination List

	AHB transfer		
	First transfer		
DDS[2:0]	Address	Data Size	Burst Type
0 (8 bits)	addr	8	SINGLE
1 (16 bits)	{addr[31:1], 0b}	16	SINGLE
2 (32 bits)	{addr[31:2], 00b}	32	SINGLE
4 (128 bits)	{addr[31:4], H'0}	32	INCR4
5 (256 bits)	{addr[31:5], H'00}	32	INCR8
6 (512 bits)	{addr[31:6], H'00}	32	INCR16

32B.9.14.2 DMA master descriptor combination list

(1) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 32B.55 Descriptor Read Transfer Combination List

Descriptor Format	Address	AHB Transfer					
		First Transfer			Second Transfer		
	addr[4:0]	Address	Size	Burst	Address	Size	Burst
4 words	H'00	{addr[31:4], 0000b}	32	INCR8			
	H'04						
	H'08						
	H'0C						
	H'10						
	H'14				{addr[31:4], 0000b} + H'20	32	INCR8
	H'18						
	H'1C						
8 words	H'00						
	H'04				{addr[31:4], 0000b} + H'20	32	INCR8
	H'08						
	H'0C						
	H'10						
	H'14						
	H'18						
	H'1C						

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 32B.56 Descriptor Write Transfer Combination List

Type	AHB transfer		
	Address	Size	Burst
Write-back in normal mode	{addr[31:2], 00b} + H'3	8	SINGLE
Write-back in the case of an error	{addr[31:2], 00b} + H'2	8	SINGLE

32B.9.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.

In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 32B.57 Priority of a transfer request for DMACs that are performing transfer

	Next DMAC	
Current DMAC	DMAC0	DMAC1
DMAC0	2	1
DMAC1	1	2

Note: Priority: 1 (high), 2 (low)

32B.9.16 Notes

32B.9.16.1 Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is H’0000_1038 and SDS is 5 (256-bit), read starts from area H’0000_1020, not from address H’0000_1038. At this time, if the area from H’0000_1020 to H’0000_1037 contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

32B.9.16.2 Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAmn (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.

To use peripheral module interrupt USBFDMAmn or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

33. SD/MMC Host Interface

NOTE

Development of the SD host--related products needs the conclusion of the following agreement. SD Host/Ancillary Product License Agreement (SD HALA)

33.1 Overview

33.1.1 Features

- 3 channels
- Channel 0 supports SDHI / e-MMC
- Channel 1 and channel 2 support SDHI
- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, and SDR104 transfer modes supported
- SD clock (SD_CLK) frequency = SDxϕ/4 frequency/2^n (n = 0 to 9) (x = 0, 1, 2)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 2
- Card detect function
- Write protect supported
- MMC interface (1-/4-/8-bit MMC bus)
- e-MMC device access supported
- Backward-compatible, high-speed, HS200 transfer modes supported
- High-priority interrupt (HPI) supported

Block Diagram

Figure 33.1 shows a block diagram of the SD/MMC host interfaces.

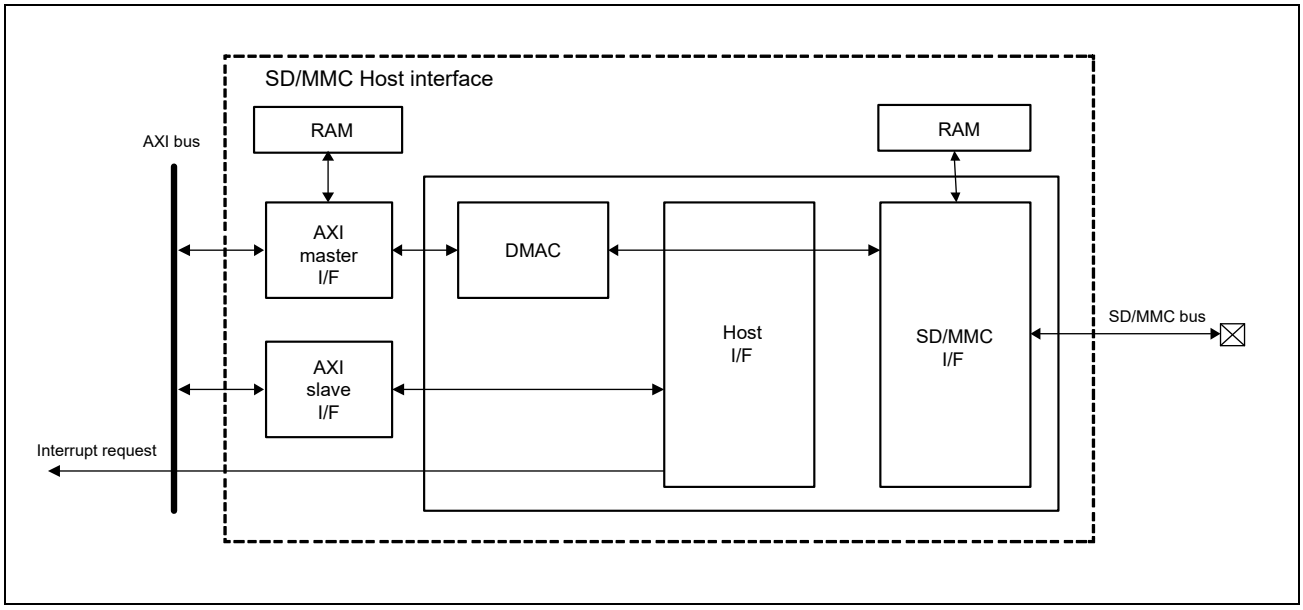

Figure 33.1 Block Diagram of SD/MMC Host Interface

33.1.2 External Pins

Table 33.1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V for ch0 and ch1, and only 3.3 V for ch2. Channels 0, 1 and 2 can operate with different voltages. Before using the pins of the SD/MMC host interface, be sure to set the SD ch0/1 IO Voltage Mode Control Register (SD_ch0 and SD_ch1) and Driving Ability Control Register (IOLH).

For details, see the following sections:

Section 45.3.7, Driving Ability Control Register,
Section 45.3.16, SD Ch0 IO Voltage Mode Control Register,
Section 45.3.17, SD Ch1 IO Voltage Mode Control Register.

Table 33.1 Pin Configuration

PIN Name	I/O	Function
SDx_CLK*1	O	SD/MMC clock output
SDx_CMD*1	I/O	SD/MMC command output, response input
SDx_DATA0*1	I/O	SD/MMC Data 0 [bit 0]
SDx_DATA1*1	I/O	SD/MMC Data 1 [bit 1], SDIO interrupt
SDx_DATA2*1	I/O	SD/MMC Data 2 [bit 2], read wait
SDx_DATA3*1	I/O	SD/MMC Data 3 [bit 3], Card detection
SD0_DATA4*1	I/O	SD/MMC Data 4 [bit 4]
SD0_DATA5*1	I/O	SD/MMC Data 5 [bit 5]
SD0_DATA6*1	I/O	SD/MMC Data 5 [bit 6]
SD0_DATA7*1	I/O	SD/MMC Data 7 [bit 7]
SDx_CD*1	I	SD/MMC card detection*2
SDx_WP*1	I	SD/MMC write protection*2
SD0_RST#	O	SD/MMC reset

Note 1. x (= 0, 1, 2) is the channel number of the SD/MMC host interface. In this manual, those pins are referred as SDDAT0, SDDAT1, …, SDDAT7.

Note 2. Fix to 1 when not in use.

33.1.3 Register Configuration

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SD_CMD).

Channel 0:

H'0_11C0_0000 (Cortex-A55 Address Space)
H'41C0_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
H'51C0_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Channel 1:

H'0_11C1_0000 (Cortex-A55 Address Space)
H'41C1_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
H'51C1_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Channel 2:

H'0_11C2_0000 (Cortex-A55 Address Space)
H'41C2_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
H'51C2_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 33.2 Register Configurations (1/2)

Name	Abbreviation	Address	Access Width	Mirror
Command type register	SD_CMD	H'0000	16/32/64	
Command argument registers	SD_ARG	H'0010	16/32/64

DM_CM_INFO2 interrupt mask register	DM_CM_INFO2_MASK	H'0858	16/32/64	
DMAC address register	DM_DTRAN_ADDR	H'0880	16/32/64	
SCC register area*2	—	—	—	—

Note 1. Only for channel 0.

Note 2. Refer to **Section 33.7, SCC Register Descriptions**.

33.2 Register Description

33.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to **Section 33.4.14, Example of SD_CMD Register Setting**.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MD7	00	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer)
14	MD6			00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multi block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD/MMC host interfaces -> SD card) 1: Read (SD/MMC host interfaces <- SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	000	R/W	Mode/Response Type
9	MD1			000: Normal mode
8	MD0			The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/R1, R5, R6, or R7 response from the SD card 101: Extended mode/R1b response from the SD card 110: Extended mode/R2 response from the SD card 111: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see **Section 33.4.14, Example of SD_CMD Register Setting** to select mode/response type.
7	C1	00	R/W	00: CMD
6	C0			01: ACMD 10: Setting prohibited 11: Setting prohibited
5	CF45	000000	R/W	Command Index
4	CF44			These bits specify Command Format[45:40] (command index).
3	CF43			[Examples]
2	CF42			CMD6: SD_CMD[7:0] = 0000_0110b CMD18: SD_CMD[7:0] = 0001_0010b
1	CF41			ACMD13: SD_CMD[7:0] = 0100_1101b
0	CF40			

Note: SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

33.2.2 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is H'0000_0000 regardless of the setting of SD_ARG.

SD_ARG

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CF39 to CF8	All 0	R/W	Set command format[39:8] (argument).

SD_ARG1 (Mirror of SD_ARG[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument).

33.2.3 Data Stop Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
18	—	0*1	R/W	Reserved The write value should always be 0.
17	HPIMODE	0*1	R/W	HPI Mode Enable 0: Disables HPI mode. 1: Enables HPI mode.
16	HPICMD	0*1	R/W*3	HPI Command Issue When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1 is as follows. • After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence. • After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
0	STP	0*1	R/W	Stop • When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. • When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. • When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. • Set STP to 1 after the response end flag has been set. • Set STP to 0 after the response end flag has been set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. It is effective only if 1 is written.

33.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CNT31 to CNT0	All 0	R/W	Number of Transfer Blocks*1 When H'0000_0001 is set, the number of transfer blocks is 1. ⋮ When H'0000_FFFF is set, the number of transfer blocks is 65535. ⋮ When H'FFFF_FFFF is set, the number of transfer blocks is 4294967295. Do not set this register to H'0000_0000 if multiple blocks are to be transferred.

Note 1. Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

33.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

SD_RSP10

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8	All 0	R	Hold the response from the SD card

SD_RSP1 (Mirror of SD_RSP10[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R39 to R24	All 0	R	Hold the response from the SD card

SD_RSP32 (Mirror of SD_RSP10[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	R71 to R40	All 0	R	Hold the response from the SD card

SD_RSP3 (Mirror of SD_RSP32[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R71 to R56	All 0	R	Hold the response from the SD card

SD_RSP54

Bit	Bit Name	Initial Value	R/W	Description
63 to 56	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
55 to 0	R127 to R72	All 0	R	Hold the response from the SD card

SD_RSP5 (Mirror of SD_RSP54[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R103 to R88	All 0	R	Hold the response from the SD card

SD_RSP76 (Mirror of SD_RSP54[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 0	R127 to R104	All 0	R	Hold the response from the SD card

SD_RSP7 (Mirror of SD_RSP76[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	R127 to R120	All 0	R	Hold the response from the SD card

Table 33.3 lists the response types and corresponding SD_RSP registers.

Table 33.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*1
R2[127:8]	SD_RSP54 and SD_RSP10
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note 1. The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

33.2.6 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	HPIRES	0*2	R/W*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0 is written to HPIRES
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	INFO10	Unknown	R	Indicates the SDDAT3 state. 0: SDDAT3 is set to 0. 1: SDDAT3 is set to 1.
9	INFO9	0	R/W*1	SDDAT3 Card Insertion [Setting condition] After change in SDDAT3 from 0 to 1, two cycles of 2 P1ϕ have elapsed with SDDAT3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SDDAT3 Card Removal [Setting condition] After change in SDDAT3 from 1 to 0, two cycles of 2 P1ϕ have elapsed with SDDAT3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the ISDWP state. 0: ISDWP is set to 1. 1: ISDWP is set to 0.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
5	INFO5	Unknown	R	Indicates the ISDCD state. 0: Indicates that Mcycle has elapsed with ISDCD held 1. 1: Indicates that Mcycle has elapsed with ISDCD held 0. Mcycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
4	INFO4	0	R/W*1	ISDCD Card Insertion [Setting condition] After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0. [Clearing condition] When 0 is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	ISDCD Card Removal [Setting condition] After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.
2	INFO2	0*2	R/W*1	Access End [Setting conditions] 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

Bit	Bit Name	Initial Value	R/W	Description
0	INFO0	0*2	R/W*1	Response End [Setting conditions] 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When issuing a command without data, the command sequence ends when the response end is set to 1.

Note 1. It is effective only if 0 is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

33.2.7 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000_1100b (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1*2	R	0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
11	—	0	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BWE	0*2	R/W*1	SD_BUF Write Enable 0: Data cannot be written in SD_BUF0. 1: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0 is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3

Bit	Bit Name	Initial Value	R/W	Description
8	BRE	0*2	R/W*1	SD_BUF Read Enable 0: Data cannot be read from SD_BUF0. 1: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0 is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.
7	DAT0	Unknown	R	SDDAT0 Indicates the SDDAT0 state. 0: SDDAT0 is set to 0. 1: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0 is written to ERR6 The command sequence is halted by a response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] 1. When SD_BUF is empty while SD_BUF0 is read 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5
4	ERR4	0*2	R/W*1	SD_BUF Illegal Write Access [Setting conditions] 1. When data is written to SD_BUF0 while it is not in the data read/write command state 2. When data is written to SD_BUF0 while SD_BUF is full 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length 4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
3	ERR3	0*2	R/W*1	Data Timeout (except response timeout) [Setting conditions] 1. After R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 2. After CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 3. After write data, the CRC status is not received even after Ncycle has elapsed. 4. After read command, read data is not received even after Ncycle has elapsed. 5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed. 7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed. [Clearing condition] When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.
2	ERR2	0*2	R/W*1	END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not ‘010’) 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*5 [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes

setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in **Figure 33.16** under **Section 33.4.8, IO_RW_EXTENDED (CMD53/Multiple Block Read)** or in **Figure 33.19** under **Section 33.4.9, IO_RW_EXTENDED (CMD53/Multiple Block Write)**.

Note 5. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

33.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt.

When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	IMASK16	1	R/W	HPIRES interrupt masked
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IMASK0	1	R/W	INFO0 interrupt masked

33.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt.

When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11	—	1	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

33.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	—	0	R/W	Reserved The write value should always be 0.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	—	0*1	R/W	Reserved The write value should always be 0.
9	SDCLKOFFEN	0	R/W	SD Clock (SDCLK) Output Automatic Control Enable 0: Automatic control for SD clock (SDCLK) output is disabled. 1: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.
8	SCLKEN	0*1	R/W*2	SD Clock (SDCLK) Output Control Enable 0: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1: SD clock (SDCLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SDCLK) *3 1000_0000b: (SDxϕ/4)/512 0100_0000b: (SDxϕ/4)/256 0010_0000b: (SDxϕ/4)/128 0001_0000b: (SDxϕ/4)/64 0000_1000b: (SDxϕ/4)/32 0000_0100b: (SDxϕ/4)/16 0000_0010b: (SDxϕ/4)/8 0000_0001b: (SDxϕ/4)/4 0000_0000b: (SDxϕ/4)/2 1111_1111b: SDxϕ/4 (x = 0, 1) Other settings are prohibited.
6	DIV6	0	R/W*2	
5	DIV5	1	R/W*2	
4	DIV4	0	R/W*2	
3	DIV3	0	R/W*2	
2	DIV2	0	R/W*2	
1	DIV1	0	R/W*2	
0	DIV0	0	R/W*2	

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

Note 3. SD Clock on ch2 must be set to 50 MHz or less.

Notes on when setting the SD clock (SDCLK) to P1ϕ (DIV[7:0] = 1111_1111b)

When changing the setting of bits DIV[7:0] to 1111_1111b, or from 1111_1111b to other setting, perform the following processing before writing to SD_CMD.

(1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

(2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)

(3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to 1111_1111b after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

33.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note 1. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

33.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	WIDTH	0*1	R/W	Bus width*2 {WIDTH,WIDTH8} = 01: 8 bits width {WIDTH,WIDTH8} = 00: 4 bits width {WIDTH,WIDTH8} = 10,11: 1 bit width
14	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
13	WIDTH8	0*1	R/W	Bus width*2 See the description of the WIDTH bit.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	EXTOP	0*1	R/W	Timeout Mode Select 0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{13} to SDCLK*2^{27}. 1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{14} to SDCLK*2^{28}.
8	TOUTMASK	0*1	R/W	Timeout Mask 0: Enables timeout. 1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.
7	TOP27	1*1	R/W	Timeout Counter*2 0000: SDCLK*2^{13} 0001: SDCLK*2^{14} ⋮ 1101: SDCLK*2^{26} 1110: SDCLK*2^{27} 1111: Setting prohibited
6	TOP26	1*1	R/W	
5	TOP25	1*1	R/W	
4	TOP24	0*1	R/W	
3	CTOP24	1*1	R/W	Card Detect Time Counter 0000: SDCLK*2^{10} 0001: SDCLK*2^{11} ⋮ 1101: SDCLK*2^{23} 1110: SDCLK*2^{24} 1111: Setting prohibited
2	CTOP23	1*1	R/W	
1	CTOP22	1*1	R/W	
0	CTOP21	0*1	R/W	

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

33.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 15	—	Unknown	R	Reserved These bits are always read as unknown. The write value should always be 0.
14	E14	0*1	R	These bits hold the CRC status. (normal: 010)
13	E13	1*1		
12	E12	0*1		
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status.
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2).
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2).
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

33.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
63 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
6	E6	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after the CRC status.
5	E5	0*1	R	Set to 1 when the CRC status is not received even after Ncycle has elapsed after data writing.
4	E4	0*1	R	Set to 1 when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after R1b response.
1	E1	0*1	R	Set to 1 when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

33.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF63 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

Note: When using the DMAC, the bus width should be fixed at 64 bits.

33.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	C52PUB	0	R/W	SDIO None Abort • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1. • Set C52PUB to 1 after the response end flag has been set.
8	IOABT	0	R/W	SDIO Abort • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. • Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Read wait state releasing] (1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IOMOD	0	R/W	SDIO Mode*1 0: Disables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card 1: Enables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

33.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. 2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	All 0*2	R/W	Reserved The write value should always be 1. The value may change during operation.
0	IOIRQ	0*2	R/W*1	[Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

33.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	—	1	R/W	Reserved The write value should always be 1.
1	—	1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

33.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9, 8	—	All 0	R/W	Reserved The write value should always be 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	—	0	R/W	Reserved The write value should always be 0.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer*1 0: The SD_BUF read/write DMA transfer is disabled. 1: The SD_BUF read/write DMA transfer is enabled.
0	—	0	R/W	Reserved The write value should always be 0.

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

33.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD/MMC host interfaces and before attempting access to the other registers.

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SDRST	1	R/W	Software Reset of SD Interface Unit 0: Reset 1: Reset released

33.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD/MMC host interfaces.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15, 14	UR7, UR6	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13, 12	UR5, UR4	00	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 8	UR3 to UR0	H'C	R	Version of Renesas' IP
7 to 0	IP7 to IP0	H'10	R	Version of introductory IP

33.2.22 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	BUSWIDTH	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 16-bit access 1: 32-bit access This bit is enabled while the WMODE bit is set to 1.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	ENDIAN	0	R/W	SD_BUF0 data swap
0	WMODE	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 64-bit access 1: 16-bit or 32-bit access

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

33.2.23 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register specifies transfer mode.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	—	0*1	R/W	Reserved The write value should always be 0.
8	NOCHKCR	0*1	R/W	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0: Enables the CRC check. 1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	—	0*1	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

33.2.24 SD Status Register (SD_STATUS)

The effective bit of the SD status register controls the output value on the SD0_RST# pin.

Bit	Bit Name	Initial Value	R/W	Description
63 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	SD_RST	0	R/W	Controls the output value on the SD0_RST# pin. 0: The output value on the SD0_RST# pin is 0. 1: The output value on the SD0_RST# pin is 1.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

33.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

The DMAC Transfer Mode Register (DM_CM_DTRAN_MODE) sets the operation mode of the module built-in DMAC.

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17, 16	CH_NUM	00	R/W	DMAC channel selector 00: SD down stream 01: SD up stream Other settings are prohibited.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5, 4	BUS_WIDTH [1:0]	11	R/W	Bus width selector 11: 64-bit Other settings are prohibited.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

33.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

The DMAC Transfer Control Register (DM_CM_DTRAN_CTRL) controls the module built-in DMAC operation. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	—	0	R/W	Reserved The write value should always be 0.
7 to 1	—	All 0	R	Reserved
0	DM_START	0	R/W	DMAC Start Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

33.2.27 DMAC Reset Register (DM_CM_RST)

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 10	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
9	DTRANRST1	1	R/W	Soft resets of the module built-in DMAC channel 1 0: Reset 1: Reset released
8	DTRANRST0	1	R/W	Soft resets of the module built-in DMAC channel 0 0: Reset 1: Reset released
7 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
0	SEQRST	1	R/W	Soft resets of the sequencer 0: Reset 1: Reset released

NOTE

Make sure there is no communication to the SD/MMC device before applying a software reset using this register.

33.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
20	DTRANEND1	0*1	R/W	Module built-in DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANEND1
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	DTRANEND0	0*2	R/W	Module built-in DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0 is written to DTRANEND0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQEND	0*3	R/W	Sequencer Operation End [Setting conditions] 1. When operation of a sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0 is written to SEQEND

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

33.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 21	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
20	DTRANEND1_MASK	1	R/W	DTRANEND1 interrupt masked
19 to 17	—	All 1	R/W	Reserved The write value should always be 1.
16	DTRANEND0_MASK	1	R/W	DTRANEND0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQEND_MASK	1	R/W	SEQEND interrupt masked

33.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
19, 18	—	00	R	Reserved The write value should always be 0.
17	DTRANERR1	0*1	R/W	Module built-in DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANERR1
16	DTRANERR0	0*2	R/W	Module built-in DMAC Channel 0 Error [Setting condition] When an error occurs on the DMAC channel 0 [Clearing condition] When 0 is written to DTRANERR0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQERR	0*3	R/W	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0 is written to SEQERR

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

33.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 20	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
19, 18	—	11	R	Reserved The write value should always be 1.
17	DTRANERR1_MASK	1	R/W	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1	R/W	DTRANERR0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQERR_MASK	1	R/W	SEQERR interrupt masked

33.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR)

The DMAC Transfer Address Register (DM_DTRAN_ADDR) sets the transfer destination and source address of the module built-in DMAC.

Higher-order 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 3	DADDR	All 0	R/W	Destination address / Source address (8 bytes unit) Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to 2^{32}.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

33.3 Operation

33.3.1 SD Interface

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see **Figure 33.2**, **Figure 33.3** and **Figure 33.4**.)
2. The receive data is stored in SD_BUF of the SD/MMC host interfaces. (SD_BUF store data: see **Figure 33.5**)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see **Table 33.4**)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See **Figure 33.5**)

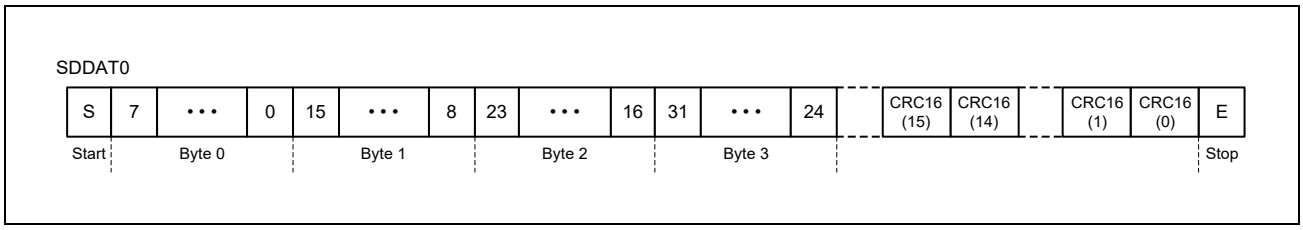

Figure 33.2 SDDAT in 1-Bit Width Mode

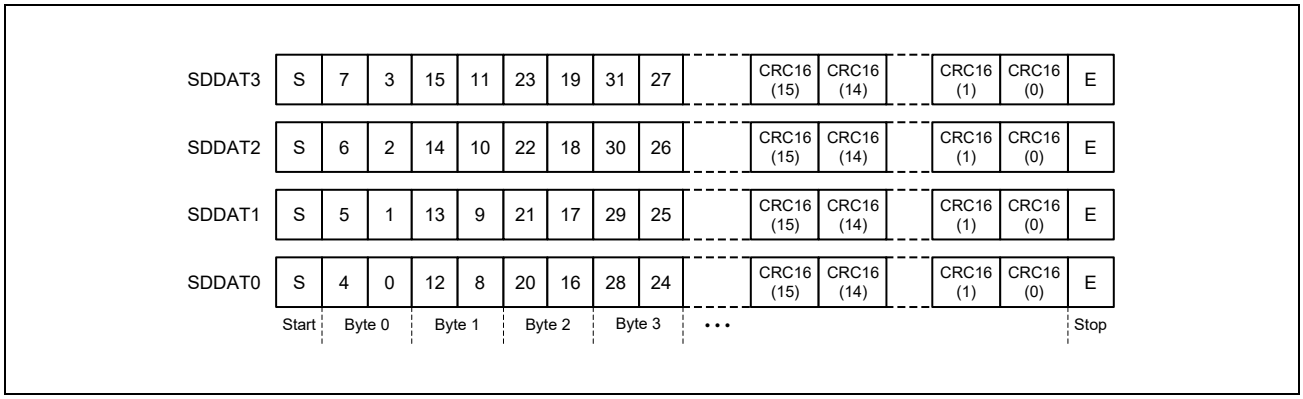

Figure 33.3 SDDAT in 4-Bit Width Mode

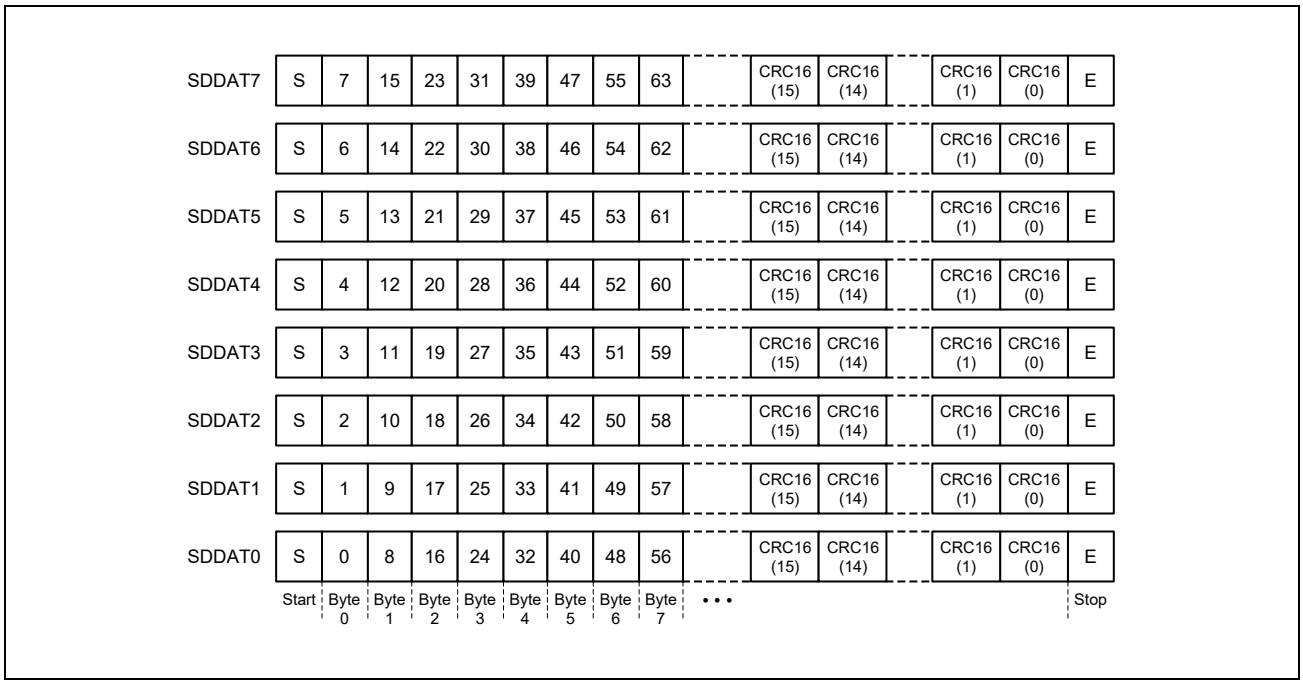

Figure 33.4 SDDAT in 8-Bit Width Mode

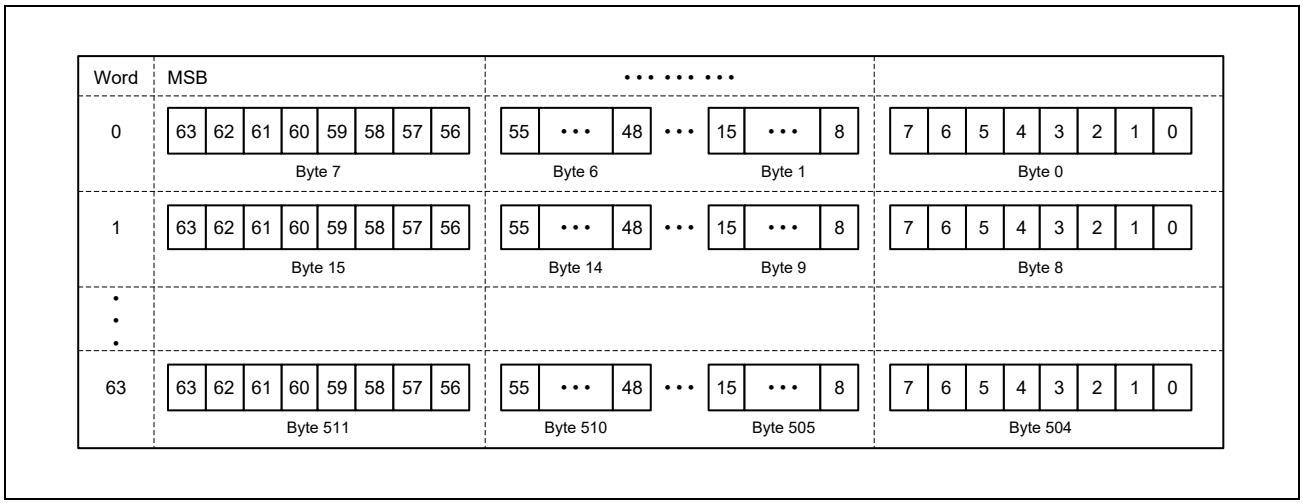

Figure 33.5 SD_BUF Store Data

Table 33.4 Reading from SD_BUF0

WMODE*1	BUSWIDTH*1	ENDIAN*1	Read Data*2
0	0	0	H'0123_4567_89AB_CDEF
0	0	1	H'EFCD_AB89_6745_2301
1	1	0	H'89AB_CDEF (1st) H'0123_4567 (2nd)
1	1	1	H'EFCD_AB89 (1st) H'6745_2301 (2nd)
1	0	0	H'CDEF (1st) H'89AB (2nd) H'4567 (3rd) H'0123 (4th)
1	0	1	H'EFCD (1st) H'AB89 (2nd) H'6745 (3rd) H'2301 (4th)

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is H'0123_4567_89AB_CDEF

(2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(1) Issuing CMD11
Perform command sequence processing of CMD11.

(2) Stopping the SD clock (a)
Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop*1 the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.

Note 1. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(3) Checking the value of SDDAT
Check that the DAT0 bit in the SD_INFO2 register is 0.

(4) Changing the supply voltage of the host device
Change the voltage which is supplied through the power supply pin of the given channel (SD0_PVDD for channel 0 or SD1_PVDD for channel 1) from 3.3 V to 1.8 V.

For details, see the following sections:

Section 45.3.4, Port Function Control Register,
Section 45.3.7, Driving Ability Control Register,
Section 45.3.16, SD Ch0 IO Voltage Mode Control Register,
Section 45.3.17, SD Ch1 IO Voltage Mode Control Register.

(5) Starting supply of the SD clock (b)
After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(6) Checking the value of SDDAT
After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

33.3.2 Card Detect/Write Protect

(1) Card Detect

The SD/MMC host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

  Figure 33.6 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

  [Card insertion]

  ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

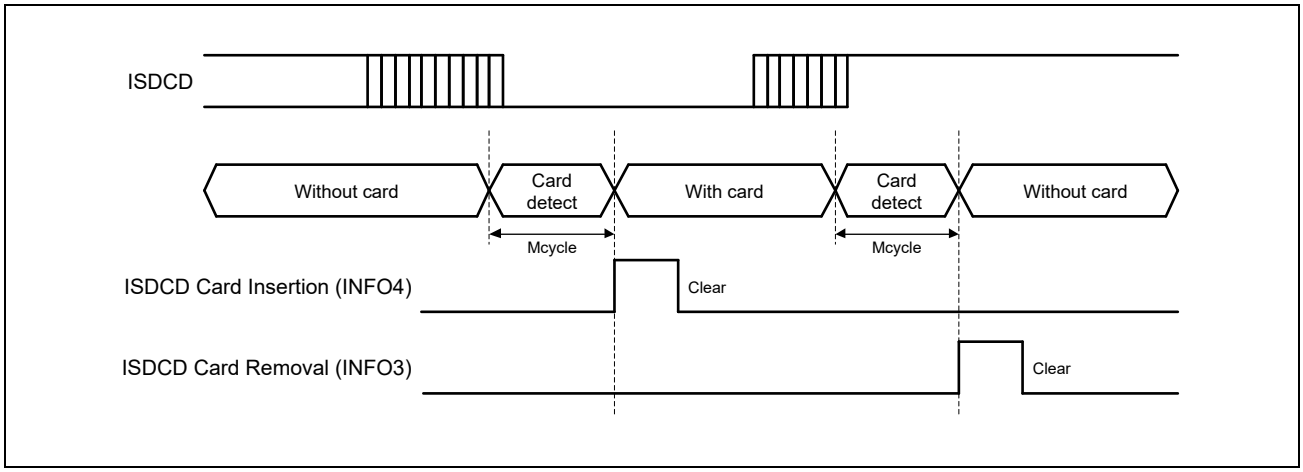

Figure 33.6 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

Figure 33.7 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

[Card insertion]

When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

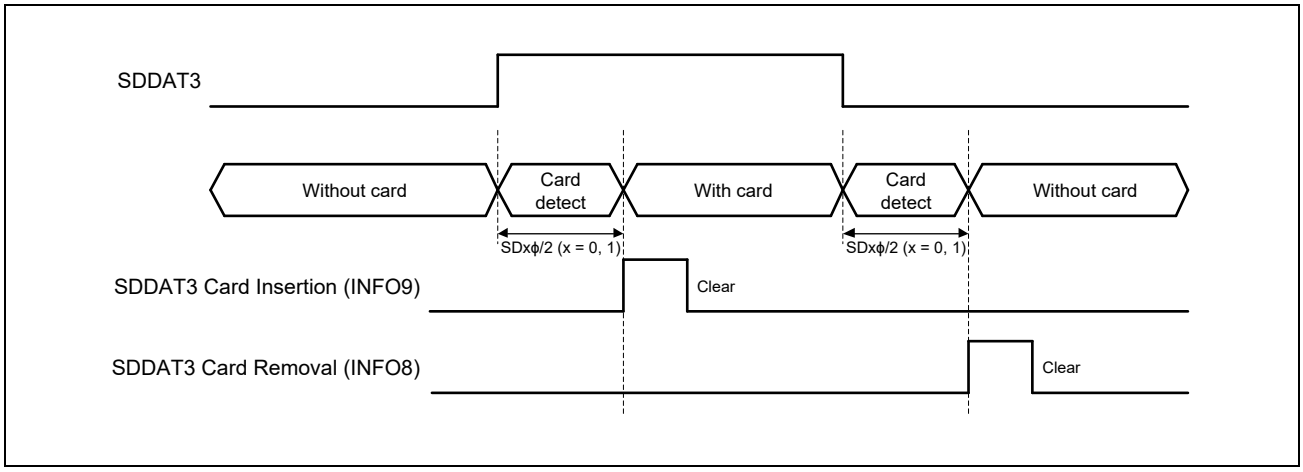

Figure 33.7 SD Card Detect with SDDAT3

(2) Write Protect

The SD/MMC host interface has two types of write protect functions.

- Write protect with ISDWP

ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

The card's internal write protection and the card lock/unlock operation are realized by the command.

33.3.3 Interrupt Request

(1) Interrupt Request

The SD/MMC host interface has the interrupt requests shown in **Table 33.5** shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 33.5 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt*1	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt*2	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt*1	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt*1	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

Note 1. Interrupt signal “OXMNIRQ” is asserted.

Note 2. Interrupt signal both “OXMNIRQ” and “OXASIOIRQ” are asserted.

33.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

Table 33.6 and **Table 33.7** show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 33.6 Communications Errors

Communication Error	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 33.7 Timeouts

Timeout	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after the CRC status
				E5	When the CRC status is not received t even after Ncycle*1 has elapsed after data writing
				E4	When read data is not received even after Ncycle*1 has elapsed after read command
					When read data for the next block are not received even after Ncycle*1 has elapsed after the reception of read data
					When read data for the next block are not received even after Ncycle*1 has elapsed after release of the read wait state
				E3	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after CMD12 has been issued within a command sequence
				E2	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after R1b response

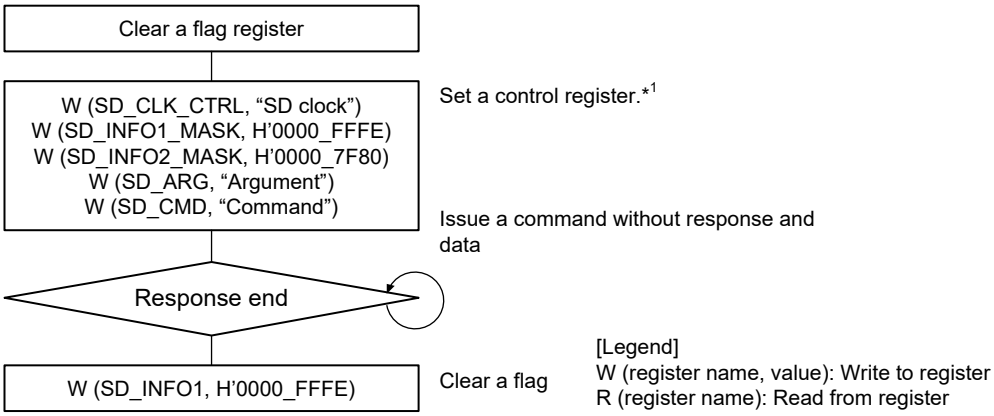
Note 1. Ncycle is set by bit 7 to bit 4 in SD_OPTION.

33.4 Usage Example

33.4.1 Command without Data Transfer

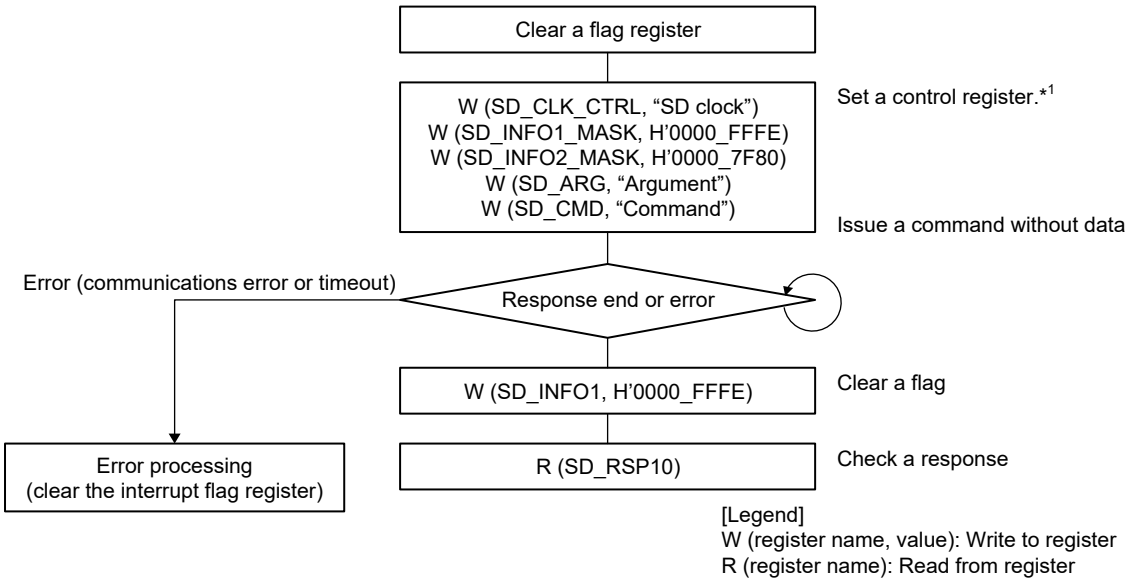
(1) Flowchart

Figure 33.8 and **Figure 33.9** show flowchart examples.



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.8 Flow Example of Command without Response and Data



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.9 Flow Example of Command without Data

(2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value):Write to register
R (register name):Read from register

The operation is described as below.

(a) Command without response and data

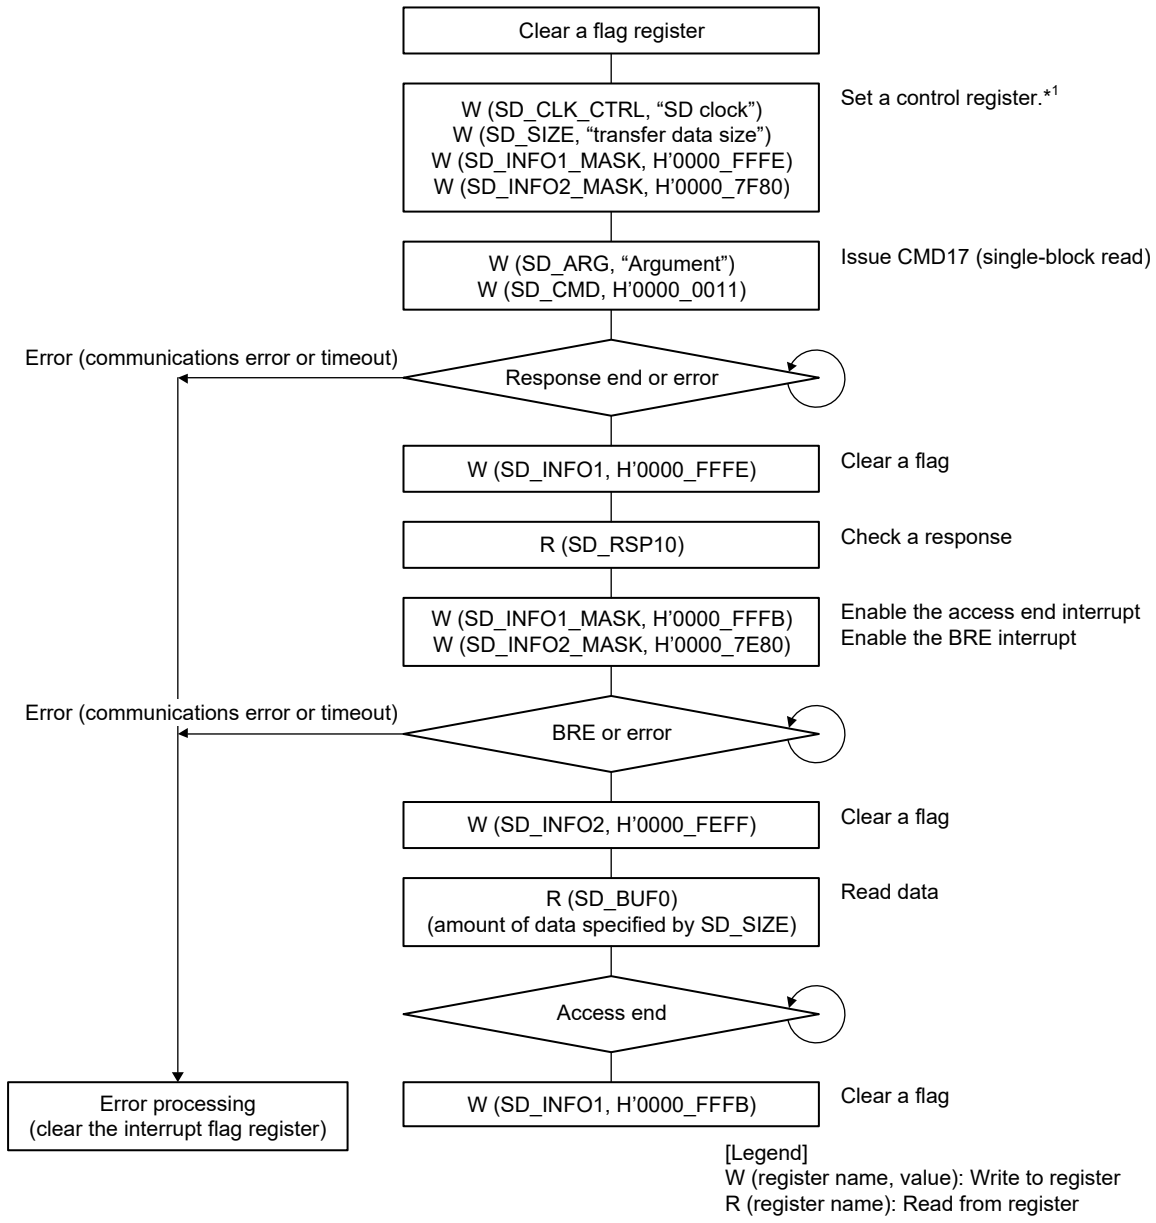
1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue.
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear.
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(b) Command without data

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue.
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear.
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.2 Single Block Read

(1) Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.10 Single Block Read Flowchart Example

(2) Operation for Single Block Read

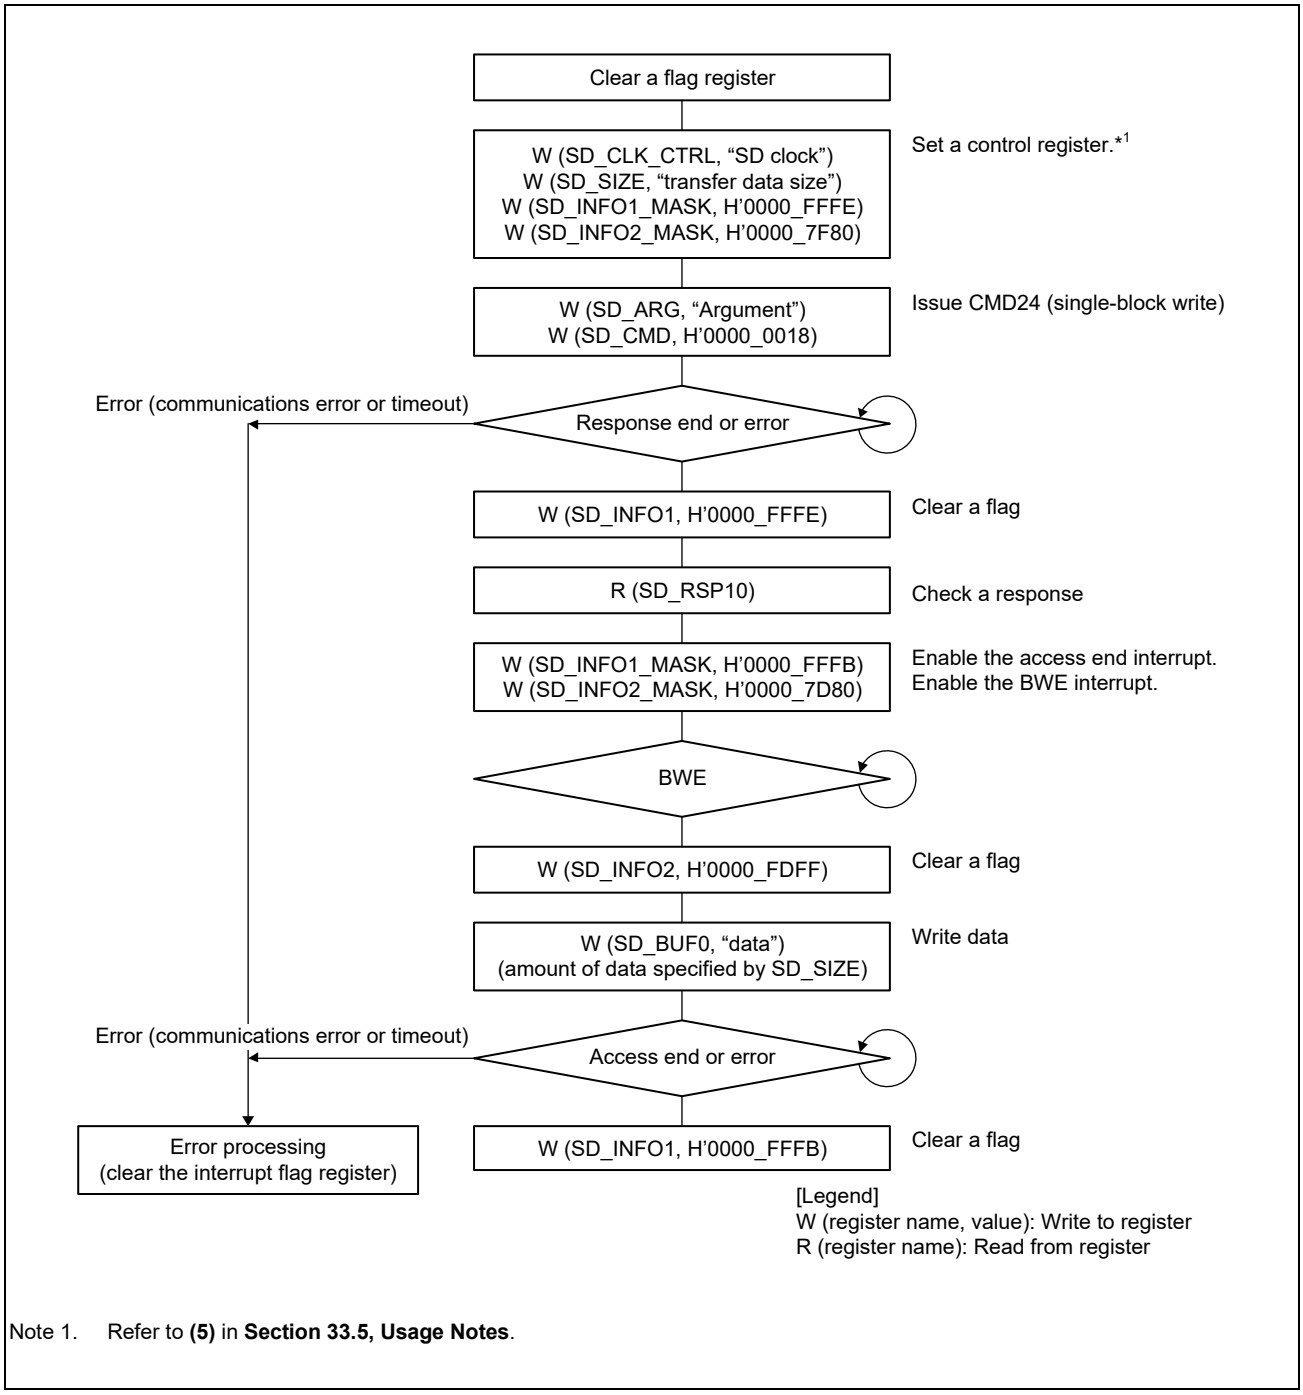
The operation of the single block read is described below.

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write H'0000_0011 to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete.
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.3 Single Block Write

(1) Flowchart



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.11 Single Block Write Flowchart Example

(2) Operation for Single Block Write

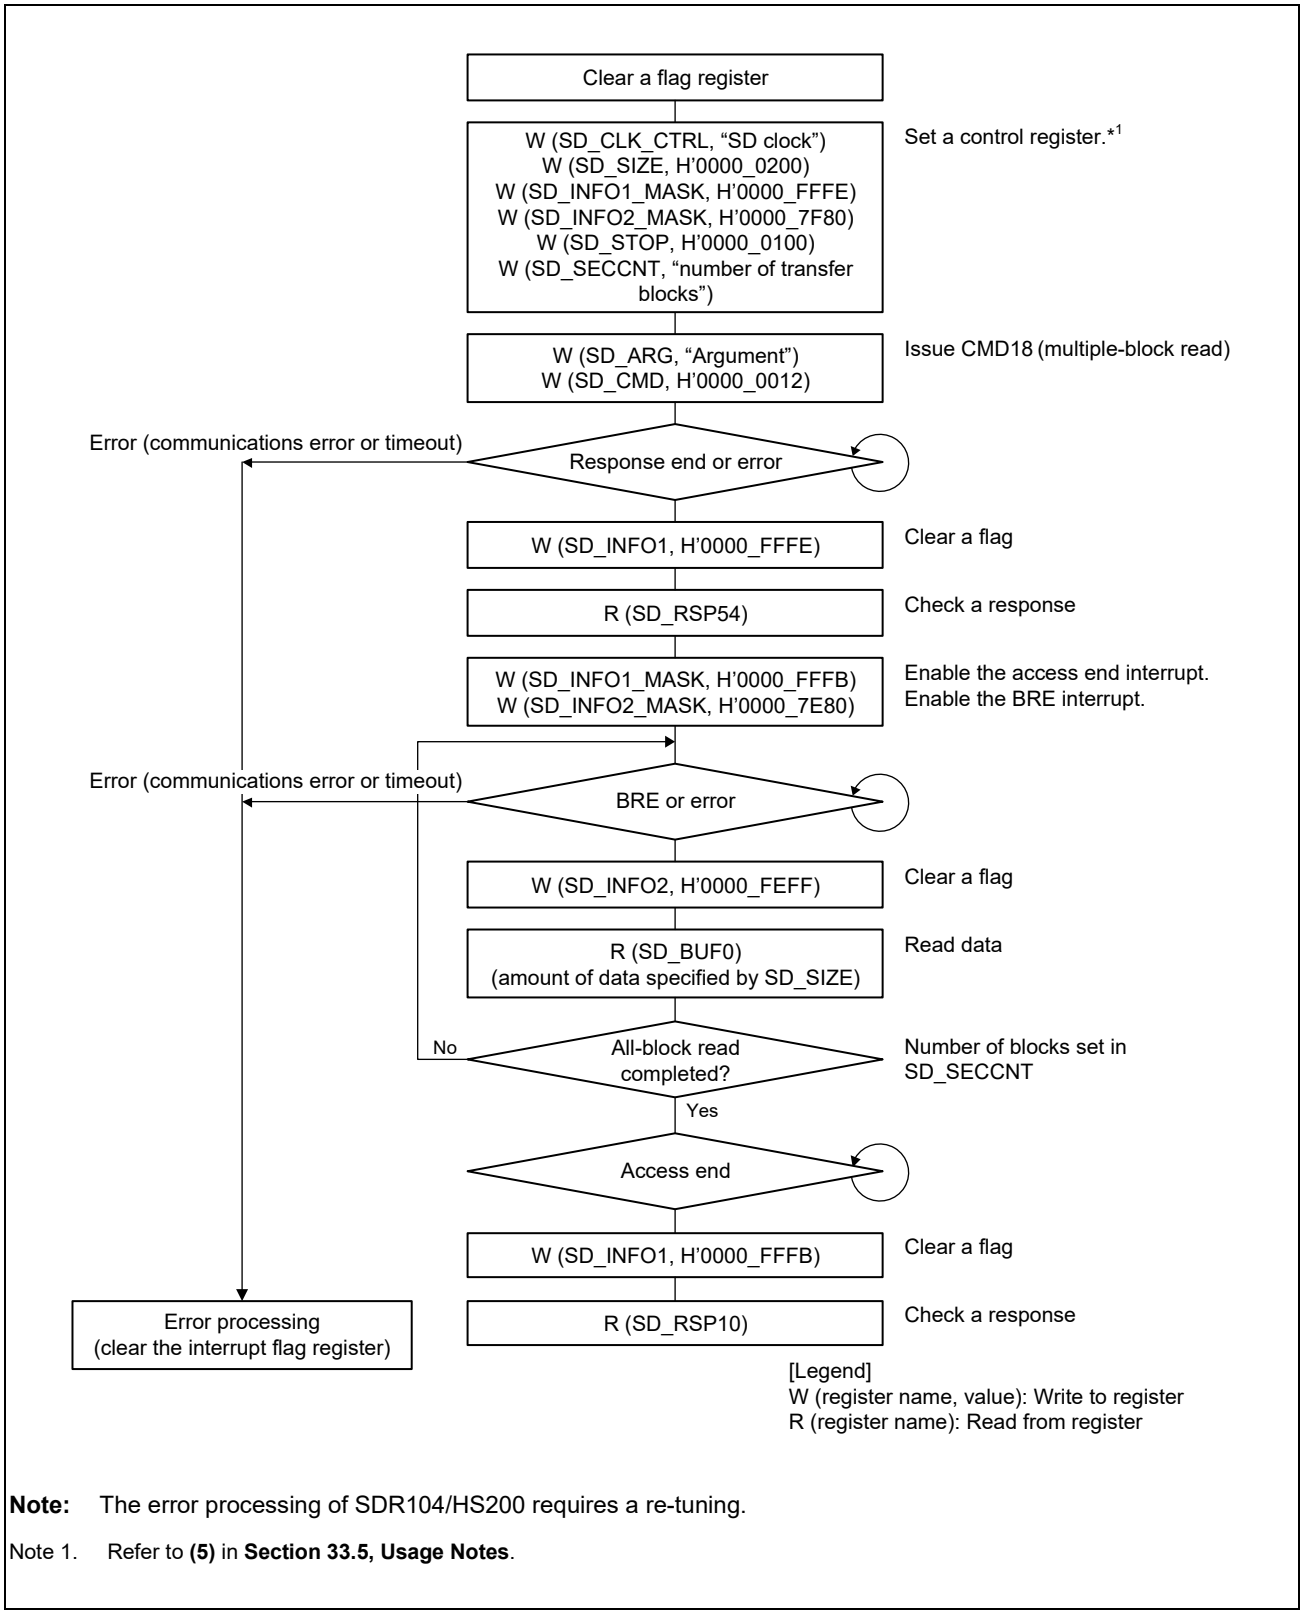
The operation of the single block write is described below.

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24).
   Set CMD24 Argument in SD_ARG and write H'0000_0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete.
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.4 Multiple Block Read

(1) Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.12 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

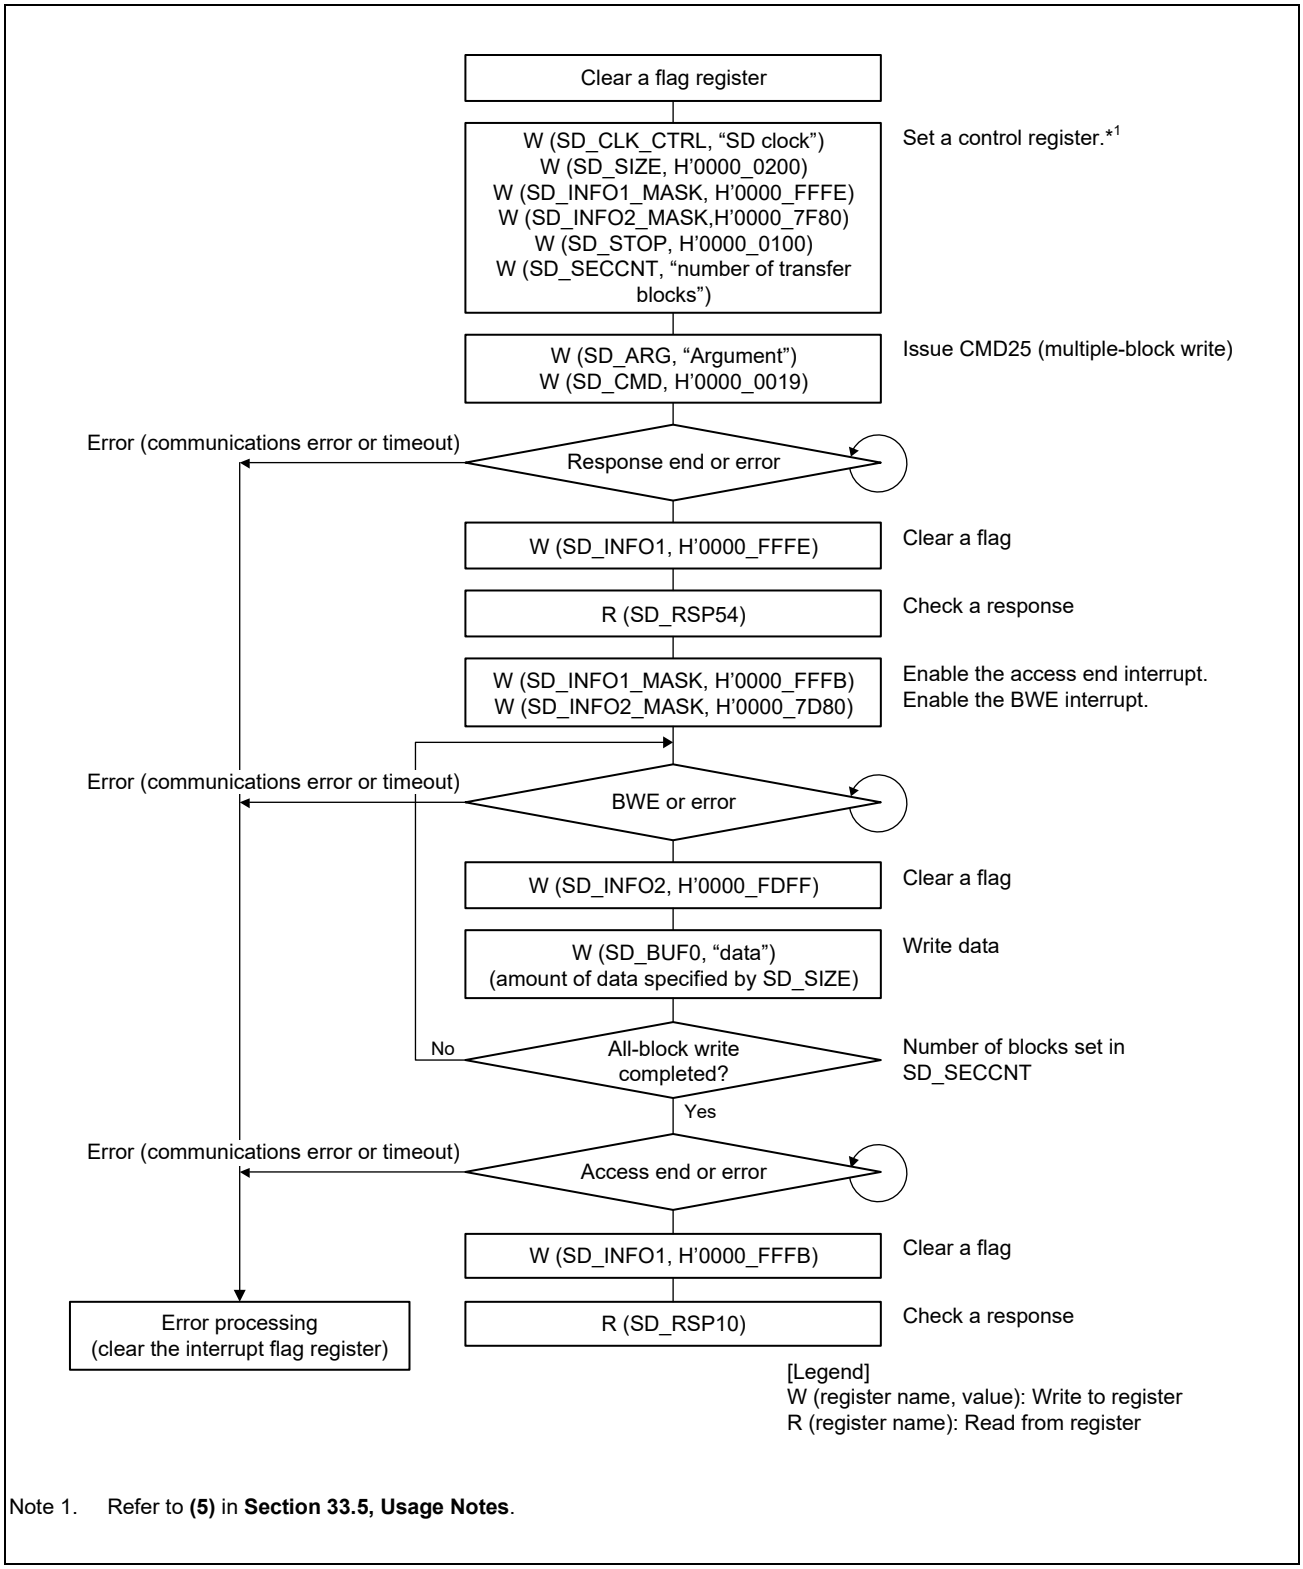
1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write H'0000_0012 to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000_0000.
6. Operation complete.
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.5 Multiple Block Write (when Using Internal Timer)

(1) Flowchart

Figure 33.13 shows the flowchart when using an internal timer.



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.13 Multiple Block Write Flowchart Example (when Using Internal Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

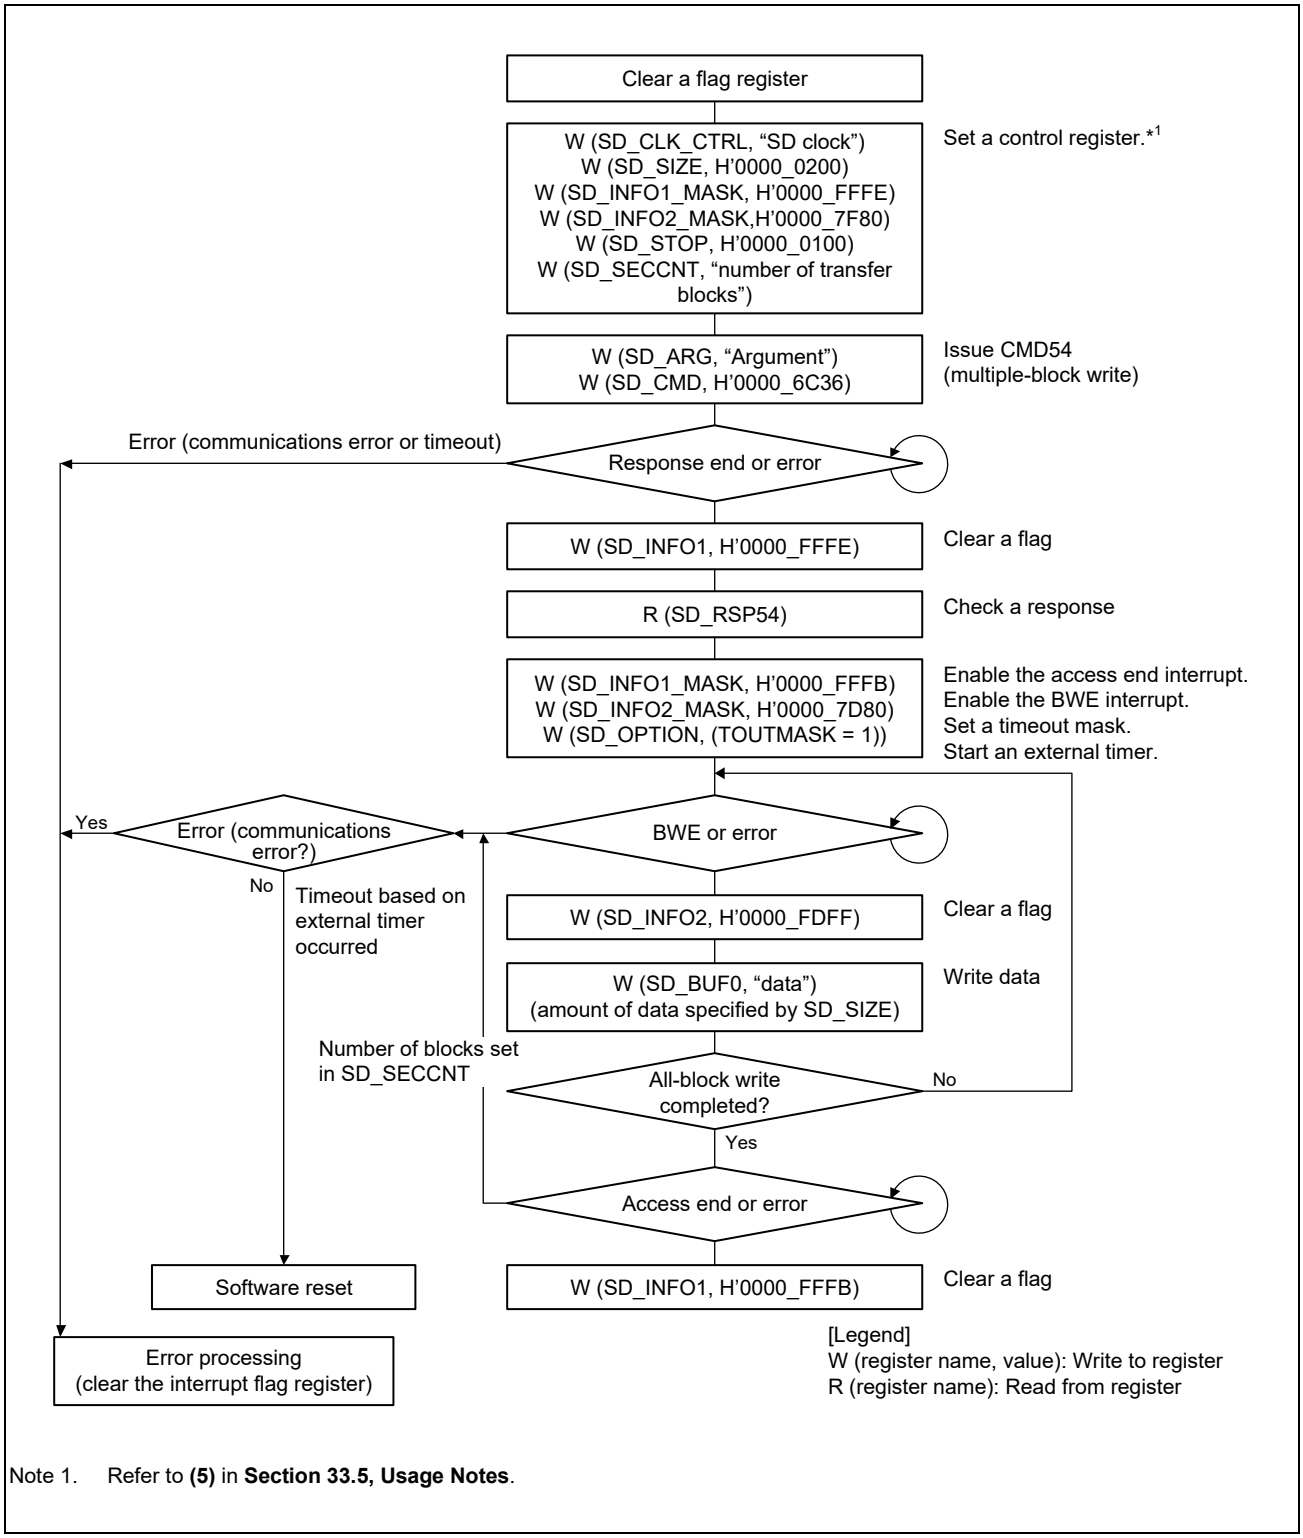
1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25).
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000_0000.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.6 Multiple Block Write (when Using External Timer)

(1) Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.14 Multiple Block Write Flowchart Example (when Using External Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write H'0000_6C36 to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete.
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

33.4.7 IO_RW_DIRECT Commend (CMD52)

Figure 33.20 shows a flowchart example when CMD52 (SDIO abort) is issued at CMD53 (multiple block write).

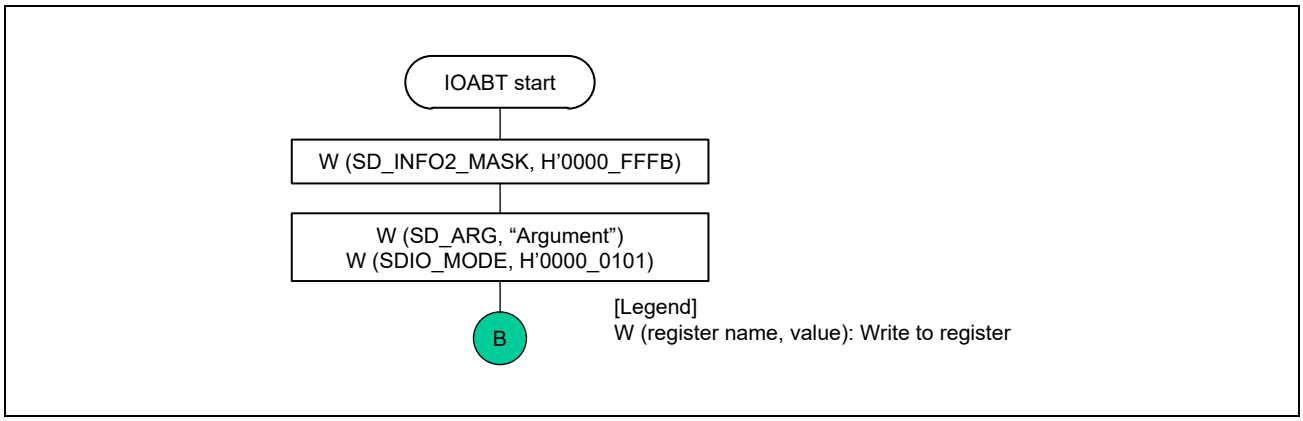

Figure 33.20 Flowchart Example when CMD52 (SDIO Abort) is Issued at CMD53 (Multiple Block Write)

Figure 33.21 shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block write).

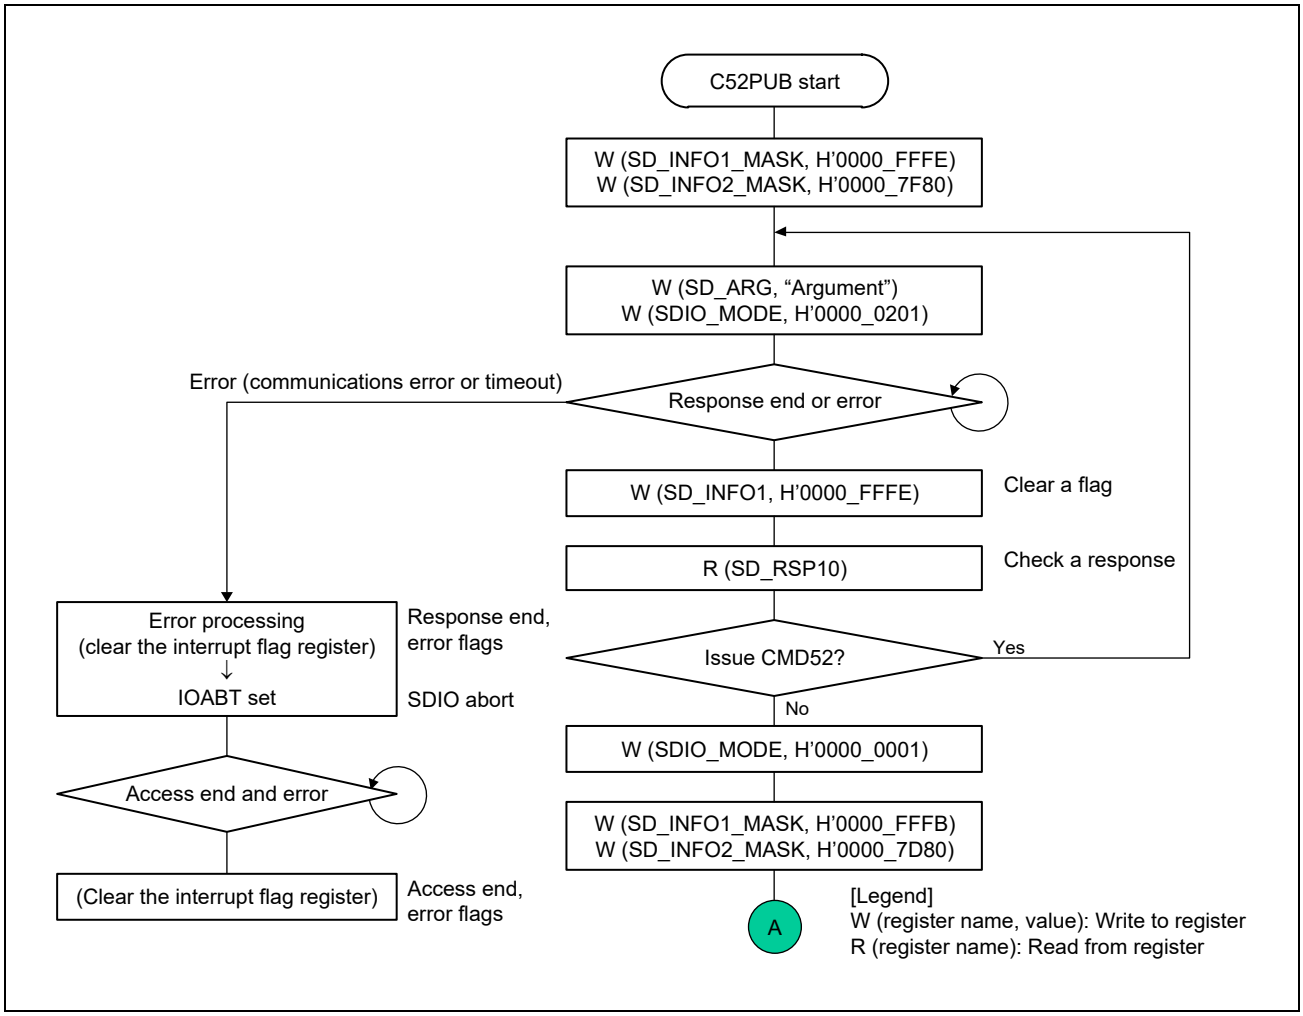

Figure 33.21 Flowchart Example when CMD52 (SDIO None Abort) is Issued at CMD53 (Multiple Block Write)

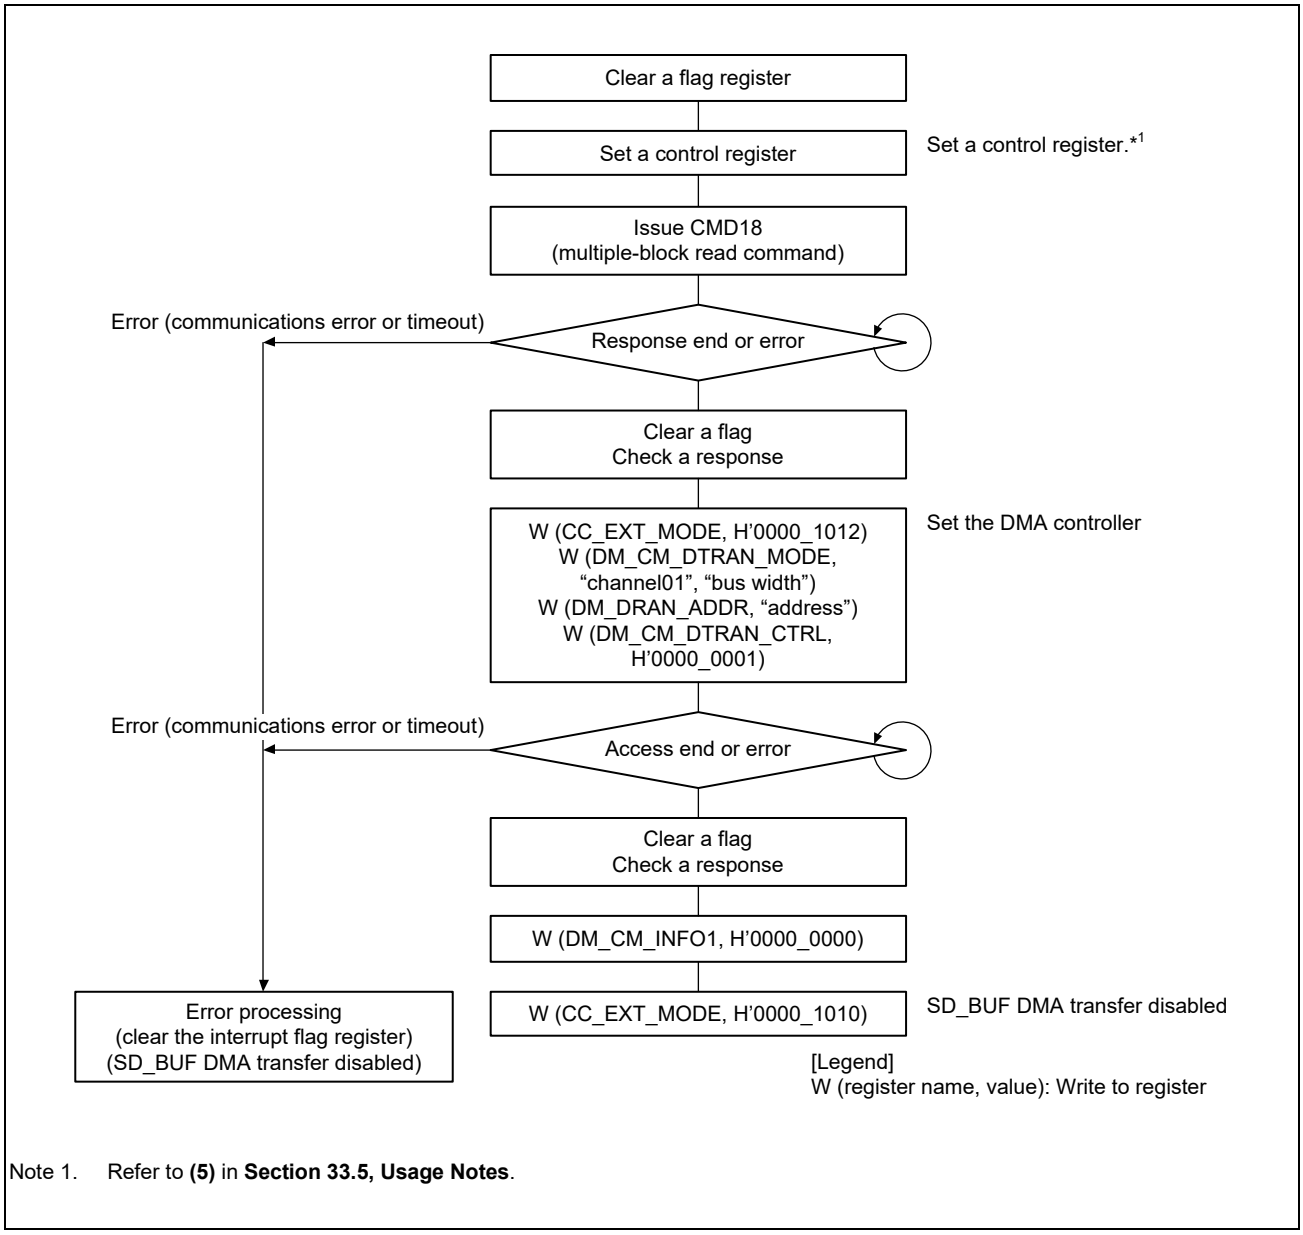
33.4.10 DMA Transfer

(1) SD_BUF DMA Transfer

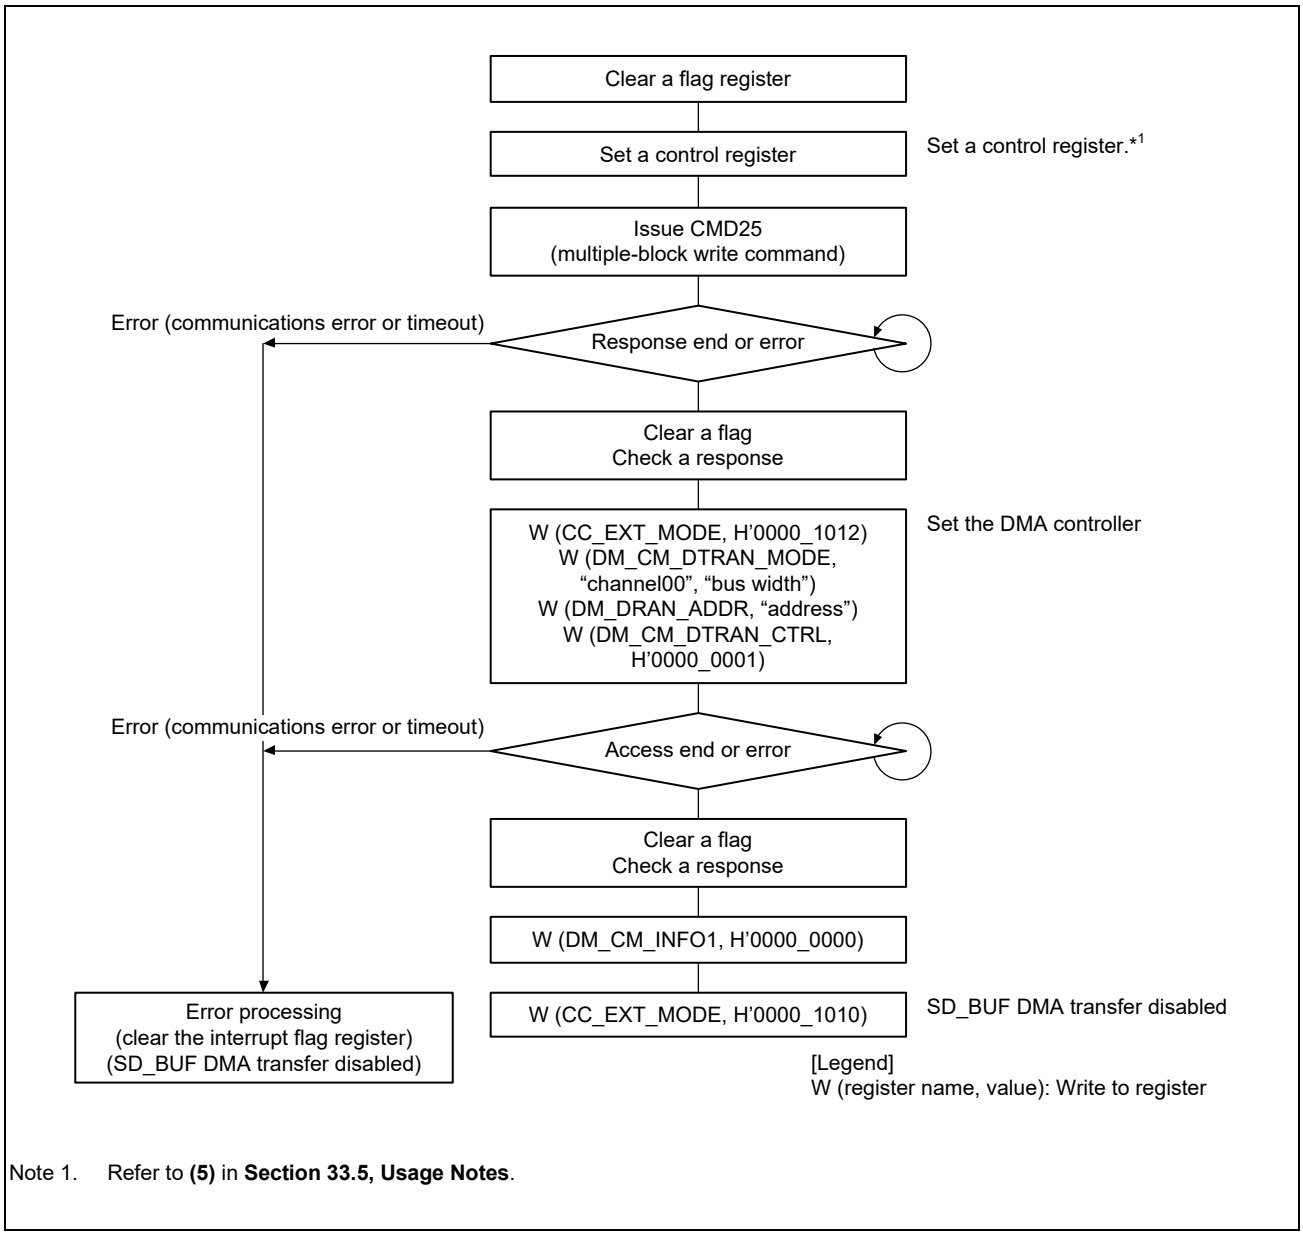
Figure 33.22 shows a flowchart example for SD_BUF DMA read when CMD18 (multiple block read) is issued.



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.22 SD_BUF DMA Read Flowchart Example

Figure 33.23 shows a flowchart example for SD_BUF DMA write when CMD25 (multiple block write) is issued.

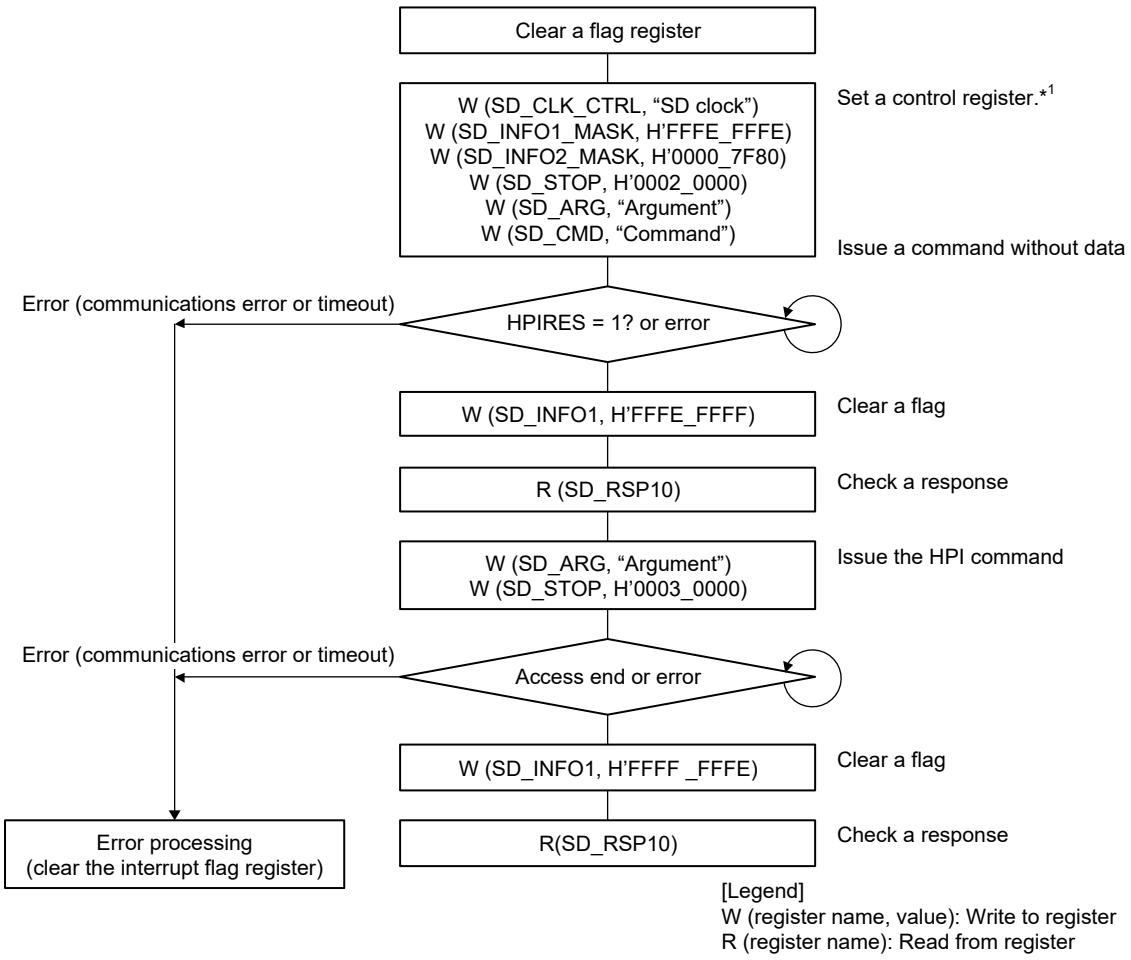


Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.23 SD_BUF DMA Write Flowchart Example

33.4.11 High-Priority Interrupt (without Data Transfer)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.24 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

(2) Operation for High-Priority Interrupt without Data Transfer

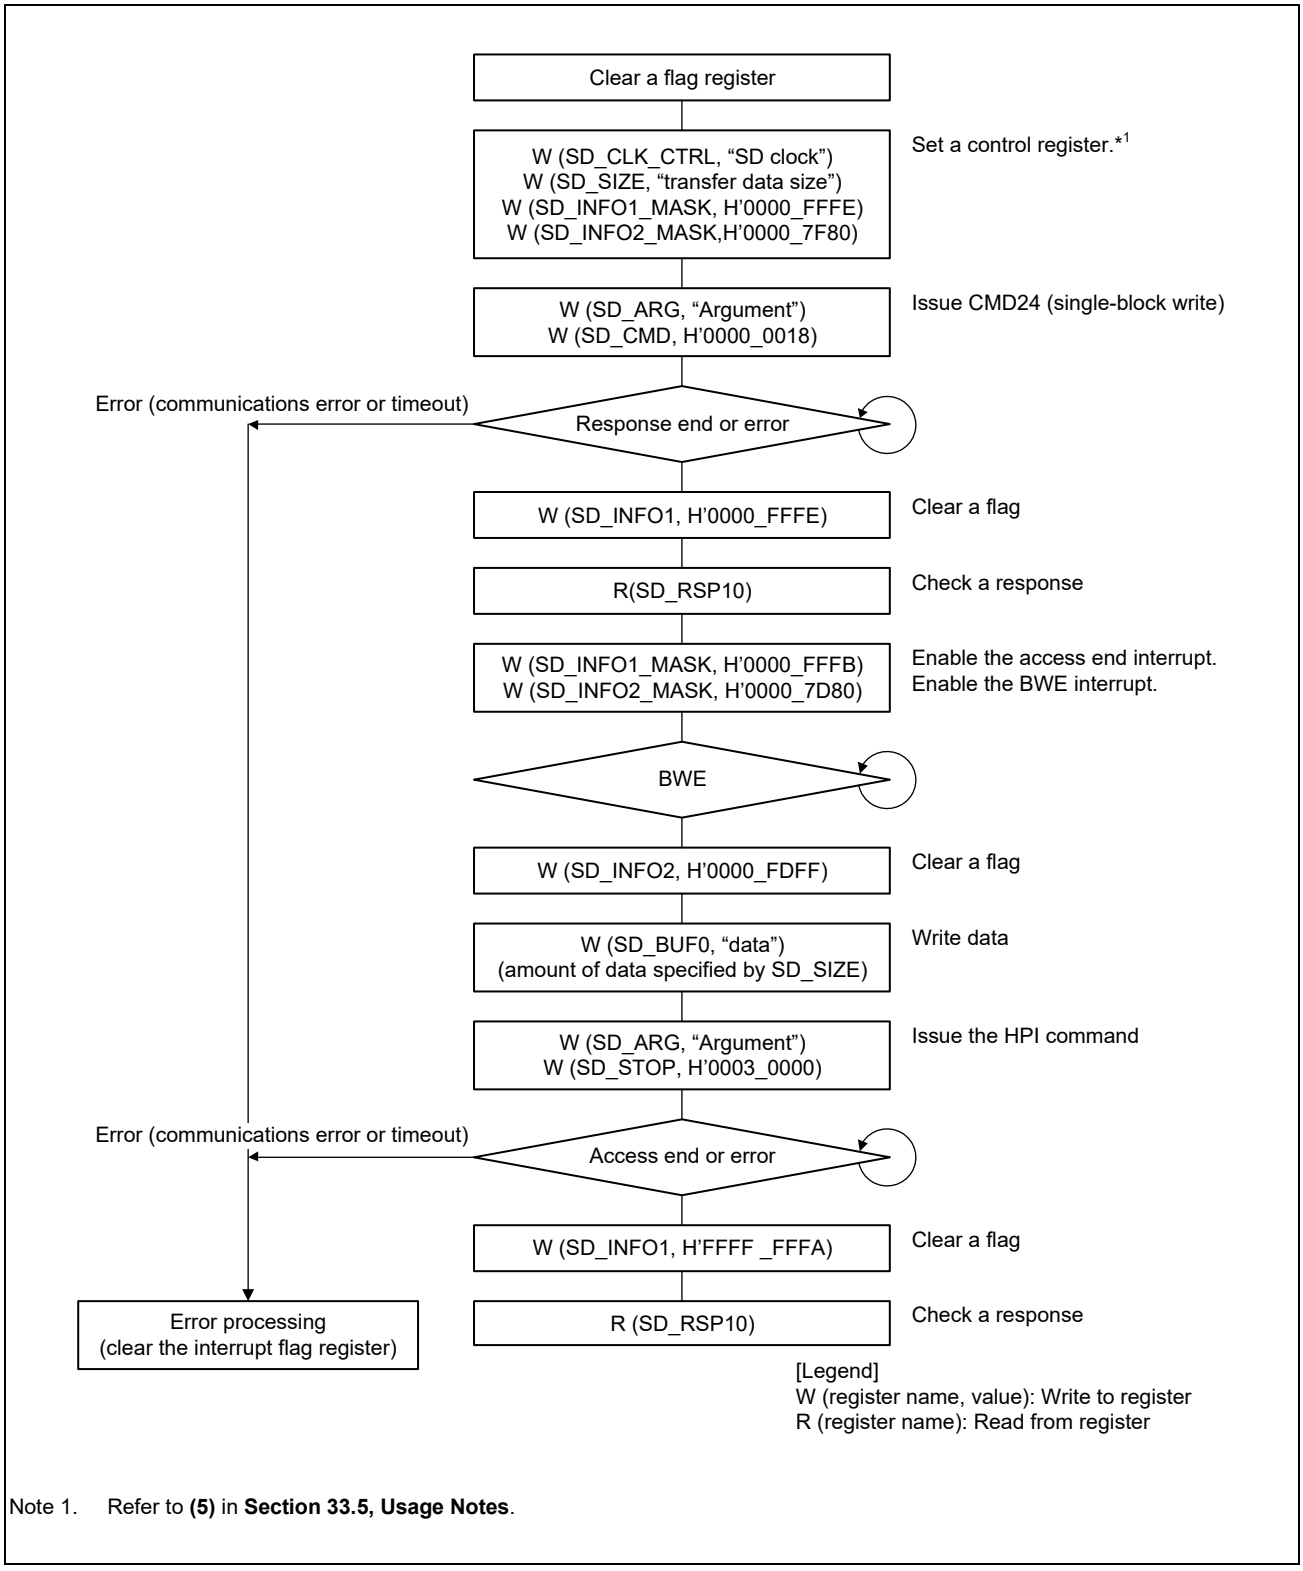
The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue.
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear.
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue.
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete.
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10.
   This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.12 High-Priority Interrupt (at Single Block Write)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.25 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

(2) Operation for HPI at Single Block Write

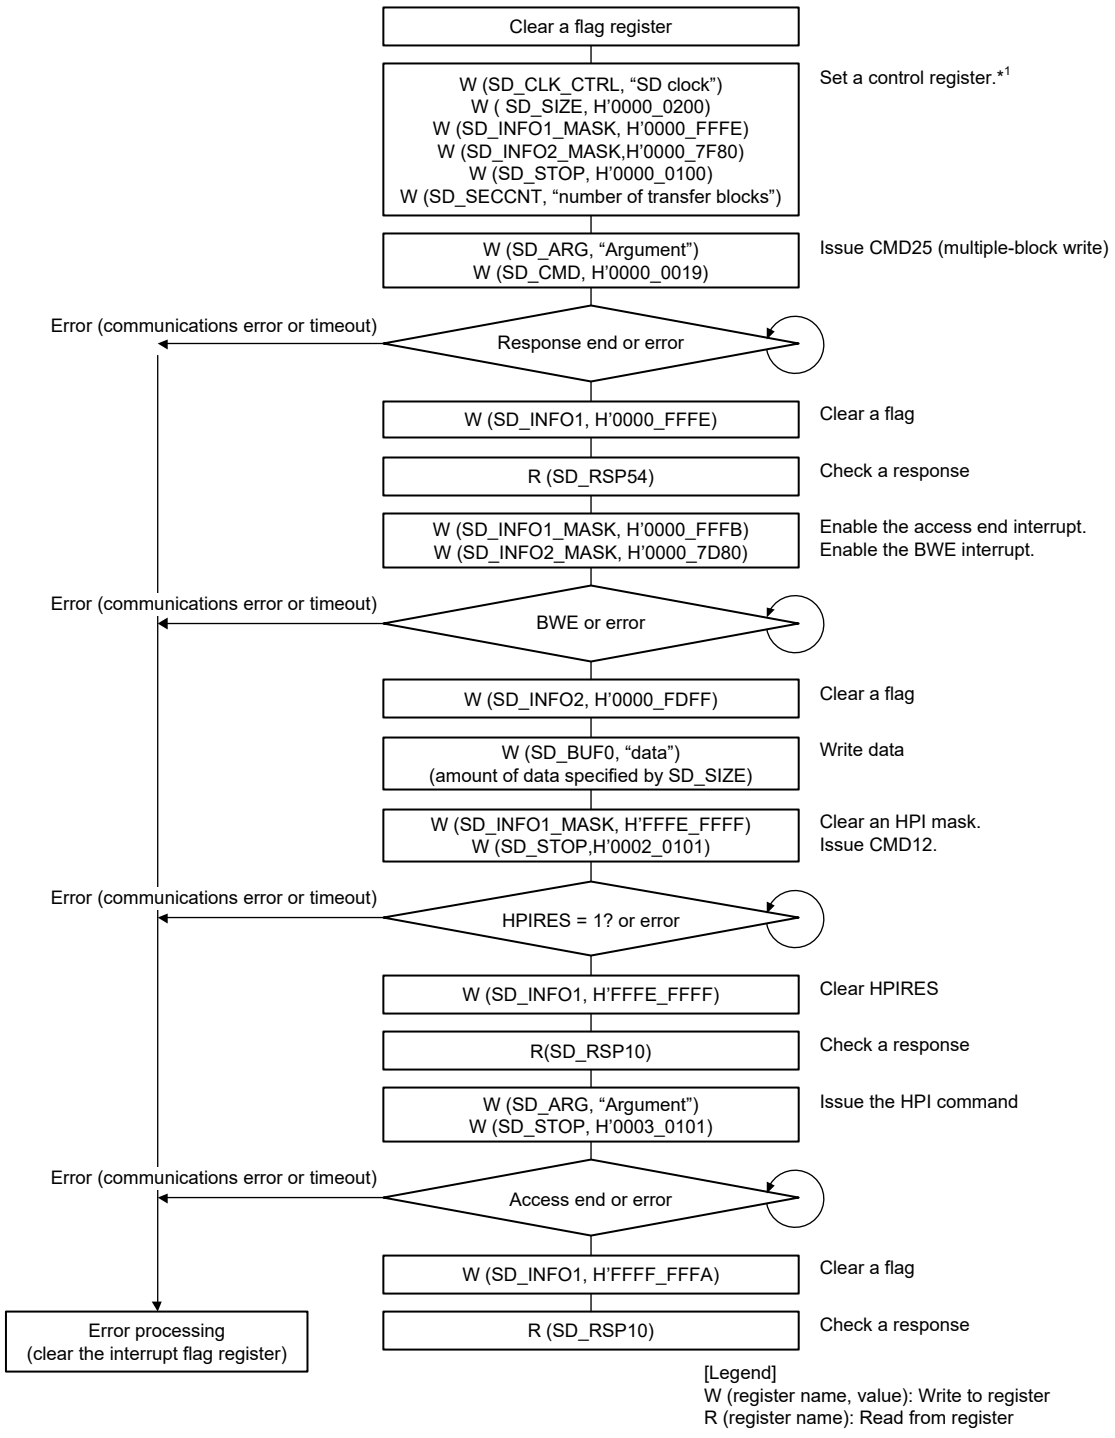
The operation of HPI at single block write is described below.

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000_0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue.
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete.
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

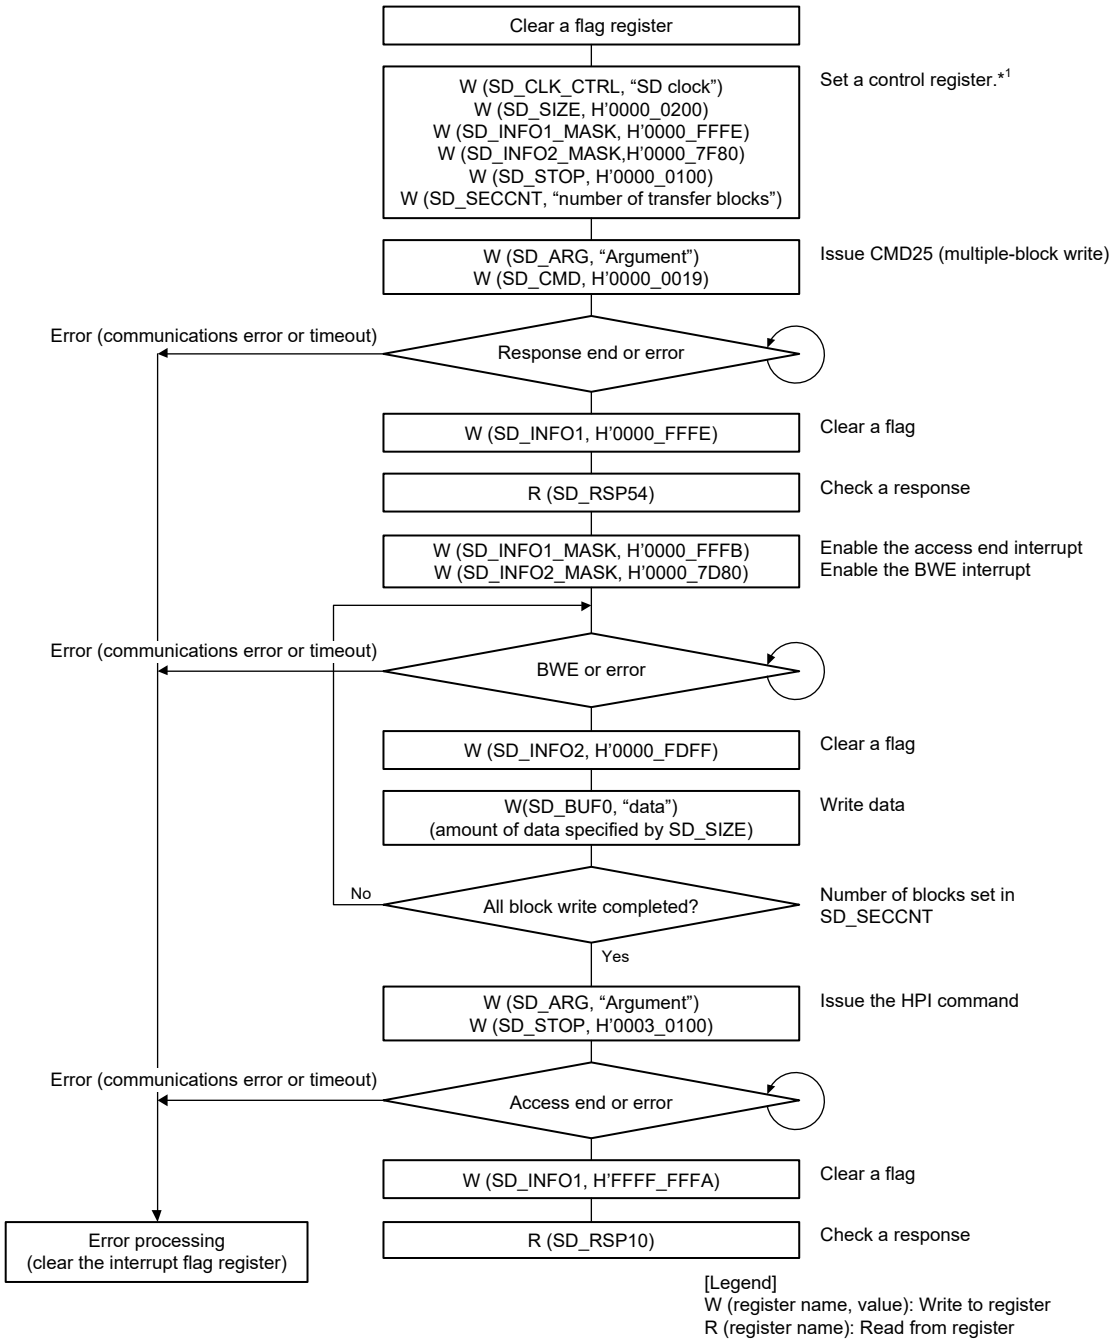
33.4.13 High-Priority Interrupt (at Multiple Block Write)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.26 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)



Note 1. Refer to **(5)** in **Section 33.5, Usage Notes**.

Figure 33.27 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

(2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

(a) When not all the data has been written to SD_BUF

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25).
   Set CMD25 Argument in SD_ARG and write H'0000_0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12).
   Write H'FFFE_FFFF to SD_INFO1_MASK to enable the HPIRES interrupt. Write H'0002_0101 to SD_STOP, which causes CMD12 to be issued.
7. Response check.
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25).
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete.
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(b) When all the data has been written to SD_BUF

1. Flag register clear.
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set.
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25).
   Set CMD25 Argument in SD_ARG and write H'0000_0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check.
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card.
   Write H'0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue.
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete.
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

33.4.14 Example of SD_CMD Register Setting

Table 33.8 lists the example of SD_CMD (SD interface) register setting.

Table 33.8 Example of SD_CMD Register Setting (SD) (1/2)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	H'0000_0000	
	CMD2	H'0000_0002	
	CMD3	H'0000_0003

33.5 Usage Notes

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

<Mechanism of incorrect reading>

Figure 33.28 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of **Figure 33.28**, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

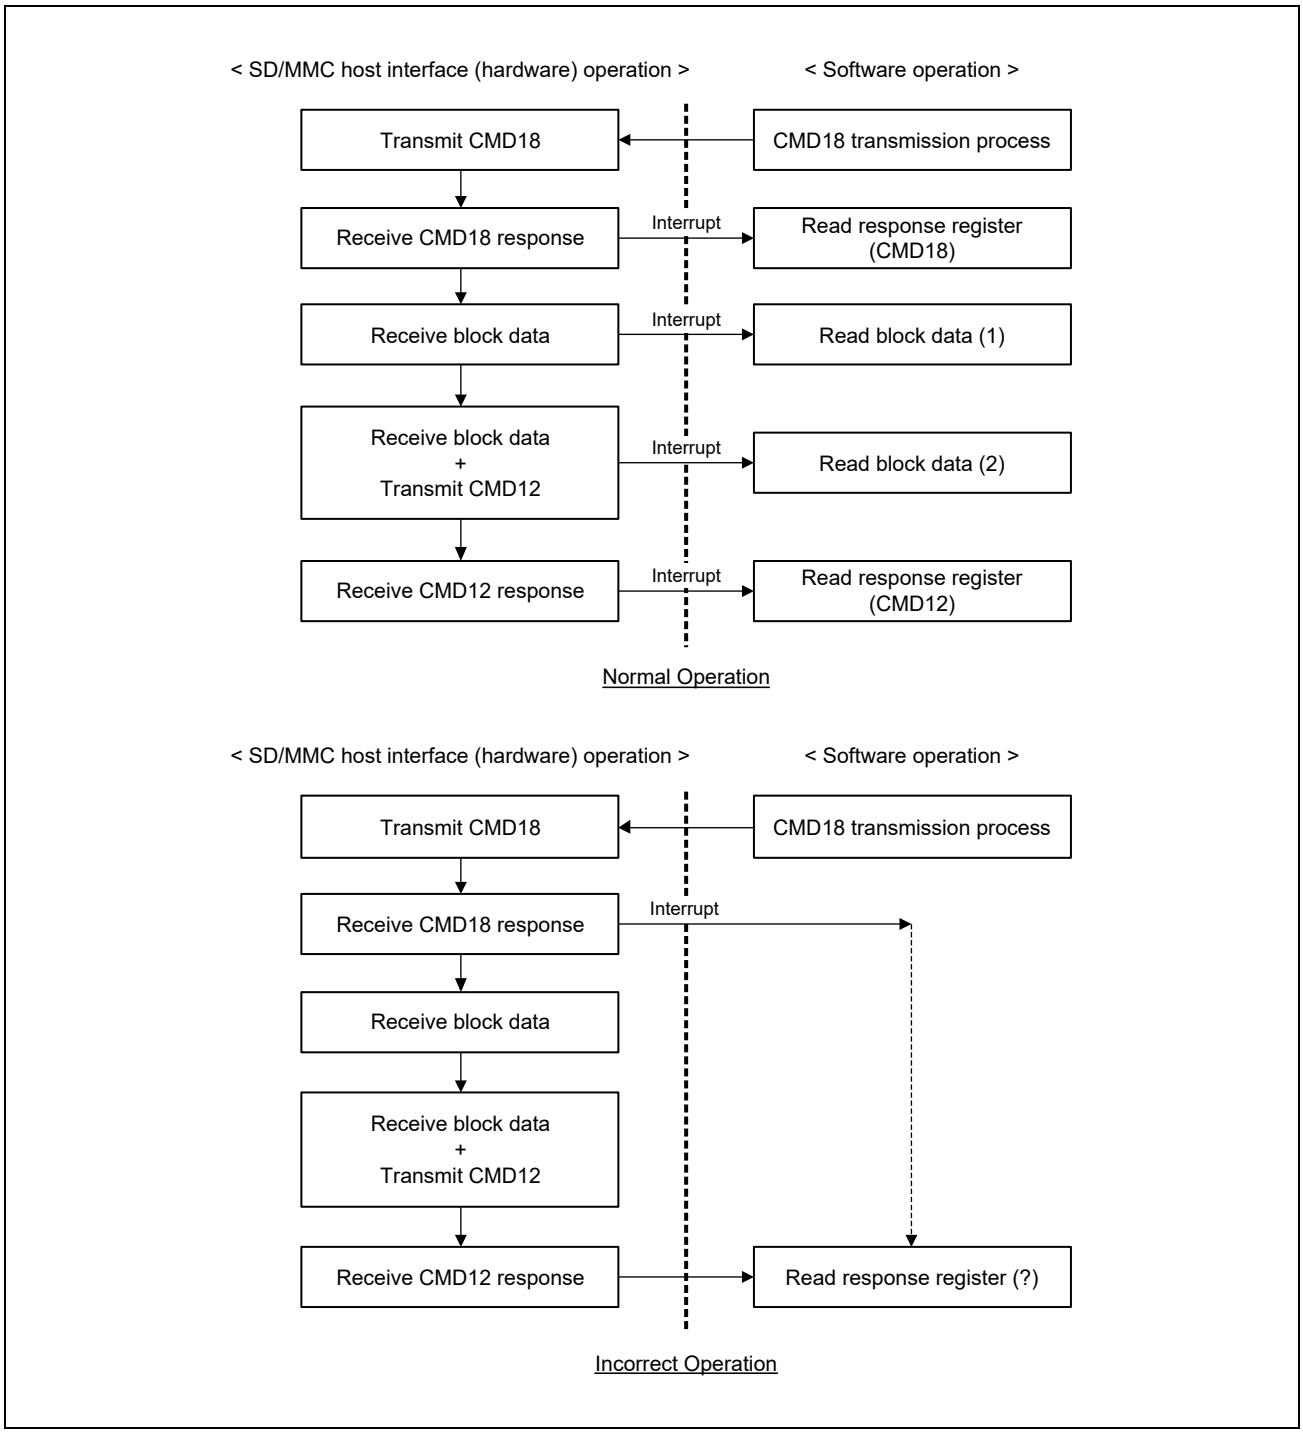

Figure 33.28 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

(6) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.

(7) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

33.6 Sampling Clock Controller (SCC)

33.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

33.6.2 SCC Block Diagram

Figure 33.29 shows a block diagram of the sampling clock controller.

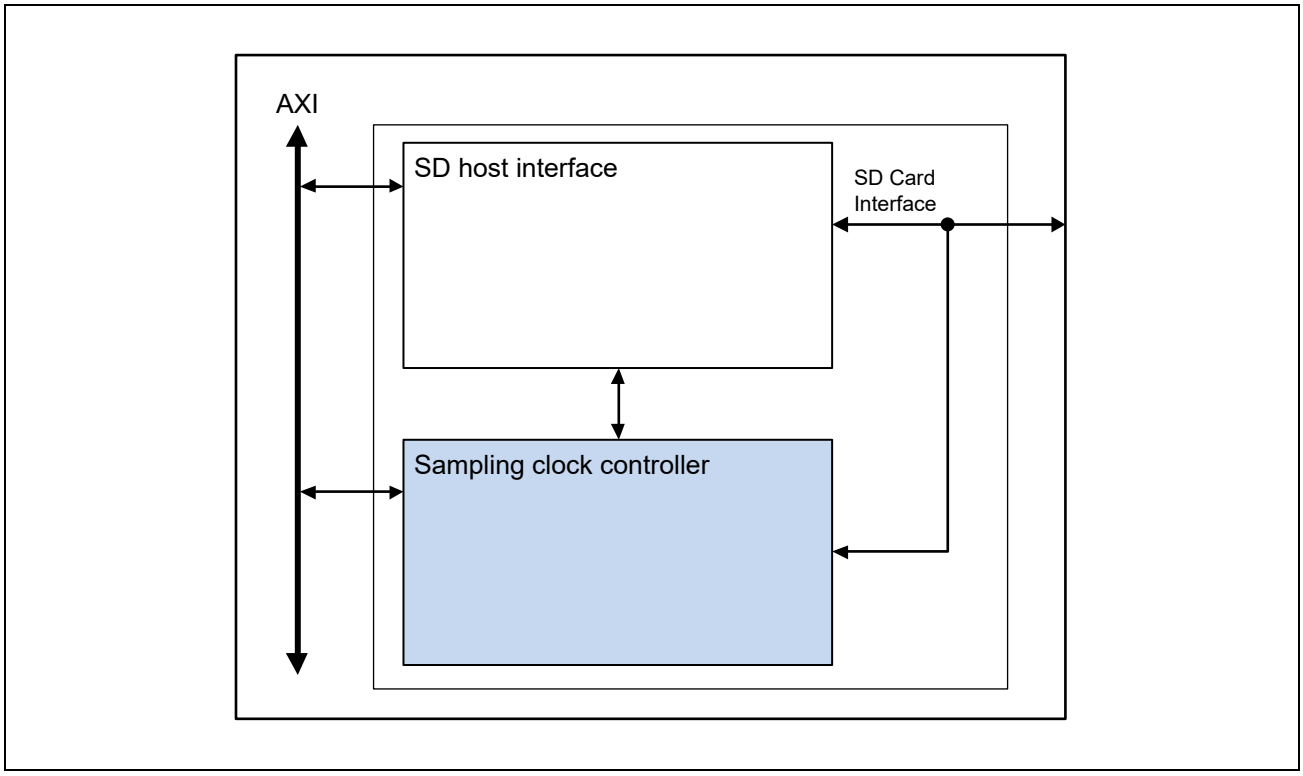

Figure 33.29 Block Diagram of the Sampling Clock Controller

33.6.3 SCC Register Configuration

Table 33.10 shows the SCC registers. Regarding the base address of registers as follows, refer to **Section 33.1.3, Register Configuration**.

Channel 0:

H'0_11C0_1000 (Cortex-A55 Address Space)
H'41C0_1000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
H'51C0_1000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Channel 1:

H'0_11C1_1000 (Cortex-A55 Address Space)
H'41C1_1000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
H'51C1_1000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 33.10 Register Configuration

Name	Abbreviation	Address [9:0]	Access Size
Initial setting register	SCC_DTCNTL	H'1000	32/64
Sampling clock position setting register	SCC_TAPSET	H'1008	32/64
Hardware adjustment register 1	SCC_DT2FF	H'1010	32/64
Sampling clock selection register	SCC_CKSEL	H'1018	32/64
Sampling clock position correction register	SCC_RVSCNTL	H'1020	32/64
Sampling clock position correction request register	SCC_RVSREQ	H'1028	32/64
Sampling data comparison register	SCC_SMPCMP	H'1030	32/64
Hardware adjustment register 2	SCC_TMPPORT	H'1038	32/64

33.7 SCC Register Descriptions

33.7.1 Initial Setting Register (SCC_DTCNTL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	TAPNUM7 to TAPNUM0	H'08	R/W	When bits DIV7 to DIV0 in the SD_CLK_CTRL register are H'FF (1: 1 mode), set these bits to H'08.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	TAPEN	0	R/W	SCC Sampling Clock Operation Enable 0: SCC sampling clock operation is disabled. 1: SCC sampling clock operation is enabled.

33.7.2 Sampling Clock Position Setting Register (SCC_TAPSET)

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	TAPSET7 to TAPSET0	H'00	R/W	SCC Sampling Clock Position • Set the tuning result in the range from 0 to TAPNUM-1.

33.7.3 Sampling Clock Selection Register (SCC_CKSEL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DTSEL	0	R/W	Sampling Clock Selection 0: An SCC sampling clock is not used (for other than SDR104 and HS200). 1: An SCC sampling clock is used (for SDR104 or HS200). • For SDR104 or HS200, set DTSEL to 1. DIV[7:0] in the SD_CLK_CTRL register to H'FF (1:1 mode). • When this bit is switched, stop the SD clock output from the SD/MMC host interface (set SCLKEN in SD_CLK_CTRL to 0).

33.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	TAPSEL7 to TAPSEL0	H'00	R	SCC Sampling Clock Position Display • Displays the SCC sampling clock position selected by hardware. • After RVSEN has been set to 1, the value may differ from that of TAPSET.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	RVSW	0	R/W	This bit is read as 0. The write value should be 1.
0	RVSEN	0	R/W	SCC Sampling Clock Position Correction Enable 0: SCC sampling clock position correction is disabled. 1: SCC sampling clock position correction is enabled. • When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. • However, when RVSERR is 1, this module does not correct the SCC sampling clock position. • While tuning is being performed, set RVSEN to 0.

33.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RVSERR	0	R/W	SCC Sampling Clock Position Correction Error 0: There is no correction error. 1: There is a correction error. • If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again. • Ignore this bit while tuning is being performed. • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
1	REQTAPUP	0	R/W	SCC Sampling Clock Position Positive Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
0	REQTAPDWN	0	R/W	SCC Sampling Clock Position Negative Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.

33.7.6 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	DT2NE	H'03	R/W	Hardware Adjustment 2 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set H'02 to this bit, make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.
7 to 0	DT2NS	H'00	R/W	Hardware Adjustment 1 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set H'07 to this bit., make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.

33.7.7 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

Bit	Bit Name	Initial Value	R/W	Description
63 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24 to 16	CMPNGU	All 0	R/W	Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit-24 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions > The start of the command sequence Write to SCC_TAPSET register
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8 to 0	CMPNGD	All 0	R/W	Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit-8 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions > The start of the command sequence Write to SCC_TAPSET register

33.7.8 Hardware adjustment register 2 (SCC_TMPPORT)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
63 to16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	TMPOUT	H'0000	R/W	Hardware adjustment 3 When using the delay tuning mechanism, set the following values. When TAPNUM = 8, set H'0000 to these bits. When operating with other than SDR104 / HS200, this register adjusts the clock delay of the Flip Flop that latches the received data from the outside of the chip. For this product, set H'0000 when transferring at 3.3 V, and set H'0001 when transferring at 1.8 V.

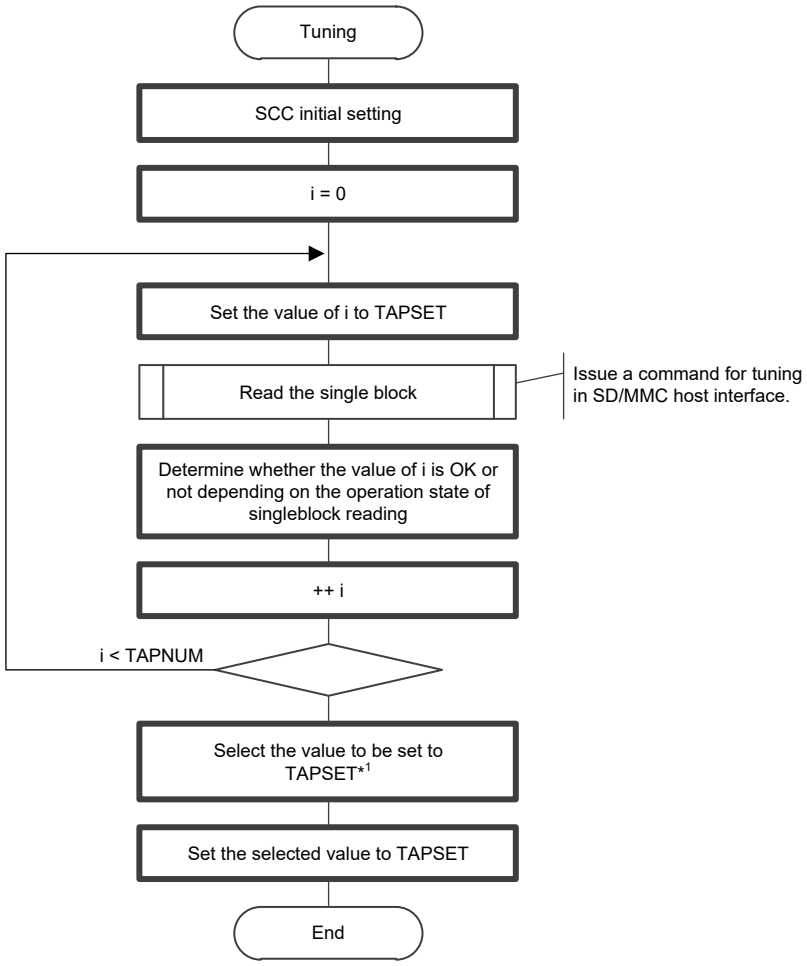
33.8 Usage Example of SCC

33.8.1 Tuning

SCC is tuned by using operation of single-block reading.

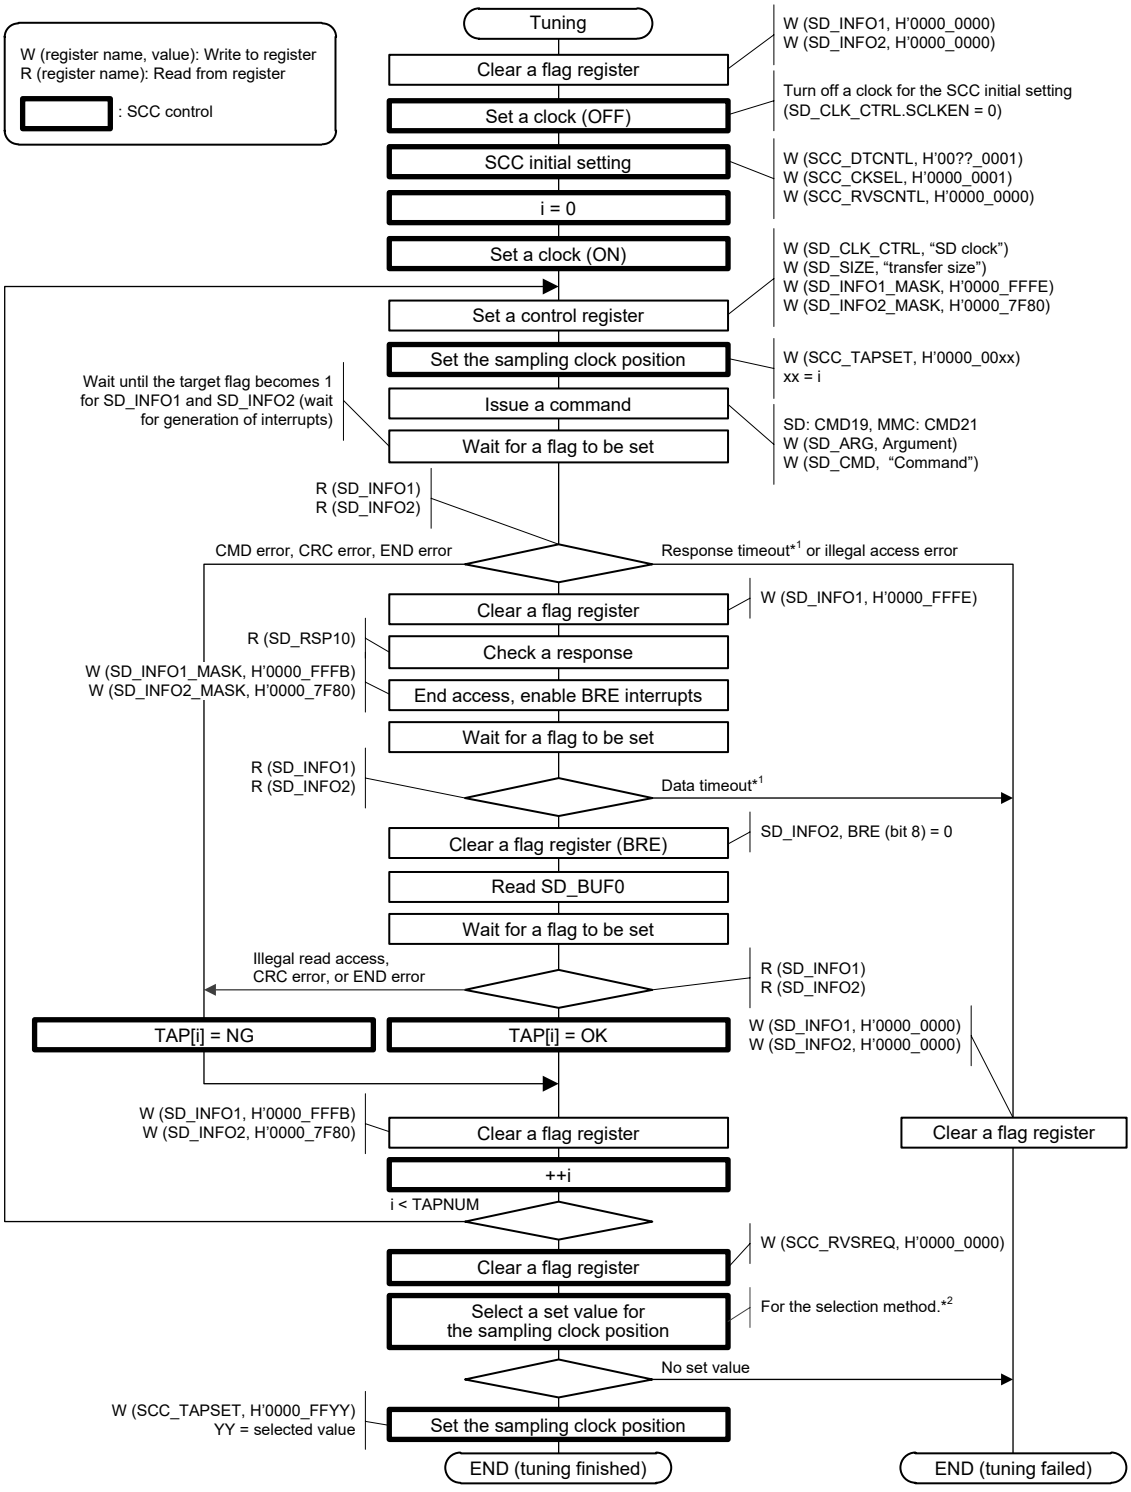
As shown in **Figure 33.30**, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 33.31 and **Table 33.11** show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).



Note 1. See the example shown in **Table 33.11**.

Figure 33.30 Example of Tuning Flow (Outline)



Note 1. If all of the TAP[i] has become "NG".

Note 2. See **Table 33.11**.

Figure 33.31 Example of Tuning Flow (Detailed)

Table 33.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5*1
TAP[i]	0	NG	OK	NG	OK	OK
	1	OK	OK	NG	NG	OK
	2	OK	NG	OK	NG	OK
	3	OK (←)	NG	OK	NG	OK
	4	OK	NG	NG	NG	OK
	5	OK	OK	NG	OK	OK
	6	NG	OK	NG	OK (←)	OK
Max. value→	7	NG	OK (←)	NG	OK	OK
	(0)	NG	OK	NG	OK	OK
	(1)	OK	OK	NG	NG	OK
	(2)	OK	NG	OK	NG	OK
	(3)	OK	NG	OK	NG	OK
	(4)	OK	NG	NG	NG	OK
	(5)	OK	OK	NG	OK	OK
	(6)	NG	OK	NG	OK	OK
	(7)	NG	OK	NG	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Remarks: (←): Example of selection, (x): repeated display of index x of TAP[x]

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

Note 1. If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data. Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is **Section 33.8.3, Change point of the input data**.

33.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

(1) Manual correction of the sampling clock position

Figure 33.32 shows the flow of manual correction of the sampling clock position. **Table 33.12** shows set values determined when correction is required (when TAPNUM = 8).

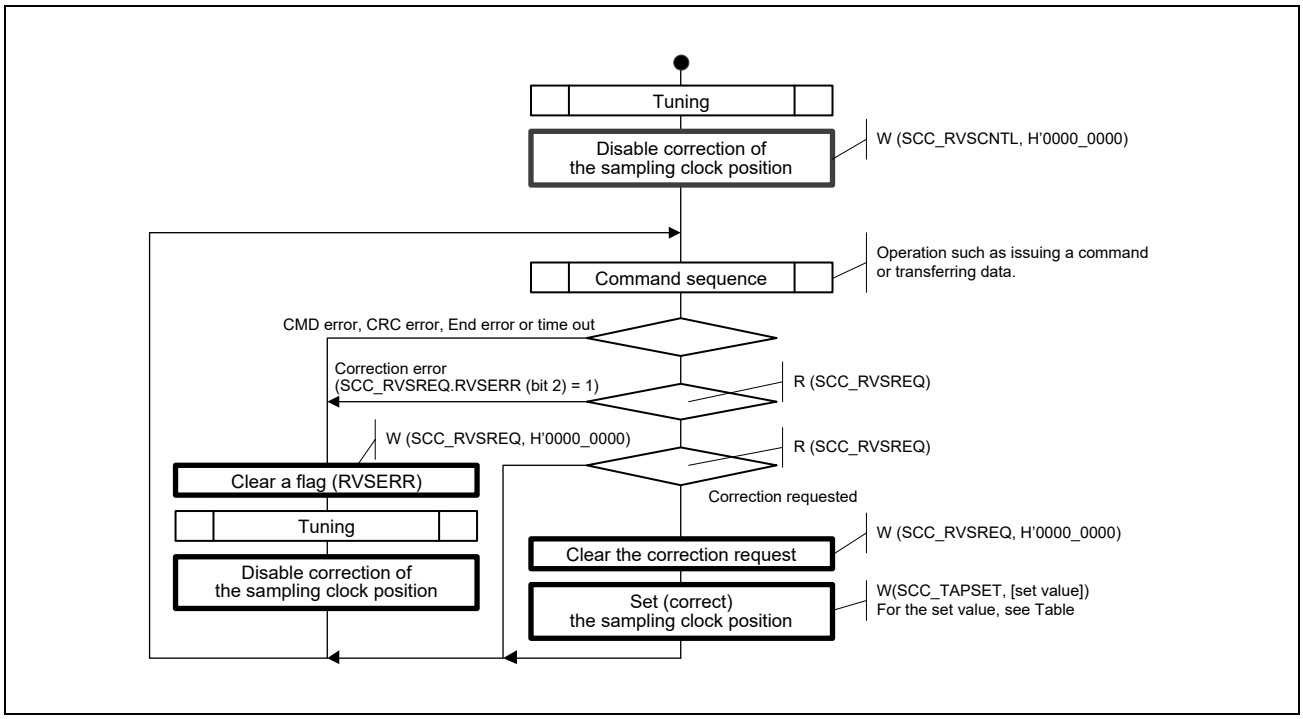


Figure 33.32 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 33.12 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

(2) Automatic correction of the sampling clock position

Figure 33.33 shows the flow of automatic correction of the sampling clock position.

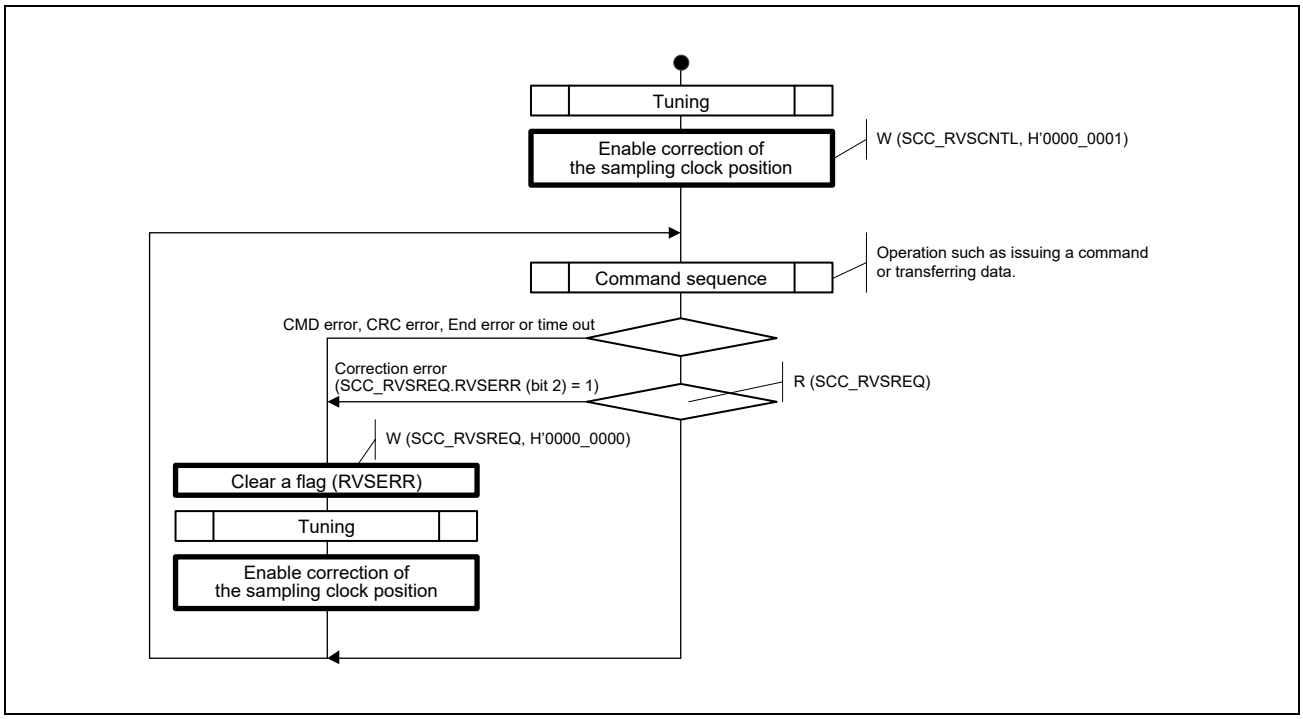

Figure 33.33 Flow of Automatic Correction of the Sampling Clock Position (Example)

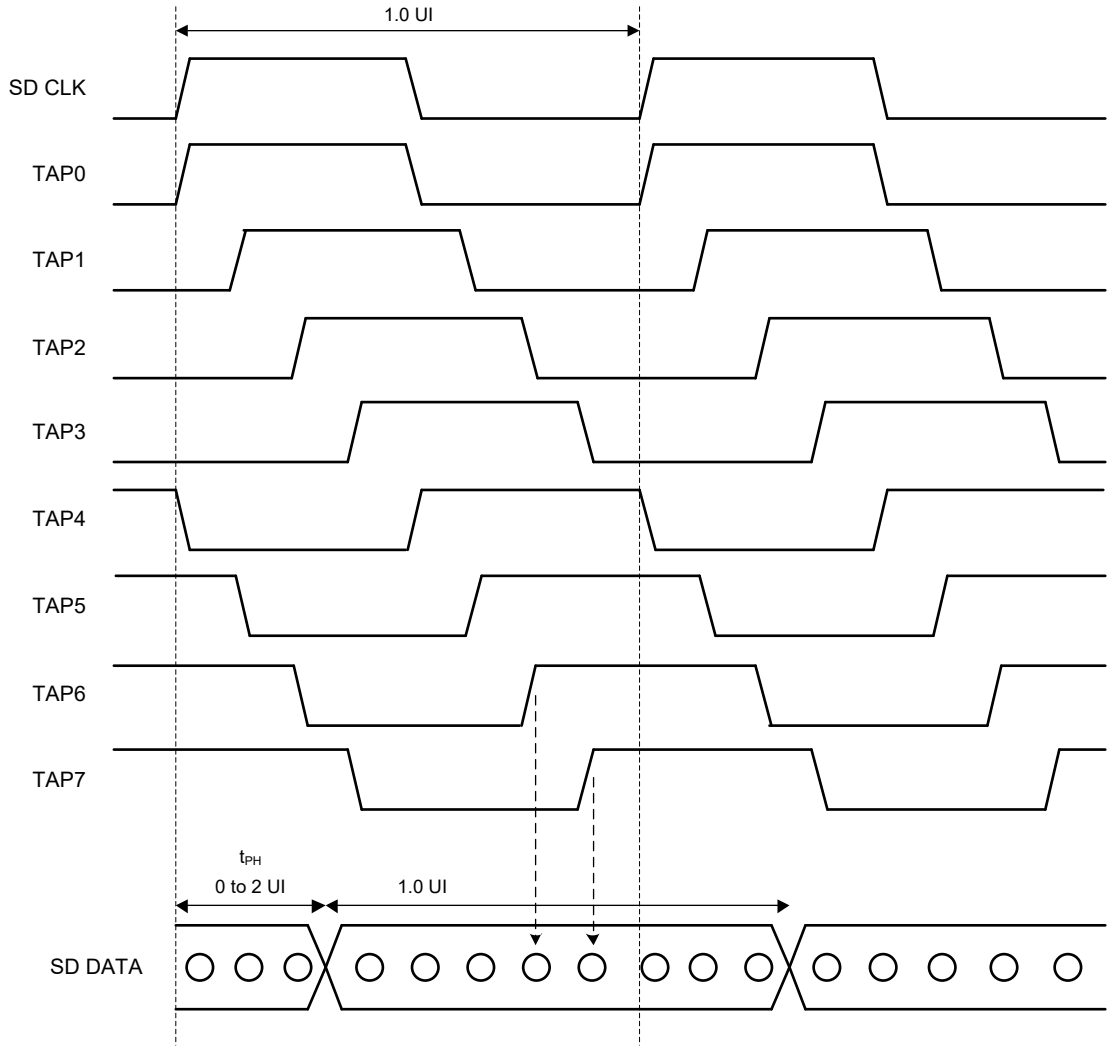
33.8.3 Change point of the input data

Tuning is capturing the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the behind the TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set as TAP6 or TAP7.



Note: After recognizing the changing point of the input data, need to set the TAP clock.

Figure 33.34 Example, All taps is OK.

Figure 33.34 is shown change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). When the tuning of TAP2 or TAP3, CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

34. PCI Express Interface (PCIe)

This section describes the functions of the PCI Express interface (PCIe).

34.1 Overview

This module complies with PCI Express Base Specification 4.0 and supports up to 5.0 GT/s (Gen2).

It works as only a root complex and includes Type1 Configuration Register. It also has a built-in DMA controller function.

34.1.1 Features

■ AXI Interface Specification

Little endian is only supported.

- Master interface
  - 1 port
  - Bus width:128 bits
  - ID width: 4 bits (fixed value)
  - Interleave not supported
  - Burst type: Incremental (INCR 1 beat (MAxSIZE=1/2/4 bytes), INCR 2 to 16 beats (MAxSIZE = 16 bytes))
  - Byte-lane transfer and narrow transfer (8 bits/16 bits/32 bits MAxLEN = only in 1beat) are supported. Unaligned transfer is not supported.
  - Allowable number of read/write requests: Variable (1 to 16)
  - Write interleave depth: 1
  - Protection (data/user/non-secure) can be set by using registers.
  - Access type: Normal only (exclusive or locked access not supported)

- Slave interface
  - 1 port
  - Bus width:128 bits
  - ID width: 20 bits
  - Burst type: Incremental (1 to 16 beats (SAxSIZE = 1/2/4/8/16 bytes))
  - Support for byte-lane transfer (only when valid bytes are consecutive), unaligned transfer, and narrow transfer (1, 2, 4, 8 bytes)
  - Number of read transactions which can be accepted: 1 to 8
  - Number of write transactions which can be accepted: 1
  - Read data reordering depth: 1 to 8
  - Write interleave depth: 1
  - Required memory area: 16 Kbytes or larger (variable)

- Protection is not distinguished (reception is possible)
- Access type: Normal only (exclusive or locked access not supported)
- Cache signals (ARCACHE/AWCACHE) are only supported for bufferable bits for writing.

- DMAC
  - DMA method: Register control, descriptor control
  - Number of channels: 8
  - Allowable number of requests to be issued (the maximum total number: 8. When DMAC-ch1 issues eight PCIe MRd/MW requests, other channels cannot issue requests)
  - Outstanding: 8

    PCIe MRd: Up to 8/ch PCIe MWr: 1/ch

    AXI Read: 1/ch AXI Write: 1/ch

■ PCI Express Specification (Compliant with the PCI Express Base Specification 4.0)

- PCI Express Gen1(2.5[GT/s])/Gen2(5.0[GT/s])
- Root Complex Applications, Type1 Configuration Register
- Lane implementation x1
- Support Polarity inversion
- Maximum data payload of 256 bytes, Maximum read request size 512 bytes
- Not support for Virtual channels (support VC0 only)
- Number of outstanding 1-8
- Dynamic control of speed/width up/down configuration
- Not support for Clock Power Management (not support P1.CPM, P2.CPM)
- Power Management (ASPM L1-Substate Support (Support PowerDown Sequence only))
- Error handling/logging (AER Support)
- Replay FIFO with ECC
- Internal Memory without Parity
- Number of Support Functions 1

34.1.2 External Pins

The following table shows the external pins of PCIe.

Table 34.1 External Pin List

Pin Name	I/O	Function
PCIE_REFCLKP0	I	Reference clock input (Positive) (Differential: 100 MHz ±300 ppm)*1
PCIE_REFCLKN0	I	Reference clock input (Negative) (Differential: 100 MHz ±300 ppm)*1
PCIE_RX_DP	I	Serial data input (Positive)
PCIE_RX_DN	I	Serial data input (Negative)
PCIE_TX_DP	O	Serial data output (Positive)
PCIE_TX_DN	O	Serial data output (Negative)
PCI_RST_OUT#	O	Reset output (Low active)
PCI_CLKREQ#	I/O	Clock request (Low active) 1: Reference clock can be stopped 0: Reference clock cannot be stopped

Note 1. A jitter of the reference clock input is defined by the PCI Express Card Electromechanical (CEM) Specification.
Tccjitter < 150 ps (Cycle to Cycle jitter)

34.1.3 Block Diagram

The following figure shows the block diagram of PCIe.

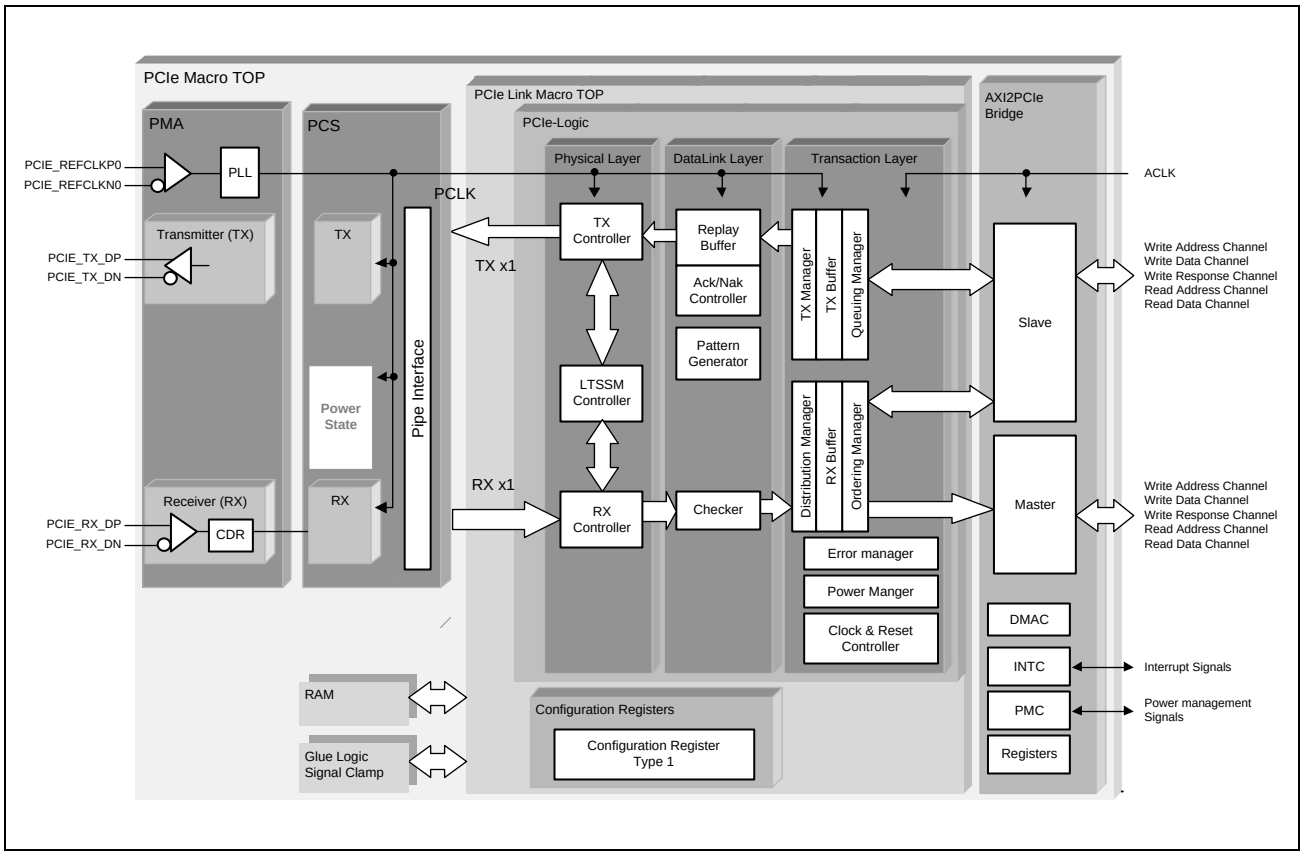


Figure 34.1 Block Diagram of PCIe

34.1.4 Reset

This module has the following reset signals.

These reset signals are controlled by the CPG_RST_PCI register. Refer to **Section 7.2.4, Register Descriptions**.

Table 34.2 Reset Signals

Reset Signal	Description	CPG_RST_PCI register
ARESETn	Reset for AXI2PCIe Bridge	Bit [0]: PCI_ARESETN
RST_B	Reset for Data Link layer/Transaction layer	Bit [1]: PCI_RST_B
PCI_RST_OUT#	Reset for Endpoint device	
RST_GP_B	Reset for Transaction layer (ACLK domain)	Bit [2]: PCI_RST_GP_B
RST_PS_B	Reset for Transaction layer (PCLK domain)	Bit [3]: PCI_RST_PS_B
RST_RSM_B	Reset for Physical layer	Bit [4]: PCI_RST_RSM_B
RST_CFG_B	Reset for Configuration register	Bit [5]: PCI_RST_CFG_B
RST_LOAD_B	Reset for Configuration register	Bit [6]: PCI_RST_LOAD_B

34.1.4.1 Reset Sequence for Power-On Reset

The following figure shows the reset sequence for power on reset.

ARESETn, RST_CFG_B and RST_LOAD_B signals should be de-asserted more than 1[ms] later after PRST# is de-asserted.

RST_B, RDT_PS_B, RST_GP_B and RST_RSM_B signals should be de-asserted after loading values into the Configuration Register.

If loading values into the Configuration Register are not needed, all reset signals (ARESETn, RST_CFG_B, RST_LOAD_B RST_B, RDT_PS_B, RST_GP_B and RST_RSM_B) can be de-asserted at the same timing.

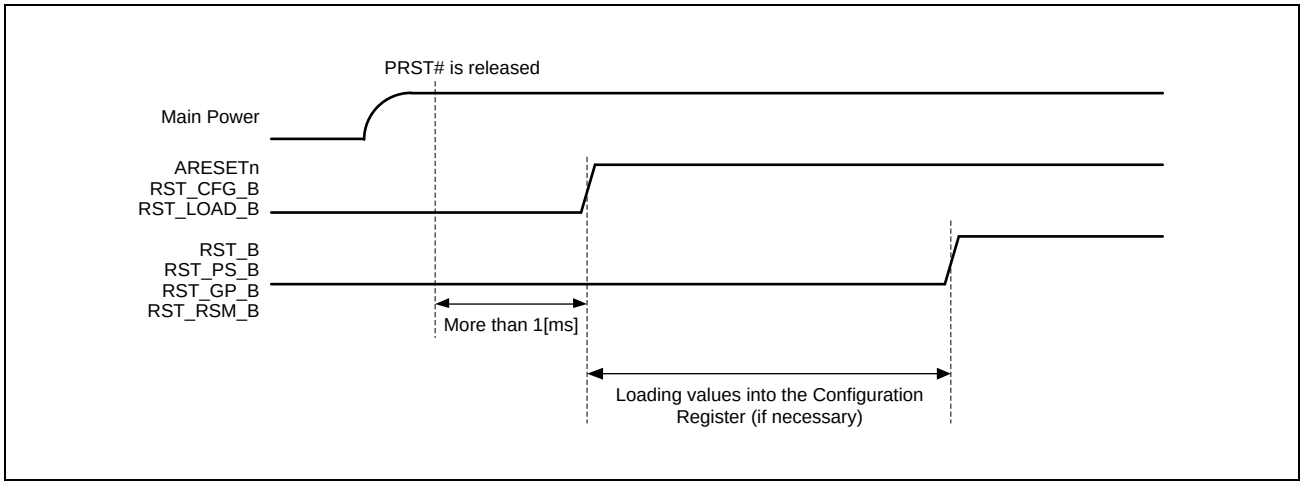

Figure 34.2 Reset Sequence for Power-On Reset

34.2 Register Configuration

34.2.1 Register Type

Table 34.3 Register Type

Register Attribute	Description
HwInit	Hardware Initialized*1
R	Read-only This register can only be read.
R/W	Read-Write This register can be read/written.
R/W1C	Write-1-to-clear status It can be cleared to 0b by writing 1b with a readable register. Writing 0b does not change anything.
RS	Sticky - Read-only Read-only registers that are reset with Resume Reset.*2
R/WS	Sticky - Read-Write A read-write register that is reset with Resume Reset.*2
R/W1CS	Sticky - Write-1-to-clear status Readable registers can be cleared to 0b by writing 1b. In addition, Resume reset indicates that this is a register that will be reset.*2

Note 1. HwInit attribute register.
Some registers with the RO attribute stated in the PCI Express Base Specification are writable at the time of initialization. When writing to these registers, CFG_HWINIT_EN (Permission Register (offset: H'300) bit[2]) must be set to 1b.

Note 2. The results of access to reserved bit areas, debug bit areas, and undefined areas are not guaranteed. The combination of reserved, debug, and undefined areas includes cases where the initial values will be non-zero, and the results of changes to such values are not guaranteed.

34.2.2 Register List

The base address of PCIe is as follows.

Base Address: H'0_11E4_0000 (Cortex-A55 Address Space)
Base Address: H'51E4_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base Address: H'41E4_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above is in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

The following is a summary classification of the register space in PCIe.

Table 34.4 Register Space

Register	Address Range
AXI Bridge Registers	H'0000 to H'1FFC
Reserved	H'2000 to H'5FFC
PCI Express Configuration Registers (Type1)	H'6000 to H'6FFC
Reserved	H'7000 to H'7FFC

Note: The reserved space that corresponds to the above is not accessible.

34.2.2.1 AXI Bridge Registers

Table 34.5 AXI Bridge Registers (1/6)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
Reserved H'00 to H'7C					
Reserved	—	—	—	H'00 to H'7C	—
Request Issuing H'80 to H'FC					
Request Data Register 0	PCI_REQDATA0	R/W	H'xxxx_xxxx	H'80	32, 16, 8
Request Data Register 1	PCI_REQDATA1	R/W	H'xxxx_xxxx	H'84	32, 16, 8
Request Data Register 2	PCI_REQDATA2	R/W	H'xxxx_xxxx	H'88	32, 16, 8
Request Receive Data Registers	PCI_REQRCVDAT	R	H'xxxx_xxxx	H'8C	32, 16, 8
Request Address Registers 1	PCI_REQADR1	R/W	H'xxxx_xxxx	H'90	32, 16, 8
Request Address Registers 2	PCI_REQADR2	R/W	H'xxxx_xxxx	H'94	32, 16, 8
Request Byte Enable Registers	PCI_REQBE	R/W*1	H'0000_000F	H'98	32, 16, 8
Request Issue Registers	PCI_REQISS	R/W*1	H'0000_0000	H'9C	32, 16, 8
Reserved	—	—	—	H'A0 to FC	—
PCI Interruption H'100 to H'11C					
MSI Receive Window Address (Lower) Registers	PCI_MSIRCVWADRL	R/W*1	H'0000_0000	H'100	32, 16, 8
MSI Receive Window Address (Upper) Registers	PCI_MSIRCVWADRU	R/W	H'0000_0000	H'104	32, 16, 8
MSI Receive Window Mask (Lower) Registers	PCI_MSIRCVWMSKL	R/W*1	H'0000_0003	H'108	32, 16, 8

Table 34.5 AXI Bridge Registers (6/6)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
PCIe Window Mask 7 (Lower) Registers	PCI_PWMASK7L	R/W*1	H'0000_0FFF	H'11E8	32, 16, 8
PCIe Window Mask 7 (Upper) Registers	PCI_PWMASK7U	R/W*1	H'0000_0000	H'11EC	32, 16, 8
PCIe Destination 7 (Lower) Registers	PCI_PDEST7L	R/W*1	H'0000_0000	H'11F0	32, 16, 8
PCIe Destination 7 (Upper) Registers	PCI_PDEST7U	R/W	H'0000_0000	H'11F4	32, 16, 8
Reserved	—	—	—	H'11F8 to 1FFC	—

Note: Reserved: Reserved registers. The results of access to these registers and operation of the core through such access are not guaranteed.

Note 1. Depending on the field, Read Only bit exists.

Note 2. The addresses listed in the above table are those for channel 0. These addresses should be read as the addresses for the other DMAC channels according to the table below.

Channel Offset Address	
offset + H'000	Channel 0
offset + H'080	Channel 1
offset + H'100	Channel 2
offset + H'180	Channel 3
offset + H'200	Channel 4
offset + H'280	Channel 5
offset + H'300	Channel 6
offset + H'380	Channel 7

[Example]

Channel 0: DMA Descriptor Control Register (offset: H'920 = H'920 + H'000)
Channel 1: DMA Descriptor Control Register (offset: H'9A0 = H'920 + H'080)
Channel 2: DMA Descriptor Control Register (offset: H'A20 = H'920 + H'100)
Channel 3: DMA Descriptor Control Register (offset: H'AA0 = H'920 + H'180)
Channel 4: DMA Descriptor Control Register (offset: H'B20 = H'920 + H'200)
Channel 5: DMA Descriptor Control Register (offset: H'BA0 = H'920 + H'280)
Channel 6: DMA Descriptor Control Register (offset: H'C20 = H'920 + H'300)
Channel 7: DMA Descriptor Control Register (offset: H'CA0 = H'920 + H'380)

34.2.2.2 PCI Express Configuration Registers (Type1)

Table 34.6 PCI Express Configuration Registers (1/2)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
Common Configuration Space					
Vendor and Device ID	PCI_CFG_VID	HwInit	H'0033_1912	H'6000	32, 16, 8
Command and Status	PCI_CFG_COM_STA	R/W*2	H'0010_0000	H'6004	32, 16, 8
Revision ID and Class Code	PCI_CFG_RID_CC	HwInit	H'0604_0000	H'6008	32, 16, 8
Cache Line and Header Type	PCI_CFG_CL_HT	R/W*1	H'0001_0000	H'600C	32, 16, 8
Configuration Space					
Base Address Register 0	PCI_CFG_BAR0	R/W*3	H'0000_0004	H'6010	32, 16, 8

Note 1. Depending on the field, Read Only bit exists.

Note 2. Depending on the field, R, R/W1C bit exists.

Note 3. Depending on the field, R, HwInit bit exists.

Note 4. Depending on the field, R, R/W1C, HwInit bit exists.

Note 5. Depending on the field, R/W1C bit exists.

Note 6. Recommended to write All “1b” at initial setting.

Note 7. Depending on the field, RS (Sticky - Read - Only) bit exists.

Note 8. Depending on the field, R/WS (Sticky - Read - Write) bit exists.

Note 9. “Specific Registers” refers to registers specific to this LSI.

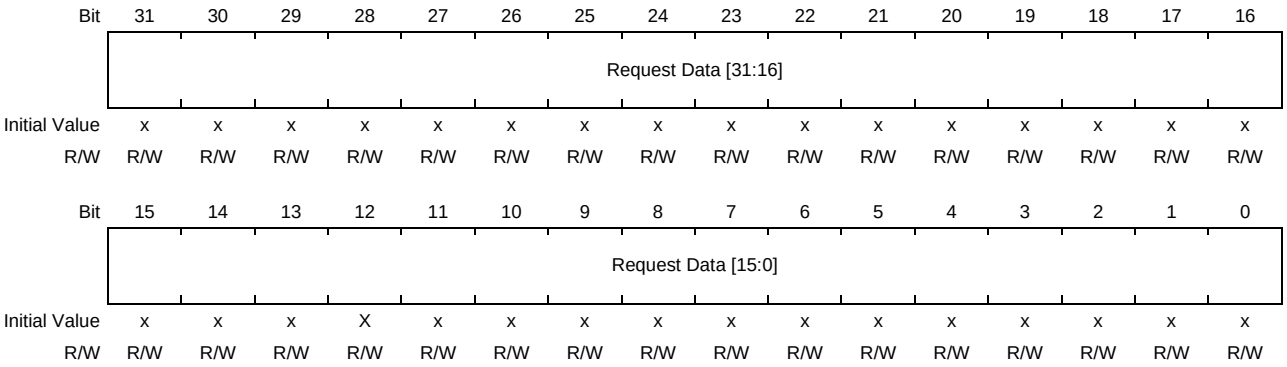
34.3 Register Description

34.3.1 AXI Bridge Register

The function of each register is described below. Register can only be accessed on the AXI bus.

34.3.1.1 Request Data Registers (Offset: H'80/ H'84/ H'88)

This register issues various Requests to PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Data	All x	R/W	Set Write Data when issuing a Request.

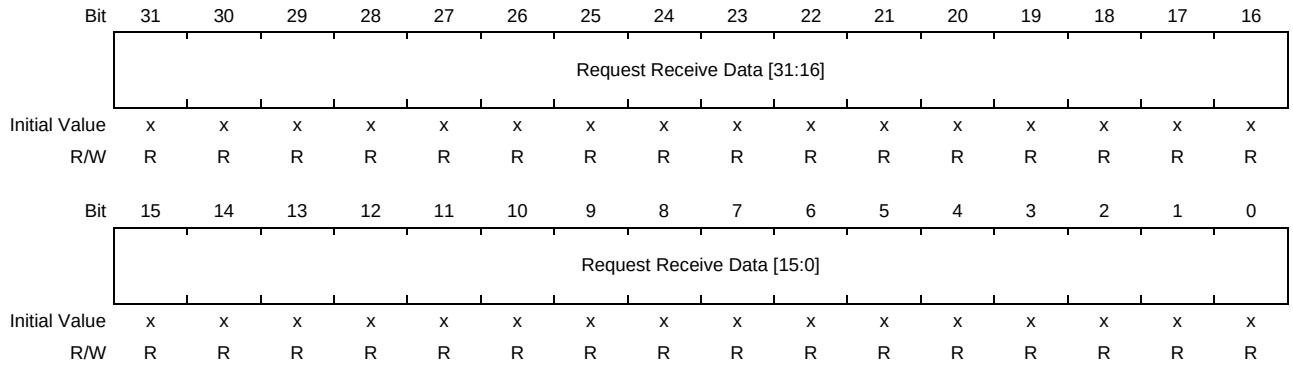
Table 34.7 Request Data Register 0, 1, 2

	Request Data Register 0 (Offset: H'80)	Request Data Register 1 (Offset: H'84)	Request Data Register 2 (Offset: H'88)
Zero-Length Read Request	Invalid	Invalid	Invalid
Configuration Write Type 0/1	Invalid	Invalid	Write Data
Configuration Read Type 0/1	Invalid	Invalid	Invalid
Message Request	3rd Header	4th Header	Invalid
Message Request with data payload	3rd Header	4th Header	Message Data

Note: The bits should be set to 0 for the requests indicated as "Invalid".

34.3.1.2 Request Receive Data Registers (Offset: H'8C)

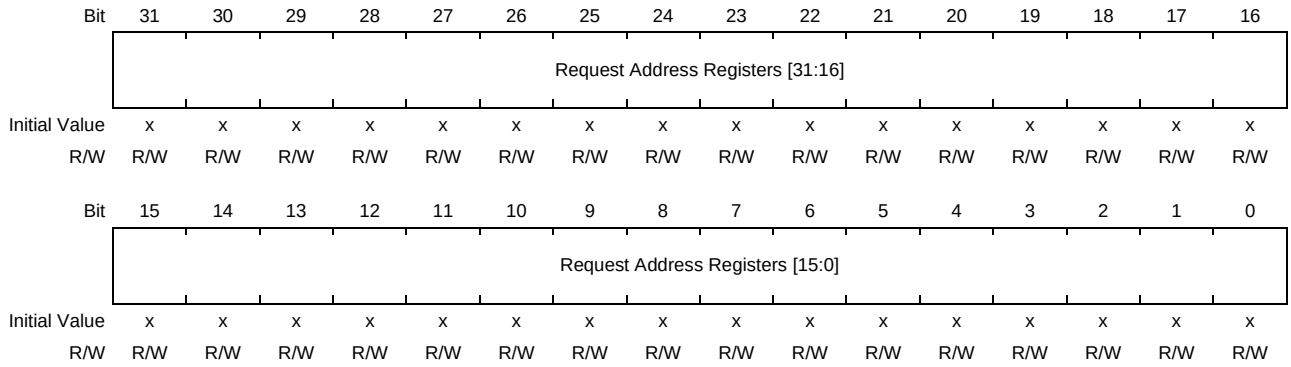
This register is set to read data when Completion is received after a Read Request is issued.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Receive Data	All x	R	Read data at Completion reception after Read Request issuance is set. However, it is invalid for Zero-Length Read and various write requests.

34.3.1.3 Request Address Registers 1 (Offset: H'90)

This register issues a Request to PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address Registers	All x	R/W	Set Address when issuing a Request.

Table 34.8 Bit 31 - Bit 16 of Request Address Registers 1

Request Address Registers 1	[31:27]	[26:24]	[23:19]	[18:16]
Zero-Length Read Request	Address			
Configuration Read Type 0/1	Bus Number		Device Number	Function Number
Configuration Write Type 0/1	Bus Number		Device Number	Function Number
Message Request	Reserved	Routing Type	Reserved	Reserved
Message Request with data payload	Reserved	Routing Type	Reserved	Reserved

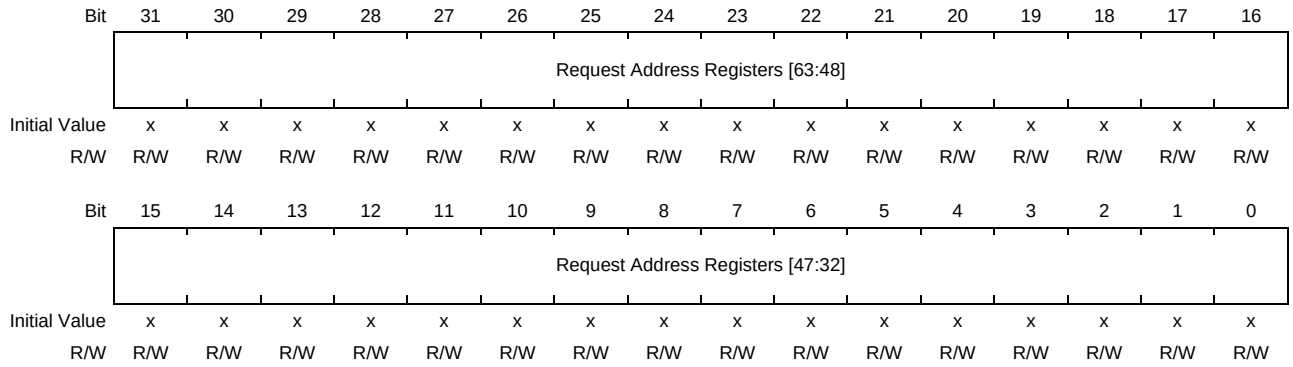
Table 34.9 Bit 15 - Bit 0 of Request Address Registers 1

Request Address Registers 1	[15:12]	[11:8]	[7:2]	[1:0]
Zero-Length Read Request	Address			Reserved
Configuration Read Type 0/1	Reserved	Ext. Reg. Number	Register Number	Reserved
Configuration Write Type 0/1	Reserved	Ext. Reg. Number	Register Number	Reserved
Message Request	Reserved	Reserved	Message Code	
Message Request with data payload	Reserved	Reserved	Message Code	

Note: The bits should be set to 0 for the requests indicated as "Reserved".

34.3.1.4 Request Address Registers 2 (Offset: H'94)

This register issues various Requests to PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address Registers	All x	R/W	Set Address when issuing a Request.

Table 34.10 Request Address Registers 2

Request Address Registers 2	[31:0]
Zero-Length Read Request	Address
Configuration Read Type 0/1	Invalid
Configuration Write Type 0/1	Invalid
Message Request	Invalid
Message Request with data payload	invalid

Note: The bits should be set to 0 for the requests indicated as "Invalid".

34.3.1.5 Request Byte Enable Registers (Offset: H'98)

This register specifies First Byte (1st DW Byte) Enable in the TLP Header when issuing a Request to PCIe.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	Request Byte Enable			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

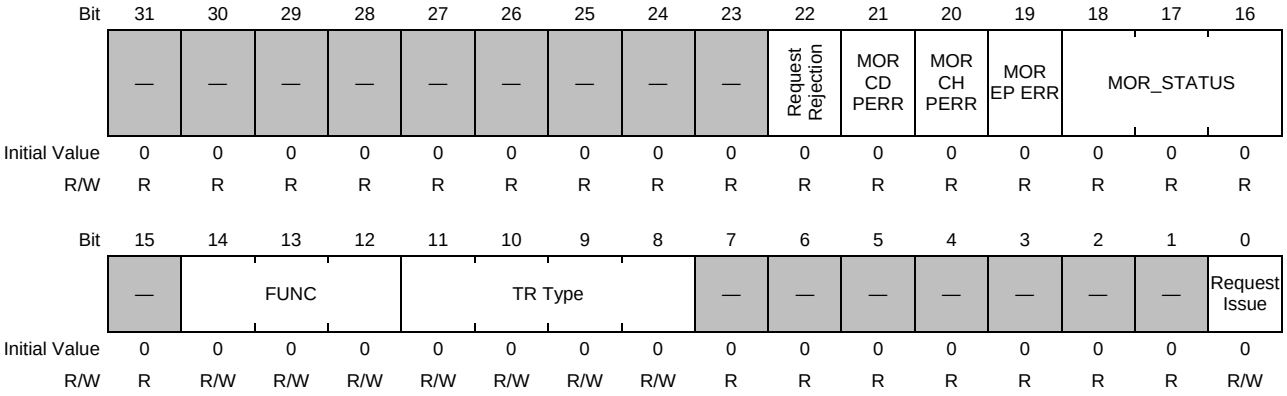
Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	Request Byte Enable	1111b	R/W	If necessary, specify Byte Enable when issuing a Cfg Request. Normally, use 1111b. 0: Byte Enable invalid 1: Byte Enable valid

Table 34.11 Bit 3 - Bit 0 of Request Byte Enable Registers

Request Byte Enable Registers	[3:0]
Zero-Length Read Request	0000b
Configuration Read Type 0/1	Optional (Usually 1111b)
Configuration Write Type 0/1	Optional (Usually 1111b)
Message Request	Invalid (1111b)
Message Request with data payload	Invalid (1111b)

34.3.1.6 Request Issue Registers (Offset: H'9C)

This register issues a Request to PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	Request Rejection	0b	R	PCI Express indicates that a stop or hibernation was detected on the sending (TX side) and processing was killed. 0: Normal state (Issue Request) 1: Forced termination (Rejection)
21	MOR CD PERR	0b	R	1 is set when a data error occurs in Completion TLP for a Non-Posted Request issued in this register. Usually do not use it. It is not updated during Posted Requests.
20	MOR CH PERR	0b	R	This is set if a header error occurs in the Completion TLP for a Non-Posted Request issued in this register. Usually do not use it. It is not updated during Posted Requests.
19	MOR EP ERR	0b	R	1 is set when the Poisoned Completion TLP for the Non-Posted Request issued in this register is received. Usually do not use it. It is not updated during Posted Requests.
18 to 16	MOR_STATUS	000b	R	Holds the MOR Status of the Completion TLP for Non-Posted Requests issued in this register. It is not updated during Posted Requests. 000b: Successful Completion (SC) 001b: Unsupported Request (UR) 010b: Configuration Request Retry Status (CRS) (Not Support) 011b: Completion Timeout 100b: Completer Abort (CA) 101b: Unexpected Completion and mismatched type (LockCompletion respond to non-Lock Request) 110b: Reserved 111b: Overrun Completion length
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 12	FUNC	000b	R/W	Set the Function of Request.
11 to 8	TR Type	0000b	R/W	Set the Type of Request.
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

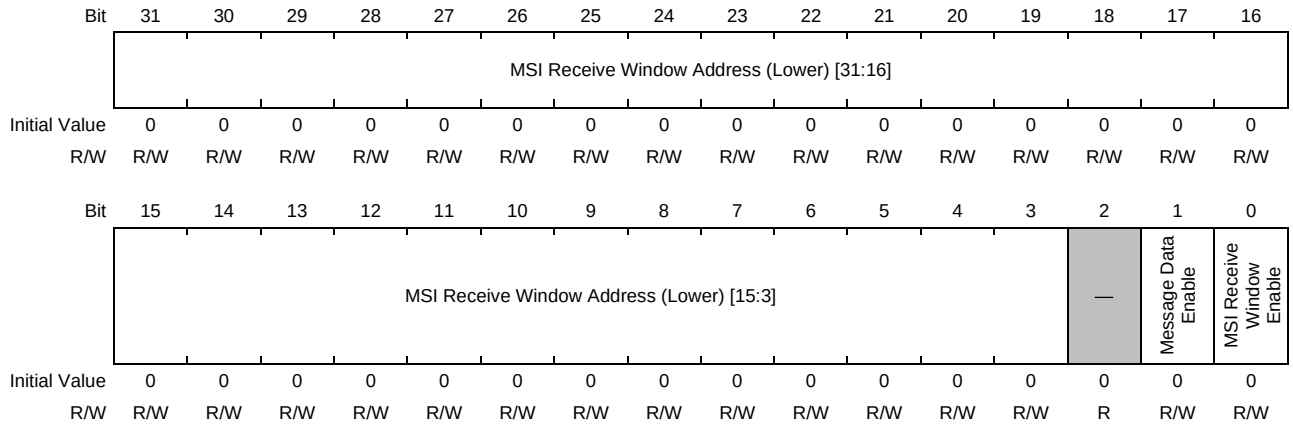
Bit	Bit Name	Initial Value	R/W	Description
0	Request Issue	0b	R/W	[Write] 1: Request 0: No Operation [Read] 1: Processing Request (Indicates that the issued Request is being processed.) 0: Request can be issued and accepted (This indicates that the issued Request has been processed.)

Table 34.12 TR Type of Request Byte Enable Registers

Request Byte Enable Registers	TR Type [11:8]	Posted/Non-Posted	Root Complex
Zero-Length Read Request	0000b (H'0)	Non-Posted	Issuable
Configuration Read Type 0	0100b (H'4)	Non-Posted	Issuable
Configuration Write Type 0	0101b (H'5)	Non-Posted	Issuable
Configuration Read Type 1	0110b (H'6)	Non-Posted	Issuable
Configuration Write Type 1	0111b (H'7)	Non-Posted	Issuable
Message Request	1000b (H'8)	Posted	Issuable
Message Request with data payload	1001b (H'9)	Posted	Issuable
—	Others	—	Issuing prohibited

34.3.1.7 MSI Receive Window Address (Lower) Registers (Offset: H'100)

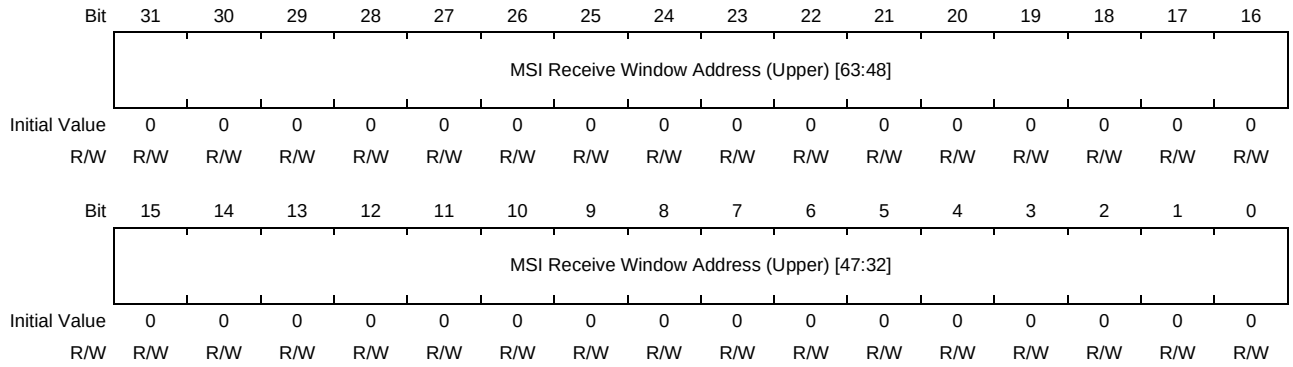
This register sets the start address in the Memory space of the receiving MSI.



Bit	Bit Name	Initial Value	R/W	Description
31 to 3	MSI Receive Window Address (Lower) [31:3]	All 0	R/W	Set the MSI receiving window's Start Address [31:3]. However, they must be aligned to the size set by the MSI Receive Window Mask. Even if an unaligned Address is set, the Address Bit set with the MSI Receive Window Mask will be 0. *Note*: To change this register, make sure that MSI Receive Window Enable is set to 0b.
2	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	Message Data Enable	0b	R/W	Controls whether Message Data is used in MSI reception decisions. 0: Unused (conventional mode) 1: Used (multiple interrupts) The MSI reception judgment result selected in this register is reflected in the INTMSI_RC terminal.
0	MSI Receive Window Enable	0b	R/W	Enable setting for the MSI Receive Window. 0: Window is disabled 1: Window is enabled

34.3.1.8 MSI Receive Window Address (Upper) Registers (Offset: H'104)

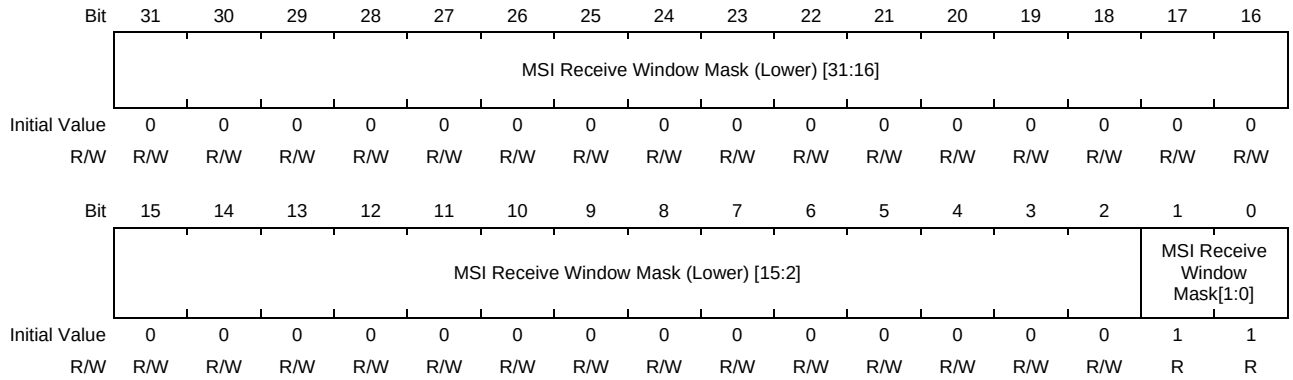
This register sets the start address in the Memory space of the receiving MSI.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Receive Window Address (Upper) [63:32]	All 0	R/W	Set the MSI receiving window's Start Address [31:3]. However, they must be aligned to the size set by the MSI Receive Window Mask. Even if an unaligned Address is set, the Address Bit set with the MSI Receive Window Mask will be 0. *Note*: To change this register, make sure that MSI Receive Window Enable is set to 0b.

34.3.1.9 MSI Receive Window Mask Registers (Lower) (Offset: H'108)

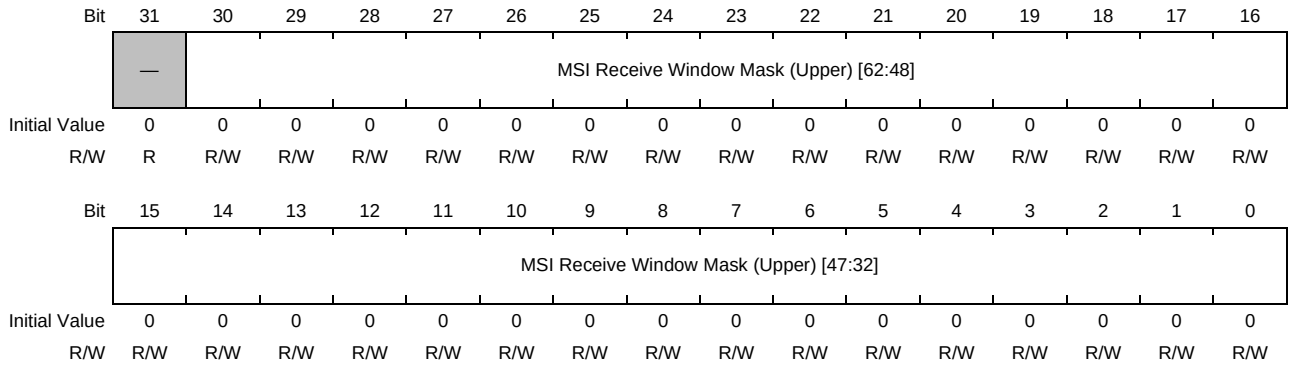
This register shows the size of the area from the address set by the MSI Receive Window Address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 2	MSI Receive Window Mask (Lower) [31:2]	All 0	R/W	Set the lower bit of the reserved area to "1". (Min4byte, Max4Gbyte free space) The following is a sample configuration. H'0000_0000: 4 bytes free space H'0000_0001: 8 bytes free space H'0000_007F: 512 bytes free space *Note*: To change this register, make sure that MSI Receive Window Enable is set to 0b.
1 ,0	MSI Receive Window Mask [1:0]	11b	R	11b fixed. *Note*: MSI Receive Window Mask [1:0] assumes that Mask is always set.

34.3.1.10 MSI Receive Window Mask Registers (Upper) (Offset: H'10C)

This register shows the size of the area from the address set by the MSI Receive Window Address.



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	0b fixed. *Note*: MSI Receive Window Mask of this register [63] is fixed at 0
30 to 0	MSI Receive Window Mask (Upper) [62:32]	All 0	R/W	(For setting up more than 4 Gbytes space) Set the MSI Receive Window Mask to [62:32]

34.3.1.11 PCI INTx Receive Interrupt Enable Registers (Offset: H'110)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MSI Receive Interrupt Enable	INTD Receive Interrupt Enable	INTC Receive Interrupt Enable	INTB Receive Interrupt Enable	INTA Receive Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MSI Receive Interrupt Enable	0b	R/W	This register permit INTMSI_RC with MSI reception. 0: Do not allow 1: Allow
3	INTD Receive Interrupt Enable	0b	R/W	This register permit INTD_RC. 0: Do not allow 1: Allow
2	INTC Receive Interrupt Enable	0b	R/W	This register permit INTC_RC. 0: Do not allow 1: Allow
1	INTB Receive Interrupt Enable	0b	R/W	This register permit INTB_RC. 0: Do not allow 1: Allow
0	INTA Receive Interrupt Enable	0b	R/W	This register permit INTA_RC. 0: Do not allow 1: Allow

34.3.1.12 PCI INTx Receive Interrupt Status Registers (Offset: H'114)

In case of Assert_INTx is received from PCIe to Msg_Req, set the corresponding interrupt bit in this register and assert interrupt INTx_RC. Also, in case of Deassert_INTx is received to Meg Req, clear the corresponding interrupt register (bit) and de-assert INTx_RC. This register can do RW1C by S/W, but PCIe does not recommend clearing this interrupt bit by S/W itself during normal operation for interrupts on the bus. In case of each factor is detected on this field of register, it is always set regardless of the PCI_INTx_Receive_Interrupt_Enable register for RC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MSI Receive Interrupt Enable	INTD Receive Interrupt Enable	INTC Receive Interrupt Enable	INTB Receive Interrupt Enable	INTA Receive Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C

Bit	Bit Name	Initial Value	R/W	Description
31:5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MSI Receive Interrupt Status	0b	R/W1C	Set when a Memory Write Req is received from the PCI bus side in the MSI receive window set area. This bit is set when an MSI is issued to AXI as a Write Transaction and a Response is returned.
3	INTD Receive Interrupt Status	0b	R/W1C	Set on receipt of Assert INTD Message. It is cleared upon receipt of a Deassert INTD Message. Or 1 write to clear it.
2	INTC Receive Interrupt Status	0b	R/W1C	Set on receipt of Assert INTD Message. It is cleared upon receipt of a Deassert INTC Message. Or 1 write to clear it.
1	INTB Receive Interrupt Status	0b	R/W1C	Set on receipt of Assert INTD Message. It is cleared upon receipt of a Deassert INTB Message. Or 1 write to clear it.
0	INTA Receive Interrupt Status	0b	R/W1C	Set on receipt of Assert INTD Message. It is cleared upon receipt of a Deassert INTA Message. Or 1 write to clear it.

34.3.1.13 Message Receive Interrupt Enable Registers (Offset: H'120)

Controls the enabling of MSG_INT upon receipt of a non-INTx, Error-related Message Request.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	Message Receive Interrupt Enable	—	—	—	—	PM_Active_State_Nak Receive Interrupt Enable	PM_PME Receive Interrupt Enable	PME Turn_Off Receive Interrupt Enable	PME TO_Ack Receive Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Message Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a Message/ 0: Assert disallowed 1: Assert allowed
23 to 20	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PM_Active_State_Nak. 0: Disable 1: Enable
18	PM_PME Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PM_PME.
17	PME_Turn_Off Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PME_Turn_Off. 0: Disable 1: Enable
16	PME_TO_Ack Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PME_TO_Ack.
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.14 Message Receive Interrupt Status Registers (Offset: H'124)

This register is a status register indicating Message Request reception other than INTx, Error related. It is reflected in MSG_INT. Only the Message Code is used to determine the type of message, the validity of the Routing and the validity of the choice of Msg/MsgD are not verified, and the Message in question is considered to have been received.

31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Message Receive Interrupt	0b	R/W1C	Set for receiving Message (Independent of Message type)
23 to 20	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt	0b	R/W1C	Invalid due to RC
18	PM_PME Receive Interrupt	0b	R/W1C	Set when PM_PME Message is received.
17	PME_Turn_Off Receive Interrupt	0b	R/W1C	Invalid due to RC
16	PME_TO_Ack Receive Interrupt	0b	R/W1C	Set when PM_TO_Ack Message is received.
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.15 Message Code Registers (Offset: H'130)

Stores the Code, Routing of the last received Message.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	Message Code								Routing			—	—	—	—	Message Payload
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

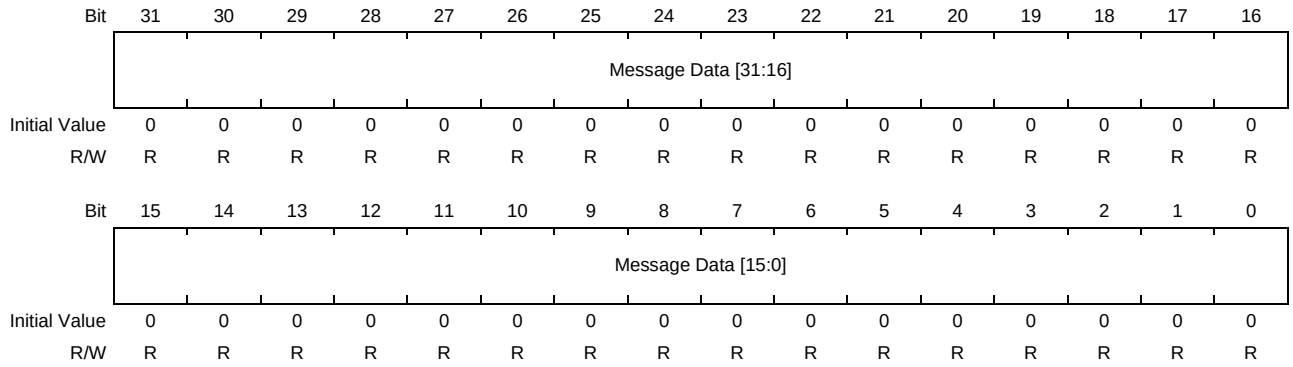
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 8	Message Code	All 0	R	Stores the Code of the last Message received.
7 to 5	Routing	000b	R	Stores the Routing of the last Message received.
4 to1	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Message Payload	0b	R	Stores whether there is a data payload for the last Message received. 0: Msg (Without Payload) 1: MsgD (with Payload)

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

34.3.1.16 Message Data Registers (Offset: H'134)

Stores the Data of the last received Message.



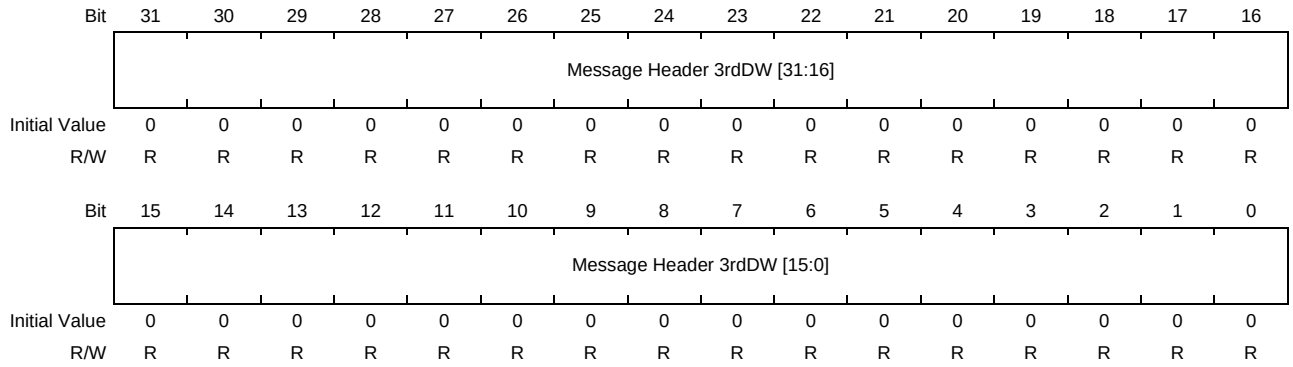
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Data	All 0	R	Stores the first DW Data of the last received Message. It is only updated when MsgD (with Data) is received, and the previous value is retained when Msg (without Data) is received.

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

34.3.1.17 Message Header 3rdDW Registers (Offset: H'138)

Stores the Header (3rdDW) of the last received Message.



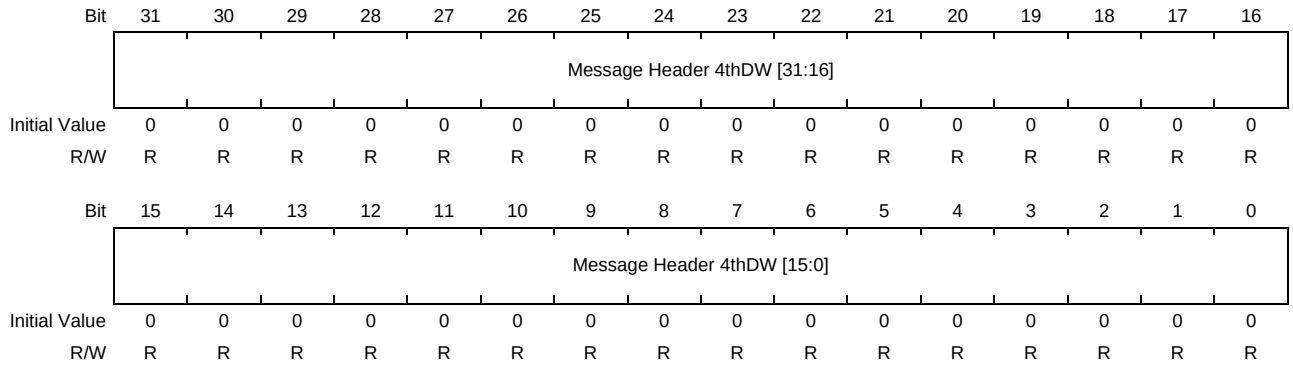
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 3rdDW	All 0	R	Stores the Header (3rdDW) of the last received Message.

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

34.3.1.18 Message Header 4thDW Registers (Offset: H'13C)

Stores the Header (4thDW) of the last received Message.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 4thDW	All 0	R	Stores the Header (4thDW) of the last received Message.

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

34.3.1.19 Interrupt Table Registers (Offset: H'140)

This register is the Index of the interrupt factor.

Interrupt signal (Active: High) status can be monitored by category in a list.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	INTMSI_RC	0b	R	INT_MSI receive interrupt signal Monitor Register
3	INTD_RC	0b	R	INTD_RC receive interrupt signal Monitor Register
2	INTC_RC	0b	R	INTC_RC receive interrupt signal Monitor Register
1	INTB_RC	0b	R	INTB_RC receive interrupt signal Monitor Register
0	INTA_RC	0b	R	INTA_RC receive interrupt signal Monitor Register

NOTE

For details on the register, refer to the description of the terminal of the same name.

34.3.1.20 PCIe Event Interrupt Enable 0 Registers (Offset: H'200)

This register is for interrupt permission due to various event factors in PCI Express. Write permission to PCIe Event Interrupt Status 0 Register (Offset: H'204). For more information about the factors, see the Status Register.

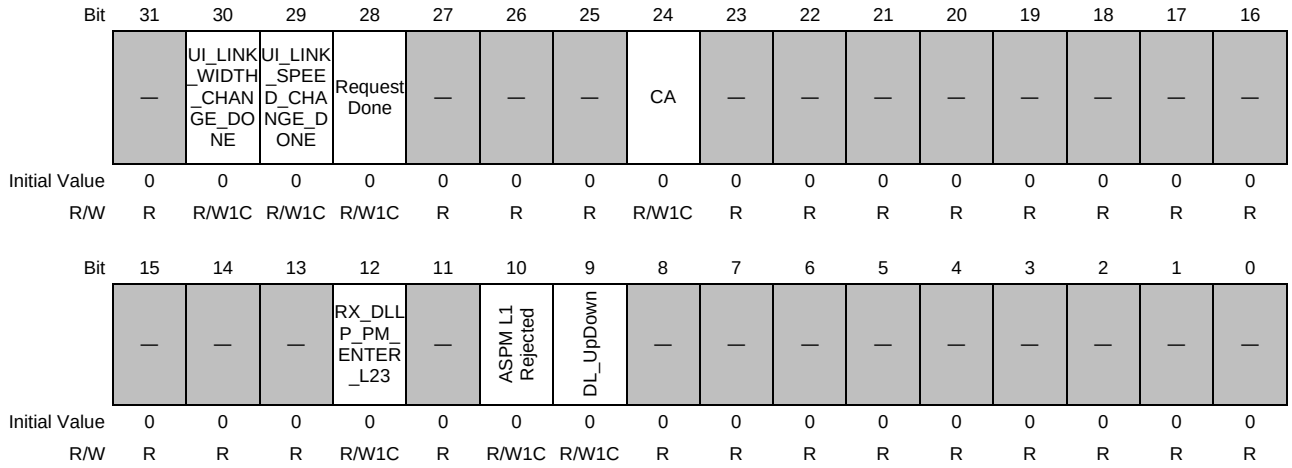
12	RX_DLLP_PM_ENTER_L23 EN	0b	R/W	RX_DLLP_PM_ENTER_L23 Interrupt Enabled. 0: Disable 1: Enable

Bit	Bit Name	Initial Value	R/W	Description
11	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10	ASPM L1 Rejected EN	0b	R/W	ASPM L1 Rejected Interrupt Enabled. 0: Disable 1: Enable
9	DL_UpDown EN	0b	R/W	Interrupt enabled due to DL state change. 0: Disable 1: Enable
8	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	—	0000b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

34.3.1.21 PCIe Event Interrupt Status 0 Registers (Offset: H'204)

This register is a status register used to indicate various events in PCI Express. It is set to 1b by the occurrence of factors in the table. After checking the factors, please do 1 write clear.



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30	UI_LINK_WIDTH_CHANGE_DONE	0b	R/W1C	Indicates Up/Down Configure operation complete.
29	UI_LINK_SPEED_CHANGE_DONE	0b	R/W1C	Indicates Speed Change operation complete.
28	Request Done	0b	R/W1C	In response to the request issued in Request Issue Registers (Offset: 9Ch): Non-Posted: Indicates completion received. Posted: Indicates that the request has been issued.
27, 26	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
24	CA	0b	R/W1C	Indicates that the opposing device responded with a CA (Completer Abort).
23, 22	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 14	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	RX_DLLP_PM_ENTER_L23	0b	R/W1C	Indicates transition to L2/L3 State in Power Management control.

Bit	Bit Name	Initial Value	R/W	Description
11	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10	ASPM L1 Rejected	0b	R/W1C	Indicates that the ASPM L1 transition was rejected.
9	DL_UpDown	0b	R/W1C	Set to 1b when the state changes from DL_Down to DL_Up or from DL_Up to DL_Down.. Check the DL_Down/DL_Up status with the PCIe Core Status 1 Registers (Offset: H'408).
8	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

34.3.1.22 PCIe Event Interrupt Enable 1 Registers (Offset: H'208)

This register is the Parity Error/ECC Error interrupt grant register. When each bit is set to allow, each corresponding status bit value in the PCIe Event Interrupt Status 1 Register (Offset: 20 Ch) takes effect.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	Write MSTERR INT EN	All 0	R/W	Write MSTERR INT Permit Each corresponding bit can be turned on or off individually. 0: Disable 1: Enable
7 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	Read MSTERR INT EN	All 0	R/W	Read MSTERR INT Permit Each corresponding bit can be turned on or off individually. 0: Disable 1: Enable

34.3.1.25 AXI Master Error Interrupt Status Registers (Offset: H'214)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	Write ERR ID	All 0	R	Saves the ID of the first DECERR/SLVERR received. When bit [11:8] is cleared, a new error ID can be saved. H'0: Normal Access
23 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	Read ERR ID	All 0	R	Saves the ID of the first DECERR/SLVERR received. When bit [3:0] is cleared, a new error ID can be saved. H'0: Normal Access
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	Write MSTERR INT	All 0	R/W1C	The AXI Master Port indicates that an error has been detected. Only the first error detected will be saved, and a new error will be ready to save if bit [11:8] is cleared Bit 11: Length Error In case of discrepancy in length of data sent by TEF and data channel. Bit 10: ID Inconsistency In case of the MBID value received in the MAWID response channel is different. Bit 9: In case of receiving DECERR Bit 8: In case of receiving SLVERR
7 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	Read MSTERR INT	All 0	R/W1C	The AXI Master Port indicates that an error has been detected. Only the first error detected will be saved, and a new error will be ready to save if bit [3:0] is cleared Bit 3: Length Error In case of discrepancy in length of data sent by TER and data channel. Bit 2: ID Inconsistency In case of the MRID value received in the MARID response channel is different. Bit 1: In case of receiving DECERR Bit 0: In case of receiving SLVERR

R/W	R	R	R	R	R/W1C	R/W1C	R/W1C	R/W1C	R	R	R	R	R	R	R/W1C	R/W1C

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	Write SLVERR INT	All 0	R/W1C	An AXI Slave Port has detected an unrecoverable error. (The response to the Transaction is SLVERR.) Bit 11: Burst length error In case of the burst length of data received by SAWLEN and the data channel does not match. Bit 10: ID Mismatch In case of the value of the SWID received in the SAWID and data channel is different. Bit 9: Burst type Invalid In case of SAWBURST is b 11 (undefined). In case of SAWBURST is b 10 (wrapping) and burst length is other than 2, 4, 8 or 16. Bit 8: Data size Invalid In case of SAWSIZE is between b 100 and b 111 (over AXI Bus width/not supported). <Each bit means> 0: Error Not Found 1: Error detection
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	Read SLVERR INT	00b	R/W1C	An AXI Slave Port has detected an unrecoverable error. (The response to the Transaction is SLVERR.) Bit 1: Burst type Invalid In case of SARBURST is b11(Undefined) In case of SARBURST is b 10 (wrapping) and burst length is other than 2, 4, 8 or 16. Bit 0: Burst type Invalid In case of SARSIZE is (over AXI Bus width/not supported). <Each bit means> 0: Error Not Found 1: Error detection

34.3.1.28 AXI Slave Error Interrupt Status 3 Registers (Offset: H'230)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ERR ID [31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	ARPROT			—	—	—	—	—	—	ARLOCK		ARCACHE			
Initial Value	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 28	AWPROT	010b	R/W	Set the protection type from PCIe to AXI transactions. These bits indicate whether the protection level of the transaction is normal, privileged, or secure, and whether the transaction is for data access or instruction access. [2] 1b: Instruction Access 0b: Data Access [1] 1b: Non-secure access 0b: Secure access [0] 1b: Privileged Access 0b: Normal Access
27 to 24	AWCACHE_L	All 0	R/W	Indicate the value of MAWCACHE [3: 0] to be issued to AXI. This setting is printed when issuing an AXI request that contains the last byte. *Note*: The recommended value is 0000b. [3] 1b: Write assignment possible 0b: Write assignment possible [2] 1b: Read assignment possible 0b: Read assignment impossible [1] 1b: Cacheable 0b: Not Cacheable [0] 1b: Buffable 0b: Not buffered
23, 22	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21, 20	AWLOCK	00b	R/W	Lock type in PCIe to AXI transactions. This signal provides information about the atomic nature of the transfer. 00b: Normal access 01b: Exclusive access 10b: Lock access 11b: Reserved
19 to 16	AWCACHE_D	0001b	R/W	Indicates the value of MAWCACHE [3: 0] to be issued to AXI. This setting is output when an AXI request other than the AWCACHE_L output condition is issued. *Note*: The recommended value is 0000b. [3] 1b: Write assignment possible 0b: Write assignment possible [2] 1b: Read assignment possible 0b: Read assignment impossible [1] 1b: Cacheable 0b: Not Cacheable [0] 1b: Buffable 0b: Not buffered
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	ARPROT	010b	R/W	Sets the protection type from PCIe to AXI transactions. This bit indicates whether the protection level of the transaction is normal, privileged, or secure, and whether the transaction is for data access or instruction access. [2] 1b: Instruction Access 0b: Data Access [1] 1b: Non-secure access 0b: Secure access [0] 1b: Privileged Access 0b: Normal Access
11 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5, 4	ARLOCK	00b	R/W	Lock type in PCIe to AXI transactions. This bit provides information about the atomic nature of the transfer. 00b: Normal access 01b: Exclusive access 10b: Lock access 11b: Reserved
3 to 0	ARCACHE	All 0	R/W	Cache type in PCIe to AXI transactions. This bit indicates whether the transaction is “buffered”, “cacheable”, “write-through”, “write-back”, or “assign” as an attribute.

34.3.1.31 Mode Set 1 Registers (Offset: H'318)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	AXI Max Issue Write	0011b	R/W	Set the number of write issuable AXI Master. Set as much as Interconnect allows. 0000b: Number 1 0001b: Number 2 ⋮ 1111b: Number 16
11 to 8	AXI Max Issue Read	0011b	R/W	Set the number of read issuable AXI Master. Set as much as Interconnect allows. 0000b: Number 1 0001b: Number 2 ⋮ 1111b: Number 16
7 to 4	AXI Master Max Burst	1111b	R/W	Set the maximum burst length as an AXI Master operation.
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RAM Parity Enable	1b	R/W	Set whether to check the internal SRAM parity. The Default value is ignored for macros that are Enable but do not have Parity. 0: RAM Parity Check disabled 1: RAM Parity Check enabled
0	PCIe Request Order	0b	R/W	Issue read requests to PCIe from the same AXI master without waiting for completion. Set it to 1 if the order of Request to Completer should be strictly followed. 0: Do not wait for completion. 1: Wait for completion.

34.3.1.32 Mode Set 3 Registers (Offset: H'380)

Outputs the value set as the ASPM L1 Idle Time bit.

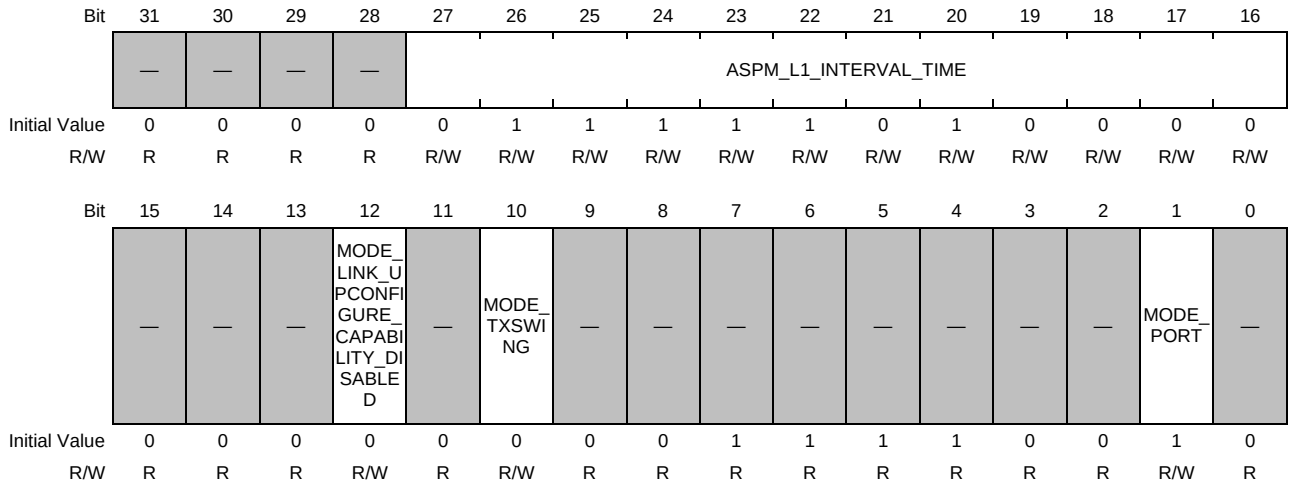
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ASPM L1 Idle Time							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 0	ASPM L1 Idle Time	All 0	R/W	Sets the idle period for AXI transactions that the macro checks during the ASPM L1 transition. One condition of the ASPM L1 transition is that the idle period is confirmed by adding H'FF to the lower 8 bits to the 8 bits set by this bit for several cycles. H'00: 256 [ACLK] H'01: 512 [ACLK] ⋮ H'FF: 65536 [ACLK]

34.3.1.33 PCIe Core Mode Set 1 Registers (Offset: H'400)

This register is used to set the operating mode of the PCI Express core.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
27 to 16	ASPM_L1_INTERVAL_TIME	H'7D0	R/W	Setting the interval for ASPM L1 requests. The PCIe Base Spec specifies that ASPM L1 transition requests must not be received consecutively within 10 µs, and this field is used to set a timer value to guard against them. Set the ACLK period x set value to 10 µs or more. Setting of this product (Default): In case of ACLK = 200 MHz (5ns): D'2000(d) = H'7D0 = 0111_1101_0000b
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14, 13	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	MODE_LINK_UPCONFIGURE_CAPABILITY_DISABLED	0b	R/W	Setting the Link Upconfigure Capability bit in the Training Sequence Ordered-set (TS-OS) 0: Link Upconfigure Capability bit = 1b set 1: Link Upconfigure Capability bit = 0b setting (Gen1 × 1) LinkUp may not occur when connecting to Gen1 PCIe devices unless this bit is 0b. In that case, use F/W to change it to 0b.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	MODE_TXSWING	0b	R/W	Amplitude control of SerDes serial output 0: Full Swing Mode (Default) 1: Half Swing Mode
9 to 4	—	H'0F	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	MODE_PORT	1b	R/W	Register for Device Type setting on our company. Changes from the initial values can cause malfunction. Please be careful.

Bit	Bit Name	Initial Value	R/W	Description
0	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

34.3.1.34 PCIe Core Control 1 Registers (Offset: H'404)

This register is a control register for Power Management control and LTSSM (Link Training Sequence State Machine) state transitions in the PCI Express core.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	BLB_RELAX_ORDERING_EN	—	—	—	—	—	UI_ENTER_L1S	—	RETURN_TO_L0	UI_RC_REJECT_ASPML1	Auto PM_Active_State_Nak	UI_ENTER_L2	UI_ENTER_TXL0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W

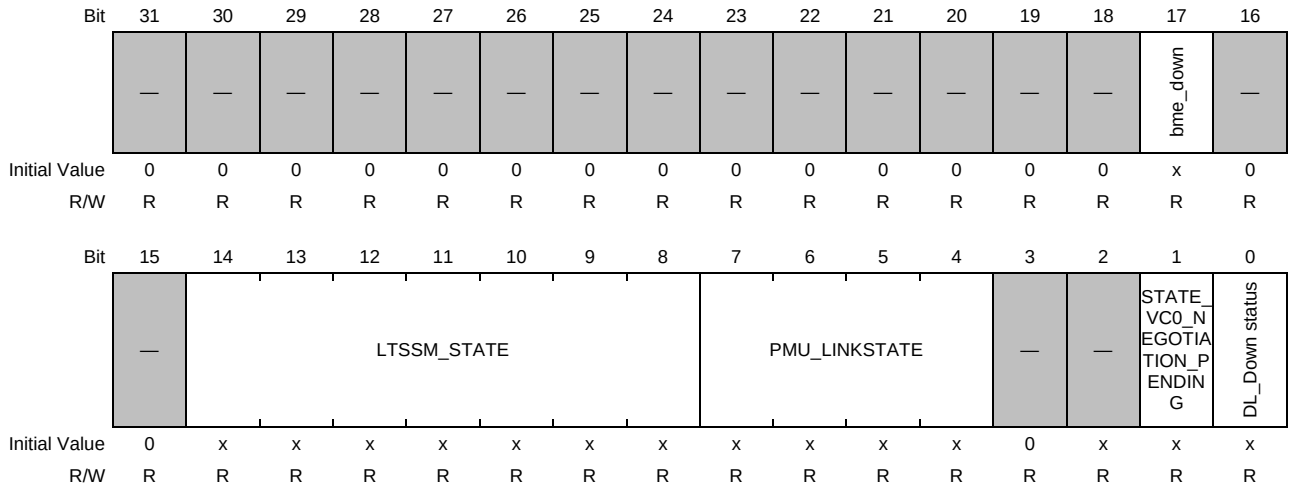
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	UI_ENTER_TX MODE_SRIS	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	BLB_RELAX_ORDERING_EN	0b	R/W	Controlling the RO bit in send requests 0: RO bit of Request TLP sent is always 0b (Default) 1: TLP can be sent with RO bit of Request TLP to be sent set to 1b.
27 to 25	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	UI_ENTER_L1S	0b	R/W	L1 SubState transition permission setting 0: L1 SubState not transitionable (Default) 1: L1 SubState transition allowed
21	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	RETURN_TO_L0	0b	R/W	Control of L1, L2 to L0 states in RC mode (Not normally used) 0: Normal operation (Default) 1: Start the return operation to the L0 state when in the L1 and L2 states in the RC mode *Note*: It is automatically cleared after checking PMU_LINKSTATE [0] = 1.
19	UI_RC_REJECT_ASPML1	0b	R/W	ASPM L1 transition rejection control 0: Accepts ASPM L1 transition requests from opposing EP devices (Default) 1: Reject ASPM L1 transition requests from opposing EP devices
18	Auto PM_Active_State_Nak	0b	R/W	PM_Active_State_Nak Message Send Mode for ASPM L1 Rejection Set 1b, if the RC wants to reject ASPM L1. When PM_Active_State_Nak is automatically sent, this Bit is automatically cleared. *Note*: Auto send only once.

Bit	Bit Name	Initial Value	R/W	Description
17	UI_ENTER_L2	0b	R/W	L2 transition control in RC mode Set to 1b when shifting to L2 in RC mode. The PCIe core must enter a reset state under the control of the Reset register during the L2 state transition. When returning, this bit must be cleared to 0b after canceling the reset.
16	UI_ENTER_TXL0S	0b	R/W	TxL0s transition control 0: Do not perform ASPM L0s transition (Default) 1: Perform ASPM L0s transition when internal conditions are satisfied
15 to 13	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11	UI_ENTER_TXMODE_SRIS	0b	R/W	Setting of Clock Tolerance Compensation 0: SRNS (Default) 1: SRIS (Not support)
10 to 8	—	000b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	—	H'0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

34.3.1.35 PCIe Core Status 1 Registers (Offset: H'408)

This register is the Power Management status register in the PCI Express core.

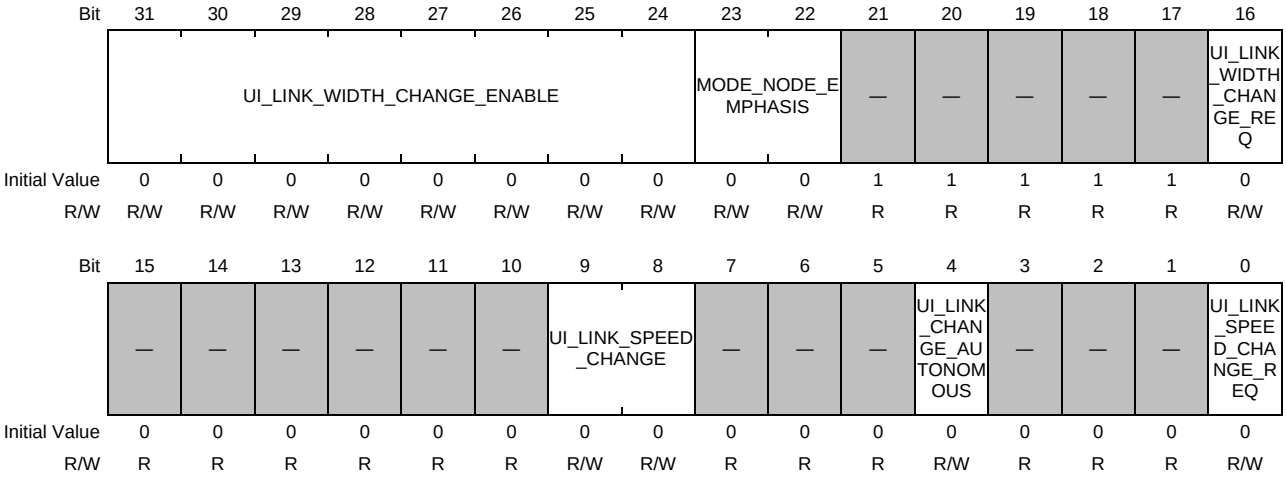


Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	—	H'0	R	Reserved When read, the initial value is read. The written value will be ignored.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 20	—	000b	R	Reserved When read, the initial value is read. The written value will be ignored.
19, 18	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	bme_down	x	R	The PCIe core transmitter is in an unusable state.
16	—	0b	R	Reserved When read, the initial value is read. The written value will be ignored.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 8	LTSSM_STATE	All x	R	Shows the state of the Link Training & Status State Machine in the PCIe Core Link. The high-order 5 bits (14:10) indicate the following conditions: 000xxb: Detect 001xxb: Polling 010xxb: Config 01100b: L0 01101b: L1 0111xb: L2 100xxb: Recovery 101xxb: Disable 110xxb: Loopback
7 to 4	PMU_LINKSTATE	All x	R	L-state monitor in power management control 0100b: L1 state 1000b: L2 state

Bit	Bit Name	Initial Value	R/W	Description
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	x	R	Reserved When read, the initial value is read. The written value will be ignored.
1	STATE_VC0_NEGOTIATION_PENDING	x	R	Flow Control Initialization Action Monitor If this bit is 1b, the transaction must not be initiated from the AXI side. Check the status of this bit as 0b and DL_Down Status (bit [0]) as 0b. 0: Indicates that Flow Control has been initialized 1: Indicates that Flow Control has not been initialized
0	DL_Down status	x	R	Indicates whether PCIe Core is in DL_Down or DL_Up state 0: DL_Up Status 1: DL_Down Status

34.3.1.36 PCIe Core Control 2 Registers (Offset: H'410)

This register is for Link Speed/Width Change control in the PCI Express core.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	UI_LINK_WIDTH_CHANGE_ENABLE	All 0	R/W	Link Width settings to be changed Set the Lane to 1b that should be activated when asserting UI_LINK_WIDTH_CHANGE_REQ to issue a Link Width change request. The low-order bit (bit [24]) drives Lane 0, and the high-order bit (bit [31]) drives Lane 7.
23, 22	MODE_NODE_EMPHASIS	00b	R/W	No de-emphasis mode setting terminal for Gen 1/Gen 2 operation [0] Gen1 operating 0: Normal operating mode (Default) 1: No de-emphasis mode [1] Gen2 operating 0: Normal operating mode (Default) 1: No de-emphasis mode
21 to 17	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
16	UI_LINK_WIDTH_CHANGE_REQ	0b	R/W	Link Width change request control Setting this bit to 1b issues a request to change the link width to the configuration set in the bit [31:24] UI_LINK_WIDTHCHANGE_ENABLE field. Asserting while in the L0 state moves from the recovered state to the configured state and negotiates with the other device. PCIe Core Status 2 Register (Offset: H'414) bit [29] Set it to 0b after seeing UI_LINK_WIDTH_CHANGE_DONE asserted.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	UI_LINK_SPEED_CHANGE	00b	R/W	Link Speed Settings Set the Link Speed to be changed. 00b: 2.5 GT/s 01b: 5.0 GT/s 10b: 8.0 GT/s (not allowed) 11b: 16.0 GT/s (not allowed)
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	UI_LINK_CHANGE_AUTONOMOUS	0b	R/W	Setting a reason for changing Link Width/Speed 0: reliability reason (Changes for reliability. Direction of band reduction) 1: autonomous reason

Bit	Bit Name	Initial Value	R/W	Description
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UI_LINK_SPEED_CHANGE_REQ	0b	R/W	Setting a reason for changing Link Speed Setting this bit to 1b issues a request to change the Link Speed to the Speed set in the bit [8] UI_LINK_SPEED_CHANGE field. Asserting while in the L0 state moves to the recovery state and negotiates with the other device. PCIe Core Status 2 Register (Offset: H'414) bit [28] Set it to 0b after seeing UI_LINK_SPEED_CHANGE_DONE asserted.

34.3.1.37 PCIe Core Status 2 Registers (Offset: H'414)

This register is the Link Speed/Width Change status register in the PCI Express core.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

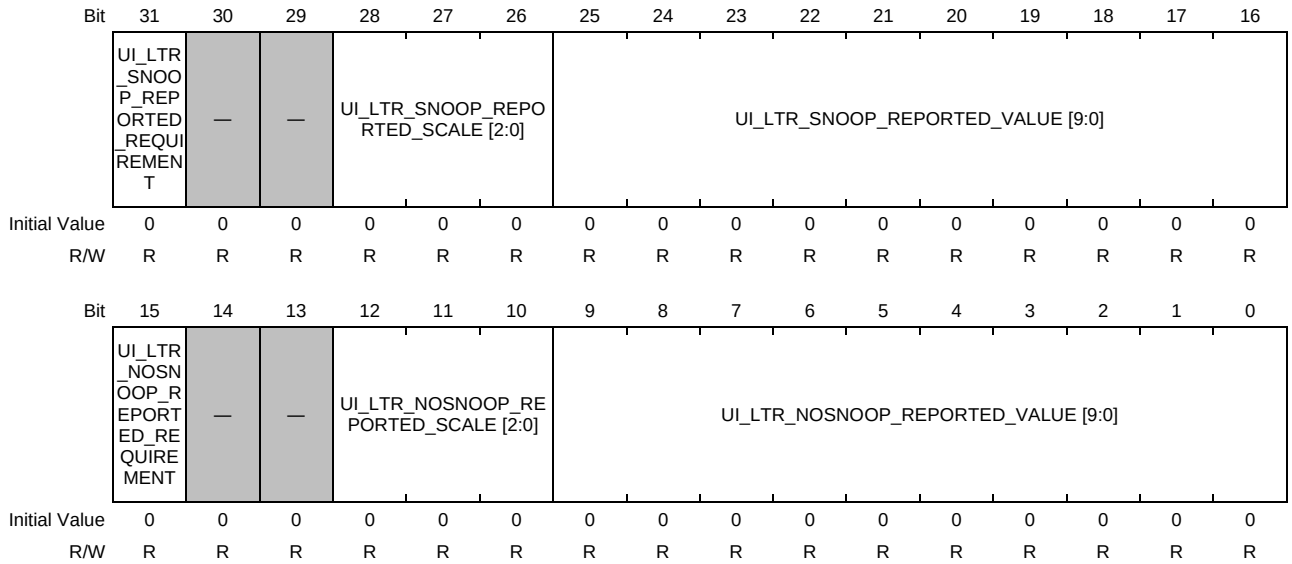
9, 8	—	xx		
7 to 1	—	All 0		
0	ORT_TRANSACTION_PENDING	0b	R	Indicates the presence or absence of an Outstanding Request (All Completions corresponding to Non-Posted Requests sent from the AXI side have not been received.). Check this bit to make sure that there is no Outstanding Request before making/granting transition requests to TxL0s/L1/L2. 0: No Outstanding Request 1: With an Outstanding Request

34.3.1.39 LTR Reported value Registers (Offset: H'470)

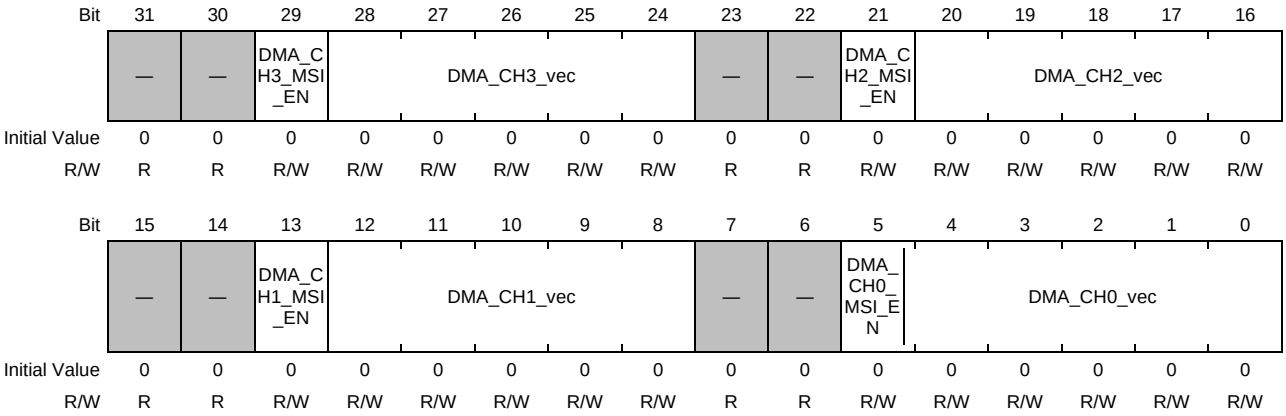
EP only, RC reserved.



Bit	Bit Name	Initial Value	R/W	Description
31	UI_LTR_SNOOP_REPORTED_REQUIREMENT	0b	R	Snoop Latency Requirement field value for issued LTR Msg
30 to 29	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 26	UI_LTR_SNOOP_REPORTED_SCALE [2:0]	000b	R	Snoop Latency Scale field value for issued LTR Msg
25 to 16	UI_LTR_SNOOP_REPORTED_VALUE [9:0]	All 0	R	Snoop Latency Value field value for issued LTR Msg
15	UI_LTR_NOSNOOP_REPORTED_REQUIREMENT	0b	R	NoSnoop Latency Requirement field value for issued LTR Msg
14 to 13	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 10	UI_LTR_NOSNOOP_REPORTED_SCALE [2:0]	000b	R	NoSnoop Latency Scale field value for issued LTR Msg
9 to 0	UI_LTR_NOSNOOP_REPORTED_VALUE [9:0]	All 0	R	NoSnoop Latency Value field value for issued LTR Msg

34.3.1.40 DMA Interrupt Vector 0 Registers (Offset: H'4D0)

Interrupt vector specification function when notifying (MSI) an interrupt from the AXI to the PCIe direction during DMAC transfer.

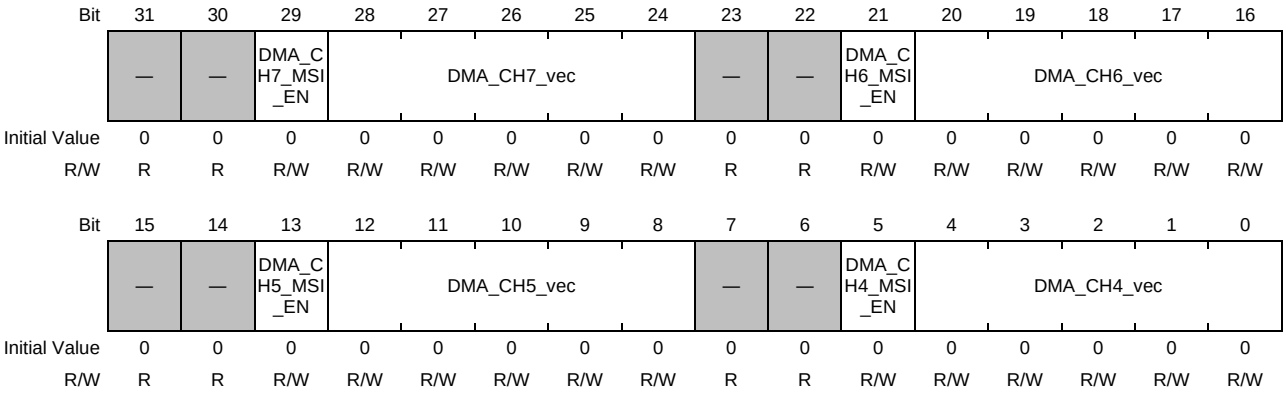


Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DMA_CH3_MSI_EN	0b	R/W	DMA Ch3 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
28 to 24	DMA_CH3_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch3
23 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	DMA_CH2_MSI_EN	0b	R/W	DMA Ch2 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
20 to 16	DMA_CH2_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch2
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	DMA_CH1_MSI_EN	0b	R/W	DMA Ch1 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
12 to 8	DMA_CH1_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch1
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DMA_CH0_MSI_EN	0b	R/W	DMA Ch0 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
4 to 0	DMA_CH0_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch0

Note: DMA_CHx_vec should be fixed at H'00 for RC functions.

34.3.1.41 DMA Interrupt Vector 1 Registers (Offset: H'4D4)

Interrupt vector specification function when notifying (MSI) an interrupt from the AXI to the PCIe direction during DMAC transfer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DMA_CH7_MSI_EN	0b	R/W	DMA Ch7 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
28 to 24	DMA_CH7_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch7
23 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	DMA_CH6_MSI_EN	0b	R/W	DMA Ch6 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
20 to 16	DMA_CH6_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch6
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	DMA_CH5_MSI_EN	0b	R/W	DMA Ch5 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
12 to 8	DMA_CH5_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch5
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DMA_CH4_MSI_EN	0b	R/W	DMA Ch4 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
4 to 0	DMA_CH4_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch4

Note: DMA_CHx_vec should be fixed at H'00 for RC functions.

34.3.1.42 MSI Receive Enable n Registers (Offset: H'6x0)

Registers to enable control of a group of one-set MSI receiving (Message Data Judgment) registers:

- MSI reception enabled n register (offset H'6x0)
- MSI received message data n register (offset H'6x4)
- MSI receive mask n register (offset H'6x8)
- MSI reception status n register (offset H'6xC)

Remark n is 0 ~ 1 and x is the 16 decimal number of n.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

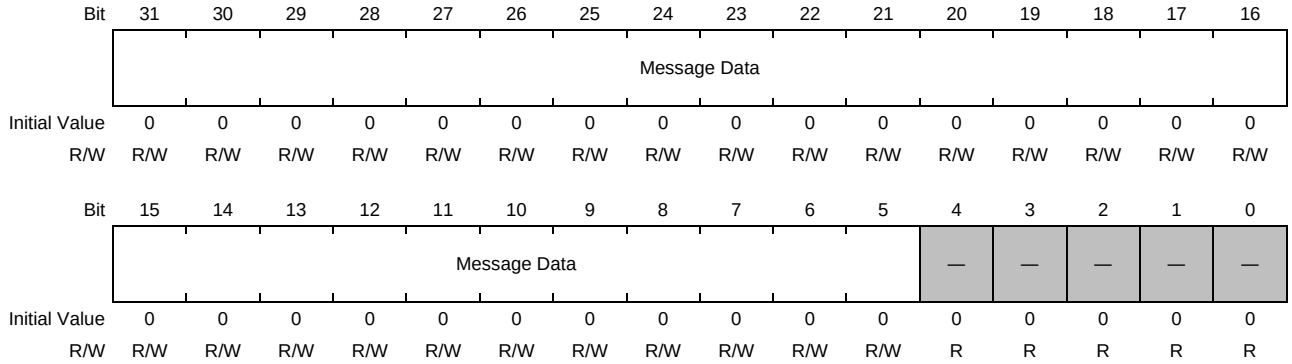
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Enable	0b	R/W	Enable/disable the MSI Receive (Message Data Judgment) register group consisting of 1 set of + 16 bytes registers from this register's Offset. 0: Disabled 1: Valid

34.3.1.43 MSI Receive Message Data n Registers (Offset: H'6x4)

Message Data setting register for MSI reception judgment of the register group to be enabled in the MSI Receive Enable n register.

Remark n is 0 ~ 1 and x is the 16 decimal number of n.

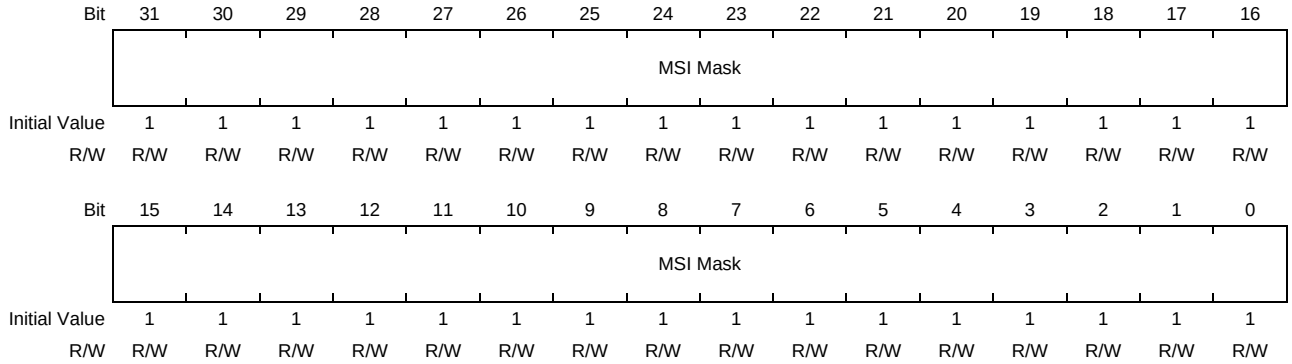


Bit	Bit Name	Initial Value	R/W	Description
31 to 5	Message Data	All 0	R/W	Setting Message Data for MSI reception judgment
4 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.44 MSI Receive Mask n Registers (Offset: H'6x8)

In the MSI Receive Enable n register, the Mask control register for interrupts by the MSI receive status of the register group to enable.

Remark n is 0 ~ 1 and x is the 16 decimal number of n.

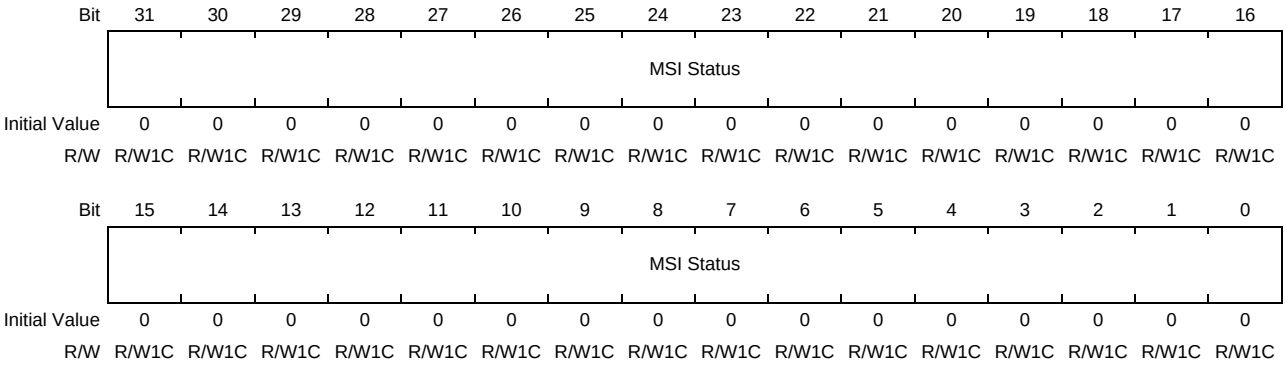


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Mask	All 1	R/W	Set the interrupt mask with each bit of MSI Status. 0: Allow interrupt 1: Interrupt Mask

34.3.1.45 MSI Receive Status n Registers (Offset: H'6xC)

A register indicating the MSI receive status of the group of registers to be enabled in the MSI Receive Enable n register.

Remark n is 0 ~ 1 and x is the 16 decimal number of n.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Status	All 0	R/W1C	MSI receive status. When Message Data [31:5] and MSI receive Data [31:5] match, the bit corresponding to Data [4:0] is set. (When Data (4:0) = H'00, MSI Status n (1) is set when MSI Status n (0) is Data (4:0) = H'01.)

34.3.1.46 DMA Control Registers (Offset: H'800)

As a function of DMAC, this is a setting related to the upper limit of the Read Request Size that can be issued to PCIe Core. Use with the default setting (128 bytes). Common settings for DMA Channel

R/W	R/W1C	R/W1C	R	R/W1C	R/W1C	R/W1C	R	R/W1C	R/W1C	R/W1C	R	R/W1C	R/W1C	R/W1C	R	R/W1C

Bit	Bit Name	Initial Value	R/W	Description
31	CH7_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
30	CH7_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
29	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28	CH7_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
27	CH6_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
26	CH6_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
25	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
24	CH6_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
23	CH5_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
22	CH5_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
21	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	CH5_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
19	CH4_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
18	CH4_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
17	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
16	CH4_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
15	CH3_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
14	CH3_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
13	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	CH3_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
11	CH2_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
10	CH2_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
9	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8	CH2_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
7	CH1_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
6	CH1_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
5	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	CH1_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
3	CH0_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
2	CH0_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CH0_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1

34.3.1.49 DMA Channel Control Registers (Offset: H'900/+Channel Offset)

This register is used to set the control method for each DMA Channel.

Please set register/descriptor method exclusively.

- Setting QUE_EN = 1b and QUE_CLR = 1b is prohibited during register-type DMA transfer (TDMA_EN = 1b).
- Setting RDMA_EN = 1b is prohibited during descriptor-type DMA transfer (QUE_EN = 1b).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

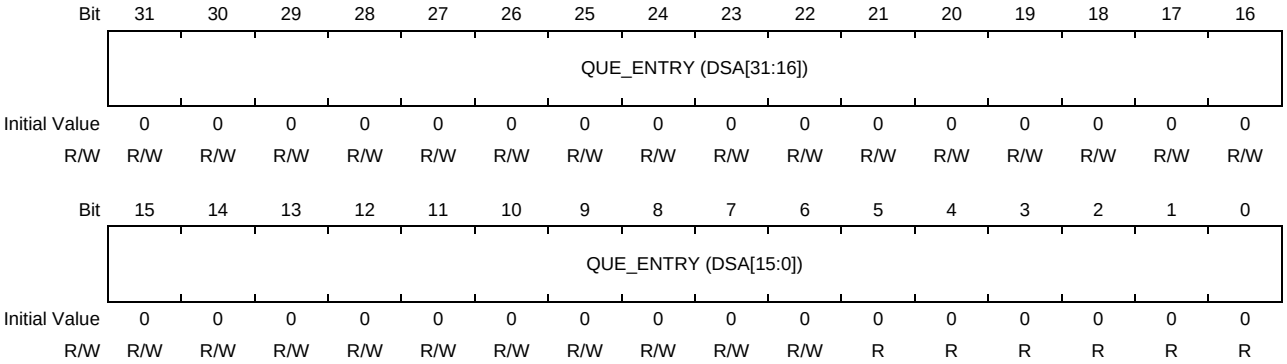
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	QUE_CLR	—	—	—	—	—	—	QUE_EN	RDMA_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	QUE_CLR	0b	R/W	QUE Clear Write 1 to clear QUE. All descriptor lists (waiting and running lists) registered in QUE are cleared. Do not clear during DMA execution. The lead value is always 0. It is prohibited to 1write at the same time as Set of QUE_EN.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	QUE_EN	0b	R/W	QUE Enable Set to 1 to enable the descriptor list registered in the descriptor queue and start DMA transfer (descriptor method). When the DMA stops (normal or abnormal), it is automatically cleared to 0.
0	RDMA_EN	0b	R/W	Register-based DMA transfer Enable Set to 1 to start a DMA transfer (register method) and perform the transfer set by RDMA_SIZE. It is automatically cleared to 0 when the DMA transfer is complete, or an error is detected, and the DMA is terminated.

34.3.1.50 Descriptor Start Address (Lower) Registers (Offset: H'908/+Channel Offset)

This registry is a register for descriptor queue list settings.

This setting is registered as the lower 32 bits of the DSA (DMA Start Address) of the queue list.



Bit	Bit Name	Initial Value	R/W	Description
31 to 6	QUE_ENTRY (DSA[31:6])	All 0	R/W	Descriptor list queue register. This area becomes the DSA. Sets the low 32 bits of the address where the first descriptor is stored.
5 to 0	QUE_ENTRY (DSA[5:0])	All 0	R	When the Data bus width is 128 bits, 16 bytes alignment: the lower 6 bits are fixed at 0.

NOTE

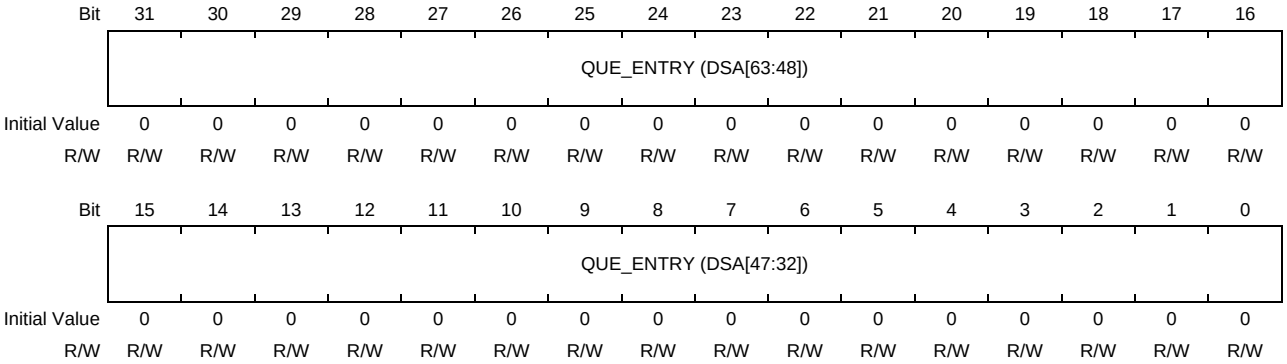
At the time of a lead, the following content will be the lead value depending on the DMA situation.

- DMA transfer in progress: running descriptor list
- DMA stopped (when QUE_EN auto-clear): Last run list

34.3.1.51 Descriptor Start Address (Upper) Registers (Offset: H'90C/+Channel Offset)

This registry is a register for descriptor queue list settings.

This setting is registered as the upper 32 bits of the DSA (DMA Start Address) of the queue list.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	QUE_ENTRY (DSA[63:32])	All 0	R/W	Descriptor list queue register. This area becomes the DSA. Sets the up 32 bits of the address where the first descriptor is stored.

NOTE

At the time of a lead, the following content will be the lead value depending on the DMA situation.

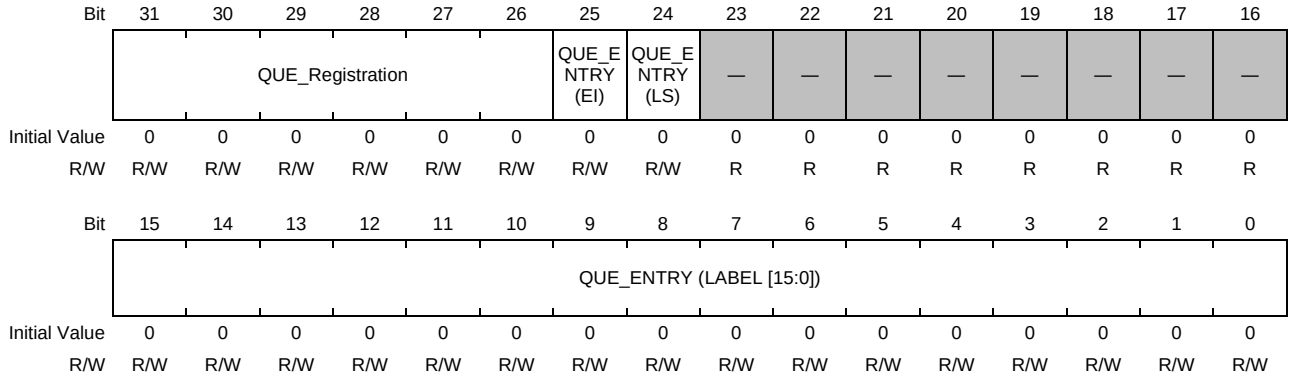
- DMA transfer in progress: running descriptor list
- DMA stopped (when QUE_EN auto-clear): Last run list

34.3.1.52 Que Entry Registers (Offset: H'910/+Channel Offset)

This register is for setting the descriptor queue list.

This setting is registered as EI (End Interrupt), LS (List Stop) and LABEL in the queue list.

Writing to 31:24 puts it in the queue.



Bit	Bit Name	Initial Value	R/W	Description
31 to 26	QUE_Registration	All 0	R/W	Write to 31:24 to queue. The read value is always 0.
25	QUE_ENTRY(EI)	0b	R/W	It indicates whether to signal an interrupt (Interrupt Status CHx_END) when the descriptor list is processing. 0: Do not signal interrupts 1: Notify interrupt
24	QUE_ENTRY(LS)	0b	R/W	It indicates whether to stop DMA upon completion of descriptor list processing. 0: Do not stop 1: Stop
23 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	QUE_ENTRY (LABEL [15:0])	All 0	R/W	In the sense of a list label, there are no rules for how to set it up. Feel free to set values.

NOTE

At the time of a lead, the following content will be the lead value depending on the DMA situation.

- DMA transfer in progress: running descriptor list
- DMA stopped (when QUE_EN auto-clear): Last run list

34.3.1.53 DMA Descriptor Control (Descriptor H’00) Registers (Offset: H’920/+Channel Offset)

This register shows the field value of Offset H’00 in the descriptor table. Valid only when the descriptor method DMA is selected (read values have no meaning when using the register method).

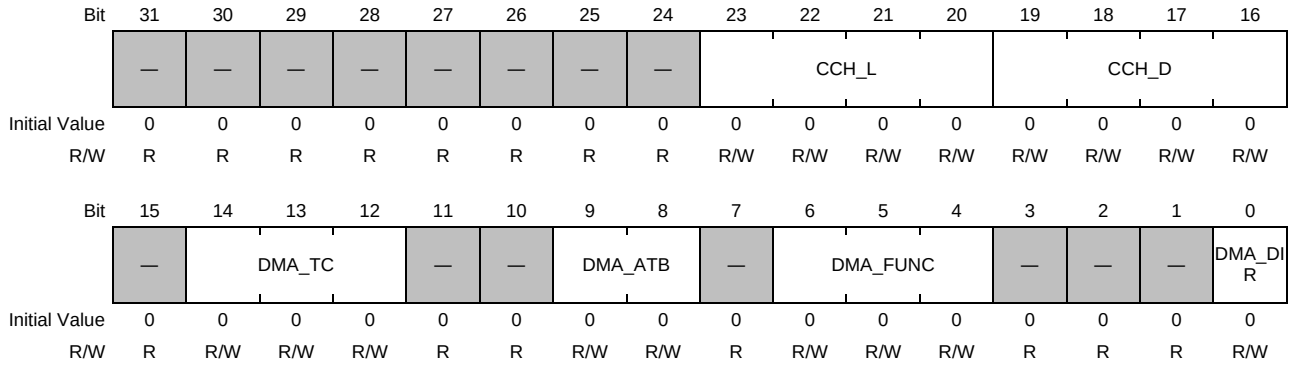
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSCFM				—	WBD	LE	LV	D	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STS															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM	H’0	R	It indicates the value of the DSCFM field in the running descriptor table.
27	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	WBD	0b	R	It indicates the value of the WBD field in the running descriptor table.
25	LE	0b	R	It indicates the value of the LE field in the running descriptor table.
24	LV	0b	R	It indicates the value of the LV field in the running descriptor table.
23	D	0b	R	It indicates the value of the D field in the running descriptor table.
22 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	STS	All 0	R	It indicates the value of the STS field in the running descriptor table.

34.3.1.54 DMA Transaction Control (Descriptor H'04) Registers (Offset: H'924/+Channel Offset))

This register is used to set transfer control to the AXI and PCIe sides when performing DMA transfers.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 20	CCH_L	All 0	R/W	It indicates the value of A * CACHE [3:0] to be issued to AXI. CCH_L is printed when issuing an AXI request with the last byte in the transfer indicated by SIZE. The recommended value is 0000b. Bit [3] 1b: Write assignment possible 0b: Write assignment possible Bit [2] 1b: Read assignment possible 0b: Read assignment impossible Bit [1] 1b: Cacheable 0b: Not Cacheable Bit [0] 1b: Buffable 0b: Not buffered
19 to 16	CCH_D	All 0	R/W	It indicates the value of A * CACHE [3:0] to be issued to AXI. CCH_D is output when an AXI request other than the output condition of CCH_L is issued. The recommended value is 0001b when DIR = 0 (PCIe AXI) and 0000b when DIR = 1 (AXI/PCIe). Bit [3] 1b: Write assignment possible 0b: Write assignment possible Bit [2] 1b: Read assignment possible 0b: Read assignment impossible Bit [1] 1b: Cacheable 0b: Not Cacheable Bit [0] 1b: Buffable 0b: Not buffered
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 12	DMA_TC	000b	R/W	The traffic class to publish to PCIe. Specifies the traffic class value for requests issued to PCIe. *Note*: This IP does not support Virtual Channel, so use it fixed at 000b.
11, 10	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	DMA_ATB	00b	R/W	Attribute to publish to PCIe. Bit [1]: Relaxed Ordering (unsupported features: 0b fixed) Bit [0]: No Snoop (0b recommended)
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	DMA_FUNC	000b	R/W	Specifies the function number of the request to be issued to PCIe.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

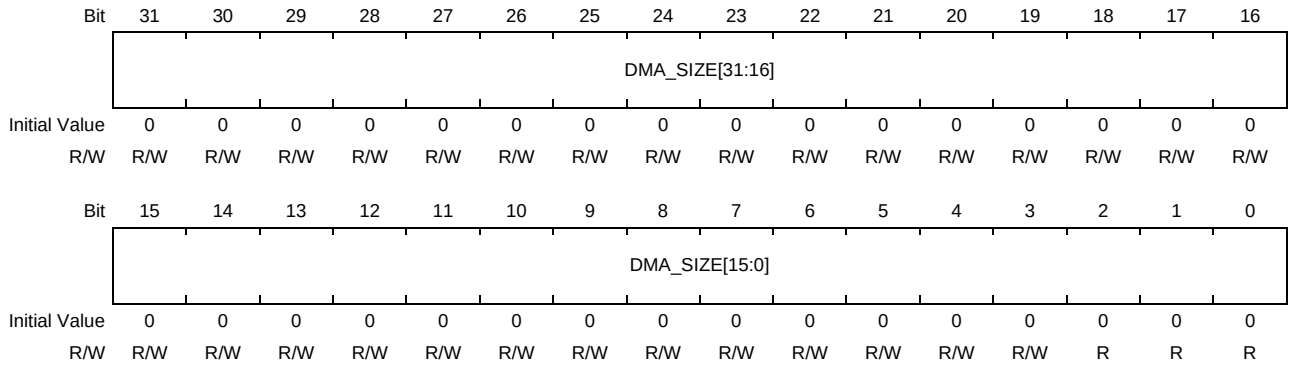
Bit	Bit Name	Initial Value	R/W	Description
0	DMA_DIR	0b	R/W	Sets the DMA transfer direction. 0: PCIe → AXI 1: AXI → PCIe

NOTE

During descriptor method DMA execution, write is prohibited and the read value indicates the value of the CCH_L, CCH_D, TC, ATB, DIR fields in the running descriptor table.

34.3.1.55 DMA Size (Descriptor H’08) Registers (Offset: H’928/+Channel Offset)

This register sets the number of DMA transfer bytes. It is reflected in the field OffsetH’08 in the descriptor table.



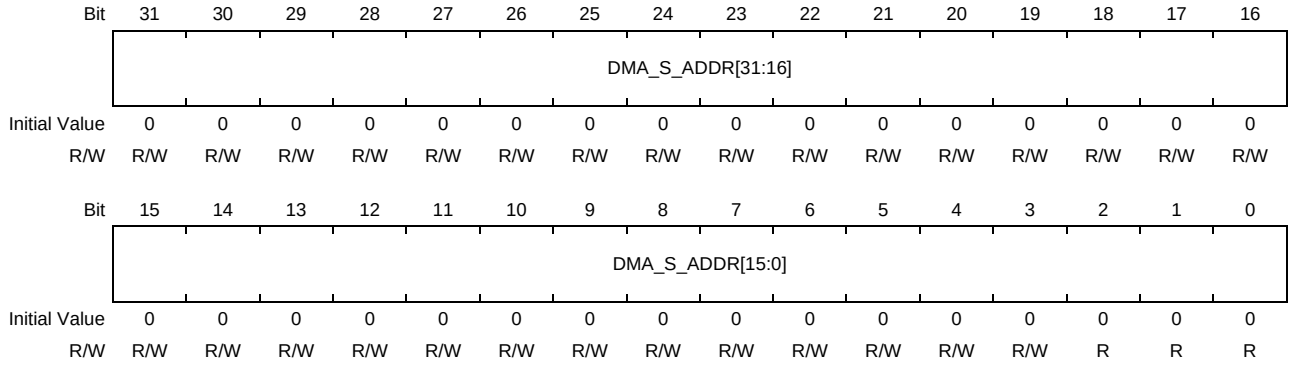
Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_SIZE [31:3]	All 0	R/W	Sets the number of DMA transfer bytes.
2 to 0	DMA_SIZE [2:0]	000b	R	Since the setting for 8-byte alignment, the lower 3 bits are fixed to 000b.

NOTE

During descriptor method DMA execution, write is prohibited and the read value is the value of the SIZE field in the running descriptor table.
The number of Bytes transferred when H’0000_0000 is set is H’1_0000_0000.

34.3.1.56 DMA Source Lower Address (Descriptor H'10) Registers (Offset: H'930/+Channel Offset)

This register sets the low-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H'10 field of the descriptor table.



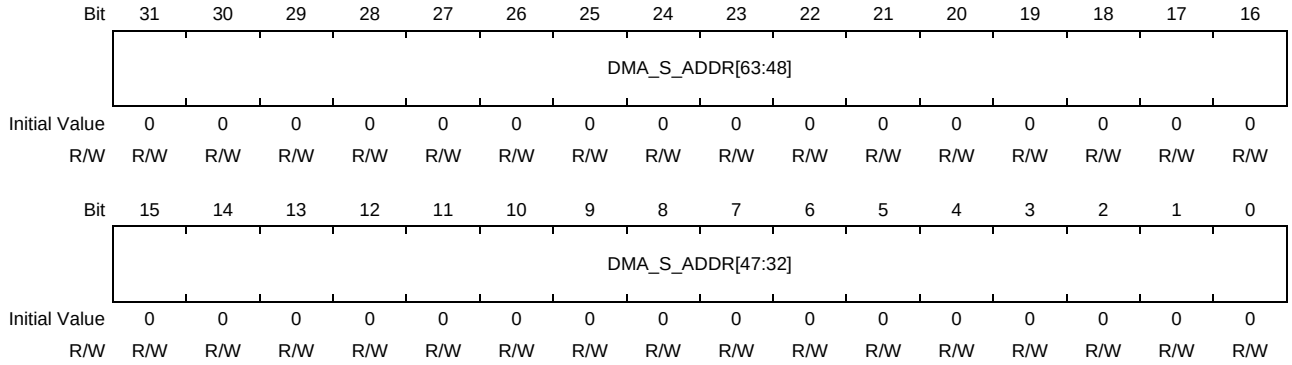
Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_S_ADDR [31:3]	All 0	R/W	Sets the low 32 bits of the source start address for DMA transfers.
2 to 0	DMA_S_ADDR [2:0]	000b	R	Since the setting for 8-byte alignment, the lower 3 bits are fixed to 000b.

NOTE

When Source Address indicates the PCIe space (DIR = 0), it is combined with the DMA PCIe Upper Address (Descriptor H'10) to form the PCIe request address. During descriptor method DMA execution, write is prohibited and the read value indicates the value of the SA field in the running descriptor table.

34.3.1.57 DMA Source Upper Address (Descriptor H'14) Registers (Offset: H'934/+Channel Offset)

This register sets the up-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H'14 field of the descriptor table.



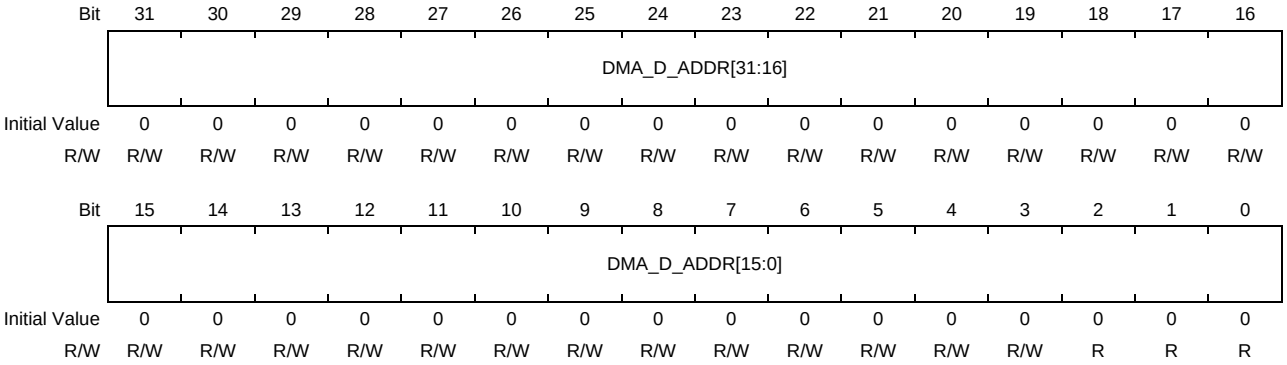
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_S_ADDR	All 0	R/W	Sets the up 32 bits of the source start address for DMA transfers.

NOTE

When Source Address indicates the PCIe space (DIR = 0), it is combined with the DMA PCIe Upper Address (Descriptor H'10) to form the PCIe request address. During descriptor method DMA execution, write is prohibited and the read value indicates the value of the SA field in the running descriptor table.

34.3.1.58 DMA Destination Lower Address (Descriptor H’18) Registers (Offset: H’938/+Channel Offset)

This register sets the low-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H’18 field of the descriptor table.



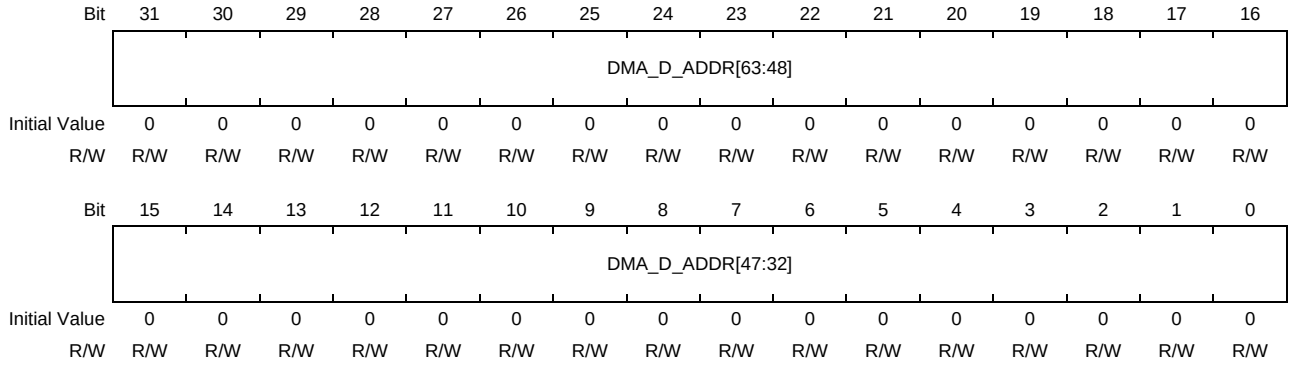
Bit	Bit Name	Initial Value	R/W	Description
31 to 3	DMA_D_ADDR [31:3]	All 0	R/W	Sets the low 32 bits of the source start address for DMA transfers.
2 to 0	DMA_D_ADDR [2:0]	000b	R	Since the setting for 8-byte alignment, the lower 3 bits are fixed to 000b.

NOTE

When Destination Address indicates the PCIe space (DIR = 1), it is combined with the DMA PCIe Upper Address (Descriptor H’10) to form the PCIe request address. During descriptor method DMA execution, write is prohibited and the read value indicates the value of the DA field in the running descriptor table.

34.3.1.59 DMA Destination Upper Address (Descriptor H'1C) Registers (Offset: H'93C/+Channel Offset)

This register sets the up-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H'32 field of the descriptor table.

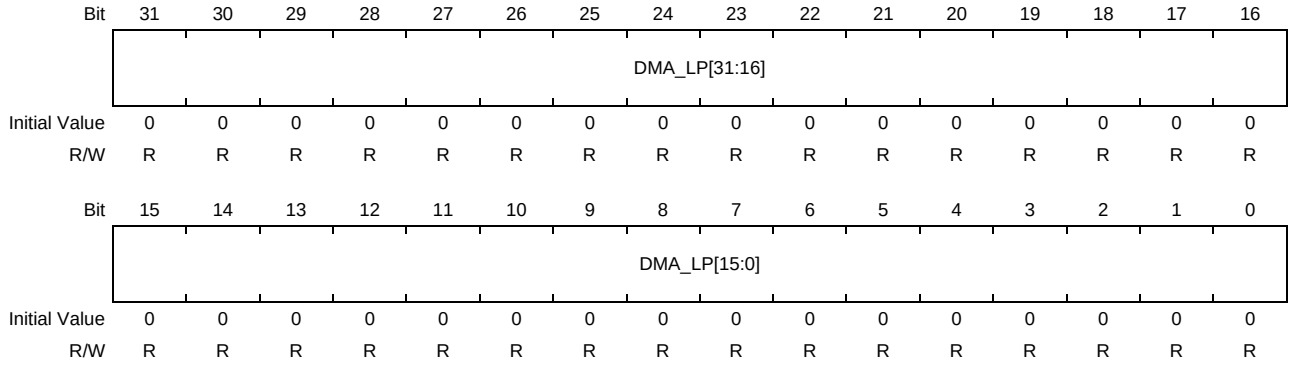


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_D_ADDR	All 0	R/W	Sets the up 32 bits of the source start address for DMA transfers.

Note: When Destination Address indicates PCIe space (DIR = 1), it becomes PCIe request address together with DMA PCIe Upper Address (Descriptor H'10). When executing descriptor method DMA, writing is prohibited, and the read value indicates the value of the DA field of the descriptor table being executed.

34.3.1.60 DMA Descriptor Lower Link Pointer (Descriptor H'20) Registers (Offset: H'940/+Channel Offset)

This register shows the Offset H'20 field value in the descriptor table. Valid only when descriptor method DMA is selected (read value has no meaning when using register method)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP	All 0	R	It indicates the value of the LP field in the running descriptor table.

34.3.1.61 DMA Descriptor Upper Link Pointer (Descriptor H'24) Registers (Offset: H'944/+Channel Offset)

This register shows the Offset H'24 field value in the descriptor table. Valid only when descriptor method DMA is selected (read value has no meaning when using register method)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_LP[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_LP[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP	All 0	R	Indicates the value of the LP field in the running descriptor table.

34.3.1.62 DMA Rest Size Registers (Offset: H'950/+Channel Offset)

This register shows the number of Bytes for which DMA transfers have not been completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_REST_SIZE[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_REST_SIZE[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_REST_SIZE	All 0	R	It shows the number of Bytes for which DMA transfers have not been completed. (Register/descriptor method common)

34.3.1.63 AXI Request Address (Lower) Registers (Offset: H'960/+Channel Offset)

This register displays the low 32 bits of the address of a transfer that is running an AXI transfer or has just completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR	All 0	R	It shows the low 32 bits of the address of a transfer that is running an AXI transfer or has just completed. (Register/descriptor method common)

34.3.1.64 AXI Request Address (Upper) Registers (Offset: H'964/+Channel Offset)

This register displays the up 32 bits of the address of a transfer that is running an AXI transfer or has just completed.

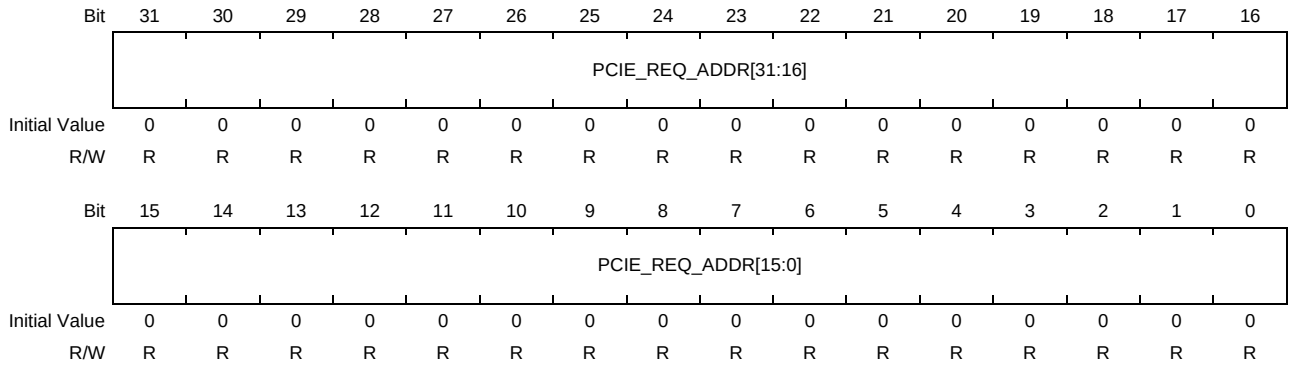
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR	All 0	R	It shows the up 32 bits of the address of a transfer that is running an AXI transfer or has just completed. (Register/descriptor method common)

34.3.1.65 PCIe Request Address (Lower) Registers (Offset: H'968/+Channel Offset)

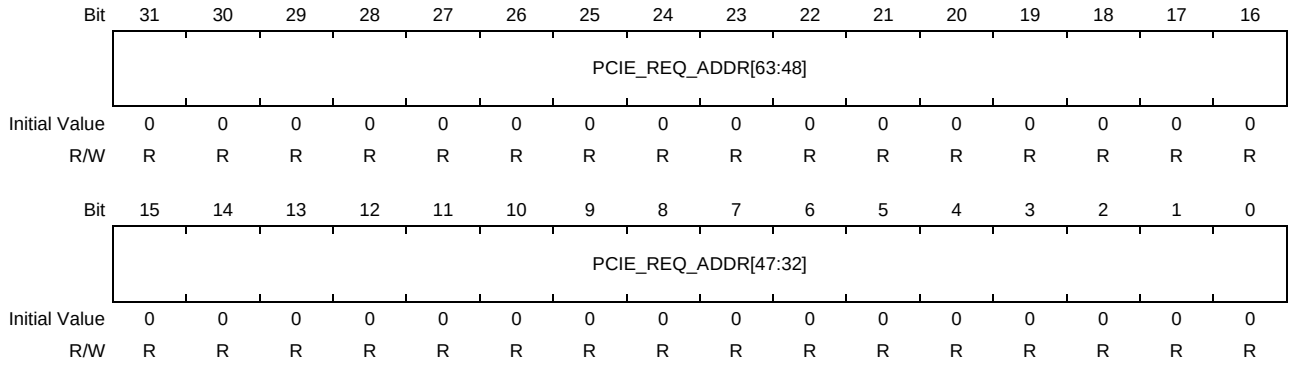
This register displays the low 32 bits of the address of a transfer that is running an PCIe transfer or has just completed.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR	All 0	R	It shows the low 32 bits of the address of a transfer that is running an PCIe transfer or has just completed. (Register/descriptor method common)

34.3.1.66 PCIe Request Address (Upper) Registers (Offset: H'96C/+Channel Offset)

This register displays the up 32 bits of the address of a transfer that is running an PCIe transfer or has just completed.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR	All 0	R	It shows the up 32 bits of the address of a transfer that is running an PCIe transfer or has just completed. (Register/descriptor method common)

34.3.1.67 QUE Status Registers (Offset: H'970/+Channel Offset)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GO_LIST	LIST_NUM			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GO_LIST	0b	R	It shows with or without a running descriptor list. 0: None 1: Yes
3 to 0	LIST_NUM	H'0	R	It shows the number of descriptor lists stacked on the QUE (not including the currently running list). When this register indicates H'8, new registrations to the QUE (write access to the QUE Entry) are disabled (discarded).

34.3.1.68 DMAC Error Status Registers (Offset: H'978/+Channel Offset)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BME_DOWN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MOR_CD_PERR	MOR_CH_PERR	MOR_EP_ERR	MOR_STATUS			—	—	—	—	—	—	AXI_RESP	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

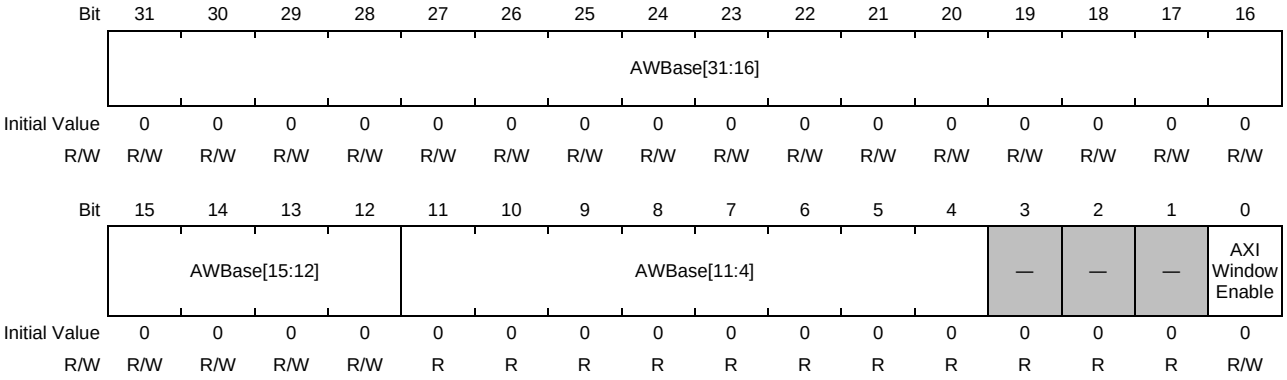
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	BME_DOWN	0b	R	This bit is set, when a stop signal from the PCIe core by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
15, 14	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	MOR_CD_PERR	0b	R	This bit is set, detecting MOR_CD_PERR error by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
12	MOR_CH_PERR	0b	R	This bit is set, detecting MOR_CH_PERR error by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
11	MOR_EP_ERR	0b	R	This bit is set, detecting Poisoned Completion status by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
10 to 8	MOR_STATUS	All 0	R	These bits set below value, detecting MOR_STATUS is not 000b (Success) by CHx_ERR error detection. Holds these bits until CHx_ERR error is cleared. 000b: Initial value 001b: Unsuspended Request 010b: CRS 011b: Completion Timeout 100b: Completer Abort 101b: Unexpected Completion 110b: Reserved 111b: Mismatched Length (Length Overrun)
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	AXI_RESP	00b	R	These bits represent the slave response status, in AXI Master transaction. These bits are updated, in causing CHx_ERR error. Holds these bits until CHx_ERR error is cleared. 00b: Initial value 01b: Unsuspended Request 10b: SLVERR 11b: DECERR

Note: CHx_ERR (x = 7 to 0).

34.3.1.69 AXI Window Base (Lower) Registers (H'1000 + Offset: H'00/H'20/H'40/…/H'E0)

This register is Window setting register for Lower address translation when accessing AXI from PCIe.

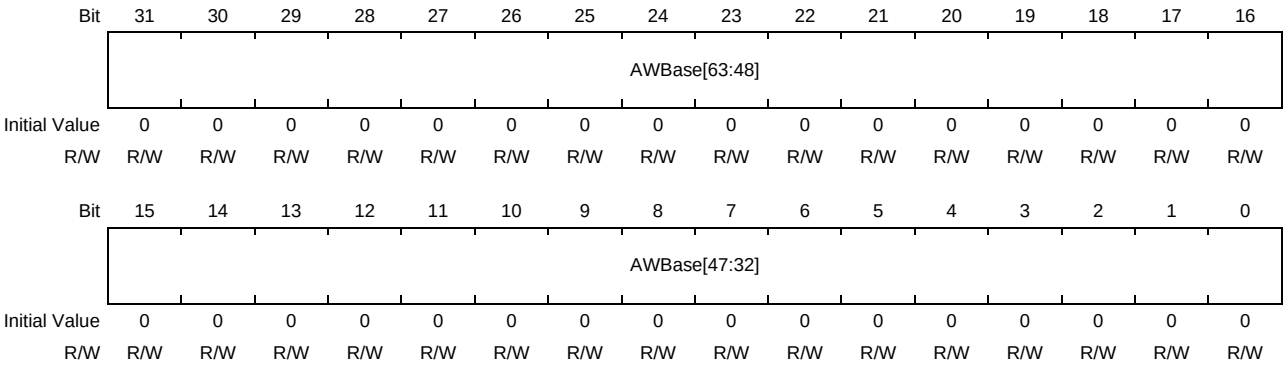
Sets the base point for PCIe side addresses. The configurable area is a 4K boundary.



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWBase	All 0	R/W	Window setting register for address translation when accessing AXI from PCIe. The configurable area is a 4K boundary.
11 to 4	AWBase	All 0	R	H'00 fixed
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI Window Enable	0b	R/W	Enable setting for the AXI Window. 0: Window disabled 1: Window enabled

34.3.1.70 AXI Window Base (Upper) Registers (H'1000 + Offset: H'04/H'24/H'44/…/H'E4)

This register is Window setting register for Upper address translation when accessing AXI from PCIe.

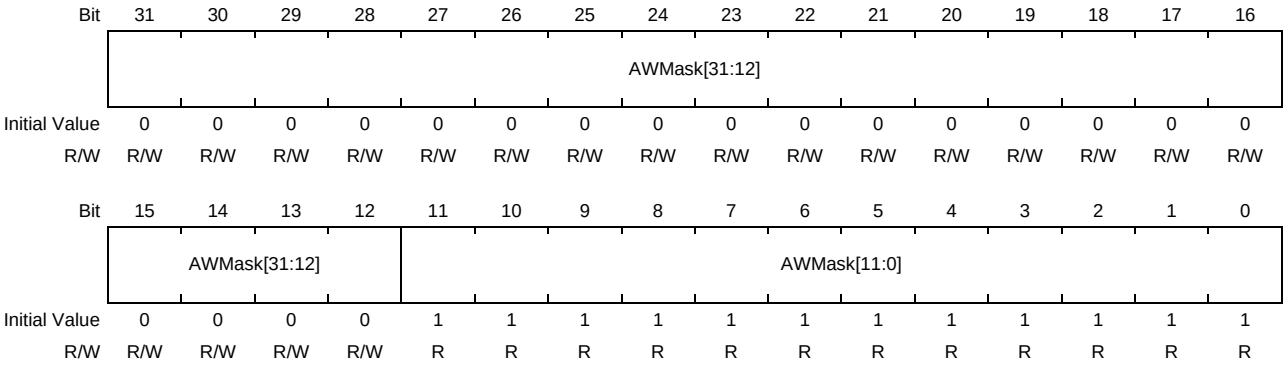


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AWBase	All 0	R/W	Window setting register for address translation when accessing AXI from PCIe.

34.3.1.71 AXI Window Mask (Lower) Registers (H'1000 + Offset: H'08/H'28/H'48/…/H'E8)

This register is Window setting register for Lower address translation when accessing AXI from PCIe.

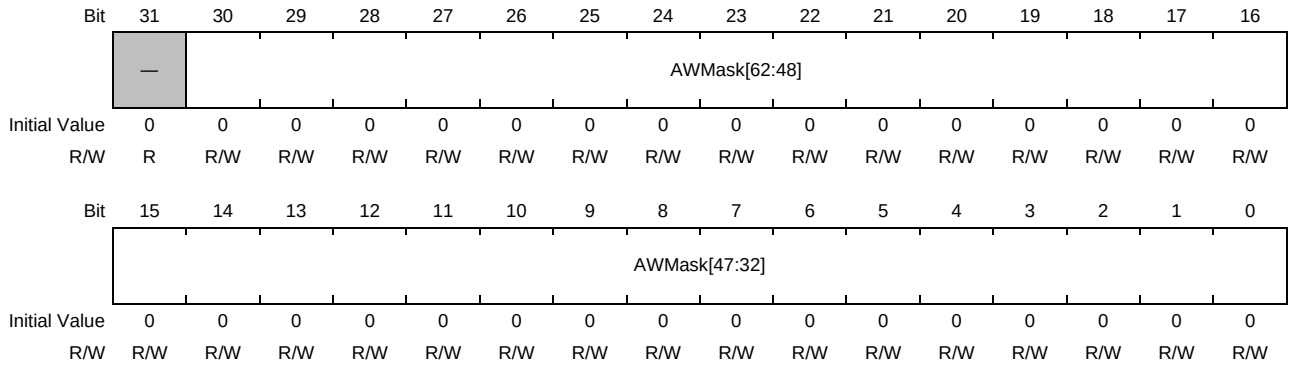
Set the Window from the address set in the AWBase register to the area of the set number of bits. The configurable area is 4K x 2N bytes.



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWMask	All 0	R/W	Set the Window from the address set in the AWBase register to the area of the set number of bits. The setting is set from the low order bit to 1. Therefore, the configurable area is 4K × 2N bytes.
11 to 0	AWMask	All 1	R	H'FFF fixed

34.3.1.72 AXI Window Mask (Upper) Registers (H'1000 + Offset: H'0C/H'2C/H'4C/…/H'EC)

This register is Window setting register for Upper address translation when accessing AXI from PCIe.

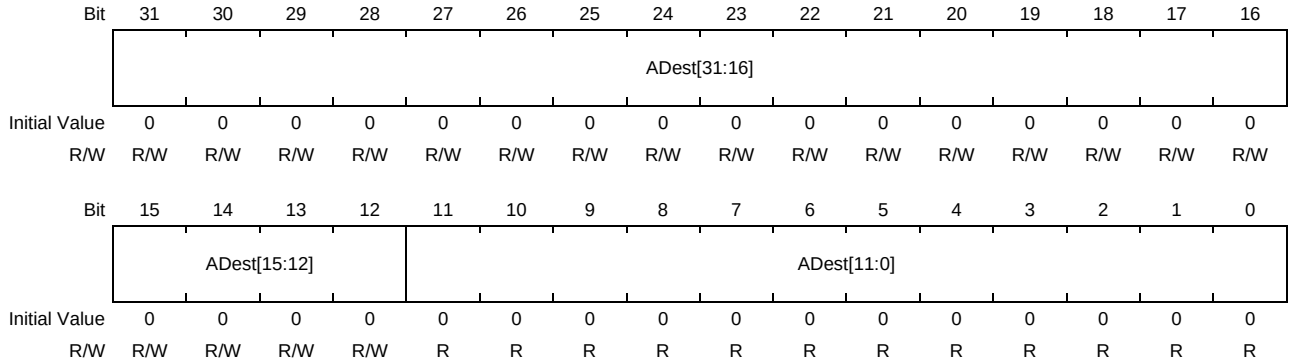


Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 0	AWMask	All 0	R/W	Set the Window from the address set in the AWBase register to the area of the set number of bits. The setting is set from the low order bit to 1.

34.3.1.73 AXI Destination (Lower) Registers (H'1000 + Offset: H'10/H'30/H'50/H'70/…/H'F0)

This register is Window setting register for Lower address translation when accessing AXI from PCIe.

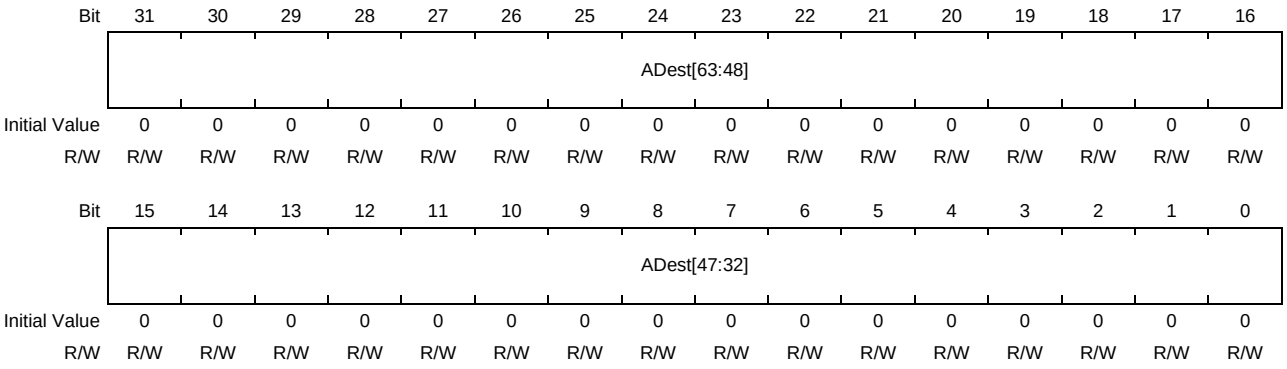
From the AXI side, set the Window point in the address space. The configurable area is a 4K boundary.



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	ADest	All 0	R/W	From the AXI side, set the Window point in the address space. The configurable area is a 4K boundary.
11 to 0	ADest	All 0	R	H'000 fixed

34.3.1.74 AXI Destination (Upper) Registers (H'1000 + Offset: H'14/H'34/H'54/H'74/…/H'F4)

This register is Window setting register for Upper address translation when accessing AXI from PCIe.

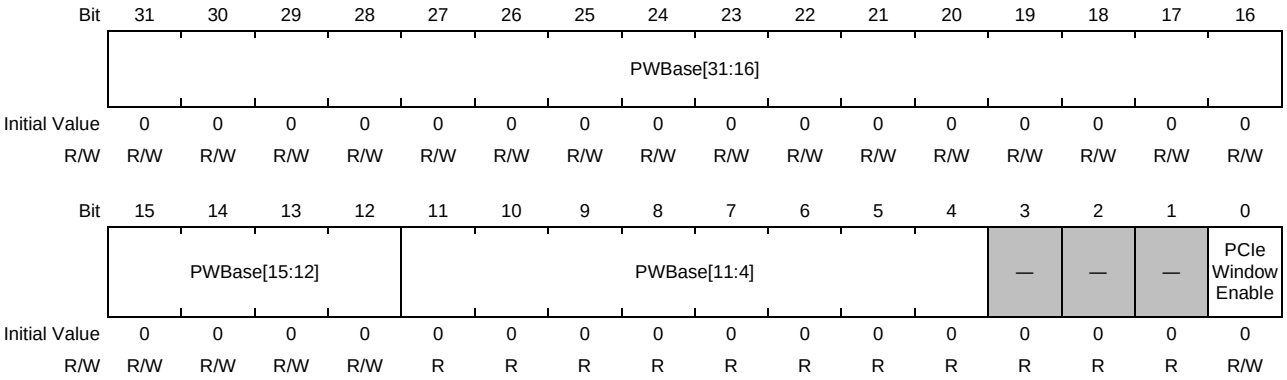


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADest	All 0	R/W	From the AXI side, set the Window point in the address space.

34.3.1.75 PCIe Window Base (Lower) Registers (H'1000 + Offset: H'100/H'120/H'140/…/H'1E0)

This register is Window setting register for Lower address translation when accessing PCIe from AXI.

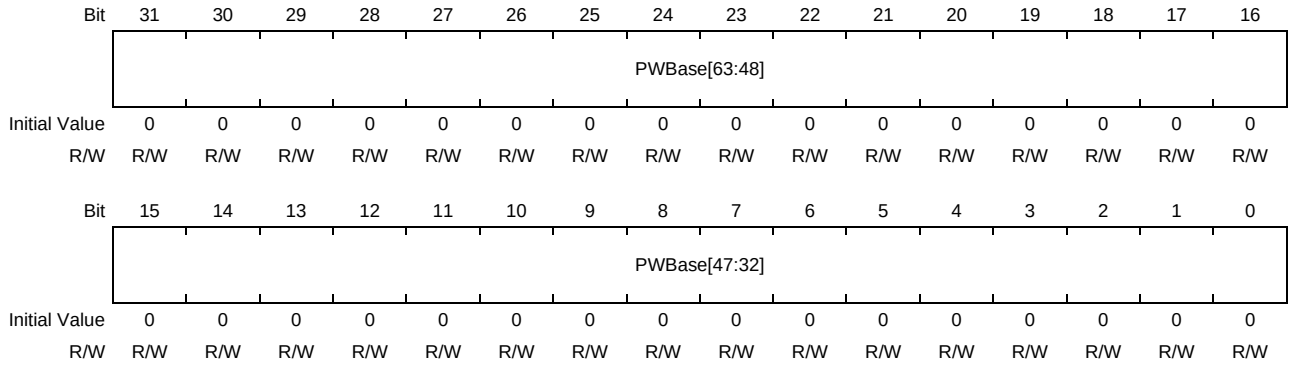
Sets the base point for AXI side addresses. The configurable area is a 4K boundary.



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWBase	All 0	R/W	Sets the base point for AXI side addresses. The configurable area is a 4K boundary.
11 to 4	PWBase	All 0	R	H'00 fixed
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PCIe Window Enable	0b	R/W	PCIe Window Enable setting. 0: Window disabled 1: Window enabled

34.3.1.76 PCIe Window Base (Upper) Registers (H'1000 + Offset: H'104/H'124/H'144/…/H'1E4)

This register is Window setting register for Upper address translation when accessing PCIe from AXI.

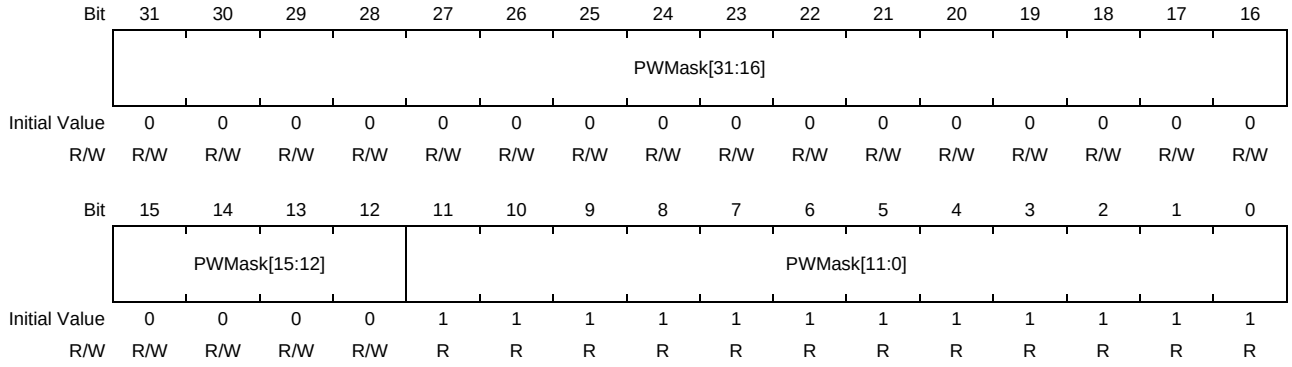


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PWBase	All 0	R/W	Sets the base point for AXI side addresses. The configurable area is a 4K boundary.

34.3.1.77 PCIe Window Mask (Lower) Registers (H'1000 + Offset: H'108/H'128/H'148/…/H'1E8)

This register is Window setting register for Lower address translation when accessing PCIe from AXI.

Set the Window from the address set in the PWBase register to the area of the set number of bits.

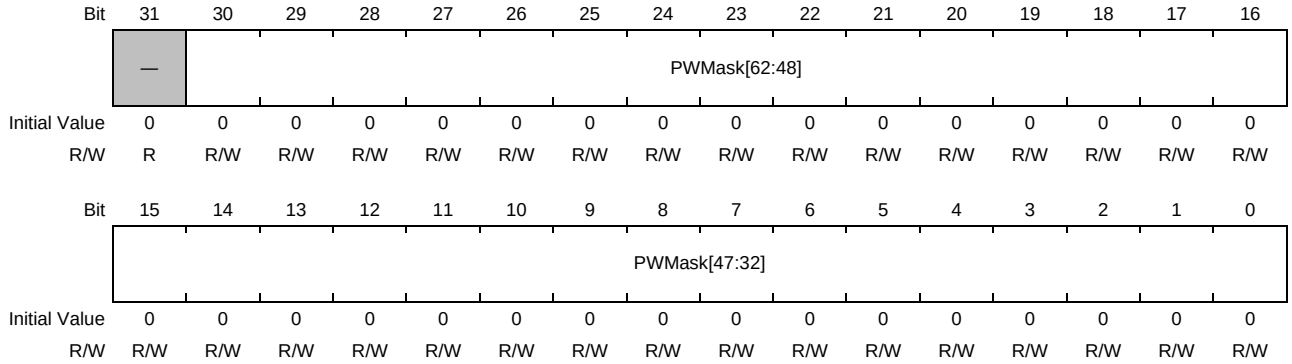


Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWMask	All 0	R/W	Set the Window from the address set in the PWBase register to the area of the set number of bits. The setting is set from the low order bit to 1.
11 to 0	PWMask	All 1	R	H'FFF fixed

34.3.1.78 PCIe Window Mask (Upper) Registers (H'1000 + Offset: H'10C/H'12C/H'14C/…/H'1EC)

This register is Window setting register for Upper address translation when accessing PCIe from AXI.

Set the Window from the address set in the PWBase register to the area of the set number of bits.

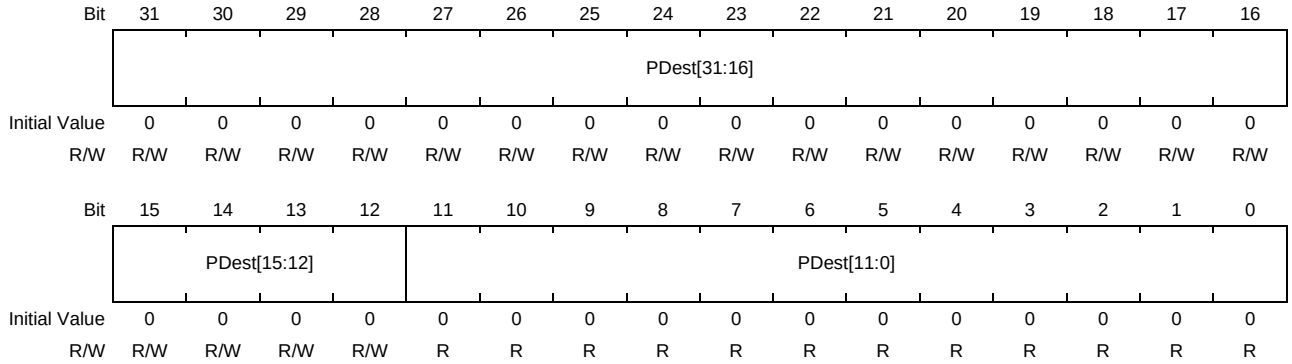


Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 0	PWMask	All 0	R/W	Set the Window from the address set in the PWBase register to the area of the set number of bits. The setting is set from the low order bit to 1.

34.3.1.79 PCIe Destination (Lower) Registers (H'1000 + Offset: H'110/H'130/H'150/H'170/…/H'1F0)

This register is Window setting register for Upper address translation when accessing PCIe from AXI.

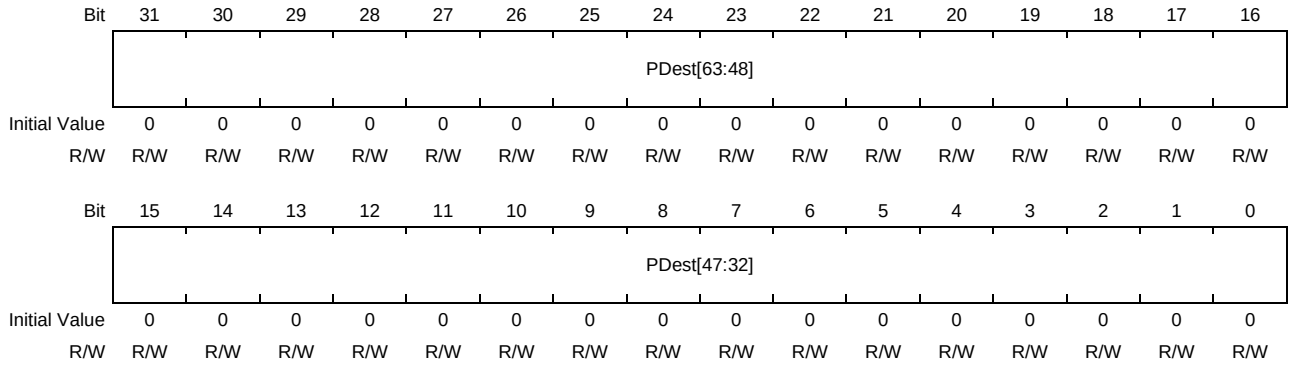
Set the Window point in the PCIe side address space. The configurable area is a 4K boundary.



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PDest	All 0	R/W	Set the Window point in the PCIe side address space. The configurable area is a 4K boundary.
11 to 0	PDest	All 0	R	H'000 fixed

34.3.1.80 PCIe Destination (Upper) Register (H'1000 + Offset: H'114/H'134/H'154/H'174/…/H'1F4)

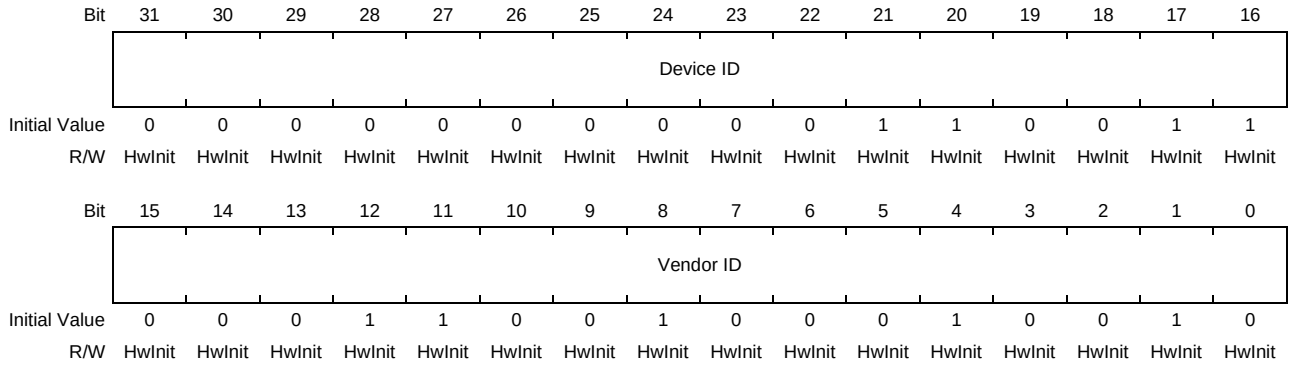
This register is Window setting register for Upper address translation when accessing PCIe from AXI.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PDest	All 0	R/W	Set the Window point in the PCIe side address space.

34.3.2 PCI Express Configuration Registers (Type1)

34.3.2.1 Vendor and Device ID (Offset: H'6000)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 16	Device ID	H'0033	HwInit	RST_LOAD_B	Indicates the manufacturer of the device. Set a fixed value.
15 to 0	Vendor ID	H'1912	HwInit	RST_LOAD_B	Used to identify the device manufactured by the manufacturer specified by Vendor ID. Set a fixed value.

34.3.2.2 Command and Status (Offset: H'6004)

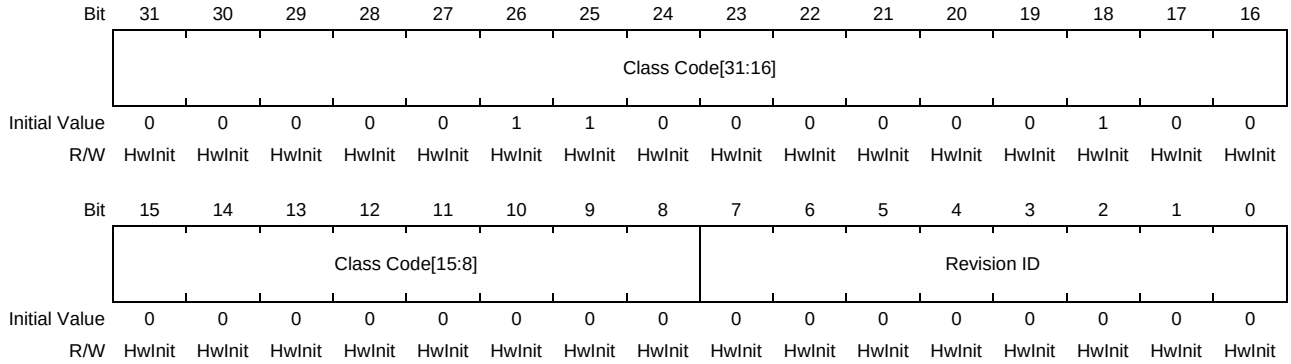
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Detected Parity Error	Signaled System Error	Received Master Abort	Received Target Abort	Signaled Target Abort	DEVSEL Timing		Master Data Parity Error	—	—	—	Capabilities List	Interrupt Status	—	—	Immediate Readiness
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R/W1C	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	Interrupt Disable	—	SERR# Enable	—	Parity Error Response	—	—	—	Bus Master Enable	Memory Space Enable	I/O Space Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	Detected Parity Error	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
30	Signaled System Error	0b	R/W1C	RST_CFG_B	The SERR Enable bit is set to 1b when this macro sends an ERR_FATAL or ERR_NONFATAL Message.
29	Received Master Abort	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
28	Received Target Abort	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
27	Signaled Target Abort	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
26, 25	DEVSEL Timing	00b	R	—	Reserved Does not apply to PCI Express.
24	Master Data Parity Error	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
23 to 21	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	Capabilities List	1b	R	RST_CFG_B	All PCI Express devices must implement PCI Express Capability, so this bit is fixed at 1b.
19	Interrupt Status	0b	R	RST_CFG_B	Indicates the interrupt status of the device.
18, 17	—	00b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	Immediate Readiness	0b	R	—	Fixed to 0b.
15 to 11	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	Interrupt Disable	0b	R/W	RST_CFG_B	Suppresses the sending of Assert_INTx Messages. Not used for Root Complex devices.
9	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

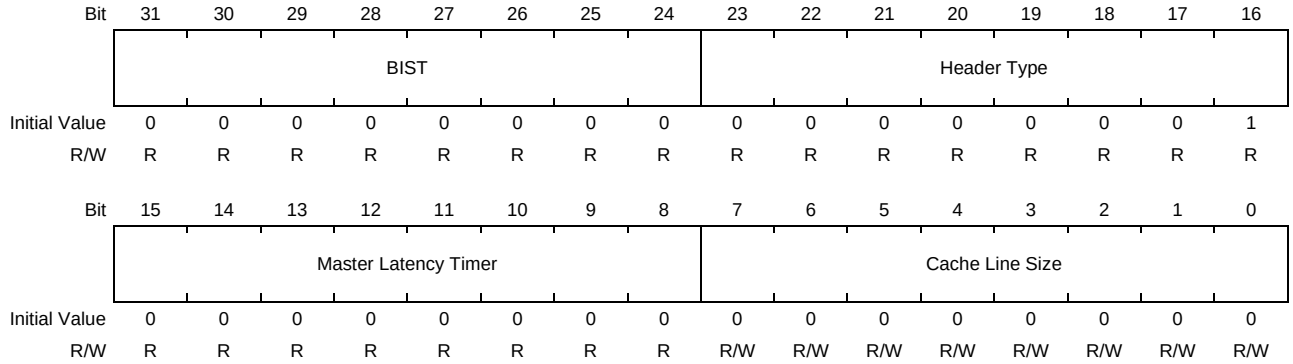
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
8	SERR# Enable	0b	R/W	RST_CFG_B	When this bit is set to “1b”, Non-Fatal Errors and Fatal Errors are notified to the Root Complex by Message Transaction. Note: Even if this bit is not set, if the Error Reporting-related bit in the Device Control register of PCI Express Capability is set to “1b”, Message If this bit is not set, the Root Complex is notified of the error by means of a Message Transaction.
7	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	Parity Error Response	0b	R/W	RST_CFG_B	Controls the behavior when a Poisoned TLP is sent or received. Note: The Detected Parity Error field in the Status register, the Device Status register in the PCI Express Capability, and the Uncorrectable Error in the Advanced Error Reporting Capability Error Logging to the Status register is performed regardless of the setting of this bit.
5 to 3	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	Bus Master Enable	0b	R/W	RST_CFG_B	Controls whether the device acts as a bus master.
1	Memory Space Enable	0b	R/W	RST_CFG_B	Controls whether to respond to accesses to memory space.
0	I/O Space Enable	0b	R	—	Does not respond to I/O space accesses. 0b fixed

34.3.2.3 Revision ID and Class Code (Offset: H’6008)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 8	Class Code	H’06_0400	HwInit	RST_LOAD_B	Information indicating the type and function of the device, the definition of the value is divided into the following two bytes by the PCI SIG: Bit [31:24]: Base class (H’06) Bit [23:16]: Sub-class (H’04) Bit [15:8]: Programming interface (H’00) Set a fixed value. The initial value is parameter settable.
7 to 0	Revision ID	All 0	HwInit	RST_LOAD_B	An 8-bit ID used to represent the revision of a particular device identified by its Vendor ID and Device ID. Set a fixed value. The initial value is parameter settable.

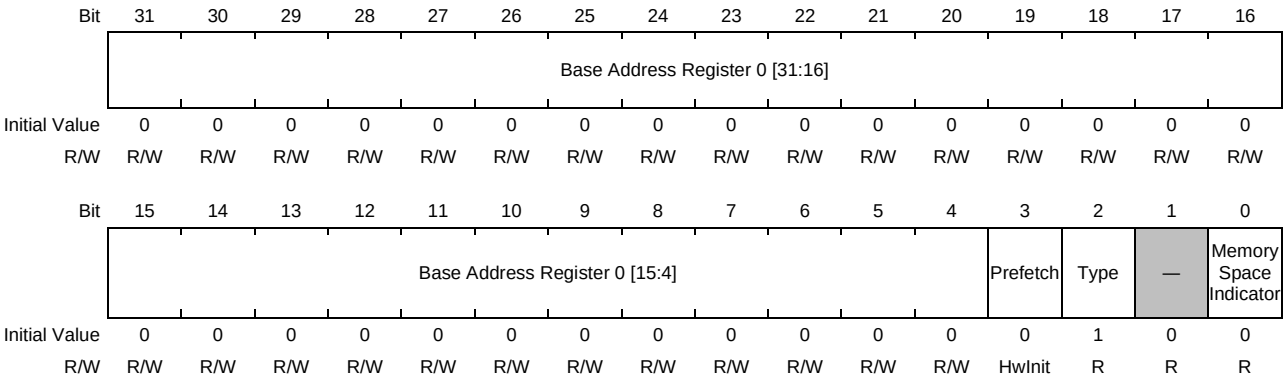
34.3.2.4 Cache Line and Header Type (Offset: H'600C)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	BIST	H'00	R	—	It does not support the BIST register function, so it is fixed at H'00.
23 to 16	Header Type	H'01	R	—	Root Complex: H'01 fixed.
15 to 8	Master Latency Timer	H'00	R	—	Master delay timer register not used in PCI Express, so it is fixed at H'00.
7 to 0	Cache Line Size	H'00	R/W	RST_CFG_B	Implemented as a read-write field for legacy compatibility, but the value set has no effect on this device.

34.3.2.5 Base Address Register 0 (Offset: H'6010)

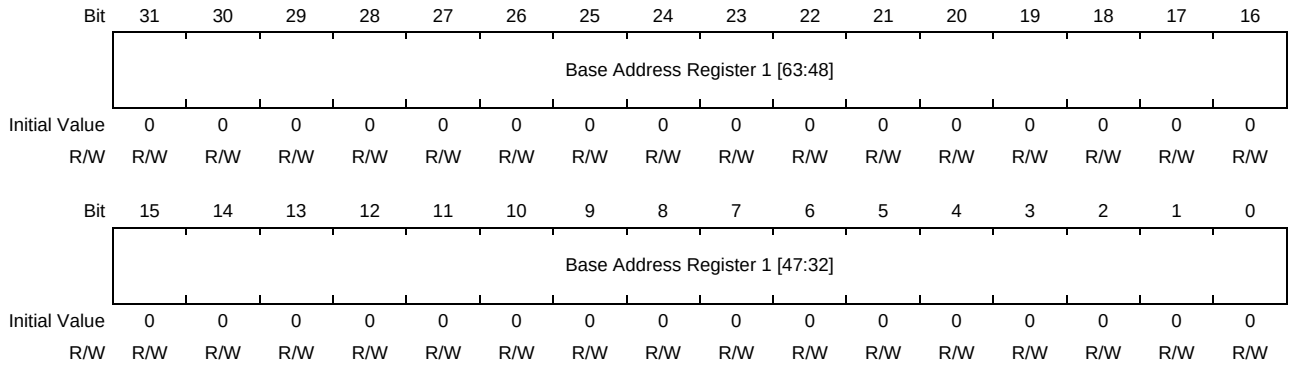
The combination with Base Address Register 1 (BAR1) constitutes a 64 bits Memory Space.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 4	Base Address Register 0	All 0	R/W	RST_CFG_B	It indicates the base address. Depending on the size of the address block required, some low-order bits of this field should be implemented as 0b fixed Read Only bits. In this macro, the Read Only bit can be set in the Base Address 0 Mask register (Offset: H'0A0).
3	Prefetch	0b	HwInit	RST_LOAD_B	The Prefetchable Memory Base and Prefetchable Memory Limit registers must indicate that 64-bit addresses are supported, as defined in PCI-to-PCI Bridge Architecture Specification. 0: Disable 1: Enable
2	Type	1b	R	—	The 64-bit addresses are supported, as defined in PCI-to-PCI Bridge Architecture Specification. 0b: 32bit address 1b: 64bit address 1b: Fixed to use 64bit Address
1	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Memory Space Indicator	0b	R	—	0b fixed to indicate memory space.

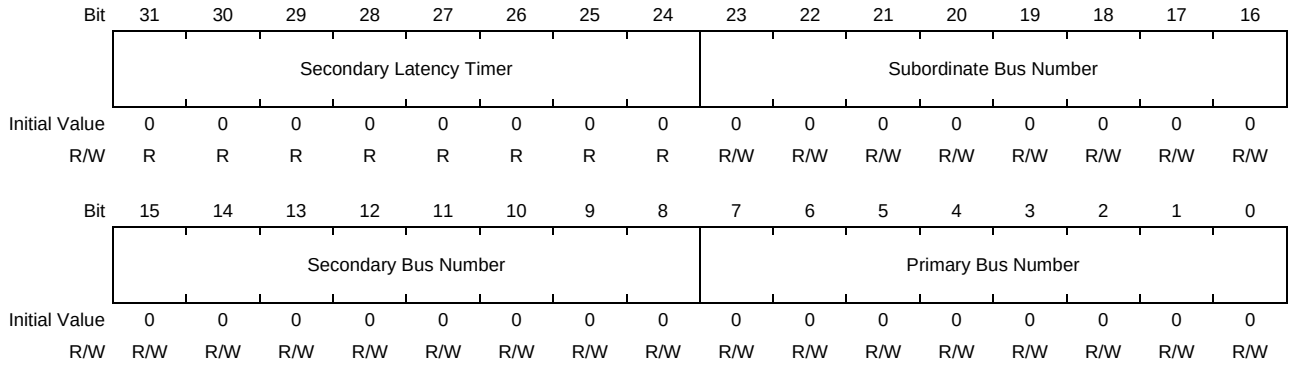
34.3.2.6 Base Address Register 1 (Offset: H'6014)

The combination with Base Address Register 0 (BAR0) constitutes a 64 bits Memory Space.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Base Address Register 1	All 0	R/W	RST_CFG_B	Base Address Register 1 (64bit Upper Address) It indicates the high-order 32 bits of the base address.

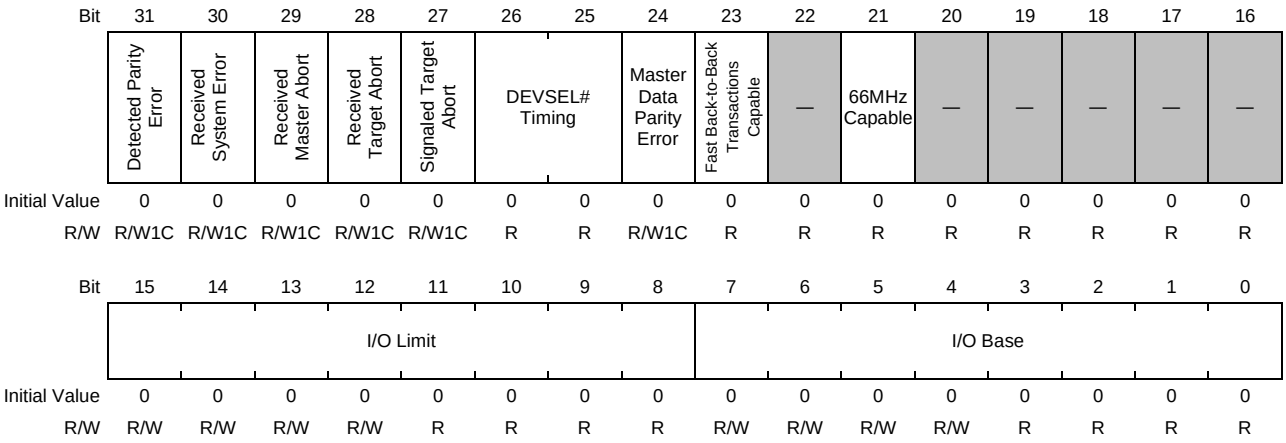
34.3.2.7 Bus Number Register (Offset: H'6018)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	Secondary Latency Timer	H'00	R	—	PCI Express does not use H'00 fixed
23 to 16	Subordinate Bus Number	H'00	R/W	RST_CFG_B	Set the Subordinate Bus Number. Default: H'00
15 to 8	Secondary Bus Number	H'00	R/W	RST_CFG_B	Set the Subordinate Bus Number. Default: H'00
7 to 0	Primary Bus Number	H'00	R/W	RST_CFG_B	Set the Primary Bus Number. Default: H'00

34.3.2.8 I/O Base/Limit and Secondary Status (Offset: H'601C)

Do not change the initial value.

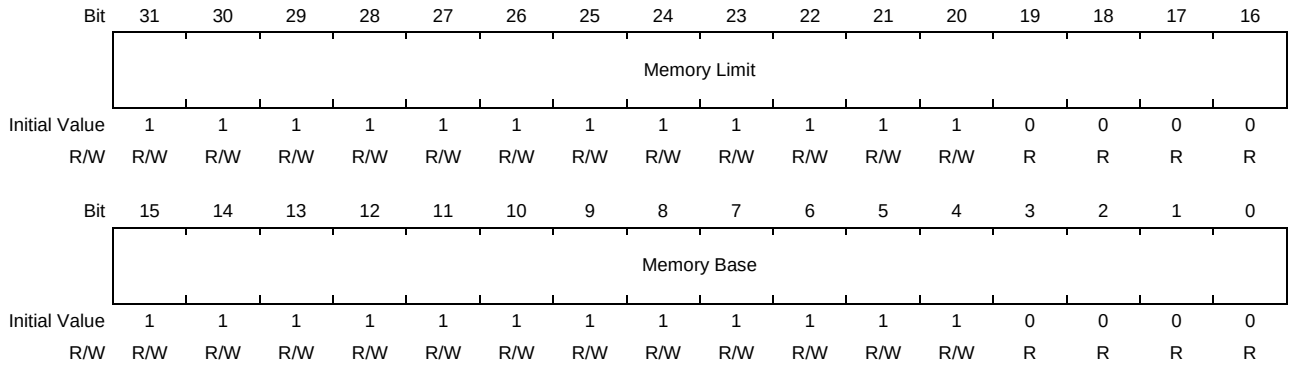


Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	Detected Parity Error	0b	R/W1C	RST_CFG_B	It is set to 1b when a Poisoned TLP is received, regardless of the setting of the Parity Error Response Enable bit in the Bridge Control and Interrupt Register (Offset: H'03C).
30	Received System Error	0b	R/W1C	RST_CFG_B	It is set to 1b when ERR_FATAL or ERR_NONFATAL Message is received.
29	Received Master Abort	0b	R/W1C	RST_CFG_B	The Completion Status field is set to 1b when Completion of an Unsupported Request is received.
28	Received Target Abort	0b	R/W1C	RST_CFG_B	The Completion Status field is set to 1b when Completion of Completer Abort is received.
27	Signaled Target Abort	0b	R/W1C	RST_CFG_B	The Completion Status field is set to 1b when a Completion of Completer Abort (Posted or Non-Posted Request) is sent.
26, 25	DEVSEL# Timing	00b	R	—	PCI Express does not use it, so it is fixed at 00b.
24	Master Data Parity Error	0b	R/W1C	RST_CFG_B	The Parity Error Response bit is set to 1b and is set to 1b when the following two conditions occur: 1) The Requester (BME) received Completion TLP of Poisoned. 2) The Requester (BME) sent the Write Request TLP of Poisoned. If the Parity Error Response bit is 0b, this bit is not set to 1b.
23	Fast Back-to-Back Transactions Capable	0b	R	—	PCI Express does not use it 0b fixed
22	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	66MHz Capable	0b	R	—	PCI Express does not use it 0b fixed
20 to 16	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	I/O Limit	All 0	R/W	—	This field is not used. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11 to 8		All 0	R	—	This field is not used. When read, the initial value is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
7 to 4	I/O Base	All 0	R/W	—	This field is not used. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 0		All 0	R	—	This field is not used. When read, the initial value is read. The written value will be ignored.

34.3.2.9 Memory Base/Limit Register (Offset: H’6020)

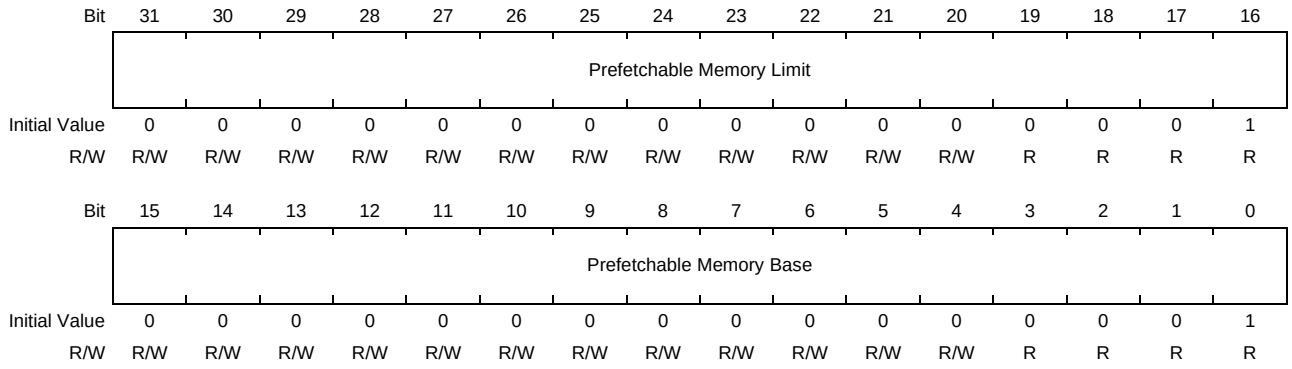
Do not change the initial value.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 20	Memory Limit	H’FFF0	R/W	RST_CFG_B	The Memory Limit register, define a memory mapped address range which is used by the bridge to determine when to forward memory transactions from one interface to the other. Initial value: H’FFF0
19 to 16			R		
15 to 4	Memory Base	H’FFF0	R/W	RST_CFG_B	The Memory Base register, define a memory mapped address range which is used by the bridge to determine when to forward memory transactions from one interface to the other. Initial value: H’FFF0
3 to 0			R		

34.3.2.10 Prefetchable Memory Base/ Limit Register (Offset: H’6024)

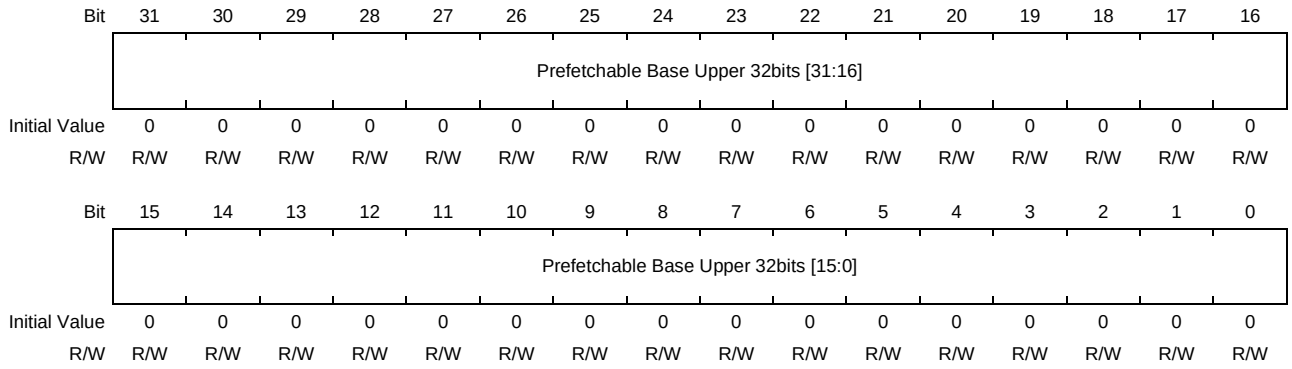
Do not change the initial value.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 20	Prefetchable Memory Limit	H’0001	R/W	RST_CFG_B	The Prefetchable Memory Limit register, define a prefetchable memory address range which is used by the bridge to determine when to forward memory transactions from one interface to the other. These are optional. Initial value: H’0001
19 to 16			R		
15 to 4	Prefetchable Memory Base	H’0001	R/W	RST_CFG_B	The Prefetchable Memory Base register, define a prefetchable memory address range which is used by the bridge to determine when to forward memory transactions from one interface to the other. These are optional. Initial value: H’0001
3 to 0			R		

34.3.2.11 Prefetchable Base Upper 32Bits Registers (Offset: H’6028)

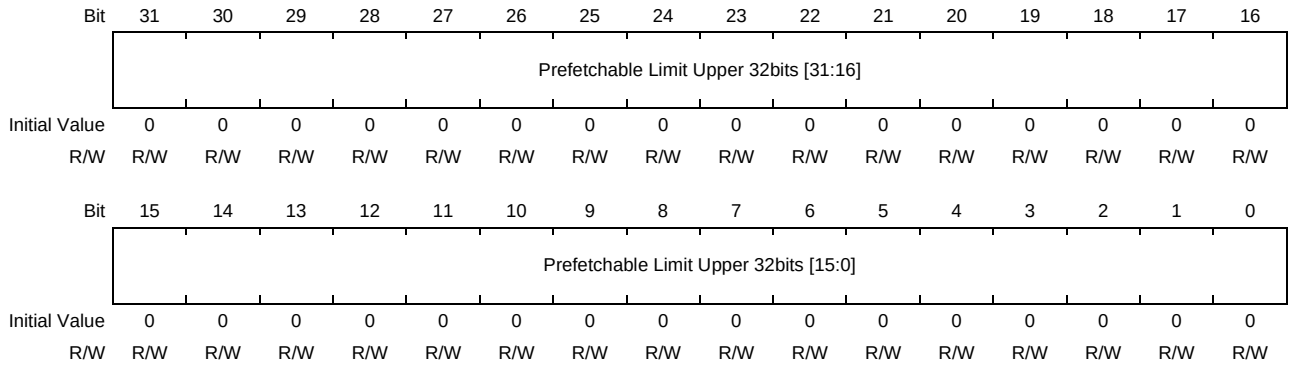
Do not change the initial value.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Prefetchable Base Upper 32bits	All 0	R/W	RST_CFG_B	These registers are optional extensions to the Prefetchable Base Upper 32 bits registers. Initial value: H’0000_0000

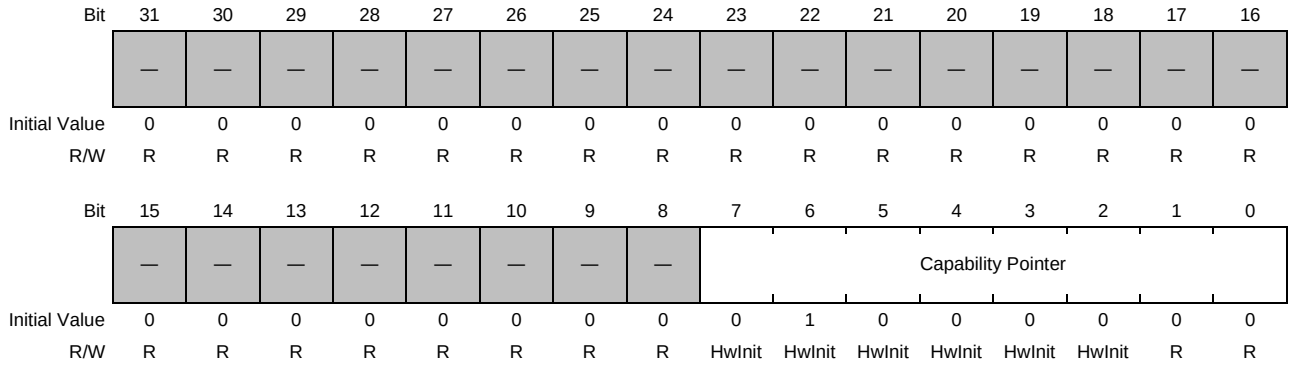
34.3.2.12 Prefetchable Limit Upper 32Bits (Offset: H'602C)

Do not change the initial value.



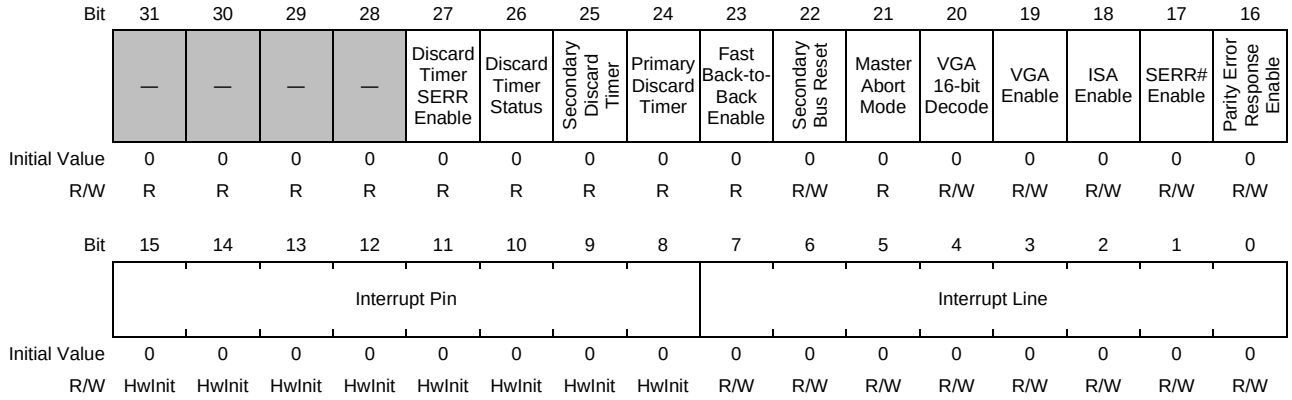
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Prefetchable Limit Upper 32bits	All 0	R/W	RST_CFG_B	These registers are optional extensions to the Prefetchable Limit Upper 32 bits registers. Initial value: H'0000_0000

34.3.2.13 Capability Pointer (Offset: H'6034)



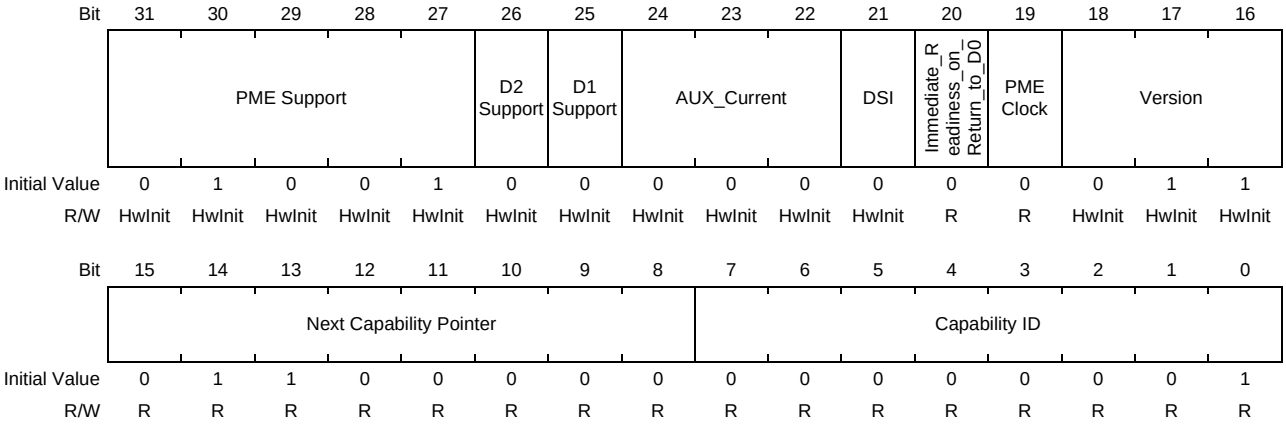
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 8	—	All 0	R	RST_CFG_B	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 2	Capability Pointer	H'40	HwInit	RST_CFG_B	Capability Implementation Start Address H'40
1, 0			R		PCI Power Management Capability has been implemented since H'40. The lower 2 bits are 00b fixed (reserved) and cannot be written even from the UDL side.

34.3.2.14 Bridge Control and Interrupt (Offset: H’603C)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 28	—	H’0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	Discard Timer SERR Enable	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
26	Discard Timer Status	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
25	Secondary Discard Timer	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
24	Primary Discard Timer	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
23	Fast Back-to-Back Enable	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
22	Secondary Bus Reset	0b	R/W	RST_CFG_B	Transition to Hot Reset state with 1b write
21	Master Abort Mode	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
20	VGA 16-bit Decode	0b	R/W	RST_CFG_B	Initial value 0b It is not used in this macro.
19	VGA Enable	0b	R/W	RST_CFG_B	Initial value 0b It is not used in this macro.
18	ISA Enable	0b	R/W	RST_CFG_B	Initial value 0b It is not used in this macro.
17	SERR# Enable	0b	R/W	RST_CFG_B	1b Write enables INT_SERR * interrupt terminal notification
16	Parity Error Response Enable	0b	R/W	RST_CFG_B	1b Set the Master Data Parity Error bit in the Secondary Status register when Poisoned TLP is received by writing.
15 to 8	Interrupt Pin	H’00	HwInit	RST_LOAD_B	The Interrupt Pin register is a read-only register that identifies the legacy interrupt Message(s) the Function uses H’00 fixed.
7 to 0	Interrupt Line	H’00	R/W	RST_CFG_B	The Interrupt Line register communicates interrupt line routing information. H’00 fixed.

34.3.2.15 PM Capabilities (Offset: H'6040)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 27	PME Support	01001b	HwInit	RST_LOAD_B	Indicates with or without PME support of each Device State. xxxx1: Supports D0 xxx1x: Supports D1 xx1xx: Supports D2 x1xxx: Supports D3hot 1xxxx: Supports D3cold (Not supported)
26	D2 Support	0b	HwInit	RST_LOAD_B	Indicates with or without D2 Power Management State support. 0: Not Support 1: Support
25	D1 Support	0b	HwInit	RST_LOAD_B	Indicates with or without D1 Power Management State support. 0: Not Support 1: Support
24 to 22	AUX_Current	000b	HwInit	RST_LOAD_B	Indicates 3.3 Vaux auxiliary current (Maximum current value, supplied by the auxiliary power supply). 111b: 375 mA 110b: 320 mA 101b: 250 mA 100b: 220mA 011b: 160 mA 010b: 100 mA 001b: 55 mA 000b: 0 (self-powered) (Read value returns 000b. AUX not supported)
21	DSI	0b	HwInit	RST_LOAD_B	Indicates with or without to use DSI (Device Specific Initialization). 0: Not Support 1: Support
20	Immediate_Readiness_on_Return_to_D0	0b	R	—	This Function is guaranteed to be ready to successfully complete valid accesses immediately after being set to D0. 0b fixed
19	PME Clock	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed.
18 to 16	Version	011b	HwInit	RST_LOAD_B	PCI Power Management Interface Specification Rev.1.2 011b fixed

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
15 to 10	Next Capability Pointer	H'60	R	RST_LOAD_B	Indicates the PCI Express Capability starting address. This field provides an offset into the Function's Configuration Space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to H'00.
9, 8				—	
7 to 0	Capability ID	H'01	R	—	Indicates PCI Power Management Capability. H'01 fixed

34.3.2.16 PM Status/Control (Offset: H'6044)

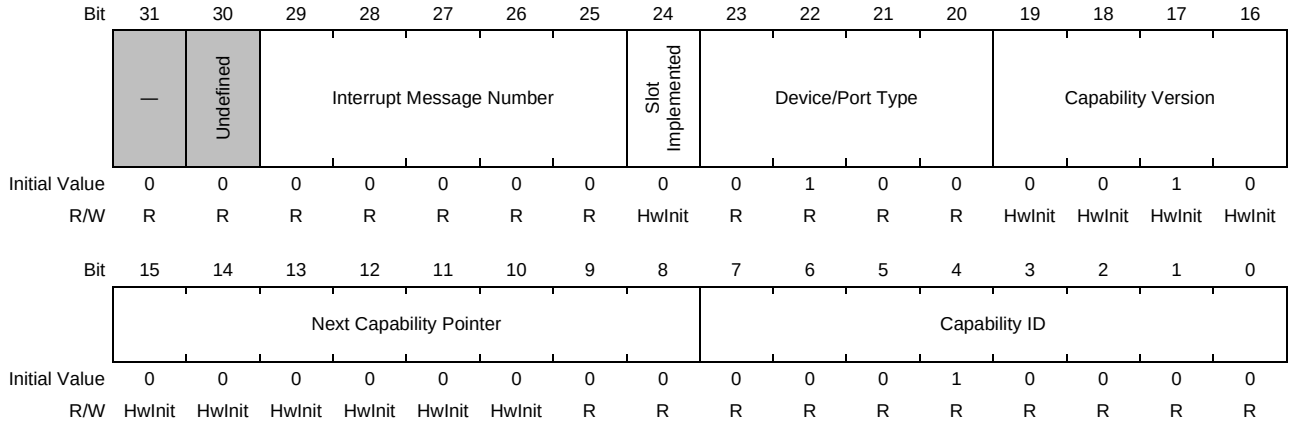
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PME Status	Data Scale		Data Select				PME Enable	—	—	—	—	No_Soft _Reset	—	PowerState	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R/W1C	R	R	R	R	R	R	R/WS	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	Data	H'00	R	—	Does not support. Fixed H'00.
23	Bus Power/Clock Control Enable	0b	R	—	Does not support. Fixed 0b.
22	B2/B3 Support	0b	R	—	Does not support. Fixed 0b.
21 to 16	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	PME Status	0b	R/W1C	—	Indicates that a PME assert factor is occurring. When this bit is 1b, indicates that there is a PME assert factor.
14,13	Data Scale	00b	R	—	Does not support. Fixed 00b.
12 to 9	Data Select	H'0	R	—	Does not support. Fixed H'0.
8	PME Enable	0b	R/WS	RST_RSM_B	Controls the assertion of the PME. When this bit is 1b, PME assertions are enabled. Assert PME if PME_Status is set. PCI Express performs Link wake-up processing and then PME assert processing by sending a PM_PME Message. *Note*: According to the value of PM Capabilities register PME Support [4] (PME Support in D3cold), the specifications are as follows. – PME Support [4] =1b Reset: RST_RSM_B PME – Support [4] = 0b Reset: RST_CFG_B
7 to 4	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	No_Soft_Reset	1b	R	—	Indicates that no internal reset occurs inside the device during the power state transition from D3hot to D0.
2	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

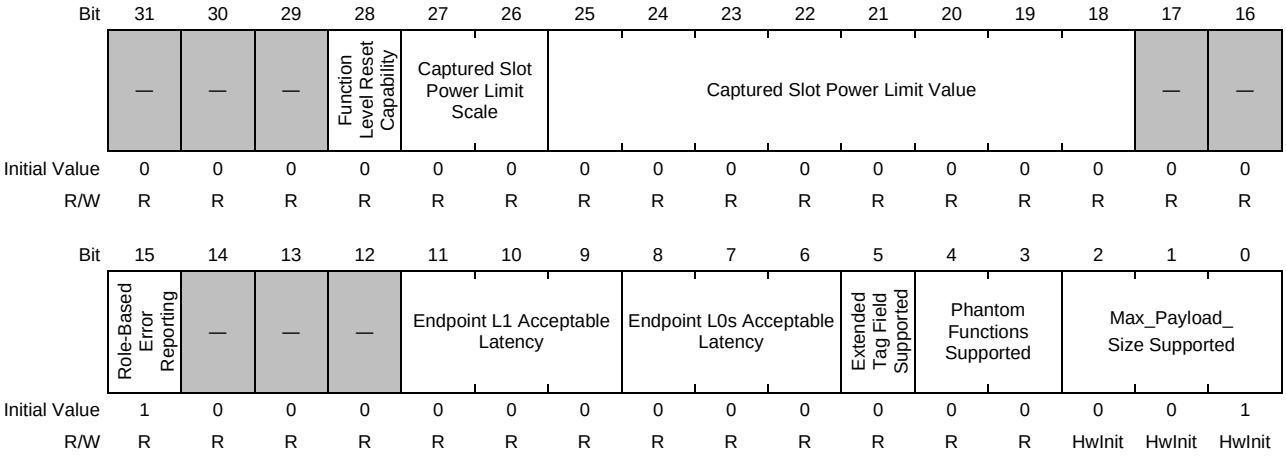
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
1 to 0	PowerState	00b	R/W	RST_CFG_B	Set the PCI Device State. 00b: D0 (Default) 01b: D1 (Setting prohibited) 10b: D2 (Setting prohibited) 11b: D3hot

34.3.2.17 PCI Express Capability (Offset: H'6060)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 25	Interrupt Message Number	All 0	R	—	This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. 00000b: fixed
24	Slot Implemented	0b	HwInit	RST_LOAD_B	Setting 1b to this bit, indicates that the PCI Express Link (Down Port) is connected to the Slot.
23 to 20	Device/Port Type	0100b	R	—	Indicates the PCI Express Root Complex device. 0000b: PCI Express Endpoint device 0001b: Legacy PCI Express Endpoint device 0100b: Root Port of PCI Express Root Complex (Default) 0101b: Upstream Port of PCI Express Switch 0110b: Downstream Port of PCI Express Switch 0111b: PCI Express-to-PCI/PCI-X Bridge 1000b: PCI/PCI-X-to-PCI Express Bridge 1001b: Root Complex Integrated Endpoint Device 1010b: Root Complex Event Collector All other encodings are reserved.
19 to 16	Capability Version	0010b	HwInit	—	Indicates the version of the PCI Express Capability Structure. 0010b: fixed
15 to 10	Next Capability Pointer	H'00	HwInit	RST_LOAD_B	Indicates that this Capability List is a final List (H'00 fixed) The lower two bits [9: 8] are Reserved and fixed at 00b.
9, 8			R	—	
7 to 0	Capability ID	H'10	R	—	Indicates the PCI Express Capability. H'10: fixed.

34.3.2.18 Device Capabilities (Offset: H'6064)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 29	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	Function Level Reset Capability	0b	R	—	It does not apply to Root Complex devices. 0b fixed.
27, 26	Captured Slot Power Limit Scale	00b	R	—	It does not apply to Root Complex devices. 00b fixed.
25 to 18	Captured Slot Power Limit Value	All 0	R	—	It does not apply to Root Complex devices. H'00 fixed.
17, 16	—	00b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	Role-Based Error Reporting	1b	R	—	1b set if implementing the Error Reporting feature (compliant since Rev 1.1). 1b fixed in this core.
14 to 12	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 9	Endpoint L1 Acceptable Latency	000b	R	—	It does not apply to Root Complex devices. 000b fixed.
8 to 6	Endpoint L0s Acceptable Latency	000b	R	—	It does not apply to Root Complex devices. 000b fixed.
5	Extended Tag Field Supported	0b	R	—	Extended Tag support. 0b: 5-bit Tag field supported 1b: 8-bit Tag field supported 0b fixed in this core.
4, 3	Phantom Functions Supported	00b	R	—	Phantom Function is not supported. 00b fixed.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
2 to 0	Max_Payload_Size Supported	001b	HwInit	RST_LOAD_B	This field indicates the maximum payload size that the Function can support for TLPs. 000b: 128 bytes max payload size 001b: 256 bytes max payload size (Default) 010b: 512 bytes max payload size 011b: 1024 bytes max payload size 100b: 2048 bytes max payload size 101b: 4096 bytes max payload size 110b: Reserved 111b: Reserved

34.3.2.19 Device Control/Status (Offset: H'6068)

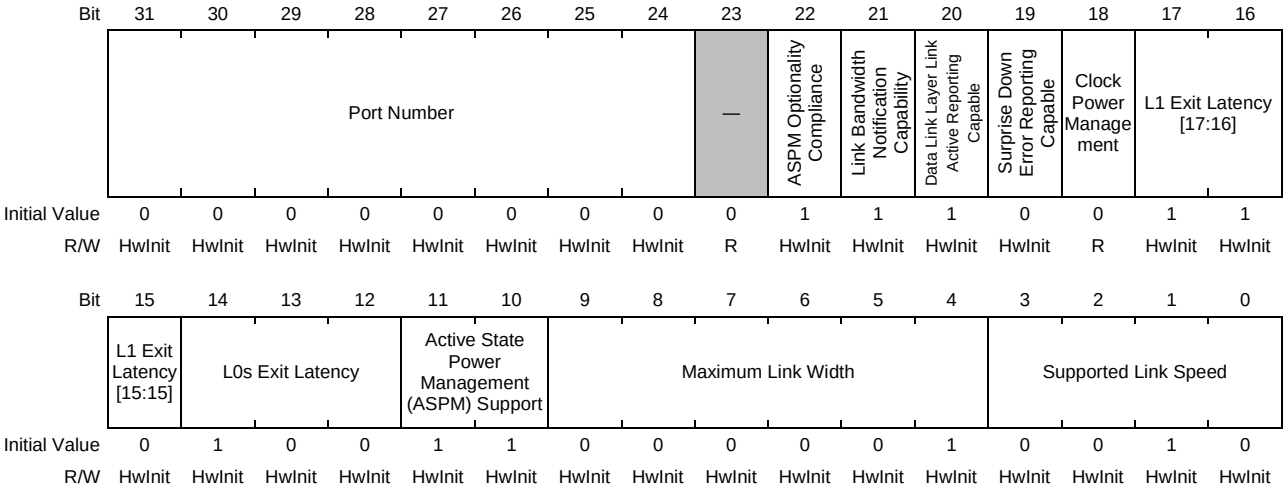
Initial Value	0	0	1	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 23	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	Emergency Power Reduction Detected	0b	R	—	Not supported 0b fixed.
21	Transaction Pending	0b	R	—	It does not apply to Root Complex devices. 0b fixed.
20	AUX Power Detected	0b	R	—	Indicates AUX Power is detected. Not supported 0b fixed
19	Unsupported Request Detected	0b	R/W1C	RST_CFG_B	Indicates that an Unsupported Request Error was detected. 1b has detected an error.
18	Fatal Error Detected	0b	R/W1C	RST_CFG_B	Indicates that a Fatal Error has been detected. 1b has detected an error.
17	Non-Fatal Error Detected	0b	R/W1C	RST_CFG_B	Indicates that a Non-Fatal error has been detected. 1b has detected an error.
16	Correctable Error Detected	0b	R/W1C	RST_CFG_B	Indicates that a Correctable Error has been detected. 1b has detected an error.
15	Initiate Function Level Reset	0b	R	—	A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b.
14 to 12	Max_Read_Request_Size	010b	R/W	RST_CFG_B	Set Max_Read_request_Size. 000b: 128 bytes max read request size 001b: 256 bytes max read request size 010b: 512 bytes max read request size (Default) 011b: 1024 bytes max read request size 100b: 2048 bytes max read request size 101b: 4096 bytes max read request size 110b: Reserved 111b: Reserved

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
11	Enable No Snoop	0b	R	—	This macro does not use No Snoop Attribute as a Requester.
10	Auxiliary (AUX) Power PM Enable	0b	R/W	RST_RSM_B	Set to with or without use Auxiliary (AUX) power. Not supported 0b fixed. 0: Not support (Default) 1: Support If this bit is set to 1b (Enable), AUX_Current (Power Management Capabilities register) must be set.
9	Phantom Functions Enable	0b	R	—	Phantom Function is not supported. 0b fixed.
8	Extended Tag Field Enable	0b	R/W	RST_CFG_B	Extended Tag is not supported. It uses only 5 Bit-Tag.
7 to 5	Max_Payload _Size	000b	R/W	RST_CFG_B	Set Max_Payload_Size. 000b: 128 bytes max payload size (Default) 001b: 256 bytes max payload size 010b: 512 bytes max payload size 011b: 1024 bytes max payload size 100b: 2048 bytes max payload size 101b: 4096 bytes max payload size 110b: Reserved 111b: Reserved
4	Enable Relaxed Ordering	1b	R/W	RST_CFG_B	Set to with or without Relaxed Ordering use as a Requester. 0: Not support 1: Support
3	Unsupported Request Reporting Enable	0b	R/W	RST_CFG_B	ERR_NONFATAL with Unsupported Request detection or control the generation of the ERR_FATAL Message. Message generation is enabled on 1b.
2	Fatal Error Reporting Enable	0b	R/W	RST_CFG_B	Controls the generation of the ERR_FATAL Message. Message generation is enabled on 1b.
1	Non-Fatal Error Reporting Enable	0b	R/W	RST_CFG_B	Controls the generation of the ERR_NONFATAL Message. Message generation is enabled on 1b.
0	Correctable Error Reporting Enable	0b	R/W	RST_CFG_B	Controls the generation of the ERR_COR Message. Message generation is enabled on 1b.

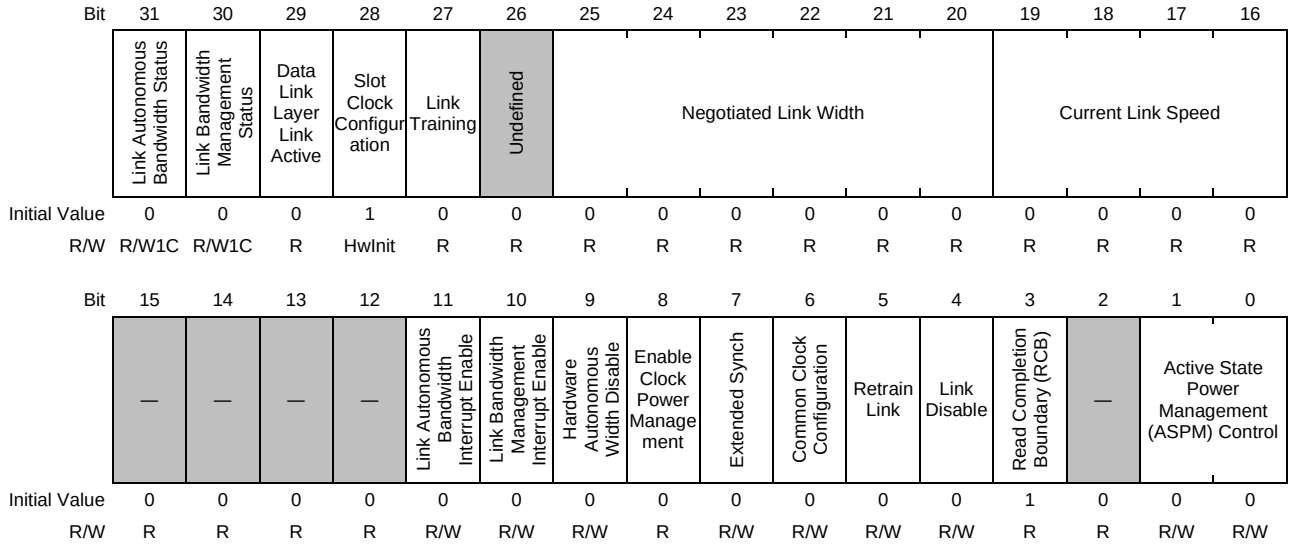
34.3.2.20 Link Capabilities (Offset: H'606C)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	Port Number	All 0	HwInit	—	Indicate PCI Express Link Port number.
23	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	ASPM Optionality Compliance	1b	HwInit	RST_LOAD_B	This bit must be set to 1b in all Functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. 1b fixed.
21	Link Bandwidth Notification Capability	1b	HwInit	RST_LOAD_B	Indicates support for Link Bandwidth Notification status and Interrupt features.
20	Data Link Layer Link Active Reporting Capable	1b	HwInit	RST_LOAD_B	Indicates support for the DL_Active state reporting feature in the Data Link Control and Management State Machine.
19	Surprise Down Error Reporting Capable	0b	HwInit	RST_LOAD_B	0b fixed. It does not support detection and reporting of Surprise Down error.
18	Clock Power Management	0b	R	—	It does not apply to Root Complex devices. 0b fixed.
17 to 15	L1 Exit Latency	110b	HwInit	RST_LOAD_B	This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. 000b: Less than 1µs 001b: 1 µs to less than 2 µs 010b: 2 µs to less than 4 µs 011b: 4 µs to less than 8 µs 100b: 8 µs to less than 16 µs 101b: 16 µs to less than 32 µs (Default) 110b: 32 µs to 64 µs 111b: More than 64 µs

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
14 to 12	L0s Exit Latency	100b	HwInit	RST_LOAD_B	This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. 000b: Less than 64 ns 001b: 64 ns to less than 128 ns 010b: 128 ns to less than 256 ns 011b: 256 ns to less than 512 ns 100b: 512 ns to less than 1 µs (Default) 101b: 1 µs to less than 2 µs 110b: 2 µs-4 µs 111b: More than 4 µs
11, 10	Active State Power Management (ASPM) Support	11b	HwInit	RST_LOAD_B	This field indicates the level of ASPM supported on the given PCI Express Link. 00b: No ASPM support 01b: L0s Entry Supported 10b: L1 Entry Supported 11b: L0s and L1 Entry Supported (Default)
9 to 4	Maximum Link Width	000001b	HwInit	RST_LOAD_B	This field indicates the maximum Link width Lanes, implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. 000000b: Reserved 000001b: x1 (Default) 000010b: x2 (Set prohibited) 000100b: x4 (Set prohibited) 001000b: x8 (Set prohibited) 001100b: x12 (Set prohibited) 010000b: x16 (Set prohibited) 100000b: x32 (Set prohibited)
3 to 0	Supported Link Speed	0010b	HwInit	RST_LOAD_B	This field indicates the maximum Link speed of the associated Port. 0001b: 2.5 GT/s Link speed supported 0010b: 5.0 GT/s and 2.5 GT/s Link speeds supported (Default) 0011b: 8.0 GT/s Link speed supported (Set prohibited) 0100b: 16.0 GT/s Link speed supported (Set prohibited) All other encodings are reserved.

34.3.2.21 Link Control/Status (Offset: H'6070)



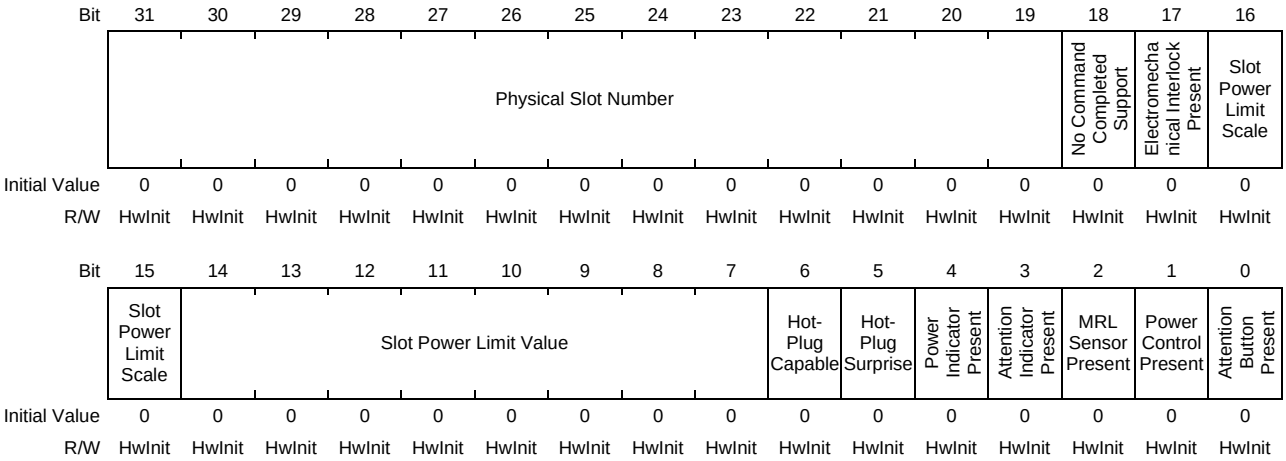
Bit	31	30	29	28	27	26	25 to 16	15 to 12	11	10	9	8	7	6	5	4	3	2	1	0
	Link Autonomous Bandwidth Status	Link Bandwidth Management Status	Data Link Layer Link Active	Slot Clock Configuration	Link Training	Undefined	Negotiated Link Width / Current Link Speed	—	Link Autonomous Bandwidth Interrupt Enable	Link Bandwidth Management Interrupt Enable	Hardware Autonomous Width Disable	Enable Clock Power Management	Extended Synch	Common Clock Configuration	Retrain Link	Link Disable	Read Completion Boundary (RCB)	—	Active State Power Management (ASPM) Control	
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R/W1C	R/W1C	R	HwInit	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	Link Autonomous Bandwidth Status	0b	R/W1C	RST_CFG_B	This bit is output when Link Autonomous Bandwidth Interrupt Enable is asserted.
30	Link Bandwidth Management Status	0b	R/W1C	RST_CFG_B	This bit is output when Link Bandwidth Management Interrupt Enable is asserted.
29	Data Link Layer Link Active	0b	R	—	1b indicates that the Data Link Layer is in the Link Active state.
28	Slot Clock Configuration	1b	HwInit	RST_LOAD_B	It indicates that it uses a common reference clock with EP. 0b: Do not use Connector Reference Clock 1b: Use Connector Reference Clock (Default)
27	Link Training	0b	R	—	1b indicates that the Physical layer LTSSM is in the Configuration state or Recovery state. This bit is cleared when exiting the Configuration/Recovery state.
26	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 20	Negotiated Link Width	All 0	R	—	Indicates the link width established because of negotiation. 000001b: x1 000010b: x2 000100b: x4 001000b: x8 001100b: x12 010000b: x16 100000b: x32 The other encoding is Reserved.
19 to 16	Current Link Speed	All 0	R	—	This field indicates the negotiated Link speed of the given PCI Express Link. 0001b: 2.5 GT/s PCI Express Link 0010b: 5.0 GT/s PCI Express Link 0011b: 8.0 GT/s PCI Express Link 0100b: 16.0 GT/s PCI Express Link 0000b during reset period

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
15 to 12	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	Link Autonomous Bandwidth Interrupt Enable	0b	R/W	RST_CFG_B	Controls interrupt generation via the Link Autonomous Bandwidth Management Status bit (bit 31). 0b: Interrupt Disable (Default) 1b: Interrupt Enable
10	Link Bandwidth Management Interrupt Enable	0b	R/W	RST_CFG_B	Controls interrupt generation via the Link Bandwidth Status bit (bit 30). 0b: Interrupt Disable (Default) 1b: Interrupt Enable
9	Hardware Autonomous Width Disable	0b	R/W	RST_CFG_B	Set the Link Width Change feature to Disable. 0b: Link Width Change Enable (Default) 1b: Link Width Change Disable
8	Enable Clock Power Management	0b	R	RST_CFG_B	It does not apply to Root Complex devices. 0b fixed
7	Extended Synch	0b	R/W	RST_CFG_B	If set to 1 b, 4096 FTS Ordered-sets are transmitted when transitioning from L0s to L0. It also sends 1024 TS1 Ordered-sets at the beginning of the Recovery state during the transition from L1 to L0. The default value is 0b.
6	Common Clock Configuration	0b	R/W	RST_CFG_B	Sets whether the Common Reference Clock is used. 0b: Supplied by Non-Common Reference Clock (Default) 1b: Supplied by Common Reference Clock
5	Retrain Link	0b	R/W	RST_CFG_B	Setting it to 1b will transition LTSSM into the Recovery state and start Link Retraining. Readout is always 0b.
4	Link Disable	0b	R/W	RST_CFG_B	Setting it to 1b to transition LTSSM to the disabled state.
3	Read Completion Boundary (RCB)	1b	R	—	Read Completion Boundary (RCB) – Indicates the RCB value for the Root Port. 0: 64 bytes 1: 128 bytes (Default)
2	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	Active State Power Management (ASPM) Control	00b	R/W	RST_CFG_B	Sets the permission level for Active State Power Management. 00b: Disabled (Default) 01b: L0s Entry Supported 10b: Reserved 11b: L0s and L1 Entry Supported

34.3.2.22 Slot Capabilities (Offset: H'6074)

PCI Express Capability Structure: Configuration Space Bit [24]: If Slot Implemented is 0 b, then this register is all '0' because it does not implement Slot.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 19	Physical Slot Number	All 0	HwInit	RST_LOAD_B	Indicates Slot Number connected to Port.
18	No Command Completed Support	0b	HwInit	RST_LOAD_B	If the issued command is completed by the Hot-Plug Controller, it indicates that the Slot does not make a software notification.
17	Electromechanical Interlock Present	0b	HwInit	RST_LOAD_B	Indicates that Electromechanical Interlock is implemented.
16, 15	Slot Power Limit Scale	00b	HwInit	RST_LOAD_B	Set the Scale for the Slot Power Limit Value. This register is effective when the Slot Implemented bit (Express Capability Register (offset: H'060), bit 24) is set.00b = 1.0x 01b: 0.1x 10b: 0.01x 11b: 0.001x
14 to 7	Slot Power Limit Value	All 0	HwInit	RST_LOAD_B	In combination with the Slot Power Limit Scale Register value, sets the upper power limit in the Slot. This register is effective when the Slot Implemented bit (Express Capability Register (offset: H'060), bit 24) is set. H'F0: 250 W Slot Power Limit H'F1: 275 W Slot Power Limit H'F2: 300 W Slot Power Limit H'F3 to H'FF: Reserved
6	Hot-Plug Capable	0b	HwInit	RST_LOAD_B	Indicates that the Slot can support Hot-plug operation.
5	Hot-Plug Surprise	0b	HwInit	RST_LOAD_B	Indicates that an adapter in a Slot may be removed without notice.
4	Power Indicator Present	0b	HwInit	RST_LOAD_B	Indicates that the Power Indicator is electrically controlled by a Slot (enclosure).
3	Attention Indicator Present	0b	HwInit	RST_LOAD_B	Indicates that the Attention Indicator is electrically controlled by a Slot (enclosure).
2	MRL Sensor Present	0b	HwInit	RST_LOAD_B	Indicates that MRL Sensor is implemented.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
1	Power Control Present	0b	HwInit	RST_LOAD_B	Indicates that a software programmable Power Controller is implemented.
0	Attention Button Present	0b	HwInit	RST_LOAD_B	Indicates that the Attention Button is electrically controlled by a Slot (enclosure).

34.3.2.23 Slot Control/Status (Offset: H'6078)

PCI Express Capability Structure: Configuration Space Bit [24]: If Slot Implemented is 0 b, it means that it has not implemented Slot, so all registers except bit [22]: Presence Detect State are all '0'.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	Data Link Layer State Changed	Electromechanical Interlock Status	Presence Detect State	MRL Sensor State	Command Completed	Presence Detect Changed	MRL Sensor Changed	Power Fault Detected	Attention Button Pressed
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W1C	R	R	R	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	Data Link Layer State Changed Enable	Electromechanical Interlock Control	Power Controller Control	Power Indicator Control		Attention Indicator Control		Hot-Plug Interrupt Enable	Command Completed Interrupt Enable	Presence Detect Changed Enable	MRL Sensor Changed Enable	Power Fault Detected Enable	Attention Button Pressed Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 25	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Data Link Layer State Changed	0b	R/W1C	RST_CFG_B	This bit is Set when the value reported in the Data Link Layer Link Active bit of the Link Status Register is changed. Not used in this macro. 0b fixed.
23	Electromechanical Interlock Status	0b	R	—	If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock. Not used in this macro. 0b fixed.
22	Presence Detect State	1b	R	—	This bit indicates the presence of an adapter in the slot. When the In-Band PD Disable bit is Clear, this is reflected by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor. The Slot Implemented bit in the PCI Express Capabilities register is 0 and then this bit is 1b fixed.
21	MRL Sensor State	0b	R	—	This bit reports the status of the MRL sensor if implemented. Not used in this macro. 0b fixed.
20	Command Completed	0b	R/W1C	RST_CFG_B	If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities Register is 0b), this bit is Set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command. Not used in this macro. 0b fixed.
19	Presence Detect Changed	0b	R/W1C	RST_CFG_B	This bit is Set when the value reported in the Presence Detect State bit is changed. Not used in this macro. 0b fixed.
18	MRL Sensor Changed	0b	R/W1C	RST_CFG_B	If an MRL sensor is implemented, this bit is Set when a MRL Sensor State change is detected. If an MRL sensor is not implemented, this bit must not be Set. Not used in this macro. 0b fixed.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
17	Power Fault Detected	0b	R/W1C	RST_CFG_B	If a Power Controller that supports power fault detection is implemented, this bit is Set when the Power Controller detects a power fault at this slot. Not used in this macro. 0b fixed.
16	Attention Button Pressed	0b	R/W1C	RST_CFG_B	If an Attention Button is implemented, this bit is Set when the attention button is pressed. Not used in this macro. 0b fixed.
15 to 13	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	Data Link Layer State Changed Enable	0b	R/W	RST_CFG_B	If the Data Link Layer Link Active Reporting Capable is 1b, this bit enables software notification when Data Link Layer Link Active bit is changed. Not used in this macro. Please use 0b fixed.
11	Electromechanical Interlock Control	0b	R/W	RST_CFG_B	If an Electromechanical Interlock is implemented, a write of 1b to this bit causes the state of the interlock to toggle. A write of 0b to this bit has no effect. A read of this bit always returns a 0b. Not used in this macro. Please use 0b fixed.
10	Power Controller Control	0b	R/W	RST_CFG_B	If a Power Controller is implemented, this bit when written sets the power state of the slot per the defined encodings. Not used in this macro. Please use 0b fixed.
9, 8	Power Indicator Control	00b	R/W	RST_CFG_B	If a Power Indicator is implemented, writes to this field set the Power Indicator to the written state Not used in this macro. Please use 00b fixed.
7, 6	Attention Indicator Control	00b	R/W	RST_CFG_B	If an Attention Indicator is implemented, writes to this field set the Attention Indicator to the written state. Not used in this macro. Please use 0b fixed.
5	Hot-Plug Interrupt Enable	0b	R/W	RST_CFG_B	When Set, this bit enables generation of an interrupt on enabled hot-plug events. Not used in this macro. Please use 0b fixed.
4	Command Completed Interrupt Enable	0b	R/W	RST_CFG_B	If Command Completed notification is supported when Set, this bit enables software notification when a hot-plug command is completed by the Hot-Plug Controller. Not used in this macro. Please use 0b fixed.
3	Presence Detect Changed Enable	0b	R/W	RST_CFG_B	When Set, this bit enables software notification on a presence detect changed event. Not used in this macro. Please use 0b fixed.
2	MRL Sensor Changed Enable	0b	R/W	RST_CFG_B	When Set, this bit enables software notification on a MRL sensor changed event. Not used in this macro. Please use 0b fixed.
1	Power Fault Detected Enable	0b	R/W	RST_CFG_B	When Set, this bit enables software notification on a power fault event. Not used in this macro. Please use 0b fixed.
0	Attention Button Pressed Enable	0b	R/W	RST_CFG_B	When Set to 1b, this bit enables software notification on an attention button pressed event. Not used in this macro. Please use 0b fixed.

34.3.2.24 Root Control/Capabilities (Offset: H'607C)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 17	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CRS Software Visibility	0b	R	—	Indicates whether the Root Port can notify the software of the CRS status. Not used in this macro. Please use 0b fixed.
15 to 5	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CRS Software Visibility Enable	0b	R/W	RST_CFG_B	When implemented, allows the Root Port to inform the software of the CRS status. Not used in this macro. Please use 0b fixed.
3	PME Interrupt Enable	0b	R/W	RST_CFG_B	When a PME Message is received, it can be combined with a set of PME status bits to generate a PME interrupt. If the PME status is already up and this bit is enabled later, an interrupt will also occur.
2	System Error on Fatal Error Enable	0b	R/W	RST_CFG_B	This bit allows a system error to be generated when ERR_FATAL occurs in any of the hierarchies below the root port.
1	System Error on Non-Fatal Error Enable	0b	R/W	RST_CFG_B	This bit allows a system error to be generated when NON_ERR_FATAL occurs in any of the hierarchies below the root port.
0	System Error on Correctable Error Enable	0b	R/W	RST_CFG_B	This bit allows a system error to be generated when ERR_ERR_COR occurs in any of the hierarchies below the root port.

34.3.2.25 Root Status (Offset: H'6080)

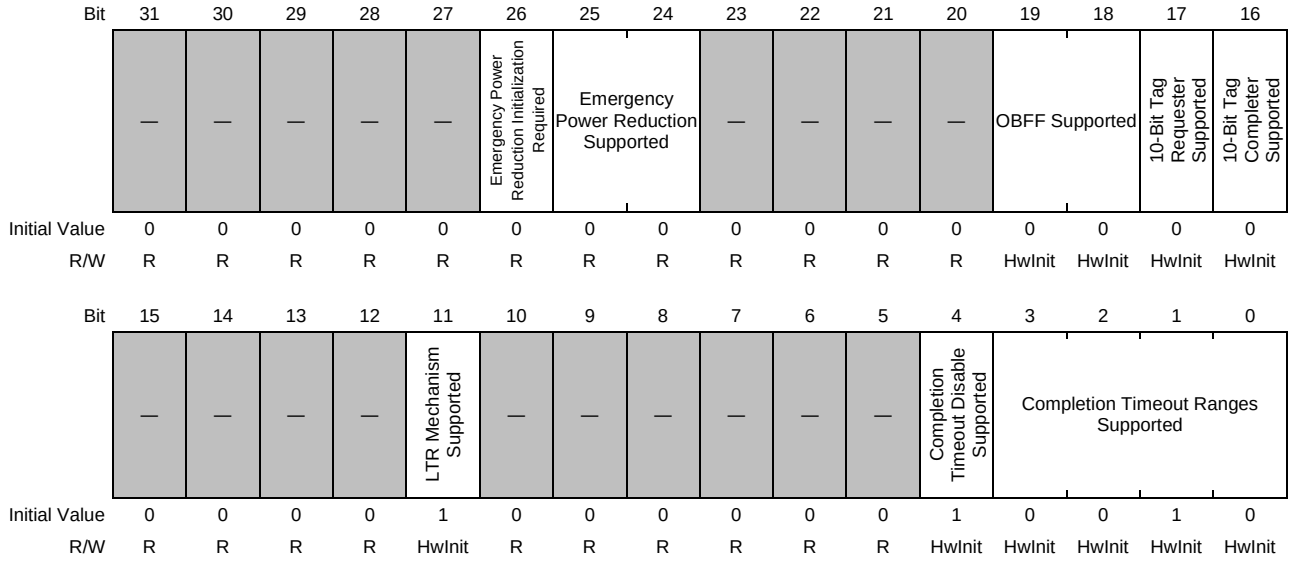
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 18	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	PME Pending	0b	R	RST_CFG_B	This bit indicates a status where the PME Status bit is 1 and further PME is pending. When the software clears the PME status bit, the pending PME is resent in hardware by resetting the PME status bit and properly updating the Requester ID field and PME status. The PME pending bit is cleared in hardware when there are no more PME's pending.
16	PME Status	0b	R/W1C	RST_CFG_B	This bit indicates that a PME was received by the requester indicated by the PME Requester ID field. Subsequent PMEs are held until this bit is cleared by the software.
15 to 0	PME Requester ID	All 0	R	RST_CFG_B	This field shows the PCI Requester ID of the most recent PME requester. This field is valid only when the PME status bit is 1.

34.3.2.26 Device Capabilities 2 (Offset: H'6084)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 27	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	Emergency Power Reduction Initialization Required	0b	R	RST_LOAD_B	Emergency Power Reduction Initialization Required Not supported 0b fixed
25, 24	Emergency Power Reduction Supported	00b	R	RST_LOAD_B	Emergency bower Reduction Supported Not supported 00b fixed
23 to 20	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19, 18	OBFF Supported	00b	HwInit	RST_LOAD_B	This field indicates if OBFF is supported and, if so, what signaling mechanism is used. 00b (Not Supported). 00b: OBFF Not Supported (Default) 01b: OBFF supported using Message signaling only 10b: OBFF supported using WAKE# signaling only 11b: OBFF supported using WAKE# and Message signaling
17	10-Bit Tag Requester Supported	0b	HwInit	RST_LOAD_B	10-Bit Tag (Requester) supported. 0b fixed. 0b: Not supported (Default) 1b: Supported
16	10-Bit Tag Completer Supported	0b	HwInit	RST_LOAD_B	10-Bit Tag (Completer) supported. 0b fixed. 0b: Not supported (Default) 1b: Supported
15 to 12	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	LTR Mechanism Supported	1b	HwInit	RST_LOAD_B	Set with or without to support Latency Tolerance Reporting (LTR). 0b: Not Supported 1b: Supported (Default)
10 to 5	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
4	Completion Timeout Disable Supported	1b	HwInit	RST_LOAD_B	Set with or without to support Completion Timeout Disable. 0b: Not Supported 1b: Supported (Default)
3 to 0	Completion Timeout Ranges Supported	0010b	HwInit	RST_LOAD_B	Set Completion Timeout Range. Range A: 50 µs to 10 ms Range B: 10 ms to 250 ms Range C: 250 ms to 4 s Range D: 4 s to 64 s The four patterns described above are determined, and settings can be made in the following combinations. 0000b: Program settings not supported 0001b: Range A 0010b: Range B 0011b: Ranges A and B 0110b: Ranges B and C 0111b: Ranges A, B, and C 1110b: Ranges B, C and D 1111b: Ranges A, B, C, and D The other encoding is Reserved. *Note*: The initial value in the UM description is “0010b”, but please change the initial value according to the installed system/device performance or specify the initial value as a product requirement.

34.3.2.27 Device Control 2/Status 2 (Offset: H'6088)

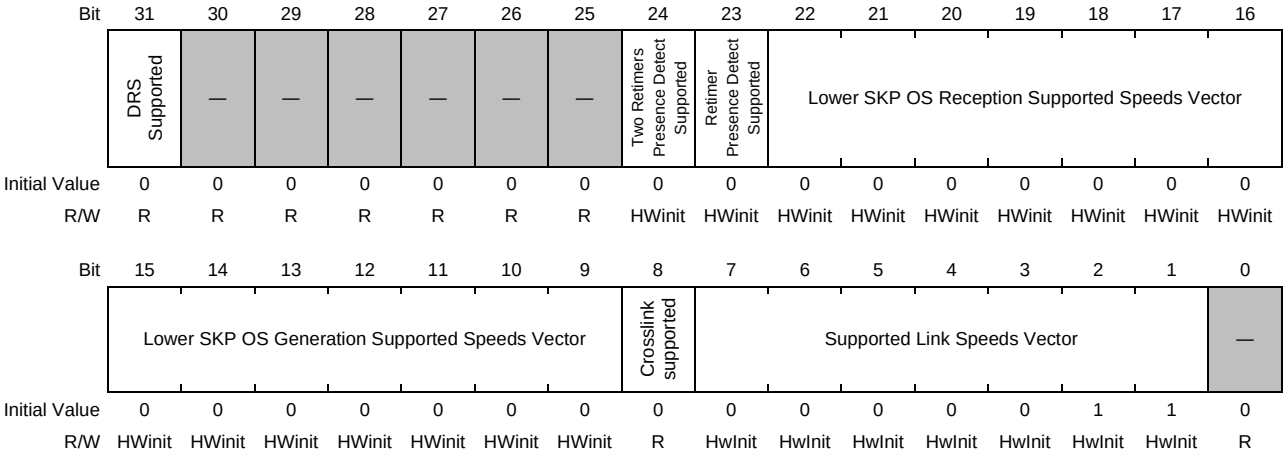
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 15	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14, 13	OBFF Enable	00b	R/W	RST_CFG_B	This field enables the OBFF mechanism and selects the signaling method. CHANGE prohibited 00b (Disabled) 01b Enabled using Message signaling [Variation A] 10b Enabled using Message signaling [Variation B] 11b Enabled using WAKE# signaling *Note*: OBFF Supported = 00b equals Reserved.
12	10-Bit Tag Requester Enable	0b	R/W	RST_CFG_B	10-Bit Tag (Requester) enabled. 0b fixed. 0b: Disabled (Default) 1b: Valid
11	Emergency Power Reduction Request	0b	R	—	Emergency Power Reduction Request. 0b fixed due to unsupported
10	LTR Mechanism Enable	0b	R/W	RST_CFG_B	If this bit is set, the LTR function is enabled.
9 to 5	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	Completion Timeout Disable	0b	R/W	RST_CFG_B	If this bit is set, the Completion Timeout Disable function is enabled.

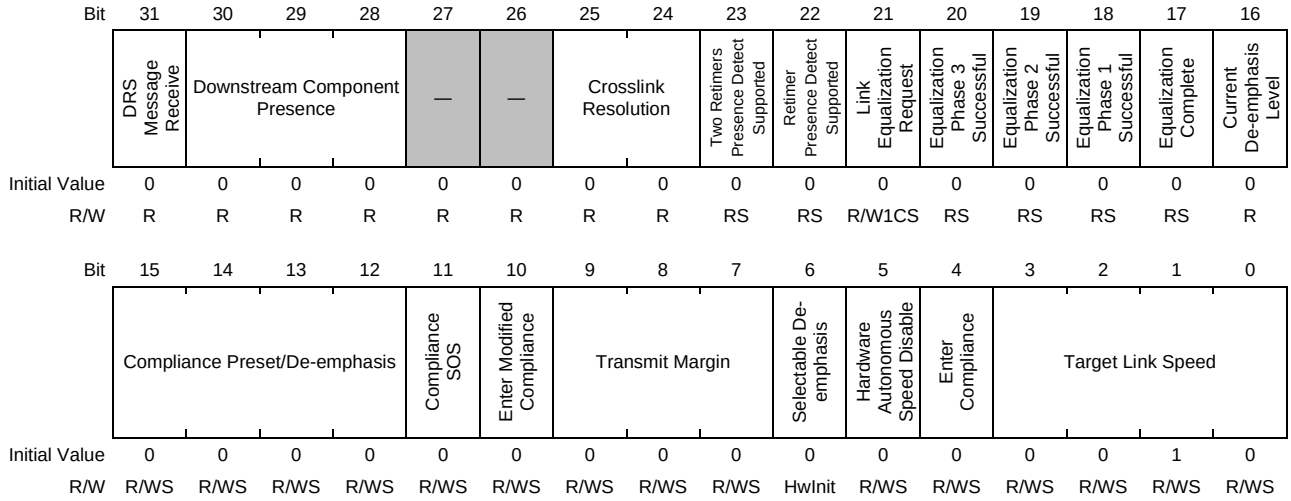
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
3 to 0	Completion Timeout Value	H'0	R/W	RST_CFG_B	Set Completion Timeout Range. 0000b: 10 ms to 50 ms (Default) 0001b: 50 µs to 100 µs 0010b: 1 ms to 10 ms 0101b: 16 ms to 55 ms 0110b: 65 ms to 210 ms 1001b: 260 ms to 900 ms 1010b: 1 s to 3.5 s 1101b: 4 s to 13 s 1110b: 17 s to 64 s Others: reserved (set prohibited) *Note*: The default, 0000b, sets Base Spec to a time longer than the default 50usec lower limit. This considers the 10 msec lower bound recommended for Base Spec.

34.3.2.28 Link Capabilities 2 (Offset: H'608C)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	DRS Supported	0b	R	—	When Set, indicates support for the optional Device Readiness Status (DRS) capability. This function is not supported by this product. 0b fixed
30 to 25	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Two Retimers Presence Detect Supported	0b	HWinit	RST_LOAD_B	When set to 1b, this bit indicates that the associated Port supports detection and reporting of two Retimers presence. This function is not supported by this product. 0b fixed
23	Retimer Presence Detect Supported	0b	HWInit	RST_LOAD_B	When set to 1b, this bit indicates that the associated Port supports detection and reporting of Retimer presence. This function is not supported by this product. 0b fixed
22 to 16	Lower SKP OS Reception Supported Speeds Vector	All 0	HWinit	RST_LOAD_B	If this field is non-zero, it indicates that the Port, when operating at the indicated speeds supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. This function is not supported by this product. 7'h00 fixed
15 to 9	Lower SKP OS Generation Supported Speeds Vector	All 0	HWinit	RST_LOAD_B	If this field is non-zero, it indicates that the Port, when operating at the indicated speeds supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. This function is not supported by this product. 7'h00 fixed
8	Crosslink supported	0b	R	—	When set to 1b, this bit indicates that the associated Port supports crosslinks. This function is not supported by this product. 0b fixed
7 to 1	Supported Link Speeds Vector	0000011b	HwInit	RST_LOAD_B	Indicate Support Link Speed. This field indicates the supported Link speed(s) of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit 0: 2.5 GT/s Bit 1: 5.0 GT/s Bit 2: 8.0 GT/s (set prohibited) Bit 3: 16.0 GT/s (set prohibited) Bits 6 to 4: Reserved
0	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

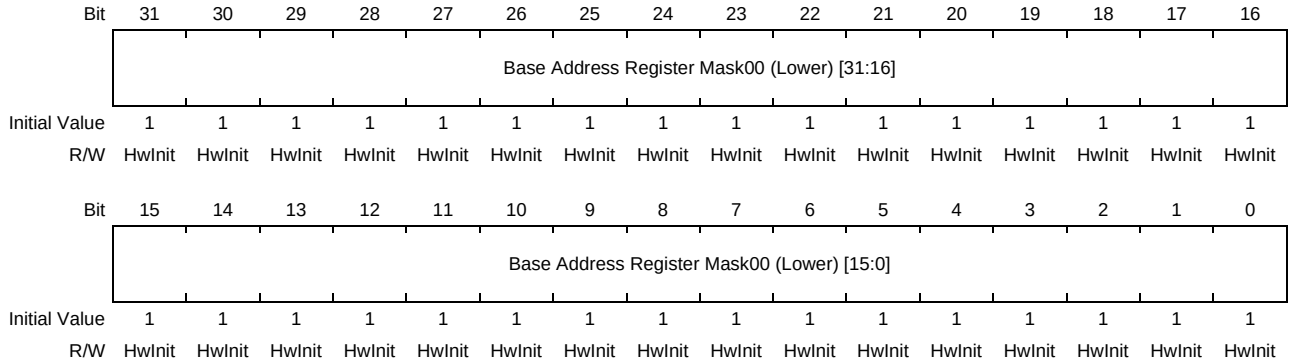
34.3.2.29 Link Control 2/Status 2 (Offset: H'6090)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	DRS Message Received	0b	R	—	This bit must be Set whenever the Port receives a DRS Message. This function is not supported by this product. 0b fixed
30 to 28	Downstream Component Presence	000b	R	—	This field indicates the presence and DRS status for the Downstream Component, if any, connected to the Link. This function is not supported by this product. 000b fixed
27, 26	—	00b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	Crosslink Resolution	00b	R	—	This field indicates the state of the Crosslink negotiation. This function is not supported by this product. 00b fixed
23	Two Retimers Presence Detect Supported	0b	RS	—	When set to 1b, this bit indicates that two Retimers were present during the most recent Link negotiation. This function is not supported by this product. 0b fixed
22	Retimer Presence Detect Supported	0b	RS	—	When set to 1b, this bit indicates that a Retimer was present during the most recent Link negotiation. This function is not supported by this product. 0b fixed
21	Link Equalization Request	0b	R/W1CS	RST_RSM_B	This bit is Set by hardware to request the Link equalization process to be performed on the Link. This function is not supported by this product. 0b fixed
20	Equalization Phase 3 Successful	0b	RS	—	When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed. This function is not supported by this product. 0b fixed
19	Equalization Phase 2 Successful	0b	RS	—	When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed. This function is not supported by this product. 0b fixed
18	Equalization Phase 1 Successful	0b	RS	—	When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed. This function is not supported by this product. 0b fixed
17	Equalization Complete	0b	RS	—	When set to 1b, this bit indicates that the Transmitter Equalization procedure has completed. This function is not supported by this product. 0b fixed

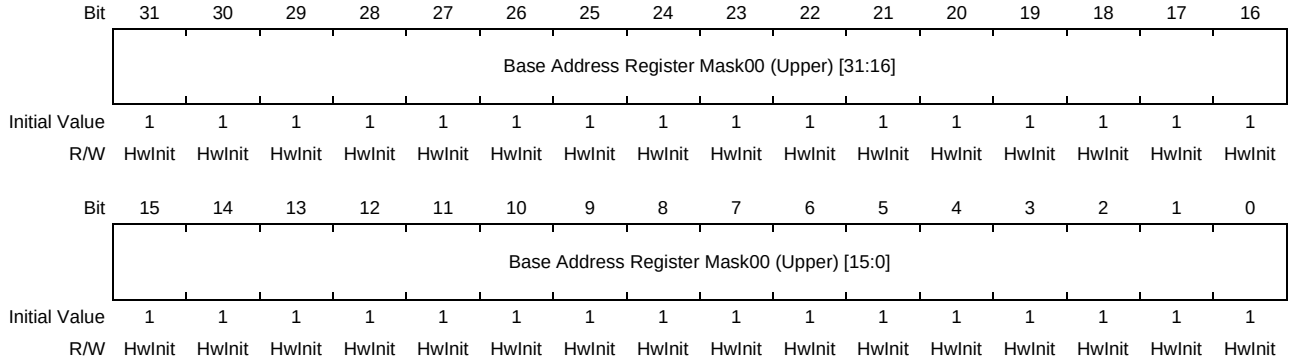
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
16	Current De-emphasis Level	0b	R	—	Status register showing De-emphasis Level during Gen2 operation. 0: −6 dB (Default) 1: −3.5 dB *Note*: The initial value of this bit is 0b at reset and after Gen2-Linkup. However, Gen1-Linkup indicates 1b, but this bit has no meaning in Gen1, so ignore it.
15 to 12	Compliance Preset/De-emphasis	0000b	R/WS	RST_RSM_B	Polling. Set the De-emphasis Level in the Compliance State. 0000b: −6 dB (Default) 0001b: −3.5 dB
11	Compliance SOS	0b	R/WS	RST_RSM_B	If this bit set to 1b, the SKP Ordered-set is inserted periodically during Compliance pattern transmission.
10	Enter Modified Compliance	0b	R/WS	RST_RSM_B	Set bit for Modified Compliance pattern transmission. 0: Compliance Pattern (Default) 1: Modified Compliance Pattern
9 to 7	Transmit Margin	000b	R/WS	RST_RSM_B	Adjust the voltage level of the Transmitter. 000b: Normal operating range 001b to 111b: See *Base Spec Section 8.3.4*.
6	Selectable De-emphasis	0b	HwInit	—	This register is for De-emphasis setting during RC Gen 2 operation. 0: −6 dB 1: −3.5 dB
5	Hardware Autonomous Speed Disable	0b	R/WS	RST_RSM_B	Controls the Link Speed Change function. 0: Support of Link Speed Change (Enable) 1: not Support of Link Speed Change (Disable)
4	Enter Compliance	0b	R/WS	RST_RSM_B	By setting it to 1b, Allows a transition to Compliance mode. At this time, the Link Speed will be the value set in the Target Link Speed field.
3 to 0	Target Link Speed	0010b	R/WS	RST_RSM_B	Set Link Speed value to notify opposing devices during training. 0001b: 2.5 GT/s Target Link Speed 0010b: 5.0 GT/s Target Link Speed (Default) 0011b: 8.0 GT/s Target Link Speed (set prohibited) 0100b: 16.0 GT/s Target Link Speed (set prohibited) All other encodings are reserved.

34.3.2.30 Base Address Register Mask00(Lower) (Offset: H'60A0)



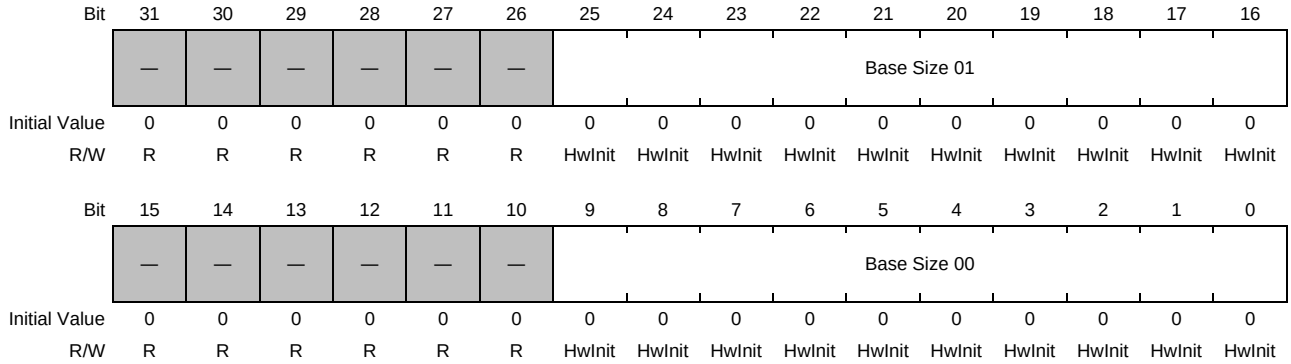
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Base Address Register Mask00 (Lower)	All 1	HwInit	RST_LOAD_B	This register is a mask register for Base Address Register 0 (BAR 0).

34.3.2.31 Base Address Register Mask00(Upper) (Offset: H'60A4)



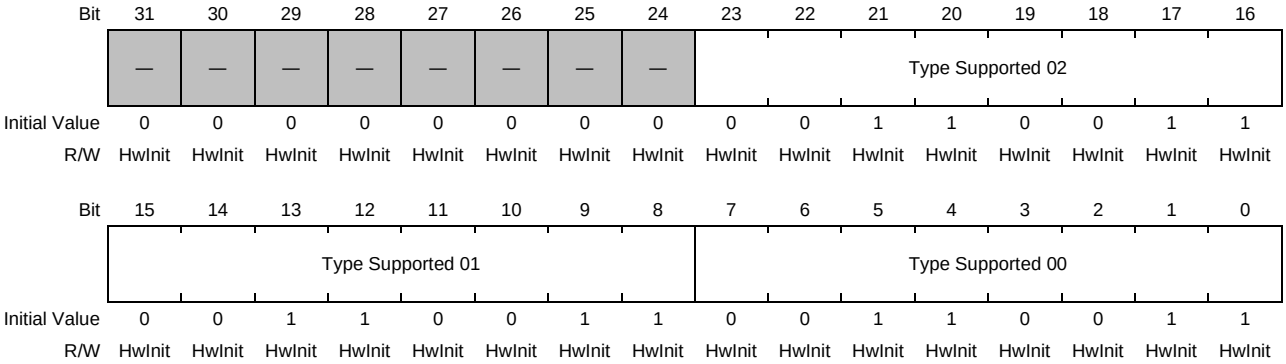
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Base Address Register Mask00 (Upper)	All 1	HwInit	RST_LOAD_B	This register is a mask register for Base Address Register 1 (BAR1).

34.3.2.32 Base Size 00/01 (Offset: H’60C8)



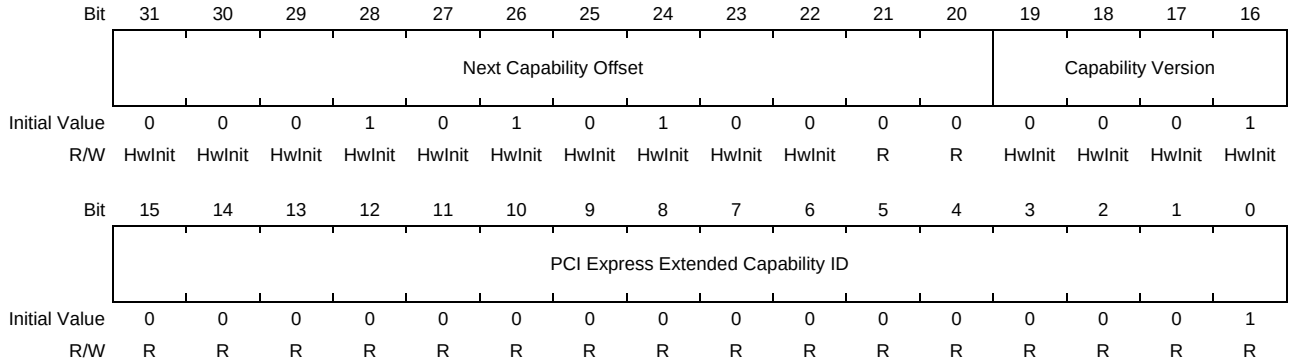
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 26	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 16	Base Size 01	All 0	HwInit	RST_LOAD_B	(H’000 fixed) Not used.
15 to 10	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 0	Base Size 00	All 0	HwInit	RST_LOAD_B	Sets the size of TLP (DW Size) accepted by Address Space 00 set by Base Address Register and Base Address Mask Register. Detects a Completer Abort Error (CA) when a TLP with a packet length greater than the size set here is received (even if it is smaller than the Max Payload Size). Note that the default value is H’000, which disables this feature.

34.3.2.33 Type Supported 00/01/02 (Offset: H’60D8)



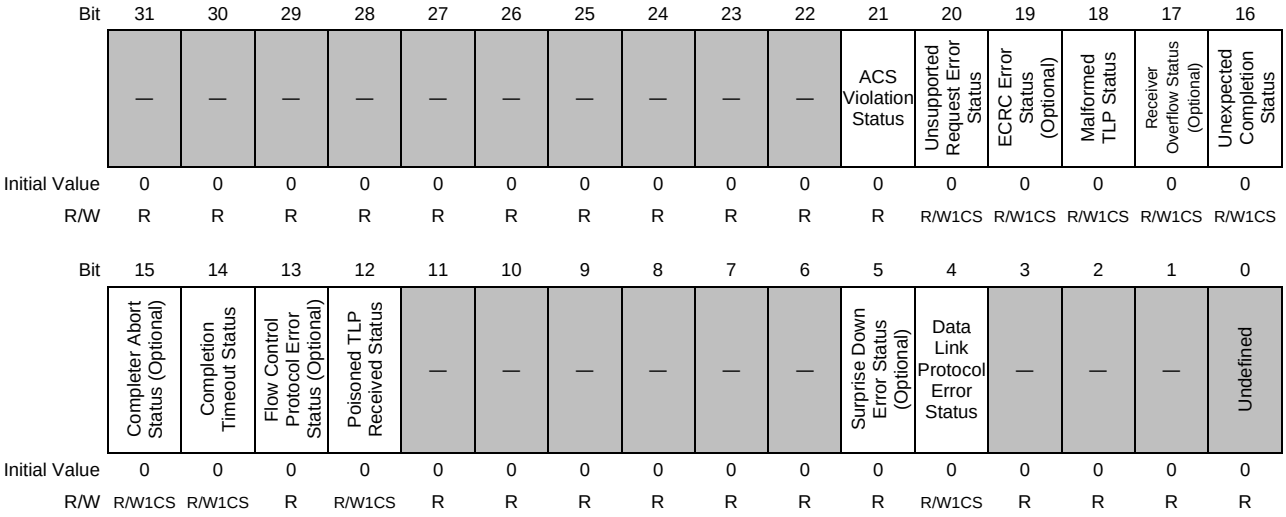
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	—	H’00	HwInit	RST_LOAD_B	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 16	Type Supported 02	H’33	HwInit	RST_LOAD_B	*Note*: Do not use.
15 to 8	Type Supported 01	H’33	HwInit	RST_LOAD_B	*Note*: Do not use.
7 to 0	Type Supported 00	H’33	HwInit	RST_LOAD_B	Set the Transaction Type that can be supported by Space00 (CFG_SPACE00_BASE). See the below for the meaning of each bit. Bit 0: Memory read 32 bits Bit 1: Memory read 64 bits Bit 2: Memory read lock 32 bits Bit 3: Memory read lock 64 bits Bit 4: Memory write 32 bits Bit 5: Memory write 64 bits Bit 6: IO Read Bit 7: IO Write

34.3.2.34 Advanced Error Reporting Capability (Offset: H’6100)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	Next Capability Offset	H’150	HwInit	RST_LOAD_B	Indicates the starting address of the Device Serial Number Capability.
21, 20			R	—	
19 to 16	Capability Version	0001b	HwInit	RST_LOAD_B	Indicates the Capability Structure version. Default: 0001b
15 to 0	PCI Express Extended Capability ID	H’0001	R	—	Indicates the Advanced Error Reporting Capability. Default: H’0001

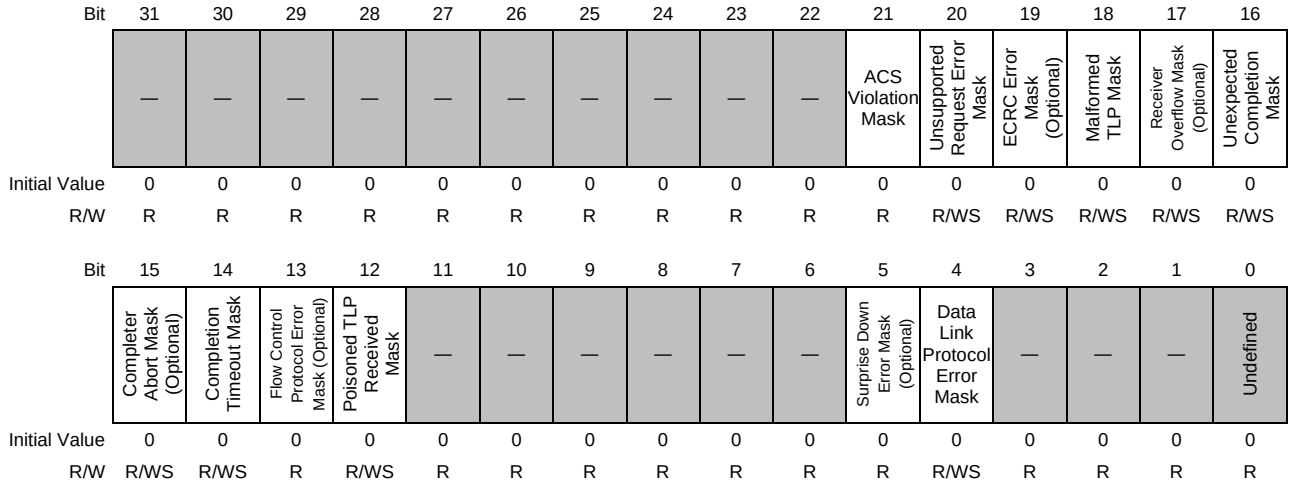
34.3.2.35 Uncorrectable Error Status Register (Offset: H'6104)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	ACS Violation Status	0b	R	—	ACS is not supported 0b fixed
20	Unsupported Request Error Status	0b	R/W1CS	—	Indicate an unsupported TLP was received. 0: No error detected 1: Error detected
19	ECRC Error Status (Optional)	0b	R/W1CS	—	ECRC Error was received. 0: No error detected 1: Error detected
18	Malformed TLP Status	0b	R/W1CS	—	Indicate Malformed TLP received. 0: No error detected 1: Error detected
17	Receiver Overflow Status (Optional)	0b	R/W1CS	—	Indicates A receipt of a TLP larger in size than the free credits in the receive buffer. 0: No error detected 1: Error detected
16	Unexpected Completion Status	0b	R/W1CS	—	Indicates that Completion was received, but there is no record of a corresponding Non-Posted Request issue (Transaction Descriptor did not match). 0: No error detected 1: Error detected
15	Completer Abort Status (Optional)	0b	R/W1CS	—	Indicates that Completion has been returned with a Completion Status of Completer Abort (CA) after receiving a Non-Posted Request. 0: No error detected 1: Error detected
14	Completion Timeout Status	0b	R/W1CS	—	Indicates that after sending a Non-Posted Request, the corresponding Completion was not received within the specified time. 0: No error detected 1: Error detected

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
13	Flow Control Protocol Error Status (Optional)	0b	R	—	Not Implemented (0b fixed)
12	Poisoned TLP Received Status	0b	R/W1CS	—	Indicates that TLP of Poisoned TLP (with payload and EP field of header is 1b) has been received. 0: No error detected 1: Error detected
11 to 6	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	Surprise Down Error Status (Optional)	0b	R	—	Not Implemented (0b fixed)
4	Data Link Protocol Error Status	0b	R/W1CS	—	Indicates that Sequence Number error has been detected in the Data Link Layer. 0: No error detected 1: Error detected
3 to 1	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

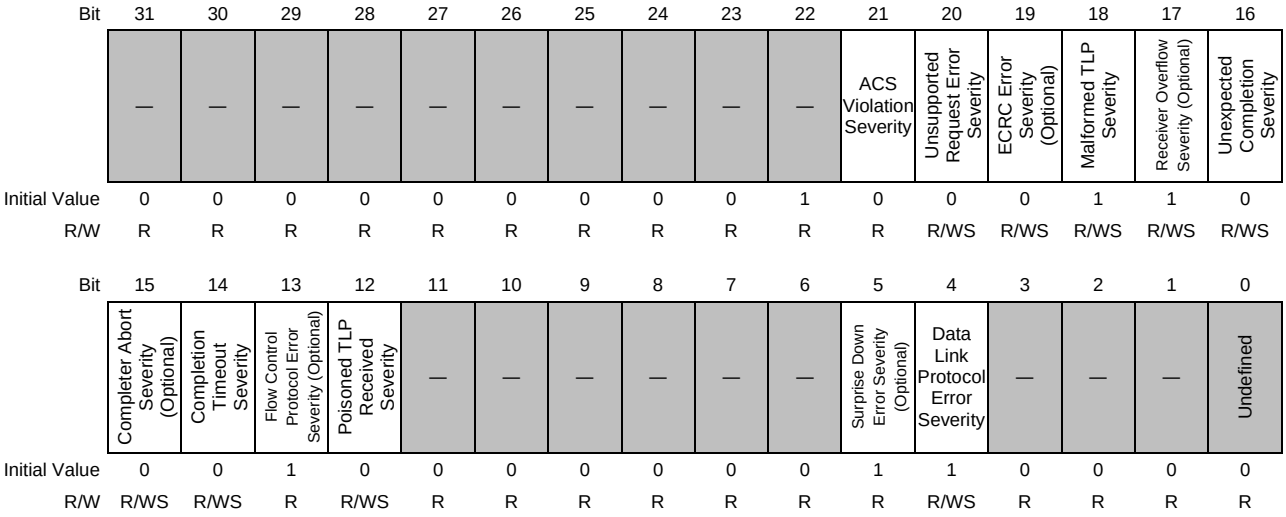
34.3.2.36 Uncorrectable Error Mask Register (Offset: H'6108)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	ACS Violation Mask	0b	R	—	ACS is not supported 0b fixed
20	Unsupported Request Error Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Unsupported Request Error is detected. 0b: No mask 1b: Send Error Message, recording headers to the Header Log register, Mask the First Error Pointer Update.
19	ECRC Error Mask (Optional)	0b	R/WS	RST_RSM_B	Mask error notifications when the ECRC Error is detected. 0b: No mask 1b: Mask
18	Malformed TLP Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Malformed TLP Error is detected. 0b: No mask 1b: Send Error Message, recording headers to the Header Log register, Mask the First Error Pointer Update.
17	Receiver Overflow Mask (Optional)	0b	R/WS	RST_RSM_B	Mask error notifications when the Receiver Overflow Error is detected. 0b: No mask 1b: Send Error Message, Mask the First Error Pointer Update.
16	Unexpected Completion Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Unexpected Completion Error is detected. 0b: No mask 1b: Send Error Message, recording headers to the Header Log register, Mask the First Error Pointer Update.
15	Completer Abort Mask (Optional)	0b	R/WS	RST_RSM_B	Mask error notifications when the Completer Abort Error is detected. 0b: No mask 1b: Send Error Message, recording headers to the Header Log register, Mask the First Error Pointer Update.
14	Completion Timeout Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Completion Timeout Error is detected. 0b: No mask 1b: Send Error Message, Mask the First Error Pointer Update.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
13	Flow Control Protocol Error Mask (Optional)	0b	R	—	Not Implemented (0b fixed)
12	Poisoned TLP Received Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Poisoned TLP Error is detected. 0b: No mask 1b: Send Error Message, recording headers to the Header Log register, Mask the First Error Pointer Update.
11 to 6	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	Surprise Down Error Mask (Optional)	0b	R	—	Not Implemented (0b fixed)
4	Data Link Protocol Error Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Data Link Protocol Error is detected. 0b: No mask 1b: Send Error Message, Mask the First Error Pointer Update.
3 to 1	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.2.37 Uncorrectable Error Severity Register (Offset: H'610C)



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
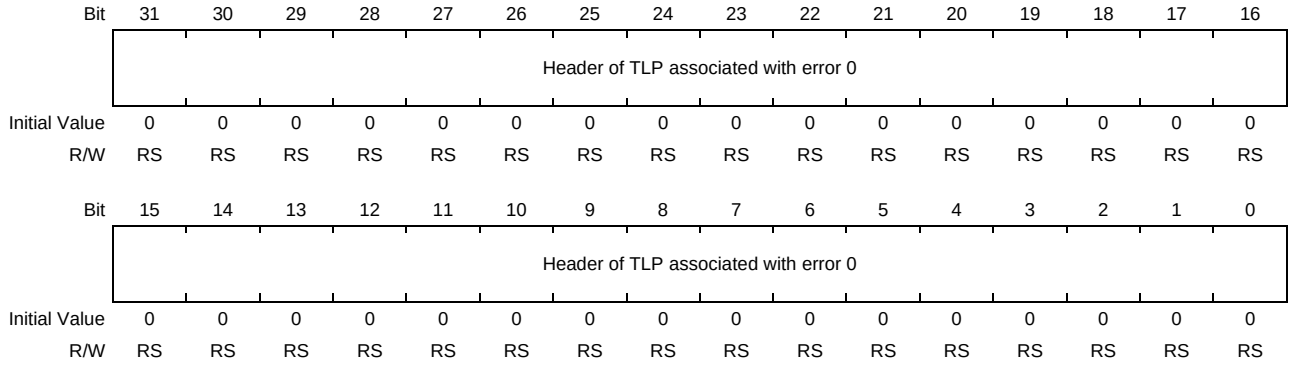
31 to 9	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	ECRC Check Enable	0b	R/WS	RST_RSM_B	Set for Enable ECRC Check. 0b: Disable (Default) 1b: Enable
7	ECRC Check Capable	1b	R	—	Whether the ECRC Check function is installed. 0b: No mounting 1b: Equipped (Default)
6	ECRC Generation Enable	0b	R/WS	RST_RSM_B	Set for Enable ECRC Check. 0b: Disable (Default) 1b: Enable
5	ECRC Generation Capable	1b	R	—	Whether ECRC Generation function is installed. 0b: No mounting 1b: Equipped (Default)
4 to 0	First Error Pointer	All 0	RS	—	Indicates the field value in the Uncorrectable Error Status register for the first Uncorrectable Error encountered.

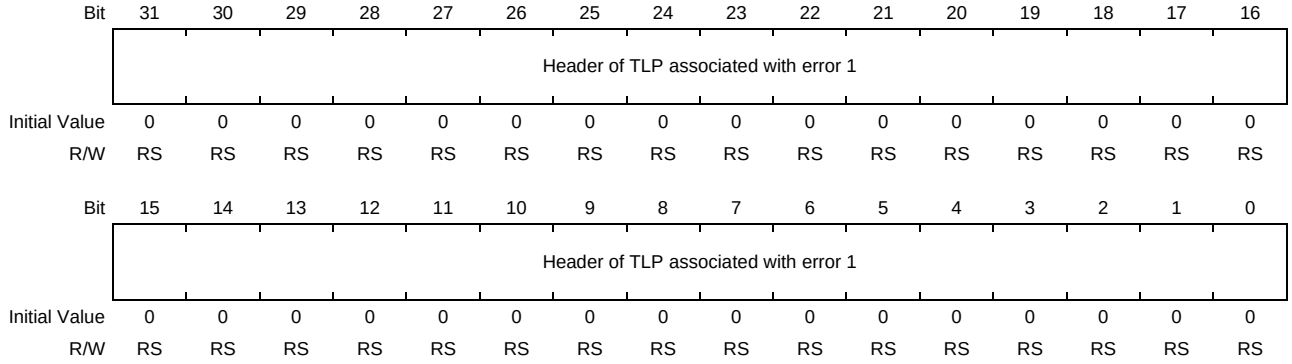
Note: Bit[4:0] The First Error Pointer is reset with PCI_RST_OUT#.

34.3.2.41 Header Log Register 0 (Offset: H'611C)



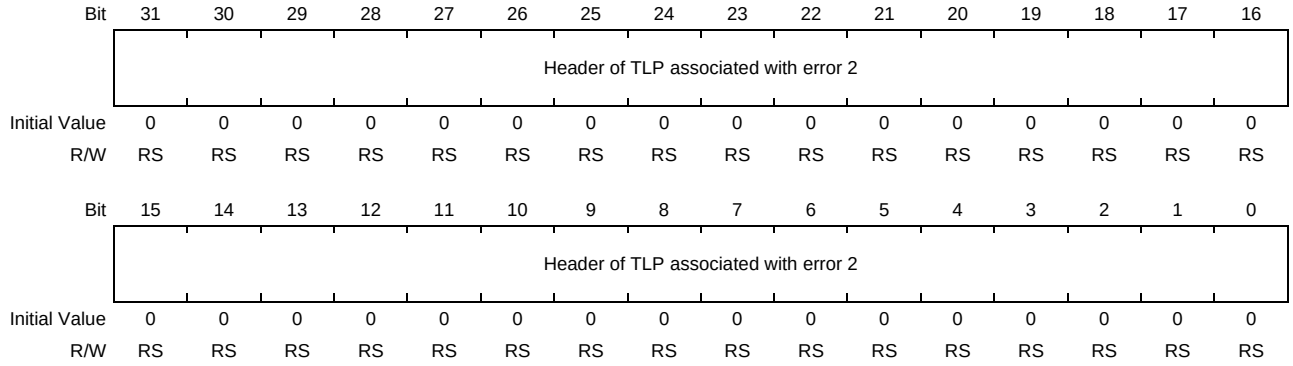
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Header of TLP associated with error 0	All 0	RS	—	For the first Uncorrectable Error detected: Shows the 1st DW of the Header.

34.3.2.42 Header Log Register 1 (Offset: H'6120)



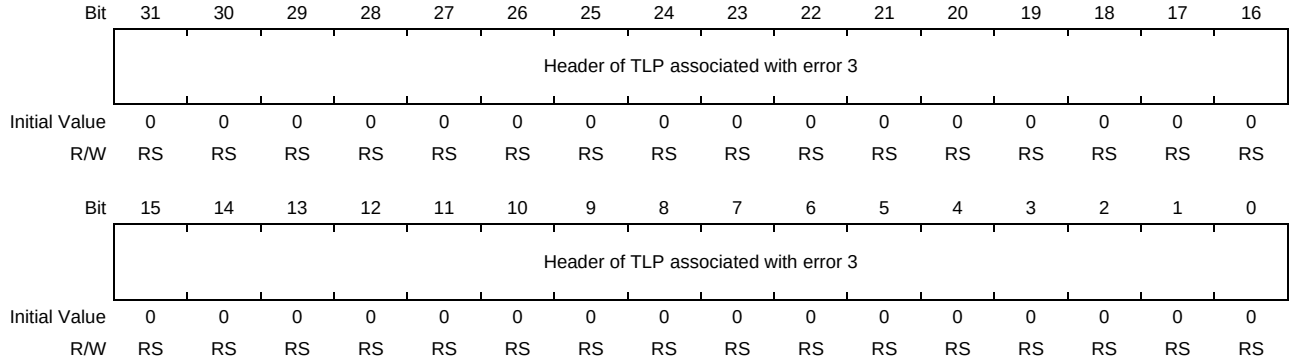
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Header of TLP associated with error 1	All 0	RS	—	For the first Uncorrectable Error detected: Shows the 2nd DW of the Header.

34.3.2.43 Header Log Register 2 (Offset: H'6124)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Header of TLP associated with error 2	All 0	RS	—	For the first Uncorrectable Error detected: Shows the 3rd DW of the Header.

34.3.2.44 Header Log Register 3 (Offset: H'6128)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Header of TLP associated with error 3	All 0	RS	—	For the first Uncorrectable Error detected: Shows the 4th DW of the Header.

34.3.2.45 Root Error Command (Offset: H'612C)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

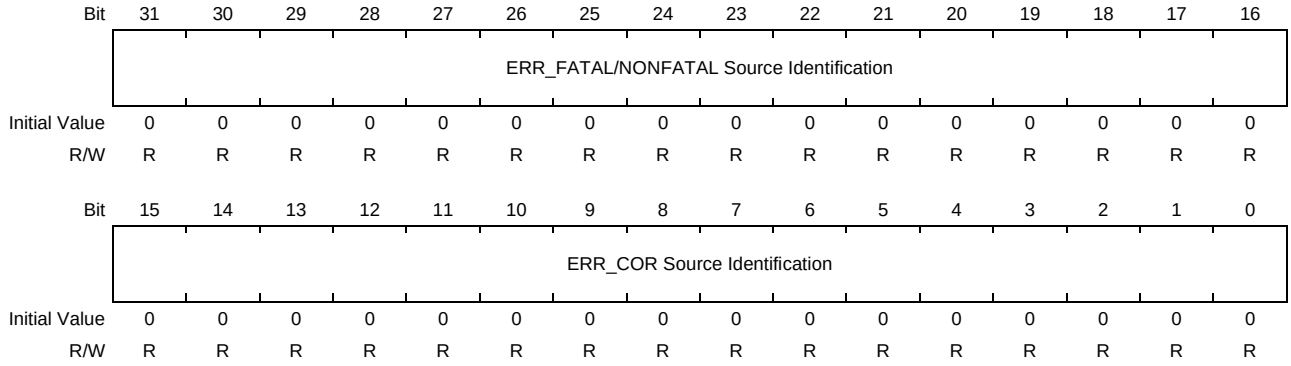
R/W	R	R	R	R	R	R	R	R	R	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C

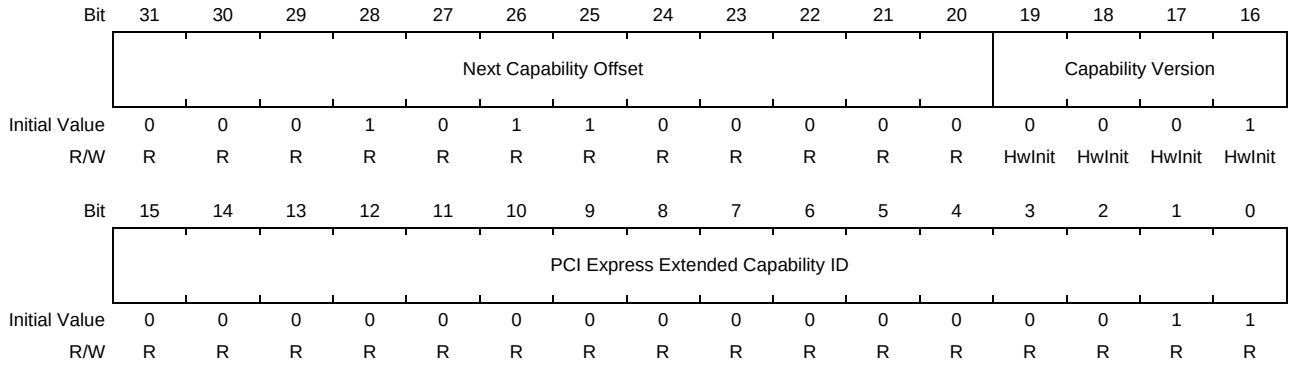
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 27	Advanced Error Interrupt Message Number	All 0	R	—	Not Implemented (H'00 fixed)
26 to 7	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	Fatal Error Message Received	0b	R/W1C	RST_RSM_B	Set when one or more ERR_FATALs are received.
5	Non-Fatal Error Message Received	0b	R/W1C	RST_RSM_B	Set when one or more ERR_NON_FATALs are received.
4	First Uncorrectable Fatal	0b	R/W1C	RST_RSM_B	Set when an uncorrectable error is first received, and the error is ERR_FATAL.
3	Multiple ERR_FATAL/ NONFATAL Received	0b	R/W1C	RST_RSM_B	Indicates that more ERR_FATAL or ERR_NON_FATAL has been received with the ERR_FATAL/NONFATAL Received bit already set.
2	ERR_FATAL/ NONFATAL Received	0b	R/W1C	RST_RSM_B	Indicates that ERR_FATAL or ERR_NON_FATAL has been received with the ERR_FATAL/NONFATAL Received bit cleared.
1	Multiple ERR_COR Received	0b	R/W1C	RST_RSM_B	Indicates that more ERR_COR has been received with the ERR_COR Received bit already set.
0	ERR_COR Received	0b	R/W1C	RST_RSM_B	Indicates that ERR_COR has been received with the ERR_COR Received bit cleared.

34.3.2.47 Error source Identification Register (Offset: H'6134)



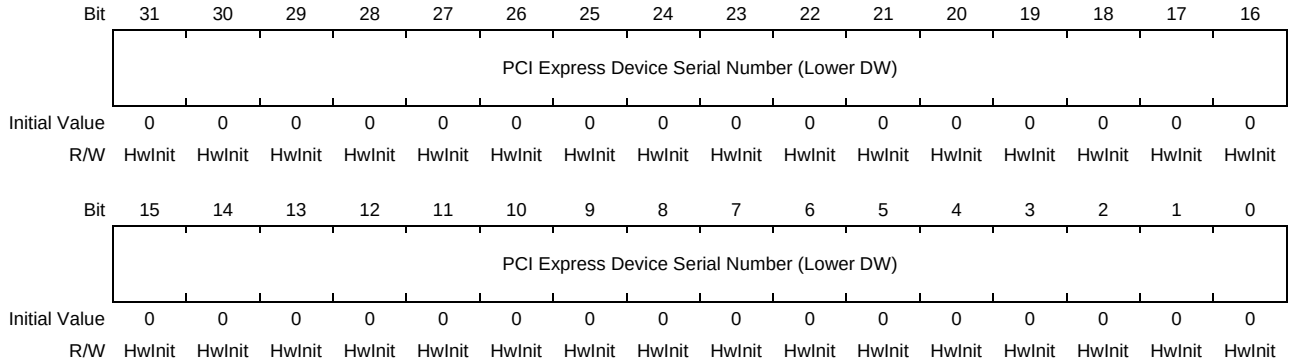
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 16	ERR_FATAL/ NONFATAL Source Identification	All 0	R	RST_RSM_B	When ERR_FATAL or ERR_NONFATAL is received without the ERR_FATAL/NONFATAL Received bit of the Root Error Status register being set, capture the requestor ID for that error.
15 to 0	ERR_COR Source Identification	All 0	R	RST_RSM_B	When ERR_COR is received without the ERR_COR Received bit in the Root Error Status register being set, the requestor ID for that error is captured.

34.3.2.48 Device Serial Number Extended Capability (Offset: H'6150)



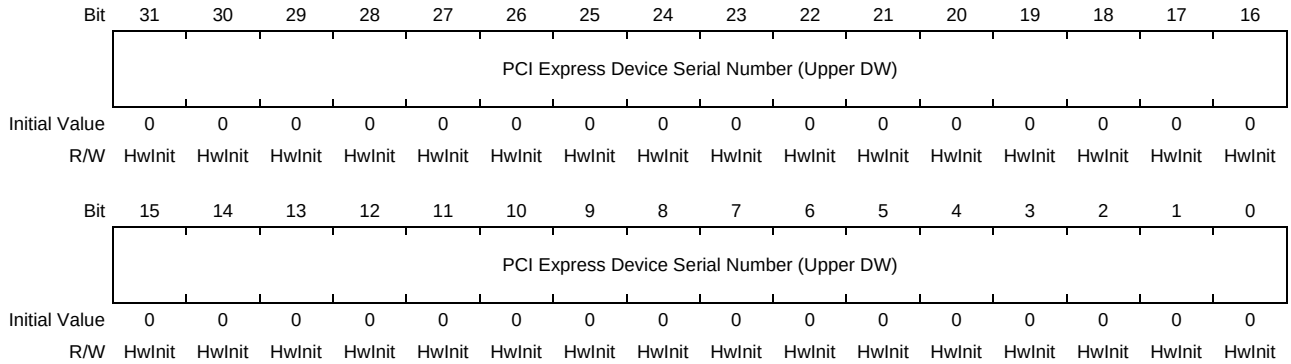
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	Next Capability Offset	H'160	R	RST_LOAD_B	Indicates the starting address of the L1 PM Substates Extended Capability Header. H'160 fixed.
21, 20				—	
19 to 16	Capability Version	H'1	HwInit	RST_LOAD_B	Indicates the Capability Structure version.
15 to 0	PCI Express Extended Capability ID	H'0003	R	—	Indicates the Device Serial Number Extended Capability.

34.3.2.49 Serial Number Register (Lower DW) (Offset: H'6154)



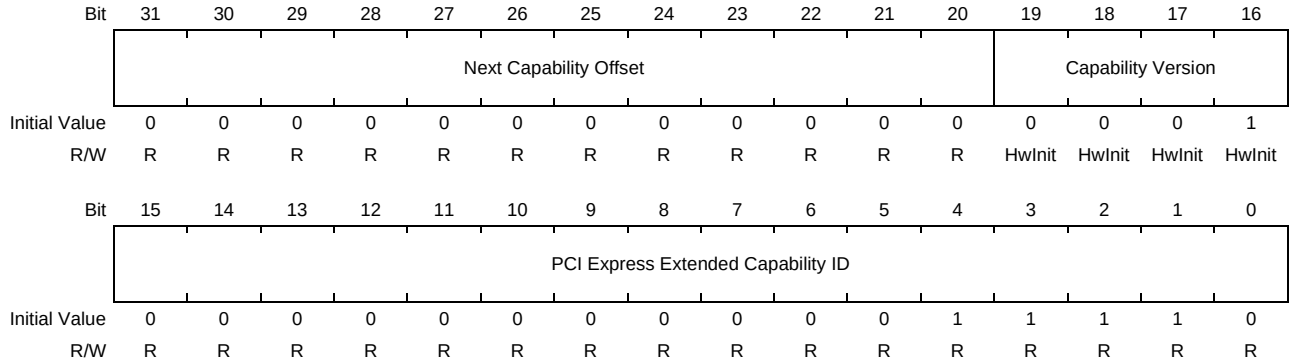
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	PCI Express Device Serial Number (Lower DW)	All 0	HwInit	RST_LOAD_B	Lower 32 bits of the IEEE standard's 64-bit unique ID (EUI-64). EUI-64 consists of a 24-bit company ID and 40-bit vendor-defined extensions. If a unique ID is used, write it from the UDL side during the timing indicated by the "Load period into the Configuration Register" in the **Figure 34.2, Reset Sequence for Power-On Reset**.

34.3.2.50 Serial Number Register (Upper DW) (Offset: H'6158)



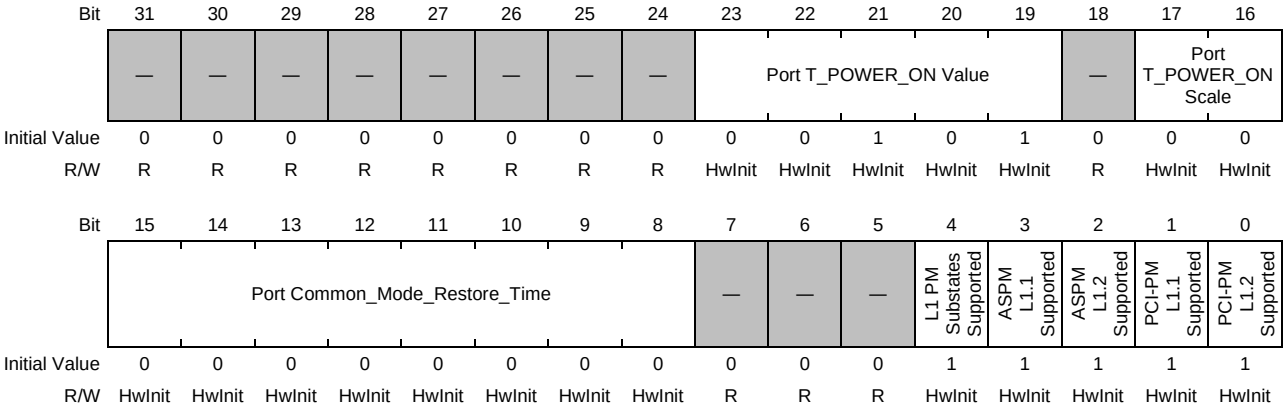
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	PCI Express Device Serial Number (Upper DW)	All 0	HwInit	RST_LOAD_B	Lower 32 bits of the IEEE standard's 64-bit unique ID (EUI-64). EUI-64 consists of a 24-bit company ID and 40-bit vendor-defined extensions. If a unique ID is used, write it from the UDL side during the timing indicated by the "Load period into the Configuration Register" in the **Figure 34.2, Reset Sequence for Power-On Reset**.

34.3.2.51 L1 PM Substates Extended Capability Header (Offset: H'6160)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 20	Next Capability Offset	H'000	R	—	Indicates that this Capability List is the final List.
19 to 16	Capability Version	H'1	HwInit	RST_LOAD_B	Indicates the Capability Structure version.
15 to 0	PCI Express Extended Capability ID	H'001E	R	—	Indicate L1 PM Substates Extended Capability Header.

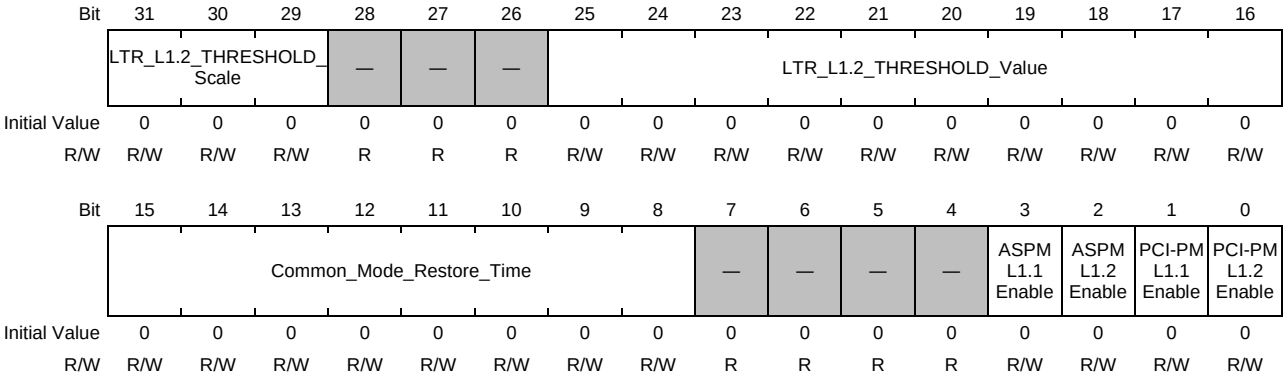
34.3.2.52 L1 PM Substates Capabilities Register (Offset: H'6164)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 19	Port T_POWER_ON Value	H'05	HwInit	RST_LOAD_B	Along with the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register sets the time (in µs) that this Port requires the port on the opposite side of Link to wait in L1.2. Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register. Default value is 00101b Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP.
18	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17, 16	Port T_POWER_ON Scale	00b	HwInit	RST_LOAD_B	Specifies the scale used for the Port T_POWER_ON Value field in the L1 PM Substates Capabilities register. Range of Values 00b: 2 µs 01b: 10 µs 10b: 100 µs 11b: Reserved Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP.
15 to 8	Port Common_Mode_Restore_Time	All 0	HwInit	RST_LOAD_B	Time (in µs) required for this Port to re-establish common mode as described in table (reference "PCI Express™ Base Specification" Table.5-11 L1.2 Timing Parameters "TCOMMONMODE"). Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP.
7 to 5	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	L1 PM Substates Supported	1b	HwInit	RST_LOAD_B	L1 PM Substates support
3	ASPM L1.1 Supported	1b	HwInit	RST_LOAD_B	ASPM L1.1 support

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
2	ASPM L1.2 Supported	1b	HwInit	RST_LOAD_B	ASPM L1.2 support
1	PCI-PM L1.1 Supported	1b	HwInit	RST_LOAD_B	PCI-PM L1.1 support
0	PCI-PM L1.2 Supported	1b	HwInit	RST_LOAD_B	PCI-PM L1.2 support

34.3.2.53 L1 PM Substates Control 1 Register (Offset: H'6168)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 29	LTR_L1.2_THRESHOLD_Scale	000b	R/W	RST_CFG_B	This field provides a scale for the value contained within the LTR_L1.2_THRESHOLD_Value. Encoding is the same as the LatencyScale fields in the LTR Message. The default value for this field is 000b. Hardware operation is undefined if software writes a Not-Permitted value to this field. This field must only be modified when the ASPM L1.2 Enable bit is Clear. The Port behavior is undefined if this field is modified when the ASPM L1.2 Enable bit is Set. Required for all Ports for which the ASPM L1.2 Supported bit is Set, otherwise this field is of type RsvdP.
28 to 26	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 16	LTR_L1.2_THRESHOLD_Value	All 0	R/W	RST_CFG_B	Along with the LTR_L1.2_THRESHOLD_Scale, this field indicates the LTR threshold used to determine if entry into L1 results in L1.1 (if enabled) or L1.2 (if enabled). The default value for this field is 00_0000_0000b. This field must only be modified when the ASPM L1.2 Enable bit is Clear. The Port behavior is undefined if this field is modified when the ASPM L1.2 Enable bit is Set. Required for all Ports for which the ASPM L1.2 Supported bit is Set, otherwise this field is of type RsvdP.
15 to 8	Common_Mode_Restore_Time	H'00	R/W	RST_CFG_B	Sets value of TCOMMONMODE (in µs), which must be used by the Downstream Port for timing the re-establishment of common mode, as described in . This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are Set. Required for Downstream Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. This field is of type RsvdP for Upstream Ports.
7 to 4	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	ASPM L1.1 Enable	0b	R/W	RST_CFG_B	ASPM L1.1 support
2	ASPM L1.2 Enable	0b	R/W	RST_CFG_B	ASPM L1.2 support
1	PCI-PM L1.1 Enable	0b	R/W	RST_CFG_B	PCI-PM L1.1 support

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
0	PCI-PM L1.2 Enable	0b	R/W	RST_CFG_B	PCI-PM L1.2 support

34.3.2.54 L1 PM Substates Control 2 Register (Offset: H'616C)

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	T_POWER_ON Value					—	T_POWER_ON Scale	
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 8	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 3	T_POWER_ON Value	H'05	R/W	RST_CFG_B	Along with the T_POWER_ON Scale sets the minimum amount of time (in µs) that the Port must wait in L1.2. Exit after sampling CLKREQ# asserted before actively driving the interface. T_POWER_ON is calculated by multiplying the value in this field by the value in the T_POWER_ON Scale field. This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are Set. Default value is 0_0101b Required for all Ports that support L1.2, otherwise this field is of type RsvdP
2	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	T_POWER_ON Scale	00b	R/W	RST_CFG_B	Specifies the scale used for T_POWER_ON Value. Range of Values 00b: 2 µs 01b: 10 µs 10b: 100 µs 11b: Reserved Required for all Ports that support L1.2, otherwise this field is of type RsvdP. This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are Set. Default value is 00b

34.4 Function Description

34.4.1 PCIe Core Functionality

This module is configured based on the Base Spec 4.0. For the detailed specification, refer to the Base Spec 4.0

34.4.2 Issuing of PCIe Request and Register Access (From AXI)

The following gives functional description on access to the PCI Express core by the AXI bus.

34.4.2.1 PCIe Requests which can be Issued (Supported Commands for TX)

Requests to be issued via PCIe windows

MRd: Memory Read Request

MWr: Memory Write Request

Requests to be issued by the registers

MRd: Zero-Length Memory Read Request

CfgRd0: Configuration Read Type 0

CfgWr0: Configuration Write Type 0

CfgRd1: Configuration Read Type 1

CfgWr1: Configuration Write Type 1

Msg: Message Request

MsgD: Message Request with data payload

Unsupported requests (issuance prohibited)

IORd: I/O Read Request

IOWr: I/O Write Request

MRdLk: Memory Read Request-Locked

CplDLk: Completion for Locked Memory Read

34.4.2.2 Register access

- Internal register read/write
- Configuration register read/write

The following restrictions apply to access to the configuration registers.

- Byte-lane transfer is only acceptable if the transfer consists of consecutive valid bytes.
- If the valid bytes are not consecutive, only values which are no greater than 32 bits (1 dword) and do not span the dword alignment are acceptable.
  [Example] A value which can represent a dword TLP for PCIe

34.4.2.3 Issuing Memory Requests

Access from the AXI side is converted into a PCIe request and then issued. Up to eight windows can be allocated. Note that only incremental bursts and fixed bursts (of 1 beat) are acceptable. Wrapping bursts and fixed bursts (of 2 or more beats) are prohibited. If these prohibited bursts are received, the module operates as follows.

- Although the response will in general be “OKAY” (except in cases that involved a protocol error of the AXI), this is
- beyond the scope of guaranteed operation.
- Unexpected requests may be issued to the PCIe bus.
- Unexpected registers may be modified.

To maintain the order between memory writing and memory reading, only issue next transactions after the reception of responses to writing. Buffering is not available in the issuing of memory write requests. (Refer to the description of AWCACHE* of Mode Set 0 Register (offset: H’314).)

Note that when accessing outside the set Window area, it responds “OKAY”, but it is discarded inside this module.

(1) Memory Write Transaction from the AXI

A write transaction from the AXI via a window is converted into a MWr command and then issued.

- Number of write transactions which can be accepted at a time: 1
- Write data are held in an internal buffer.
- The order between memory write transactions is preserved (with the exception of transactions for messages and configuration).
- The order of memory write and other transactions is not preserved (a preceding memory read may be overtaken).
- To preserve the order between memory writing and memory reading or of Msg and MsgD, make sure that a next transaction is only issued after a response is returned. Buffering is not available in the issuing of memory write requests.
- Writing does not proceed if the PCI power state is not D0.
- Transactions where all bits of WSTRB are 0 during a burst return an “OKAY” response, but the written data are not reflected.

(2) Memory Read Transaction from the AXI

A read transaction from the AXI via a window is converted into an MRd command and then issued.

- Number of read transactions which can be accepted at a time: 1 to 8.
- Read data are held in an internal buffer to preserve the order of transactions with the same ID.
- To preserve the order of memory read transactions from the same master ID, the system can also wait until the indicator of completion of a preceding read transaction is returned. The method of waiting is selectable as either of the above by the setting of an internal register as listed in the table below.

PCIe Request Order*1	Method of Waiting	Performance	Severity of Order
0 (Default)	Make Read Data wait in internal buffer	✓	—
1	Waiting to issue a Read Request	—	✓

Note 1. The order can be set by using the PCIe Request Order bit (bit [0]) of Mode Set 1 Register (offset: H'318).

- The order of memory read transactions from a different master ID is not preserved.
- The order of memory read and other transactions is not preserved.
- To preserve the order between memory reading and memory writing, make sure that a next transaction is only issued after a response is returned. Buffering is not available in the issuing of memory write requests.
- MRdLk requests are not supported and therefore cannot be issued.
- Reading does not proceed if the PCI power state is not D0.

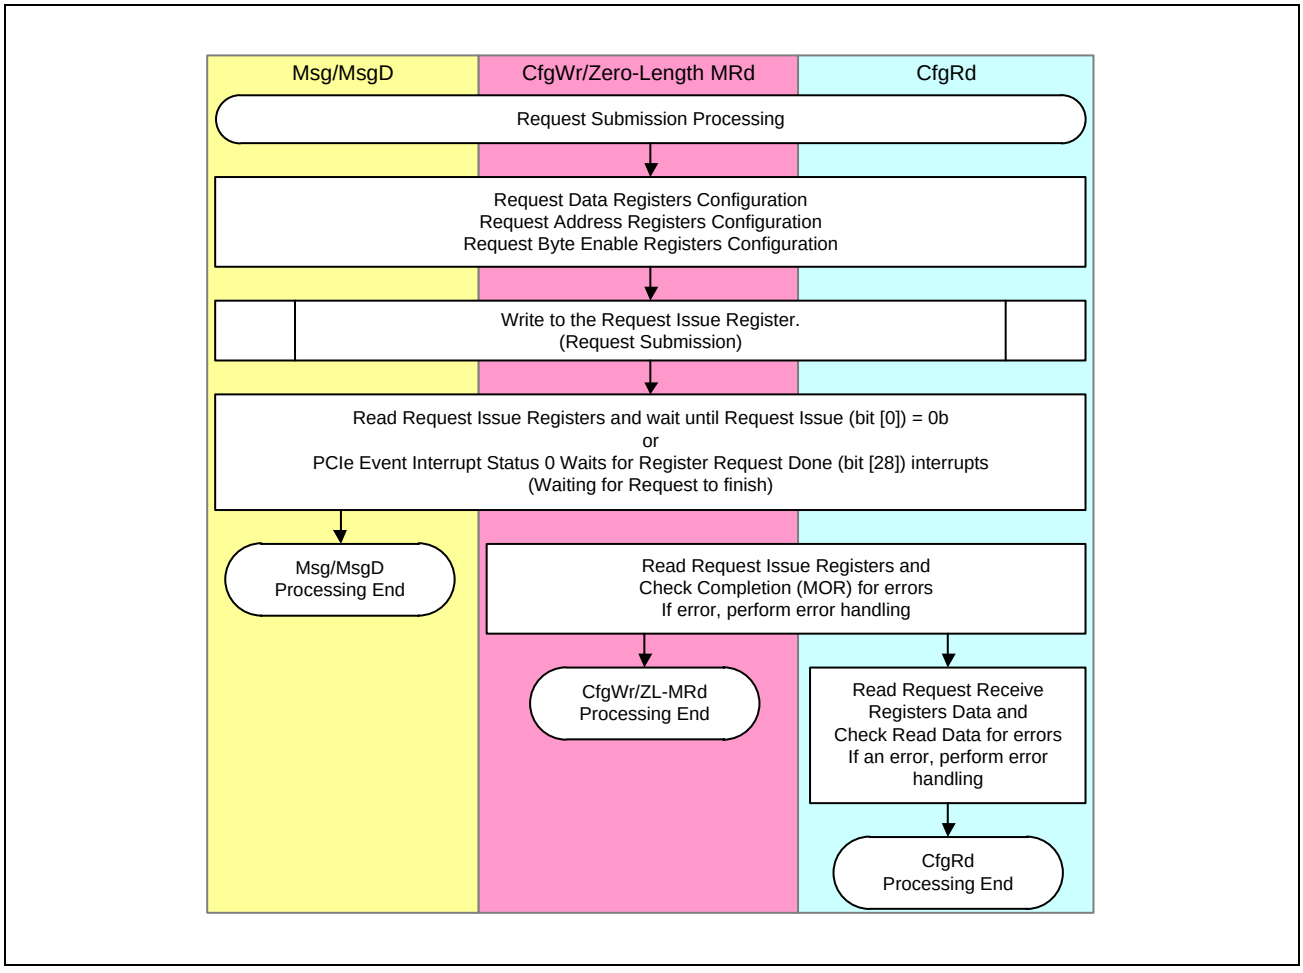
34.4.2.4 Issuing Special Requests

The following requests can be issued by controlling the internal registers.

- Configuration Read Type0/1
- Configuration Write Type0/1
- Zero-Length Memory Read Request
- Message Request
- Message Request with data payload

The internal registers are only writable from the AXI side. Attempted writing from the PCIe side is ignored and the write operation returns an “OKAY” response, but the written data are not reflected.

The figure below shows the flow of issuing requests by the registers.



(1) Issuing a Configuration Request

AXI Slave I/F accesses internal registers, sets destination in Request Address Registers 1 (Offset: H’90), then sets Request Issue (bit [0]) in Request Issue Registers (Offset: H’9C), and automatically issues a Configuration Request.

(a) Flow of issuing Configuration Requests

An example of the flow for issuing a Configuration Requests is described below.

1. Set a destination in Request Address Registers 1 (Offset: H’90)

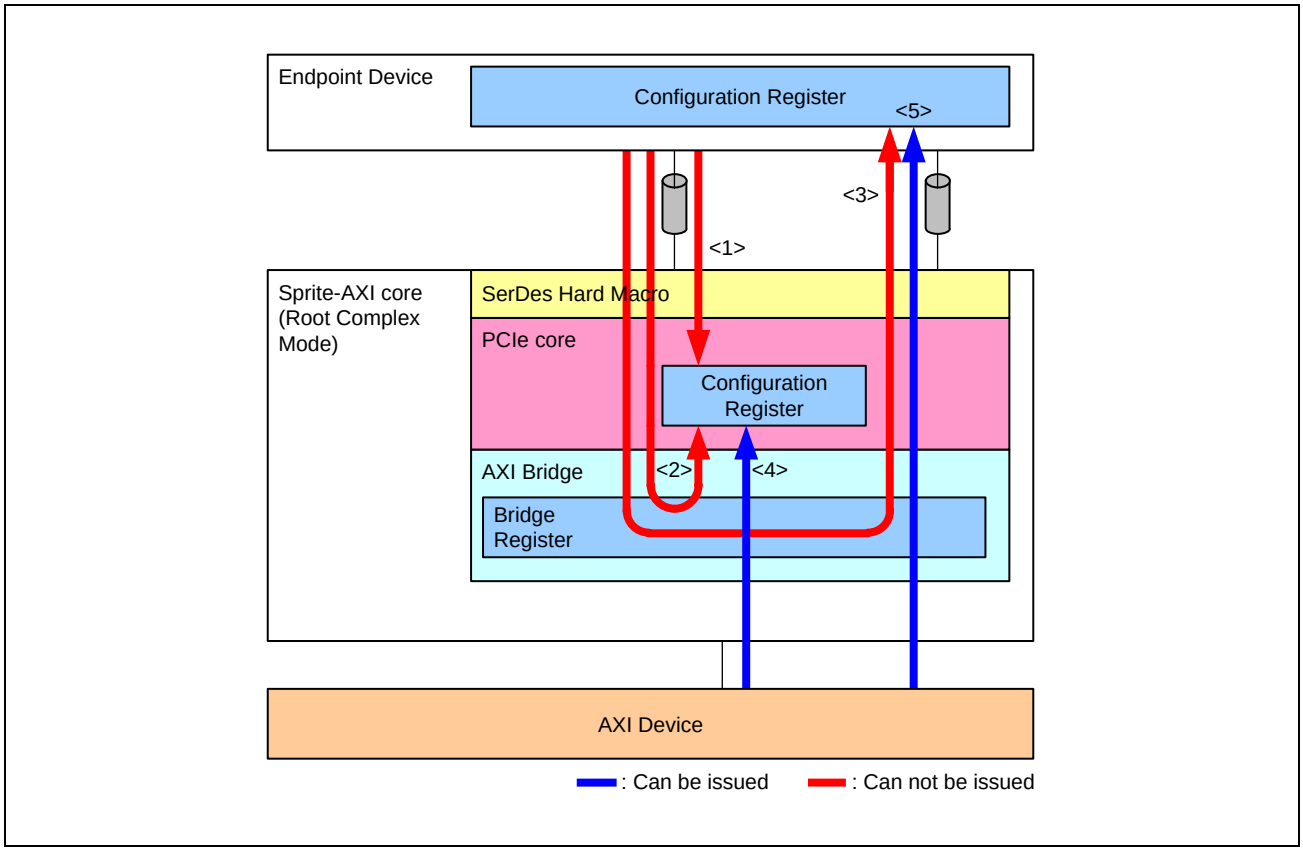
Bits [31: 24]:	Bus Number [7:0]	Set 0 to 255
Bits [23:19]:	Device Number [4:0]	Set 0 to 31
Bits [18:16]:	Function Number [2:0]	Set 0 to 7
Bits [15:12]:	Reserved	Set 0000b (Fixed value)
Bits [11:8]:	Extend Register Number [3:0]	
Bits [7:2]:	Register Number [7:0]	
Bits [1:0]:	Reserved	Set 00b (Fixed value)

2. Set to Byte Enable in Request Byte Enable Registers (Offset: H’98).
   Set Enable/Disable corresponding to each Byte position if Read/Write is desired for each Byte (Default: 1111b)
3. For CfgWr, set Write Data in Request Data Registers (Offset: H’80/H’84/H’88). (Not needed for CfgRd)
4. A Configuration Request is automatically issued by setting the Request Issue (bit [0]) in the Request Issue Registers (Offset: H’9C) to 1b. (Set CfgWr/CfgRd in TR type (bit [11:8]) of Request Issue Registers (Offset: H’9C).)
5. Wait for the Request to finish by reading the Request Issue Registers (Offset: H’9C) and waiting for the Request Done (bit [28]) interrupt of wait (Polling) or PCIe Event Interrupt Status 0 Registers (Offset: H’204) until the Request Issue (bit [0]) reaches 0b.
6. For CfgRd, the CplD from the opposing Endpoint device is stored in Request Receive Data Registers (Offset: H’8C). It is possible to check this register by reading it.

(b) Configuration Request Issue Patterns

The following table shows whether the Configuration Request can be issued in Root complex mode.

No.	Request Direction	Access
1	EP to PCIe Core	Can not be issued
2	EP to Register → PCIe Core	Can not be issued
3	EP to Register → EP	Can not be issued
4	AXI to PCIe Core	Can be issued
5	AXI to Register → EP	Can be issued



(2) Issuing Message Requests

A message request is automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register after access to an internal register through the AXI slave interface and setting a destination in Request Address Register 1.

(a) Flow of Issuing Message Requests

An example of the flow of issuing message requests is described below.

1. Set a destination in Request Address Register 1.

Bits [31:27]:	Reserved	Set 0_0000b (Fixed value)
Bits [26:24]:	Routing Type	Specify the message routing
Bits [23:8]:	Reserved	Set H'0000 (Fixed value)
Bits [7:0]:	Message Code	Specify the message code

2. Set the 3rd header in Request Data Register 1 as required.
3. Set the 4th header in Request Data Register 2 as required.
4. For MsgD, set write data in Request Data Register 3 (not required in the case of Msg)
5. Message requests are automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register to 1b (the TR type bits (bits [11:8]) of the Request Issue Register are used to set Msg/MsgD).
6. Read the Request Issue Register and wait (polling) or wait for an interrupt of Request Done (bit [28]) of PCIe Event Interrupt Status 0 Register until the Request Issue bit (bit [0]) is set to 0b, wait for the request to end.

(b) Notes when Issuing Message Requests

Points to note when issuing message requests are described below.

- INTx and error type messages are automatically issued. They do not require issuing as message requests by the user (prohibited).
- Set message headers appropriately.
- A value to be set in a message header must be 0 except when sending a vendor defined message.

(3) Issuing Zero-Length Read

A zero-length read request is automatically issued by setting a destination in Request Address Register 1 after access to an internal register through the AXI slave interface and setting the Request Issue bit (bit [0]) of the Request Issue Register.

(a) Flow of Issuing Zero-Length Read Requests

An example of the flow of issuing zero-length read requests is described below.

1. Set a destination in Request Address Register 1.

Bits [31:2]:	Address	Set the address
Bits [1:0]:	Reserved	Set 00b (Fixed value)

2. Set a destination in Request Address Register 1.

Bits [64:32]:	Address	Set the address

3. Set Byte Enable (0000b) in Request Byte Enable Register.
4. Zero-length read requests are automatically issued by setting the Request Issue bit (bit[0]) of the Request Issue Register to 1b (the TR type bits (bits [11:8]) of the Request Issue Register are used to set zero-length read).
5. Read the Request Issue Register and wait (polling) or wait for an interrupt of Request Done (bit [28]) of PCIe Event Interrupt Status 0 Register until the Request Issue bit (bit [0]) is set to 0b, wait for the request to end.

An example of using this request is to issue a zero-length read request to the same address where the write request was issued for a Posted Request that did not receive a response, such as a memory write, and use the response as a completion notification for the write request.

34.4.3 Issuing of AXI Transaction and Register Access (From PCIe)

The following gives functional description on access to the AXI bus by the PCI Express core.

34.4.3.1 PCIe Requests which can be Received (Supported Commands for RX)

MRd: Memory Read Request

MWr: Memory Write Request

CfgRd0: Configuration Read Type 0

CfgWr0: Configuration Write Type 0

Msg: Message Request

MsgD: Message Request with data payload

Cpl: Completion

CplD: Completion with Data

The following requests are not supported.

MRdLk: Memory Read Request-Locked

IORd: I/O Read Request

IOWr: I/O Write Request

CplLK: Completion for Locked Memory Read without Data

CplDLk: Completion for Locked Memory Read

CfgRd1: Configuration Read Type 1

CfgWr1: Configuration Write Type 1

AtomicOP is not supported.

34.4.3.2 Issuing AXI Transaction

Access from the PCIe side is converted into an AXI transaction and then issued. Up to eight windows can be allocated.

To avoid a read-after-write (RAW) hazard, only issue a next memory write request following reception of the completion TLP for the previous one.

Table 34.13 AXI transaction from PCIe Request

PCIe Request Order	Burst Type	Bath Size	Split
MWr/MRd	Increment	64/128	Yes
		32	No
IOWr/IORd	Unsupported request		
MRdLk	Unsupported request		

(1) Memory Write Transaction from the PCIe

- Allowable number of write requests to be issued: Variable (the value is set by the AXI Max Issue Write bits (bits [15:12]) of Mode Set 1 Register).
- Write data are not held in an internal buffer (buffering within the PCIe core).
- The order between memory write transactions is preserved.
- The order of memory writing and memory reading is not preserved.
- To preserve the order between memory writing and memory reading, make sure that a next request is only issued after a completion TLP is returned.
- AWCACHE and AWPROT can be set by using Mode Set 0 Register.
- In cases of contention between DMA transfer (from PCIe to AXI) and memory write transaction, requests are accepted in turn in round-robin fashion.

(2) Memory Read Transaction from the PCIe

- Allowable number of read requests to be issued: Variable (the value is set by the AXI Max Issue Read bits (bits[11:8]) of Mode Set 1 Register).
- Since the PCI specification requires dword-aligned memory addresses in transfer, invalid byte lanes may be read. If an AXI slave as a read destination has a register or FIFO buffer which has been cleared by being read, the transaction may be non-compliant.
- Data read are held in an internal buffer.
- The order between memory read operations is preserved.
- A preceding memory write is not overtaken.
  Data read are held in an internal buffer until a preceding memory write is completed.
- When a zero-length read request is received, an “OKAY” response is returned, but the written data are not reflected and a completion TLP is transmitted after waiting for the completion of the preceding memory write.
  Data read are held in an internal buffer until a preceding memory write is completed.
- ARCACHE can be set by using Mode Set 0 Register.
- In cases of contention between DMA transfer (from AXI to PCIe) and memory read transaction, requests are accepted in turn in round-robin fashion.

34.4.3.3 Narrow Transfer

Narrow transfer to be initiated by the AXI transfer only supports the following AXI transactions.

- MAxBURST = INCR
- MAxSIZE = H’0 to H’2 (8 bits / 16 bits / 32 bits)
- MAxLEN = H’0 (1 beat)

The following restrictions apply to TLPs from the PCIe module in narrow transfer.

- The length is 1 dword.
- The First Byte Enable bit only supports the following.
  - MAxSIZE = H’0 (8 bits): 1000b / 0100b / 0010b / 0001b
  - MAxSIZE = H’1 (16 bits): 1100b / 0011b
  - MAxSIZE = H’2 (32 bits): 1111b

34.4.4 DMA Functions

This section explains functions of the DMAC within the module. Control by registers and by descriptors are both supported as methods of DMA control. The method of control is independently selected per channel.

34.4.4.1 Register-Type Transfer

DMA transfer from AXI to PCIe or vice versa is handled by software making register settings. The table below lists the DMAC registers for execution of register-type DMA transfer.

Table 34.14 Registers Related to Register-Type DMA Transfer

Common Control	
H'800	DMAC Control
H'808	DMAC Interrupt Enable
H'80C	DMAC Interrupt Status
Channel Control	
H'900 + channel offset	DMA Channel Control
DMA Setting	
H'924 + channel offset	DMA Transaction Control (Descriptor H'04)
H'928 + channel offset	DMA Size (Descriptor H'08)
H'930 + channel offset	DMA Source Lower Address (Descriptor H'10)
H'934 + channel offset	DMA Source Upper Address (Descriptor H'14)
H'938 + channel offset	DMA Destination Lower Address (Descriptor H'18)
H'93C + channel offset	DMA Destination Upper Address (Descriptor H'1C)
DMA Status	
H'950 + channel offset	DMA Reset Size
H'960 + channel offset	AXI Request Address (Lower)
H'964 + channel offset	AXI Request Address (Upper)
H'968 + channel offset	PCIe Request Address (Lower)
H'96C + channel offset	PCIe Request Address (Upper)
H'978 + channel offset	DMAC Error Status

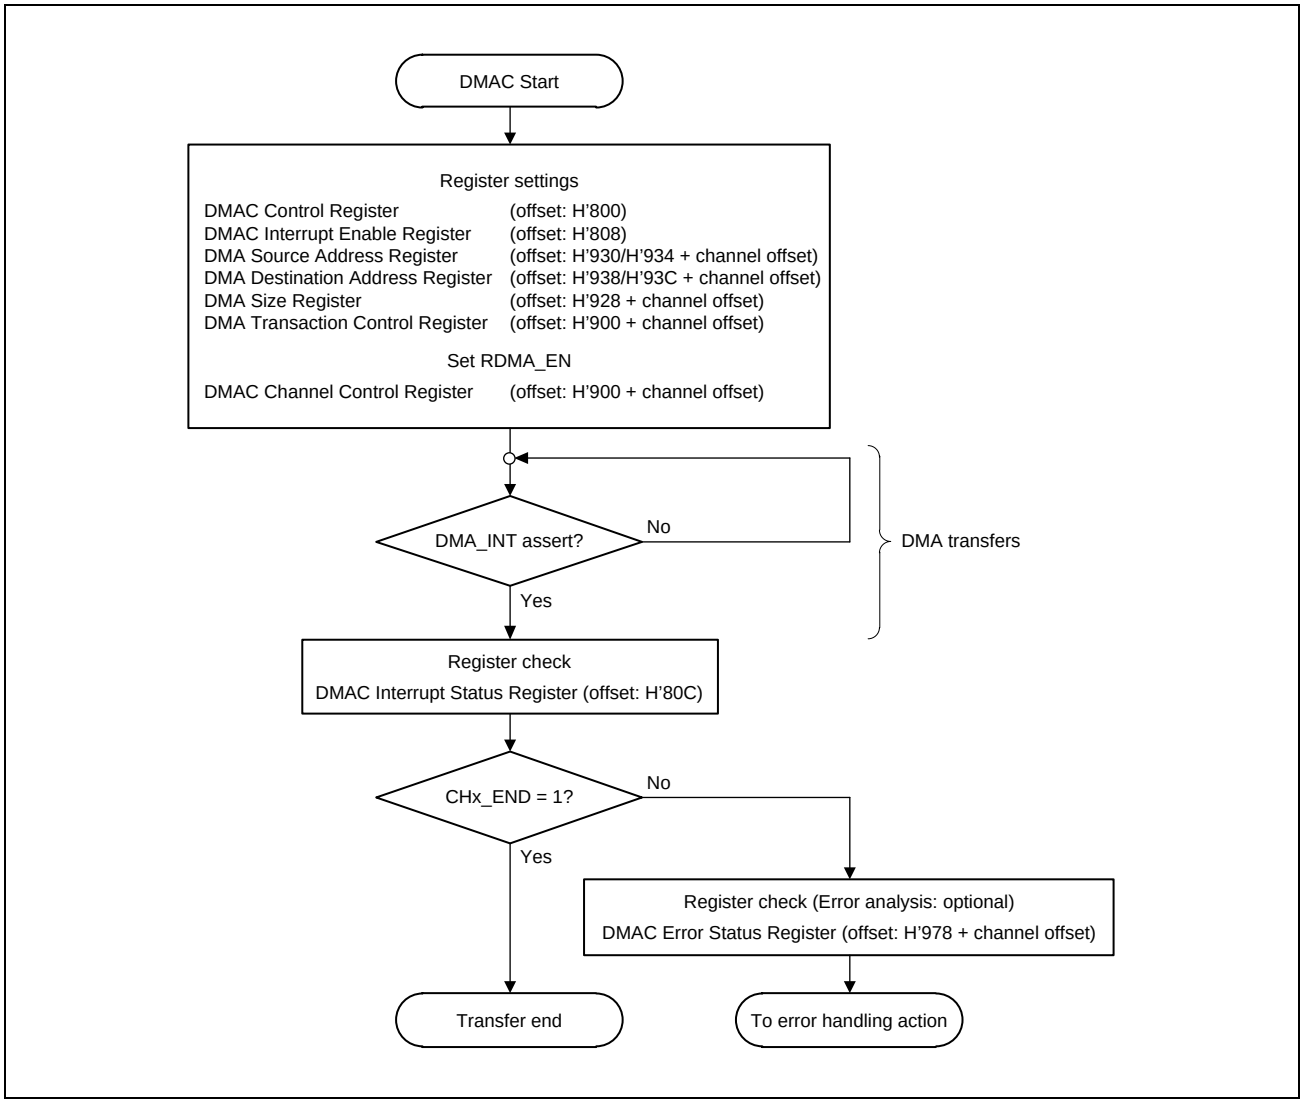
Note: During Register-type DMA, the maximum number of bytes transferred at one time is 4 Gbytes.

(1) Flow of Operations

The following describes the procedures for settings to activate and stop the DMAC in the case of register-type transfer.

(a) Activation and Normal Operation

Before activating the DMAC, set the PCIe and AXI windows. After that, set the registers of the DMAC to start the DMAC.

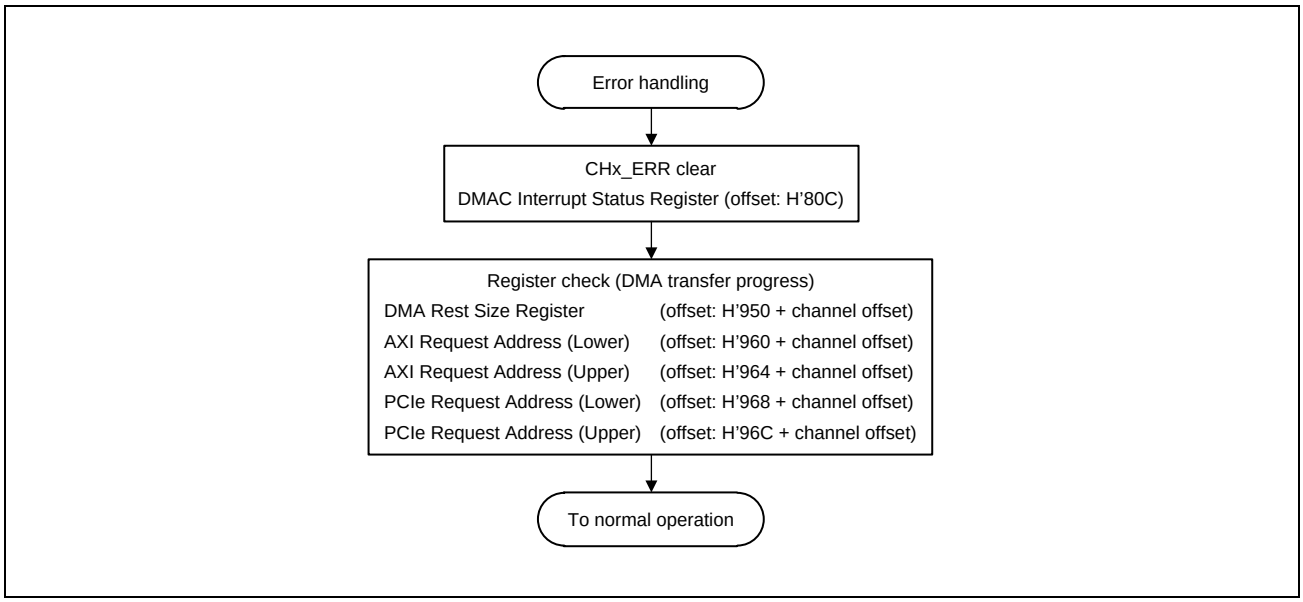


(b) Error Processing

If an error is detected in the AXI bus or a PCIe link while DMA transfer is in progress, the DMA_INT interrupt signal is asserted.

Check the channel where the error was found (CHx_ERR = 1b) by using the DMAC Interrupt Status Register (offset: H’80C) and also the type of error by using the DMAC Error Status Register (offset: H’968 + channel offset) as required.

Clear the CHx_ERR bit that is currently set in the DMAC interrupt status register (offset: H’80C) by writing 0b to it and check the address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer by reading the DMA Status registers (offset: H’950 + channel offset to H’96C + channel offset) for the given channel.



34.4.4.2 Descriptor-Type Transfer

Consecutive DMA transfer is achieved by sequentially reading descriptors which indicate parameters of DMA transfer. Descriptors are allocated to the AXI memory space, and the descriptor lists indicate the addresses where the descriptors start. This DMAC has a queue for storing multiple descriptors lists and these descriptor lists are written by software. The first list loaded in the queue is executed after being moved to become the descriptor list for execution following the detection of the condition for starting DMA transfer (the DMAC retains up to nine lists, including the one currently being executed).

Descriptors can have a chained configuration; execution of a descriptor list ends on detection of the last descriptor, and if the queue has a next list, execution of the next descriptor follows.

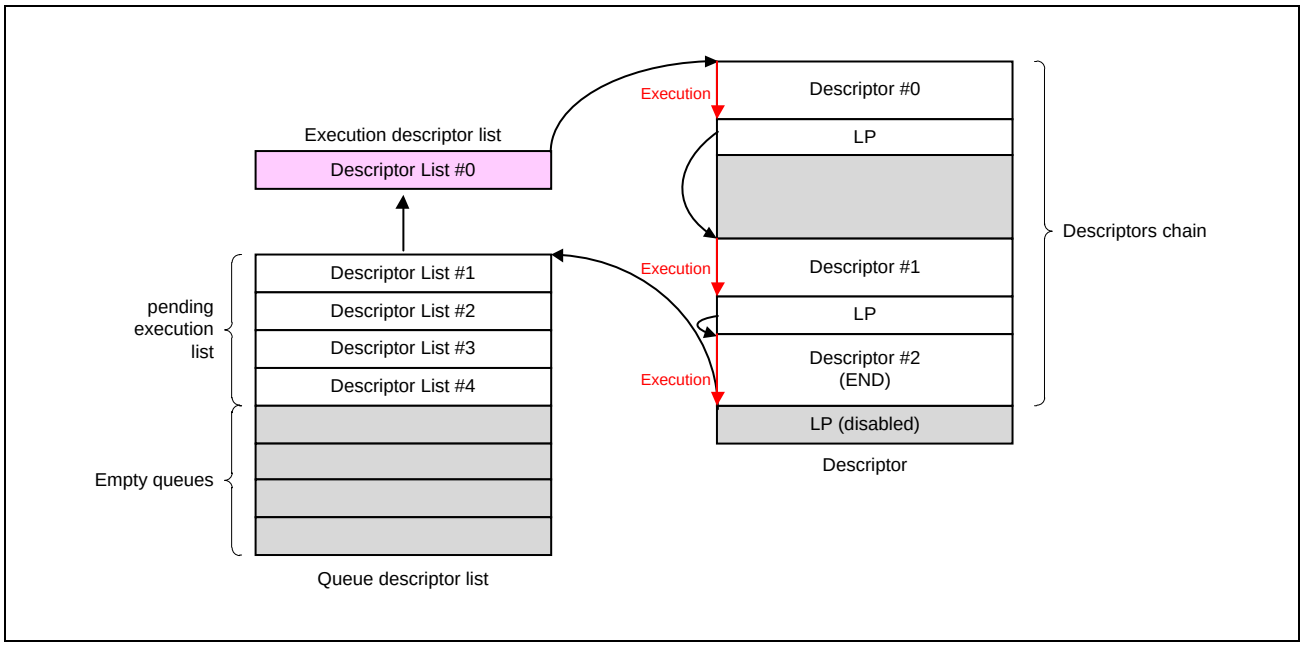


Figure 34.3 Descriptor Chain

The table below lists the DMAC registers for execution of descriptor-type DMA transfer.

Table 34.15 Registers Related to Descriptor-Type DMA Transfer

Common Control	
H'800	DMAC Control
H'808	DMAC Interrupt Enable
H'80C	DMAC Interrupt Status
Channel Control	
H'900 + channel offset	DMA Channel Control
H'908 + channel offset	Descriptor Start Address (Lower)
H'90C + channel offset	Descriptor Start Address (Upper)
H'910 + channel offset	QUE Entry
DMA Setting	
H'920 + channel offset	DMA Descriptor Control (Descriptor H'00)
H'924 + channel offset	DMA Transaction Control (Descriptor H'04)
H'928 + channel offset	DMA Size (Descriptor H'08)
H'930 + channel offset	DMA Source Lower Address (Descriptor H'10)
H'934 + channel offset	DMA Source Upper Address (Descriptor H'14)
H'938 + channel offset	DMA Destination Lower Address (Descriptor H'18)
H'93C + channel offset	DMA Destination Upper Address (Descriptor H'1C)
H'940 + channel offset	DMA Descriptor Lower Link Pointer (Descriptor H'20)
H'944 + channel offset	DMA Descriptor Upper Link Pointer (Descriptor H'24)
DMA Status	
H'950 + channel offset	DMA Rest Size
H'960 + channel offset	AXI Request Address (Lower)
H'964 + channel offset	AXI Request Address (Upper)
H'968 + channel offset	PCIe Request Address (Lower)
H'96C + channel offset	PCIe Request Address (Upper)
H'970 + channel offset	QUE Status
H'978 + channel offset	DMAC Error Status

(1) Descriptor List Queues

The DMAC has queues for storing descriptor lists for each of the channels. The number of FIFO queue stages is eight, so it can hold up to eight descriptor list entries (not including the one currently being executed).

Software places descriptor list entries in the queue. The descriptor lists to be entered are set by the combination of the QUE_ENTRY (upper) register and the QUE_ENTRY (lower) register in 64-bit (or 8-byte) units.

Since the target registers are also accessible in 8-bit units, making the settings in byte units through multiple accesses is also possible. A descriptor list entry is placed in the queue at the time when the QUE_ENTRY (upper) bits [31:24] are written. When making the settings and entering lists in the queue, take care with the order of register access (values written to the QUE_ENTRY (upper) bits [31:26] will not affect the register values and settings because they are read-only bits).

When the DMAC detects the presence of a list which has been entered in the queue, the first list entry is moved to become the pointer to the next descriptor for execution and DMA transfer starts.

(2) Descriptor List Format

The table below is the format of a descriptor list.

Table 34.16 Descriptor List Format

Offset	Byte 3			Byte 2	Byte 1	Byte 0
H'00	DSA[31:0] (Descriptor Start Address)					
H'04	DSA[63:32] (Descriptor Start Address)					
H'08	Reserved	EI	LS	Reserved	LABEL [15:0]	

Field Name	Description
DSA[63:0]	Descriptor start address for DAM. Sets the address where the first descriptor is stored. 16-byte alignment and 1 descriptor (H'00 to H'24) beyond the 4K boundary is prohibited. Set the lower 6 bits [5:0] to be 00_0000b.
EI	End Interrupt bit. This bit indicates whether an interrupt (Interrupt Status CHx_END of the DMAC Interrupt Status Register (offset: H'80C)) is or is not conveyed when processing of this descriptor list is completed. 1b: The interrupt is conveyed. 0b: The interrupt is not conveyed.
LS	List Stop bit. This bit indicates whether DMA transfer is or is not to be stopped on completion of processing for this descriptor list entry. 1b: Stopped 0b: Not stopped On completion of the list in which the setting of this bit is 1b, the QUE_EN bit of the DMA control register is cleared.
LABEL[15:0]	This field represents the label of the list. There are no special rules for the setting procedures. The value can be set as desired.

Operations by the settings of the EI and LS bits following the completion of the descriptor list are as follows.

Table 34.17 Details of the EI/LS Bits

EI	LS	
0	0	No interrupt. DMA transfer is not stopped. If the queue has a next list, execution of the next descriptor follows.
0	1	No interrupt. DMA transfer is stopped (QUE_EN is cleared).
1	0	Interrupt (DMAC Interrupt Status Register (Offset: H'80C), Interrupt Status CHx_END) is present. DMA transfer is not stopped. If the queue has a next list, execution of the next descriptor follows.
1	1	Interrupt (DMAC Interrupt Status Register (Offset: H'80C), Interrupt Status CHx_END) is present. DMA transfer is stopped (QUE_EN is cleared).

(3) Descriptor Format

The table below is the format of descriptors.

When reading descriptors, this module reads data up to Offset H'00 to H'2C, but data up to Offset H'28 to H'2C is not used in the macro.

Table 34.18 Descriptor List Format

Offset	Byte 3								Byte 2								Byte 1								Byte 0							
H'00	DSCFM = 0001b			—	WBD	LE	LV	D	—	—	—	—	—	—	—	STS (not used)																
H'04	—	—	—	—	—	—	—	—	CCH_L								CCH_D								—	TC			—	—	ATB		
H'08	—	DMA_FUNC							—	—	—	DIR					SIZE [31:0]																
H'0C	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
H'10	Source Address [31:0]																																
H'14	Source Address [63:32]																																
H'18	Destination Address [31:0]																																
H'1C	Destination Address [63:32]																																
H'20	Link Pointer [31:0]																																
H'24	Link Pointer [63:32]																																

Field Name	Description
DSCFM[3:0]	Descriptor Format, which specifies the format of the descriptor. This DMAC only supports 0001b. Do not set any other values.
WBD	Write Back Disable bit Indicates whether the DMAC writes 0b back to the LV bit when DMA transfer specified by a single descriptor is completed. 1b: The LV bit is not written back. 0b: The LV bit is written back.
LE	List End bit Indicates the end of the current descriptor chain. 1b: The current descriptor is the last of the chain. 0b: The current descriptor is not the last of the chain.
LV	Link Valid bit Indicates that the descriptor is valid. When DMA transfer is completed, the DMAC writes 0b back to this bit. When DMA transfer ends due to an error, write-back does not proceed. 1b: The descriptor is valid (DMA transfer specified by the descriptor is not completed). 0b: The descriptor is not valid (DMA transfer specified by the descriptor is completed).
D	Descriptor error bit Indicates a descriptor access error. If LV = 0 when the descriptor is read, the DMAC writes 1b back to the LV bit. When a descriptor error occurs, if the setting of the LE bit is 0 (indicating that the current descriptor is not the last of the chain), the DMAC continues transfer in accord with the descriptor the LP bits indicate. 1b: A descriptor access error occurred. 0b: No error
STS[15:0]	This field has no effect when DSCFM = 0001b. The DMAC does not use this field.

Field Name	Description
CCH_L[3:0]	This field indicates the value of A*CACHE [3:0] to be issued through the AXI. The value of CCH_L [3:0] is output when an AXI request including the last byte is issued in transfer specified in the SIZE bits. Bit [3]: Write allocation Bit [2]: Read allocation Bit [1]: Cache enabled Bit [0]: Buffer enabled The recommend value is 0000b regardless of whether DIR is 0 or 1.
CCH_D[3:0]	This field indicates the value of A*CACHE [3:0] to be issued through the AXI. The value of CCH_D[3:0] is output when an AXI request other than the condition for the output of CCH_L[3:0] is issued. Bit [3]: Write allocation Bit [2]: Read allocation Bit [1]: Cache enabled Bit [0]: Buffer enabled The recommended value is 0001b when DIR = 0b (PCIe to AXI) and 0000b when DIR = 1b (AXI to PCIe).
TC[2:0]	This field specifies the value of the traffic class of the request to be issued through the PCIe interface. The value must be fixed to 000b.
ATB[1:0]	This field indicates the value of the attribute to be issued through the PCIe interface. Bit [1]: Relaxed ordering Bit [0]: No-snoop If neither relaxed ordering nor no-snoop is used, this field should be set to 00b (recommended).
DMA_FUNC[2:0]	This field specifies the function number of the request to be issued through the PCIe interface.
DIR	This bit indicates the direction of data transfer. 1b: AXI to PCIe 0b: PCIe to AXI
SIZE[31:0]	This field indicates the number of bytes for transfer. Since the setting is 16-byte alignment, do not set anything other than 0000b for the lower 4 bits ([3:0]).
SA[63:0]	The Source Address field indicates the address of the source data for transfer. Since the setting is 16-byte alignment, do not set anything other than 0000b for the lower 4 bits ([3:0]).
DA[63:0]	The Destination Address field indicates the destination address. Since the setting is 16-byte alignment, do not set anything other than 0000b for the lower 4 bits ([3:0]).
LP[63:0]	This field indicates the address where a next descriptor is stored. Since 16-byte alignment and 1 descriptor (H'00 to H'24) beyond the 4K boundary is prohibited, set the lower 6 bits ([5:0]) to be 00_0000b.

The conditions where the descriptor is written back after the descriptor is read, the timings, and the corresponding bits are listed below.

Condition	Timing	Corresponding Bit and Value
WBD = 0 && LV = 1	After DMA transfer specified by the descriptor is completed	LV = 0
WBD = (1 or 0) && LV = 0	After the descriptor is read (DMA transfer does not proceed)	D = 1
WBD = 1 && LV = 1	Write-back does not proceed.	—

(4) Flow of Operations

The following describes the procedures for settings to activate and stop the DMAC in the case of descriptor-type transfer.

(a) Activation and Normal Operation

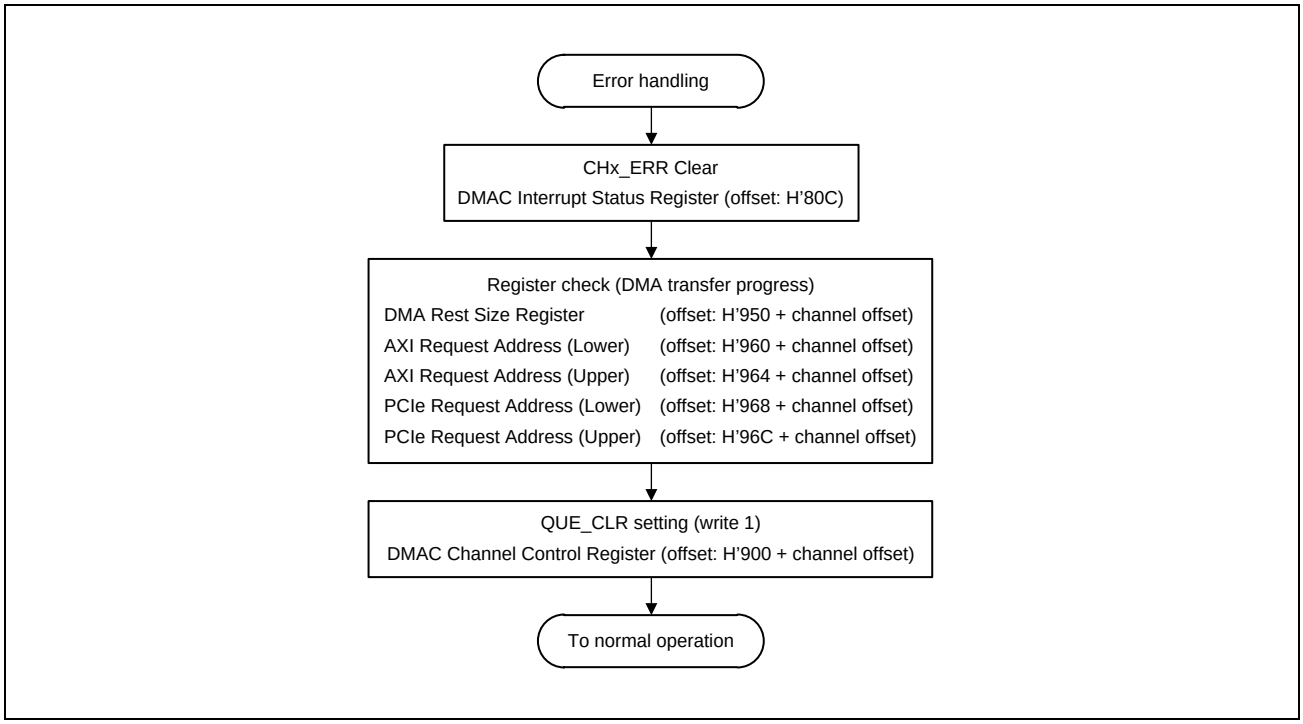
Before activating the DMAC, set the PCIe and AXI windows. After that, set the registers of the DMAC to start the DMAC.

(b) Error Processing

If an error is detected in the AXI bus or a PCIe link while DMA transfer is in progress, the DMA_INT interrupt signal is asserted. Check the channel where the error was found (CHx_ERR = 1b) by using the DMAC interrupt status register and also the type of error by using the DMAC error status register (offset: H'978 + channel offset) as required.

Clear the CHx_ERR bit that is currently set in the DMAC interrupt status register (offset: H'80C) to 0b by writing to it. The address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer can be checked by reading the DMA status registers (offset: H'950 + channel offset to H'96C + channel offset) for the given channel.

Based on that information, setting the registers as described in **Section 34.4.4.2(4)(a), Activation and Normal Operation** and create a descriptor table again. At this time, write 1b to the QUE_CLR bit (bit [8]) of the DMAC channel control register (offset: H'900 + channel offset). Writing 1b to it leads to clearing of the queue. The descriptor lists registered in the queue (those waiting for execution and the one currently being executed) are all cleared.



34.4.4.3 Method of Transfer

This section describes the issuing of requests to the AXI or PCIe and data transfer in the case of DMA transfer. In either direction of transfer (from AXI to PCIe or vice versa), a request is issued to the reading side. After confirming the completion of preparation (reception) of the data to be read, a request is issued to the writing side for data transfer.

(1) DMA Transfer from PCIe to AXI

An MRd is issued to the PCIe module and an AXI write request is transferred following the reception of CplD from the PCIe. MRd requests corresponding to the number of outstanding transfers can be issued regardless of the reception of CplD. The received CplD (read data) is stored in the data buffer (RAM) once and then transferred by the DMAC to the AXI.

(2) DMA Transfer from AXI to PCIe

After the DMAC is activated, a read request (address channel) is issued to the AXI. The reception of data for reading from the given AXI slave starts and an MWr is issued to the PCIe. Data are repeatedly transferred until the completion of DMA data transfer corresponding to the amount of data set in the DMA Size bits.

34.4.4.4 Inter-Channel Arbitration

The DMAC arbitrates the following three types of requests between channels.

1) PCIe Read Request
2) AXI Read Request
3) AXI Write Request

PCIe write requests do not require arbitration because data read over the AXI are returned one by one.

In the case of arbitration on the AXI side, not only requests for DMA data, but also reading and writing of descriptor data are subject to arbitration (each channel has a single source of requests for arbitration since a channel will not output a descriptor and request for data at the same time).

(1) Method of Arbitration

An MRd is issued to the PCIe module and an AXI write request is transferred following the reception of CplD from the PCIe. MRd requests corresponding to the number of outstanding transfers (eight) can be issued regardless of the reception of CplD. The received CplD (read data) is stored in the data buffer (RAM) once and then transferred by the DMAC to the AXI.

Arbitration for each type of request 1) to 3) above proceeds in round-robin fashion. A channel for which execution has just been completed is given the lowest priority and each channel which had a lower priority than that channel is raised by one rank in the order of priority.

The initial order of priority is ch0 > ch1 > ch2 > ch3 > ch4 > ch5 > ch6 > ch7.

The order of priority is changed every time a single request is completed.

There are two types of request for the AXI, requests for DMA data and requests for descriptors, but they are not distinguished for purposes of arbitration.

34.4.4.5 DMA Completed Interrupt

The DMAC has interrupt functions. It supports two types of interrupt source: one set is for normal operation and the other is for errors. For details, see **Section 34.4.6.4, DMA Interrupt**.

34.4.5 Reception of PCIe Commands

34.4.5.1 Reception of MSIs (Root Complex)

When an MSI is received (see Judgment conditions), it is forwarded to AXI as a Write Transaction and at the same time, it is reflected in the MSI reception status (see Status). MSI receive Asserts the interrupt signal (INTMSI_RC) when the interrupt generation condition (see Interrupt conditions) is satisfied. S/W identifies MSI by interrupt factor. When Message Data Enable = 0, it is possible to determine the factors by reading the data in memory.

Related Registers

- MSI Receive Window Address (Lower) Registers (Offset: H’100) Message Data Enable
- PCI INTx Receive Interrupt Enable Registers (Offset: H’110) MSI Receive Interrupt Enable
- PCI INTx Receive Interrupt Status Registers (Offset: H’114) MSI Receive Interrupt Status
- MSI Receive Mast n Registers (Offset: H’6x8) MSI Mask
- MSI receive Status n Registers (Offset: H’6xC) MSI Status

Judgment conditions

When all of the following conditions are satisfied, a request is judged to be an MSI.

- The request is a memory write request.
- The request is entered for any area within an AXI window.
- The address of an MWr from the PCIe interface must be within the area set by the MSI Reception Window Address register and the MSI Reception Window Mask register. If a memory read request is received in the MSI reception area, the request is not judged to be an MSI so an interrupt is not generated.
- The length of memory write requests is 1 dword.
- When Message Data matches (only when Message Data Enable is 1)

Status

- When Message Data Enable is 0, MSI Receive Interrupt Status (bit[4]) is set.
- When Message Data Enable is 1, the corresponding vector bit of MSI Status is set.

Interrupt conditions

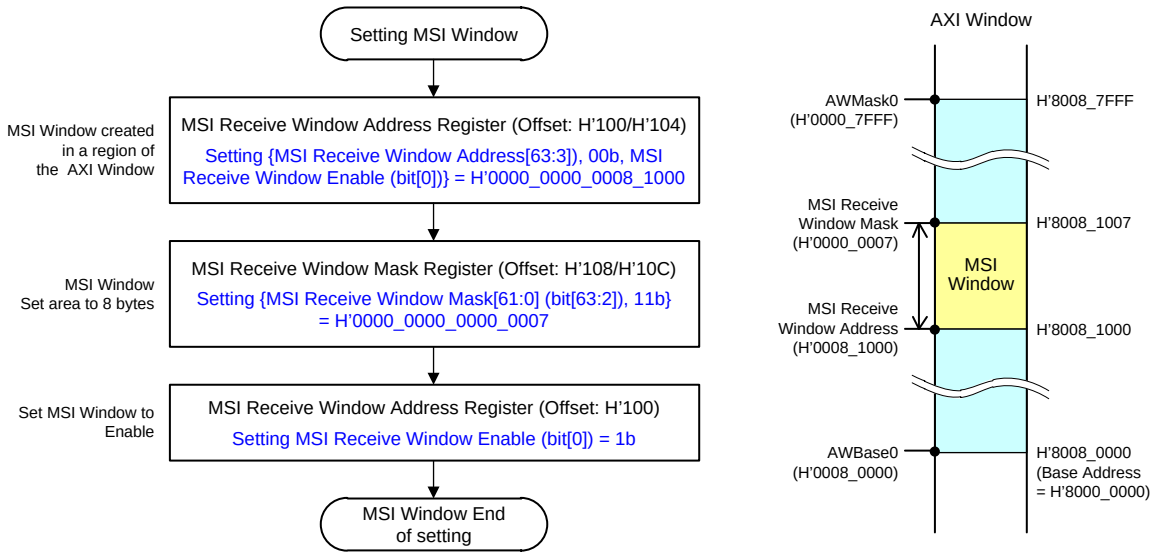
- When Message Data Enable is 0, when MSI Receive Interrupt Enable (bit[4]) is set
- When Message Data Enable is 1, when the corresponding vector bit of MSI Mask is 0.

Notes on the MSI (When Message Data Enable is 0)

- When a response to the MSI write transaction is returned, this module judges execution of the MSI to have been completed and asserts an interrupt signal. Depending on the system, however, the MSI memory write transaction may not be completed due to the latency over the AXI to the actual memory even if the interrupt signal is asserted.
  To avoid this problem, buffering of AXI write transactions must be disabled (MAWCACHE[0] = 0b) at the time an MSI is issued.
  For MAWCACHE[3:1], the setting of AWCACHE_L (bits [27:24]) of Mode Set 0 Register is used.
- If an MSI is received, the MSI write transaction is executed when MAWID[3:0] = 0001b. This is required for the module to recognize the reception of the response to the MSI and for assertion of INTMSI_RC.

34.4.5.2 Setting the MSI Window

To enable MSI interrupts, the MSI window must be set. **Figure 34.4, Settings for the MSI Window** shows example settings. The MSI window can be allocated within any AXI window.



Note: The values assigned in the figure (values in blue) are examples

Figure 34.4 Settings for the MSI Window

34.4.5.3 Reception of an Interrupt in Response to a Message Request (Root Complex)

When Assert_INTx is received in response to an Msg request from the PCIe interface, the corresponding interrupt bit (bits [3] to [0]) is set in the PCI INTx Receive Interrupt Status Register (offset: H'114) and an interrupt (INTx_RC) is asserted. When Deassert_INTx is received in response to a message request, the corresponding interrupt register (bit) is cleared and INTx_RC is de-asserted. The PCI INTx Receive Interrupt Status Register (offset: H'114) can be cleared by writing to it (RW1C) by software. In the PCIe, however, we do not recommend using software to clear an interrupt bit which has been set in response to an Msg in normal operation.

34.4.5.4 Reception of Message Requests

When a message is received through the PCIe interface, the relevant information is stored in the following registers.

Table 34.19 Message Related Registers

	Related Register
Message Code/Routing	Message Code Registers (Offset: H'130)
Message Data	Message Data Registers (Offset: H'134)
Message 3rd Header	Message Header 3rdDW Registers (Offset: H'138)
Message 4th Header	Message Header 4thDW Registers (Offset: H'13C)

The corresponding bit in the Message Receive Interrupt Status Register is set at the same time as the reception of the following messages, and this is indicated by an interrupt.

Received Message		Corresponding Bit in Message Receive Interrupt Status Register
Type of Message	Message Code	
PM_Active_State_Nak	0001_0100	Bit [19]
PM_PME	0001_1000	Bit [18]
PME_Turn_Off	0001_1001	Bit [17]
PME_TO_Ack	0001_1011	Bit [16]

In the reception of PM messages other than the above, the relevant information is not written to the registers listed in **Table 34.19, Message Related Registers**.

- Unsupported messages:
  - Unlock
  - Vendor Defined Type 0
  - Vendor Defined Type 1

34.4.6 Interrupt

This module prepares the output of interrupt signals in the ways stated below. The states of all interrupt signals are indicated at a glance in the Interrupt Table Register.

34.4.6.1 Error and Event Interrupt Notification

Table 34.20 Error/Event Interrupt Outputs

Signal Name	Active	Attribute	Description
DMA_INT	High	Level	DMA-related events
PCIE_EVT_INT	High	Level	PCIe related events
MSG_INT	High	Level	Reception of messages
AXI_ERR_INT	High	Level	AXI-related errors

Interrupt Output Related Status Registers

DMA_INT: DMAC Interrupt Status Registers (Offset: H’80C)
DMAC Error Status Registers (Offset: H’968/+Channel Offset)

PCIE_EVT_INT: PCIe Event Interrupt Status 0 Registers (Offset: H’204)
PCIe Event Interrupt Status 1 Registers (Offset: H’20C)
PCIe Event Interrupt Status 2 Registers (Offset: H’244)

MSG_INT: Message Receive Interrupt Status Registers (Offset: H’124)

AXI_ERR_INT: AXI Master Error Interrupt Status Registers (Offset: H:214)
AXI Slave Error Interrupt Status 1 Registers (Offset: H’224)

34.4.6.2 INTx/MSI Interrupt Notification (Root Complex)

Table 34.21 INTx/MSI Interrupt Outputs

Signal Name	Active	Attribute	Description
INTA_RC	High	Level	Set in response to the reception of an assert INTA message and cleared in response to the reception of a deassert INTA message.
INTB_RC	High	Level	Set in response to the reception of an assert INTB message and cleared in response to the reception of a deassert INTB message.
INTC_RC	High	Level	Set in response to the reception of an assert INTC message and cleared in response to the reception of a deassert INTC message.
INTD_RC	High	Level	Set in response to the reception of an assert INTD message and cleared in response to the reception of a deassert INTD message.
INTMSI_RC	High	Level	Set when a memory write request comes from the PCIe to the area set in the MSI reception window.
INT_LINK_BANDWIDTH	High	Level	Set when the link width has been changed.
INT_PM_PME	High	Level	Set in response to the reception of PME event notification (PM_PME message).
INT_SERR_COR/ INT_SERR_NONFATAL/ INT_SERR_FATAL	High	Level	Set in response to the reception of a correctable error message, non-fatal error message, or fatal error message.

34.4.6.3 Root Complex Interrupt Notification

This module has the following interrupt sources.

- INT_LINK_BAND_WIDTH
- INT_PM_PME
- INT_SERR
- INT_SERR_COR
- INT_SERR_FATAL
- INT_SERR_NONFATAL

(1) Interrupt due to the Change to the Link Bandwidth (INT_LINK_BAND_WIDTH)

This interrupt source is conveyed in response to the change to the bandwidth in link negotiation of PCI Express.

This interrupt source is only enabled when the Link Bandwidth Notification Capability bit (bit 21) of the Link Capabilities register (offset: H’60C) is set to 1b. This interrupt signal can also be disabled by setting the Link Bandwidth Notification Capability bit to 0b even in operation as the root complex.

If the Link Bandwidth Notification Capability bit (bit 21) is set to 1b, the Link Bandwidth Management Status bit (bit 30) and the Link Autonomous Bandwidth Status bit (bit 31) in the Link Status register (offset H’70) serve as a source of the interrupt. These bits are set to 1b when the bandwidth is changed.

Whether to enable this interrupt source corresponds to the respective states of the Link Bandwidth Management Interrupt Enable bit (bit 10) and the Link Autonomous Bandwidth Interrupt Enable (bit 11) of the Link Control register (offset: H’70).

The following is the Related Registers.

Offset	Bit	Description
PCI Express Capability Structure: Link Control / Status		
H’06C	21	Link Bandwidth Notification Capability
H’070	10	Link Bandwidth Management Interrupt Enable
	11	Link Autonomous Bandwidth Interrupt Enable
	30	Link Bandwidth Management Status
	31	Link Autonomous Bandwidth Status

(2) PM-PME Reception Interrupt (INT_PM_PME)

This interrupt source is conveyed when the notification of a PME event (PM_PME message) is received from the other party device.

Note that this interrupt source is enabled when the root complex in use and it is fixed to “0: Low” when the endpoint is in use.

This interrupt source is only conveyed when the PME Interrupt Enable bit (bit 3) of the Root Control/Capabilities Register (offset: H’7C) is set to 1b. This interrupt source is not conveyed when the PME Interrupt Enable bit (bit 3) is set to 0b.

Note that the reception state of the received PM_PME message and the ID information, etc. are stored in the Root Status Register (offset: H’80) regardless of the setting of the PME Interrupt Enable bit mentioned above.

Offset	Bit	Description
PCI Express Capability Structure: Root Control Capabilities		
H’07C	3	PME Interrupt Enable
PCI Express Capability Structure: Root Status		
H’080	15:0	PME Requester ID
	16	PME Status
	17	PME Pending

(3) System Error Interrupt (INT_SERR_xxx)

This interrupt is conveyed when a correctable error message, non-fatal error message, or fatal error message is received.

- INT_SERR: The system error notification mentioned in the Base Spec. is obtained as the logical OR of the following three signals.
- INT_SERR_COR: System Error on Correctable Error
- INT_SERR_FATAL: System Error on Fatal Error
- INT_SERR_NONFATAL: System Error on Non-Fatal Error

(a) Correctable Error Interrupt (INT_SERR_COR)

To proceed with interrupt control due to a correctable error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	H'03C	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	H'068	0	Correctable Error Reporting Enable
3	Advanced Error Reporting (AER) Capability: Root Error Command		
	H'12C	0	Correctable Error Reporting Enable

Interrupt Source

(1) ERR_COR Message Reception

If an ERR_COR message is received from the other-party device (endpoint), the INT_SERR_COR interrupt will be asserted. The following status register will be set at the same time.

Offset	Bit	Description
Advanced Error Reporting (AER) Capability: Root Error Status		
H'130	0	ERR_COR Received

Note: If the Enable bits in no. 1, 2, and 3 are not set, the interrupt source will not be generated.
If the Enable bits in no. 1 and 2 are not set, writing will be masked.

(2) Correctable Error Detection

Any of the following correctable errors being detected within the unit will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Correctable Error Status		
8B10B Decode Error 8B10B RD Error 1	H'110	0	Receiver Error Status
Bad TLP		6	Bad TLP Status
Bad DLLP		7	Bad DLLP Status
REPLAY_NUM Roll over		8	REPLAY_NUM Rollover Status
Replay Timer Timeout		12	Replay Timer Timeout Status
Advisory Non-Fatal Error		13	Advisory Non-Fatal Error Status

Note: If the Mask bit (Correctable Error Mask Register: Offset H'114) corresponding to each bit is set (masked), the corresponding error will not be detected, and the interrupt source will not be generated.

At the same time, the INT_SERR_COR interrupt will be generated, and the following status registers will be set to 1b.

Offset	Bit	Description
PCI Express Capability Structure: Device Status		
H'068	16	Correctable Error Detect
Advanced Error Reporting (AER) Capability : Root Error Status		
H'130	0	ERR_COR Received

Note: If the Enable bit in no. 2 is not set, the interrupt source will not be generated.
If the Enable bit in no. 2 is not set, writing to the Root Error Status Register will be masked.
If the Correctable Error Reporting Enable bit listed in no. 3 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_COR will not be asserted even if writing to the Root Error Register has proceeded.

(b) Fatal Error Interrupt (INT_SERR_FATAL)

To proceed with interrupt control due to a fatal error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	H'03C	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	H'068	2	Fatal Error Reporting Enable
3	Common Configuration Space: Command and Status		
	H'004	8	SERR# Enable
4	Advanced Error Reporting (AER) Capability: Root Error Command		
	H'12C	2	Fatal Error Reporting Enable

Interrupt Source

(1) ERR_FATAL Message Reception

If an ERR_FATAL message is received from the other-party device (endpoint), the INT_SERR_FATAL interrupt will be asserted (if the Enable bits in no.1 and 2 or no.3 and 4 are not set, the interrupt source will not be generated).

The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
Type1 Configuration Space: Secondary Status			*1
H'01C	30	Received System Error	
Common Configuration Space: Status Register			*2
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*3
H'130	6	Fatal Error Message Received	

Note 1. Writing to this status register proceeds at the point a message is received regardless of the settings of the Enable bits.

Note 2. If the Enable bits in no. 1 and 3 are not set, writing will be masked.

Note 3. If the Enable bit in no. 1, 2, or 3 is not set, writing will be masked.

(2) Fatal Error Detection

Any of the following fatal errors being detected within the module will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Uncorrectable Error Status		
Data Link Protocol Error	H'104	4	Data Link Protocol Error Status
Poisoned TLP		12	Poisoned TLP Status
Completion Timeout		14	Completion Timeout Status
Completer Abort		15	Completer Abort Status
Unexpected Completion		16	Unexpected Completion Status
Receiver Overflow		17	Receiver Overflow Status
Malformed TLP		18	Malformed TLP Status
ECRC Error		19	ECRC Error Status
Unsupported Request		20	Unsupported Request Error Status

Note: If the Mask bit (Uncorrectable Error Mask Register: Offset H'108) corresponding to each bit is set (masked), the corresponding error will not be detected and the interrupt source will not be generated.
Also, the setting of the corresponding Severity bit (Uncorrectable Error Severity: Offset H'10C) must be 1b (Fatal).

The INT_SERR_FATAL interrupt will be generated at the same time (if the Enable bits in no. 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
PCI Express Capability Structure: Device Status			
H'068	18	Fatal Error Detect	
Common Configuration Space: Status Register			*1
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*2
H'130	6	Fatal Error Message Received	

Note 1. If the Enable bit in no. 3 is not set, writing will be masked.

Note 2. If the Enable bit in no. 2 or 3 is not set, writing will be masked.

If the Fatal Error Reporting Enable bit listed in no. 4 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_FATAL will not be generated even if writing to the Root Error Status Register has proceeded.

(c) Non-Fatal Error Interrupt (INT_SERR_NONFATAL)

To proceed with interrupt control due to a non-fatal error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	H'03C	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	H'068	1	Non-Fatal Error Reporting Enable
3	Common Configuration Space: Command and Status		
	H'004	8	SERR# Enable
4	Advanced Error Reporting (AER) Capability: Root Error Command		
	H'12C	1	Non-Fatal Error Reporting Enable

Interrupt Source

(1) ERR_NONFATAL Message Reception

If an ERR_NONFATAL message is received from the other-party device (endpoint), the INT_SERR_NONFATAL interrupt will be generated (if the Enable bits in no.1 and 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
Type1 Configuration Space: Secondary Status			*1
H'01C	30	Received System Error	
Common Configuration Space: Status Register			*2
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*3
H'130	5	Non-Fatal Error Message Received	

Note 1. Writing to this status register proceeds at the point a message is received regardless of the settings of the Enable bits.

Note 2. If the Enable bits in no. 1 and 3 are not set, writing will be masked.

Note 3. If the Enable bit in no. 1, 2, or 3 is not set, writing will be masked.

(2) Non-Fatal Error Detection

Any of the following non-fatal errors being detected within the module will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Uncorrectable Error Status		
Data Link Protocol Error	H'104	4	Data Link Protocol Error Status
Poisoned TLP		12	Poisoned TLP Status
Completion Timeout		14	Completion Timeout Status
Completer Abort		15	Completer Abort Status
Unexpected Completion		16	Unexpected Completion Status
Receiver Overflow		17	Receiver Overflow Status
Malformed TLP		18	Malformed TLP Status
ECRC Error		19	ECRC Error Status
Unsupported Request		20	Unsupported Request Error Status

Note: If the Mask bit (Uncorrectable Error Mask Register: Offset H'108) corresponding to each bit is set (masked), the corresponding error will not be detected, and the interrupt source will not be generated.
Also, the setting of the corresponding Severity bit (Uncorrectable Error Severity: Offset H'10C) must be 0b (Non-fatal).

The INT_SERR_NONFATAL interrupt will be generated at the same time (if the Enable bits in no. 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
PCI Express Capability Structure: Device Status			
H'068	17	Non-Fatal Error Detect	
Common Configuration Space: Status Register			*1
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*2
H'130	5	Non-Fatal Error Message Received	

Note 1. If the Enable bit in no. 3 is not set, writing will be masked.

Note 2. If the Enable bit in no. 2 or 3 is not set, writing will be masked.

If the Non-Fatal Error Reporting Enable bit listed in no. 4 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_NONFATAL will not be generated even if writing to the Root Error Status Register has proceeded.

34.4.6.4 DMA Interrupt

The DMAC has interrupt functions. It supports two types of interrupt source: one set is for normal operation and the other is for errors. Use the DMAC Interrupt Enable Register to select the interrupt sources and control masking. DMA interrupt notification includes notification by DMA_INT in the direction of the AXI bus (local bus direction) and notification by issuing an MSI to an other-party RC.

On completion of DMA transfer, either conveying a DMA_INT interrupt or transmitting an MSI to the RC, but not both, is selected per-channel by a register setting (transmitting an MSI is prohibited in RC mode).

The DMA_CH*_MSI_EN bits of the DMA Interrupt Vector 0 Register and the DMA Interrupt Vector 1 Register are used to switch the setting ("*" corresponds to the channel number of a given DMA and per-channel control is possible). If an MSI is to be issued, the value of its traffic class (TC) bits is fixed to 0. The vector value can be specified by using the DMA_CH*_vec bits of these registers.

CAUTION

Take care that the specified vector value does not impose a related restriction on the Multiple Message Enable register.

For example, if the number set for Multiple Message Enable is 4, the two lower-order bits within the value set for the Message Data are overwritten by the value specified for the DMA_CH*_vec bits, and at that time, specify the value 0b for the higher-order bits that are not overwritten by DMA_CH*_vec bits.

34.4.7 Power Management (Root Complex Mode)

34.4.7.1 PCI Power Management (PCI-PM)

An endpoint is placed in non-D0 (the D3 hot state) by changing the setting of the Power State field register of the endpoint by the root complex., which causes a transition of the link state of both RC and EP to L1.

This module does not support the AUX power supply function. D3 cold is not supported. Implementing the L2 function goes to implementation of L2/L3 ready.

(1) Flow of Transition to the L2/L3 Ready State (RC)

< For transition via PCIPM L1 >

1. A root complex (RC) issues a config write to change the D-state of an endpoint (EP) to D3 (D3 hot).
2. The RC is automatically placed in L1 by automatic response of the other-party EP.
3. The RC transmits a PME_Turn_Off Message.
4. Confirm the reception of a PME_TO_Ack Message from the EP by reading the value of the PME_TO_Ack Receive Interrupt bit (bit 16) in the Message Receive Interrupt Status Register of the RC.
5. Set PCIe Core Control 1 Register (bit [17]: UI_ENTER_L2 = 1b).
6. Confirm the transition to the L2/L3 ready state by reading the value of the LTSSM_STATE bits (bits [14:8]) in the PCIe Core Status 1 Register (5 higher-order bits [14:10] = 0111xb: L2).

< For direct transition to the L2/L3 ready state >

Steps 3 to 6 above apply.

(2) Flow of Return from the L2/L3 Ready State (RC)

< Return from the L2/L3 ready state by the RC >

1. Assert the following reset signals.
   RST_B, RST_GP_B, RST_PS_B, RST_CFG_B
2. Deassert the reset signals at a desired time and wait for return to L0 (wait for linkup).
3. Clear PCIe Core Control 1 Register (bit [17]: UI_ENTER_L2 = 0b).
4. If the link is not up, repeat steps 1 and 2.

< Return from the L2/L3 ready state by the EP >

1. Wait for the reception of a beacon by the EP. Read the LINKDN bit (H’0204, bit 9) in the PCIe Event Interrupt Status register regularly to check whether ELECTRICAL_IDLE_BROKEN has been generated.
2. Assert the following reset signals.
   RST_B, RST_GP_B, RST_PS_B, RST_CFG_B
3. Deassert the reset signals at a desired time, clear UI_ENTER_L2 of PCIe Core Control 1 Registers to 0b, and wait for it to return to L0 (wait for linkup).
4. Clear PCIe Core Control 1 Register (bit [17]: UI_ENTER_L2 = 0b).
5. If the link is not up, repeat steps 2 and 3.

34.4.7.2 Active State Power Management (ASPM)

The ASPM L0s and L1 states can be used by the setting of the Active State PM Control bits (bits [1:0]) in the Link Control/Status Register (PCIe Configuration Register: H’6070).

ASPM L0s:

The module is automatically placed in the ASPM L0s state following setting of the Active State PM Control bits to 01b or 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core.

ASPM L1:

An RC is placed in the ASPM L1 state in response a request for transition to the ASPM L1 state from an EP following setting of the Active State PM Control bit to 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core.

A transition to the ASPM L1 state is enabled by setting the UI_RC_REJECT_ASPM_L1 bit (bit [19]) of the PCIe Core Control 1 Register (offset: H’404) to 0b. To reject a transition to the ASPM L1 state on the RC side, set the UI_RC_REJECT_ASPM_L1 bit to 1b.

Return to the L0 state from the L1 state:

- Resuming access from the AXI master side:

  Return to the L0 state is initiated in response to the other-party PCIe device resuming access.

- Resuming access from the AXI slave side:

  The AXI can be returned to the L0 state in response to the AXI starting access to a PCIe device. Access to an AXI configuration register also returns the AXI to the L0 state.

34.4.8 Power Management (Common)

34.4.8.1 L1 PM Substate

This module supports the L1-Substate transition function. The procedure for transitioning to the L1 state and the basic procedure are the same, but the main difference information is provided below as supplementary information to the procedure for transitioning to each state and the procedure for returning to the L0 state.

(1) PCI-PM “L0 to L1.1”

1. Set the following register bits with register write by RC and CfgWr to instruct L1.1 transition.

   PCI_PM L1.2 Enable = 0b

   PCI_PM L1.1 Enable = 1b

2. Perform procedures as with PCI-PM control.

(2) PCI-PM “L0 to L1.2”

1. Check the register bit value below and change the setting value with register write by RC and CfgWr if necessary.

   T_POWER_ON Scale

   T_POWER_ON Value

2. Set the following register bits with register write by RC and CfgWr to indicate L1.2 transition.

   PCI_PM L1.2 Enable = 1b

3. Perform procedures as with PCI-PM control.

(3) PCI-PM “L1.1/L1.2 to L0”

< Resume from RC side >

1. Assert PCIE_CLKREQ if PCI_CLKREQ# is de-asserted on RC side.
2. The LTSSM state on the RC side transitions to the Recovery state.
3. RC sets POWERSTATE bit to 00b (D0) by CfgWr.

(4) ASPM “L0 to L1.1”

Transition to L1 is allowed by setting the ALLOW_ENTER_L1 bit of the SYS_PCIE_CFG register to 1. Refer to **Section 7.2.4, Register Descriptions**.

Set the ASPM L1 Idle Time field of the Mode Set 3 Registers in advance according to the AXI bus specifications. (Setting range: 256 (ACLK) to 65536 (ACLK))

1. Set the following register bits with register write by RC and CfgWr to instruct L1.1 transition.

   ASPM L1.2 Enable = 0b

   ASPM L1.1 Enable = 1b
2. RC sets the Active State Power Management (ASPM) Control bit to 1b by CfgWr.
3. Set the Active State Power Management (ASPM) Control bit of RC side to 1b.

After the above settings, if transmission and reception are not performed for the specified time, it will automatically transit to the ASPM L1.1 state.

(5) ASPM “L0 to L1.2

Transition to L1 is allowed by setting the ALLOW_ENTER_L1 bit of the SYS_PCIE_CFG register to 1. Refer to **Section 7.2.4, Register Descriptions**.

Set the ASPM L1 Idle Time field of the Mode Set 3 Registers in advance according to the AXI bus specifications. (Setting range: 256 (ACLK) to 65536 (ACLK))

1. Check the register bit value below and change the setting value with register write by RC and CfgWr if necessary.

   LTR_L1.2_THRESHOLD_Value

   LTR_L1.2_THRESHOLD_Scale

   T_POWER_ON Scale

   T_POWER_ON Value
2. Set the following register bits with register write by RC and CfgWr to instruct L1.2transition.

   ASPM L 1.2 Enable = 1b
3. RC sets the Active State Power Management (ASPM) Control bit to 1b by CfgWr.
4. RC sets the LTR Mechanism Enable bit to 1b by CfgWr.
5. Set the Active State Power Management (ASPM) Control bit of RC side to 1b.

After the above settings, if transmission and reception are not performed for the specified time, it will automatically transit to the ASPM L1.2 state.

Remark Transition to L1.2 is required LTR Message transmission. Refer to **Section 34.4.8.2, LTR Function**.

(6) ASPM “L1.1/L1.2 to L0”

If a cause occurs that returns to the ASPM L0 state, it automatically returns to ASPM L0 as appropriate.

<Resume from own>

1. The following controls automatically transition from L1.x to L0.

   Issued CfgWr/Rd, MemWr/Rd to EP

   Write/Read access to the Configuration Registers of RC.

Remark Write/Read access to AXI Bridge Registers with RC does not return to L0.

<Resume form opposite device>

1. When PCI_CLKREQ# is asserted from EP.
2. When MemWr/Rd is received from EP.

34.4.8.2 LTR Function

This module has the following functions related to the LTR function.

1. ASPM L1.2 transition permission judgment function
2. The transition permission judgement function of ASPM L1.2 determines the state transition based on the L1.2 threshold set in CFGU.

34.4.9 Error Processing

Two error reporting paradigms are defined for PCI Express: baseline error reporting capability, which is the minimal requirement, and advanced error reporting (AER) capability, which can provide greater stability, as an optional error reporting facility. This module supports both error reporting functions.

34.4.9.1 Error Classification

PCI Express errors are of two types, correctable and uncorrectable. Uncorrectable errors are further classified into two types, non-fatal and fatal.

Error Type	Description
Correctable Error	An error which cannot be recovered by hardware
Uncorrectable Error (Non-Fatal)	An error which causes a particular transaction in PCI Express to be unreliable (but the PCI Express link itself is functional).
Uncorrectable Error (Fatal)	An error which causes the PCI Express link itself to be unreliable

In operation as a root complex, the above types of error are indicated by the individual interrupt names.

- INT_SERR_COR
- INT_SERR_NONFATAL
- INT_SERR_FATAL

34.4.9.2 Error Checking Mechanism

(1) Physical Layer Error List

The following type of error is to be detected in the physical layer.

- Receiver Error

(2) Data Link Layer Error List

The following type of error is to be detected in the link layer.

- Bad TLP Error
- Bad DLLP Error
- REPLAY_NUM Rollover
- Replay Timer Timeout
- Receiver Overflow Error

(3) Transaction Layer Error List

The following type of error is to be detected in the transaction layer.

- Completion Timeout
- Completer Abort
- Unsupported Request
- Unexpected Completion
- Malformed TLP
- Poisoned TLP

NOTE

The specifications of the receiver error detection function in each LTSSM state are as listed below.

LTSSM State	Module Specifications	Base Spec Specifications
Configuration	Support	Must
Recovery	Non-Support	Option
L0	Support	Must
Disabled	Support	Option
HotReset	Support	Option

34.4.9.3 Error Message

The PCI Express Base Specification defines error messages as one of the mechanisms for notifying the system or another device of an error when it is detected by a PCI Express agent.

Error Message	Description
ERR_COR	Used when Correctable Error is detected
ERR_NONFATAL	Used when a non-fatal, uncorrectable error is detected ERR_FATAL
ERR_FATAL	Used when a fatal, uncorrectable error is detected

(1) Advisory Non-Fatal Error

The PCI Express Base Specification states that when a PCI Express agent as the detecting agent detects a non-fatal error, it handles the error as an advisory non-fatal error whether it does or does not support AER. In handling a non-fatal error as an advisory non-fatal error, the agent sends an ERR_COR message instead of an ERR_NONFATAL message and sends an advisory notification to the software. At this time, the advisory non-fatal error status bit of the correctable error status register is set to indicate the error state. Note that subsequent setting of the first error pointer register, logging of the header, and message transmission only proceed if the Advisory Non-Fatal Error Mask bit of the Correctable Error Mask Register is clear (no masking). They do not proceed if the bit is set.

The error cases which are handled as advisory non-fatal errors are as follows.

- Reception of unsupported Non-Posted Requests
- Reception of a Non-Posted Request with a completer abort completion response
- Reception of an unexpected completion
- Reception of a poisoned TLP (this is not handled as an advisory non-fatal error in this core)
- Detection of a completion timeout (this is not handled as an advisory non-fatal error in this core)

This module may merge multiple error messages with the same ID. This would occur when multiple errors are detected during the wait for the module to be ready for the transmission of messages after an error condition is detected. However, messages will not always be merged in such cases.

34.5 Operation

34.5.1 Setting Up

Set the internal registers of the module including the configuration registers.

This section explains the procedure for setting up until the PCI Express link is up (the module is ready for data transfer).

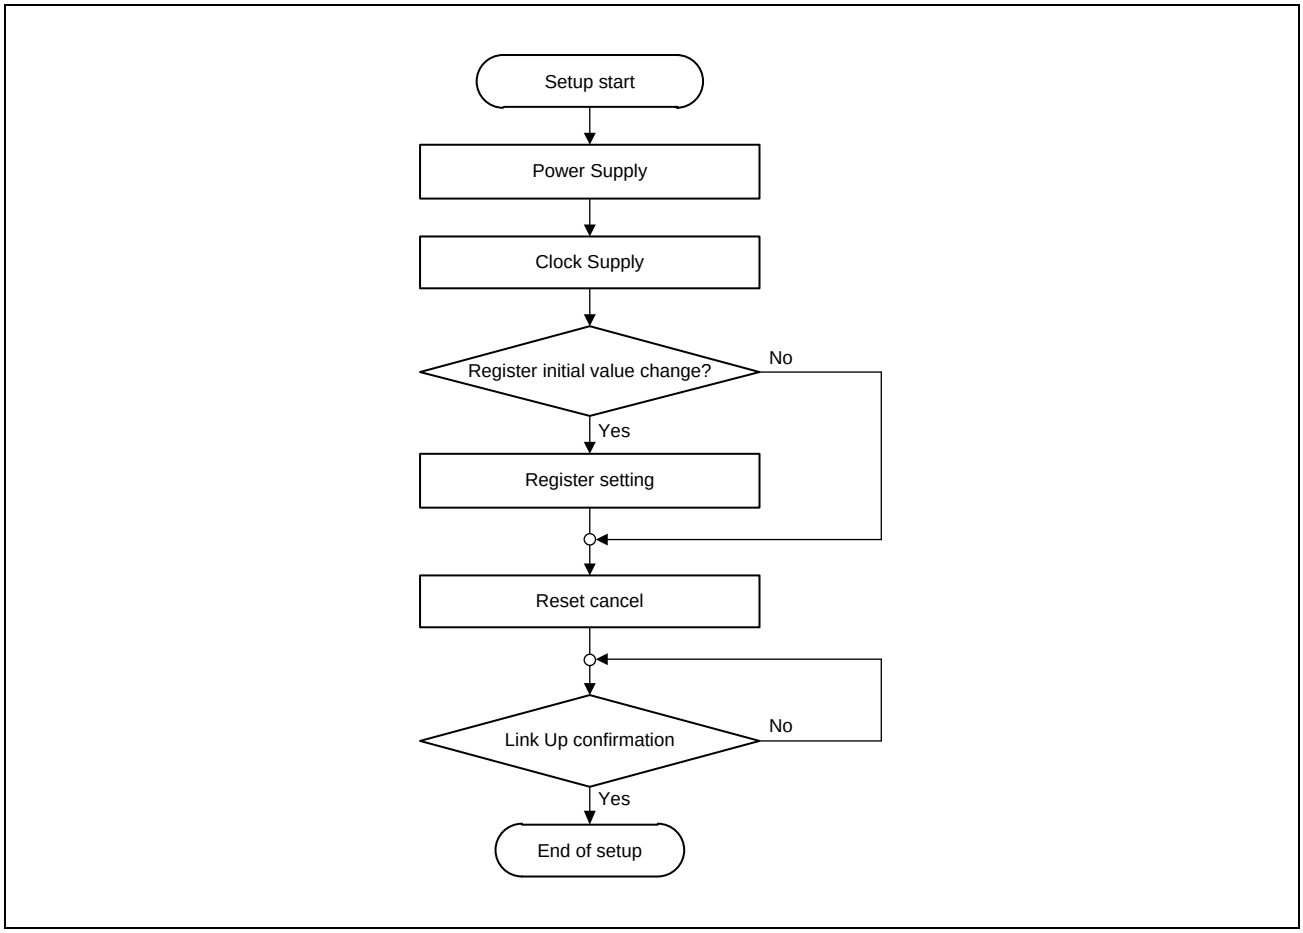


Figure 34.5 Setting Up

34.5.1.1 Changing the Initial Values of the Registers

Of the internal registers, the initial values of the configuration registers can be changed via the AXI slave interface.

AXI Bridge Registers

De-asserting ARESETn following supply of CLK allows access to these registers. In the case of resetting of the PCIe core, write to the registers while the reset signal is being asserted.

PCIe Configuration Register

De-asserting ARESETn following supply of CLK allows access to these registers. Of the reset signals of the PCIe core, those related to the configuration register must be de-asserted.

(1) Setting the Initial Values of the Registers

The initial values of the registers listed below are 0. Set appropriate values in the registers before the start of link up.

- Device ID
- Vendor ID
- Class Code (base class/sub-class/programming interface)
- Revision ID
- Subsystem ID
- Subsystem Vendor ID

34.5.1.2 De-asserting the Reset

De-asserting of the reset of the core automatically starts operations such as receiver detection and the training sequence with the other-party device.

Check that link negotiation with the other party has been completed and the link with the module is up.

Refer to **Section 34.1.4.1, Reset Sequence for Power-On Reset**.

Note that this module requires a wait of at least 5[ms] from power-on to de-assertion of the reset.

34.5.1.3 Checking if the Link is Up

Checking if the link is up can be done through either of the following methods. This is usually done by the root complex.

(1) Polling

Have the CPU of the chip poll the DL_Down Status bit (bit [0]) of the PCIe core Status 1 Register in AXI bridge registers until the value of the bit is 0 (indicating the DL_Up state).

(2) Interrupt

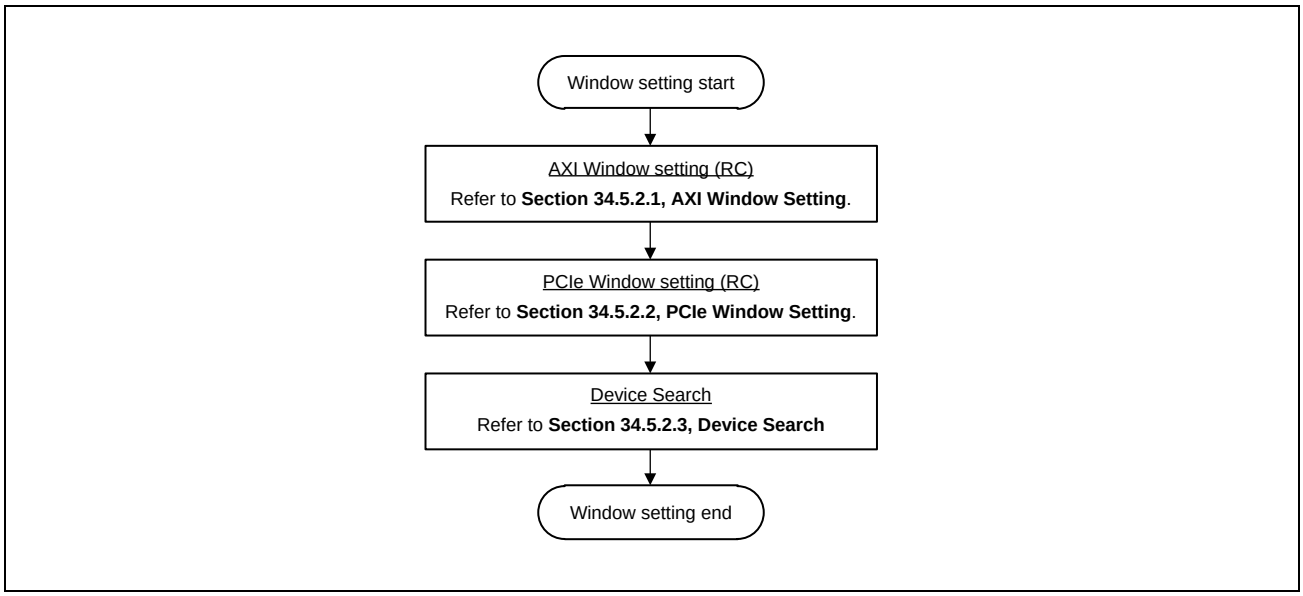
After assertion of the PCIE_EVT_INT pin of the interrupt signal, check the interrupt source by reading the DL_UpDown bit (bit [9]) in the PCIe Event Interrupt Status 0 register in AXI Bridge Registers. After that, check that the DL_Down Status bit (bit [0]) of the PCIe Core Status 1 Register is 0 (indicating the DL_Up state)

The settings above make this module ready for transfer with the other party device.

However, data transfer such as reading or writing memory is not yet possible in this state. This requires subsequent window settings.

34.5.2 Setting the Windows (Root Complex Mode)

Set Window to Root Complex. All PCI Express commands are issued through this memory or register space. After configuring Window settings and Configuration Register, data such as PCIe MRd/MWr can be sent and received.



When using the window settings in the root complex configuration, the recommended settings in the BAR and BAR Mask registers are “BAR: All 0s” and “BAR Mask: All 1s”.

Table 34.22 Example BAR Settings (64 Bits, Function = 1)

Function	BAR (Memory Space)	AXI Window	Note
Function #0	64-bit Memory space {BAR1, BAR0}	AXI #0	
		AXI #1	
		AXI #2	
		AXI #3	
		AXI #4	
		AXI #5	
		AXI #6	
		AXI #7	

34.5.2.1 AXI Window Setting

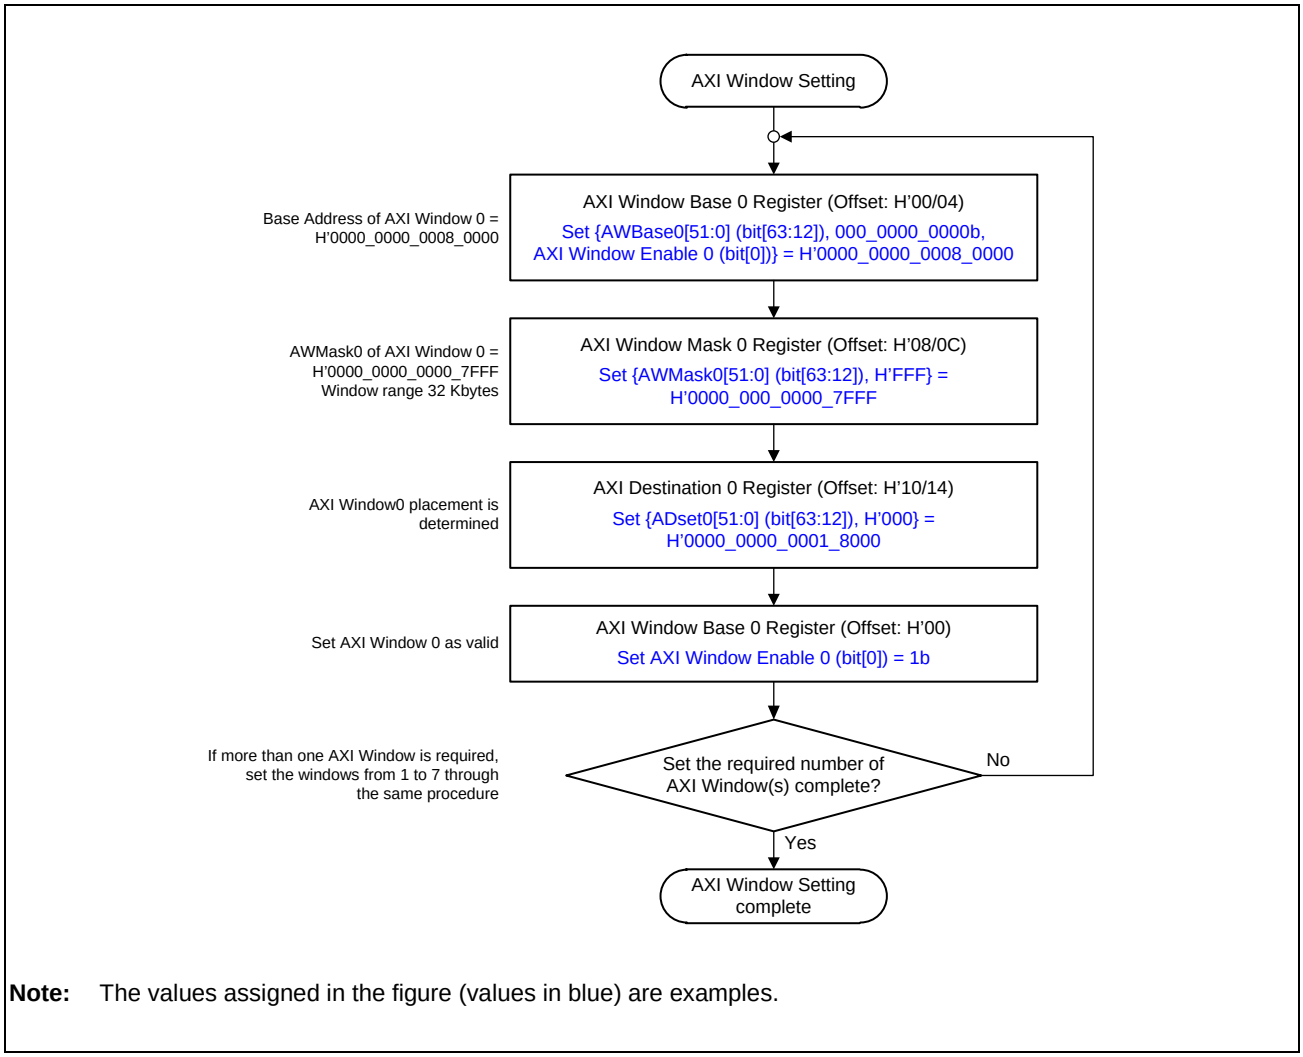
AXI Window is used to transfer MWR/MRd data from PCIe (RX side) to AXI bus.

It can be set by write access to the following registers from the AXI Slave I/F.

Up to 8 windows can be set. The following registers need to be set for the required number of windows.

AXI Window Base x Lower Register	(PCI_AWBasexL)	(Offset: H'00/20/40/60/80/A0/C0/E0)
AXI Window Base x Upper Register	(PCI_AWBasexU)	(Offset: H'04/24/44/64/84/A4/C4/E4)
AXI Window Mask x Lower Register	(PCI_AWMaskxL)	(Offset: H'08/28/48/68/88/A8/C8/E8)
AXI Window Mask x Upper Register	(PCI_AWMaskxU)	(Offset: H'0C/2C/4C/6C/8C/AC/CC/EC)
AXI Destination x Lower Register	(PCI_ADestxL)	(Offset: H'10/30/50/70/90/B0/D0/F0)
AXI Destination x Upper Register	(PCI_ADestxU)	(Offset: H'14/34/54/74/94/B4/D4/F4)

(x = 0 to 7)



Note: The values assigned in the figure (values in blue) are examples.

34.5.2.2 PCIe Window Setting

PCIe Window is used to transfer data from the AXI bus to PCIe (TX side) as MWr/MRd.

It can be set by write access to the following registers from the AXI Slave I/F.

Up to 8 windows can be set. The following register settings are required for the required number of windows.

PCIe Window Base x Lower Register (PCI_PWBasexL) (Offset: H'100/120/140/160/180/1A0/1C0/1E0)

PCIe Window Base x Upper Register (PCI_PWBasexU) (Offset: H'104/124/144/164/184/1A4/1C4/1E4)

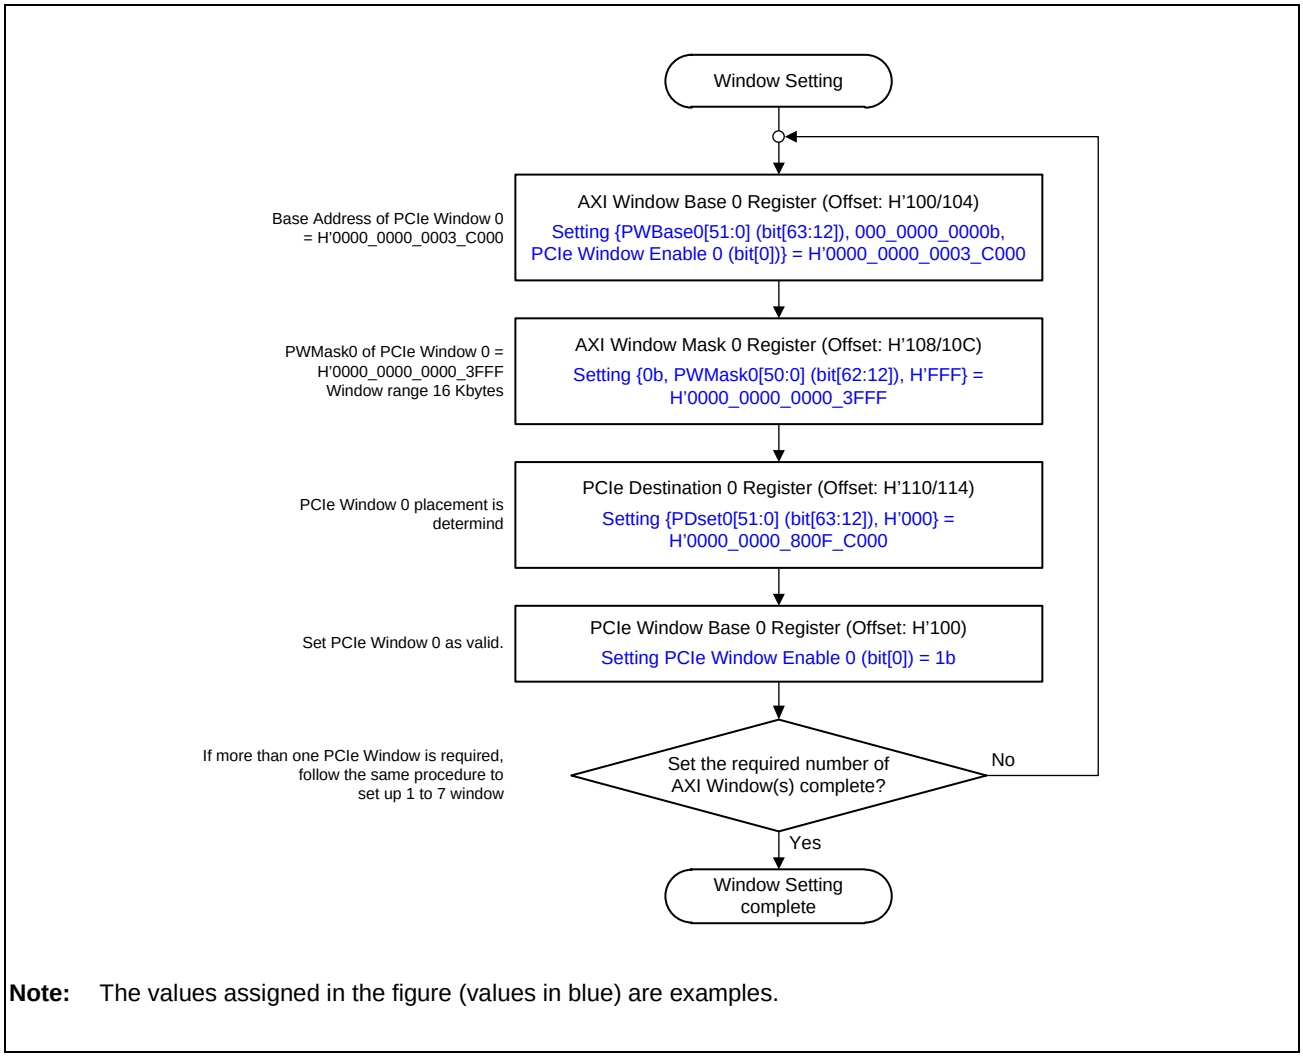
PCIe Window Mask x Lower Register (PCI_PWMaskxL) (Offset: H'108/128/148/168/188/1A8/1C8/1E8)

PCIe Window Mask x Upper Register (PCI_PWMaskxU) (Offset: H'10C/12C/14C/16C/18C/1AC/1CC/1EC)

PCIe Destination x Register (Lower) (PCI_PDestxL) (Offset: H'110/130/150/170/190/1B0/1D0/1F0)

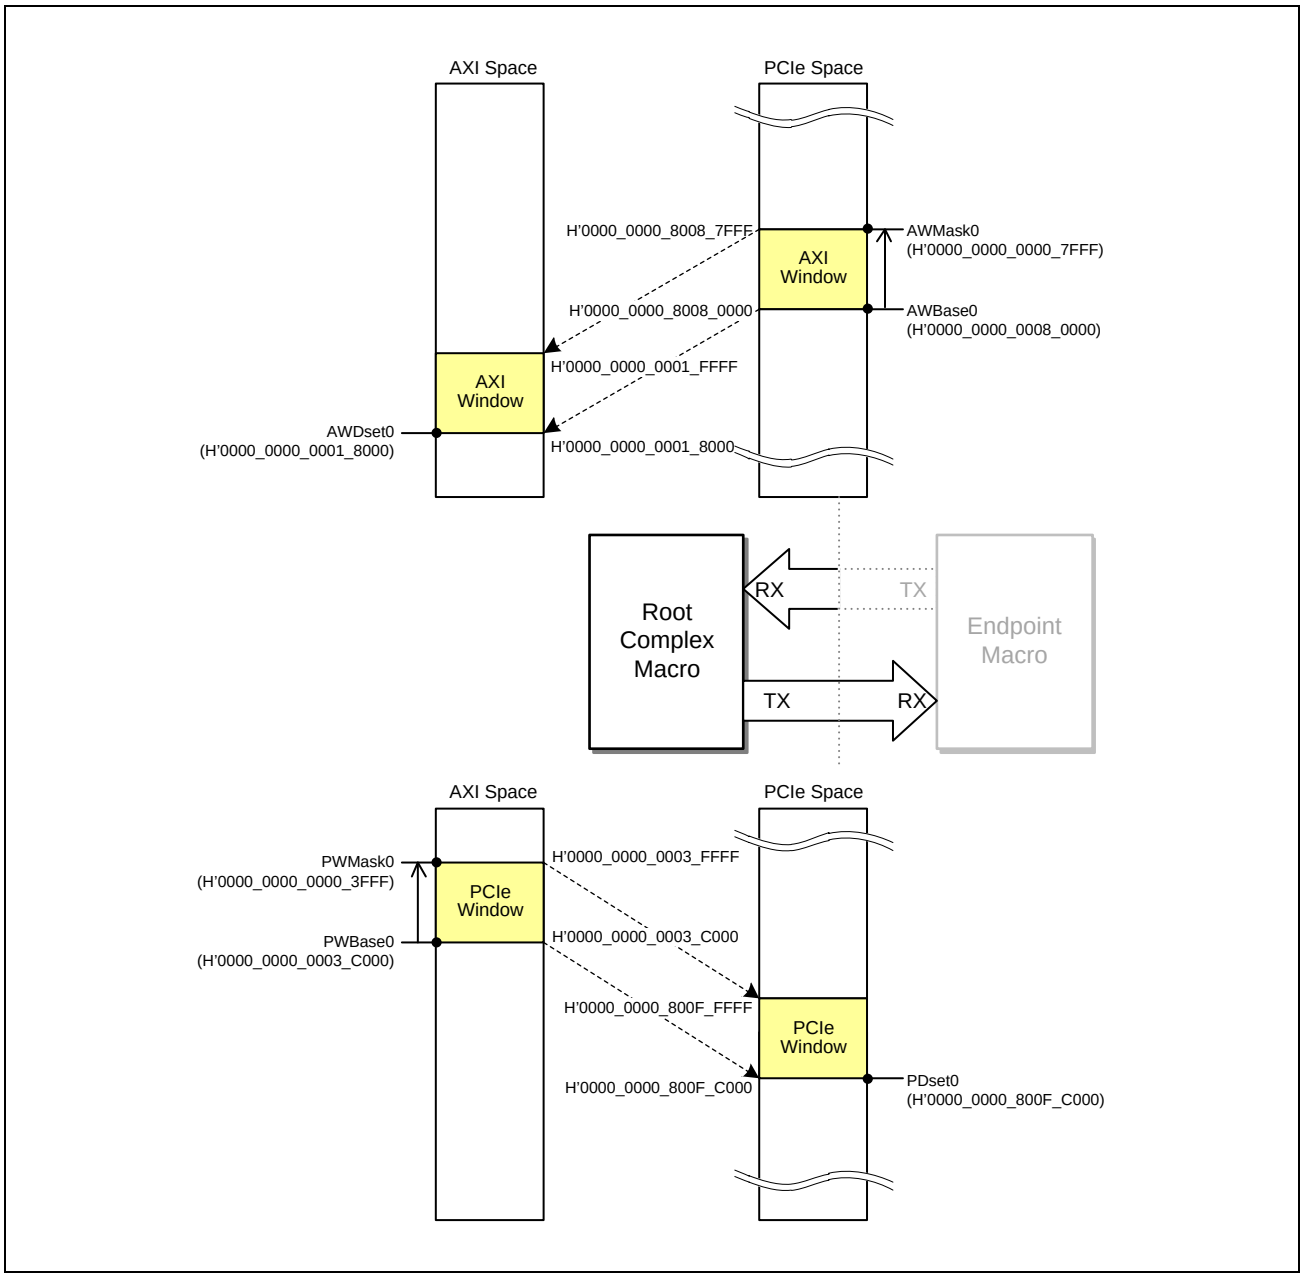
PCIe Destination x Register (Upper) (PCI_PDestxU) (Offset: H'114/134/154/174/194/1B4/1D4/1F4)

(x = 0 to 7)



Note: The values assigned in the figure (values in blue) are examples.

Figure 34.7 Example Settings of the PCIe Window



34.5.2.3 Device Search

On PC systems, the Root Complex (Host CPU) reads the Vendor ID/Device ID and Header Type in the oncoming device's Configuration Register to determine what product is connected as the oncoming device. Please check Base Spec for details.

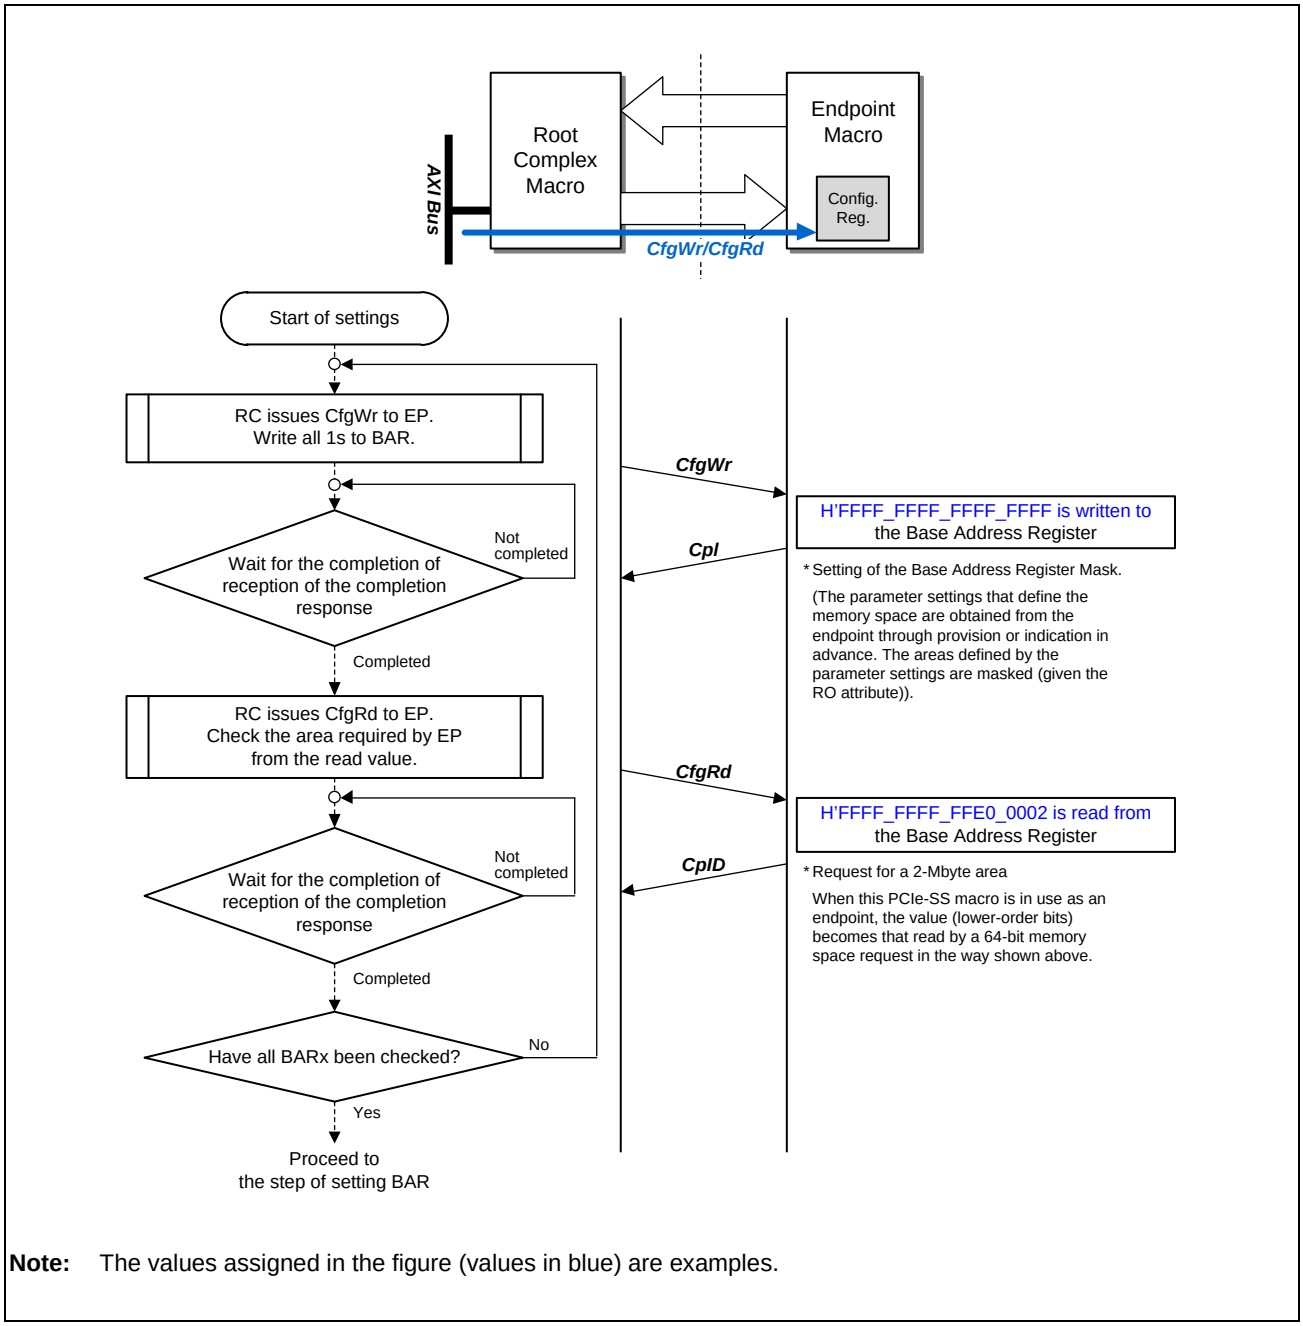
If it is clear that the oncoming device is an endpoint device, such as an embedded system, there is no need to perform a device search. However, the allocation of the bus number must be performed from the Root Complex side to the Endpoint side.

34.5.3 Setting the PCIe Address Space

A PC or similar system recognizes information on the areas of the memory space which are required by other-party endpoint devices by access to the configuration registers of the endpoints through software processing by the CPU on the root-complex side. In the case of embedded systems, etc., the areas required by the other-party devices will generally be known in advance, so this processing is not usually required.

The following is an example procedure for setting of the PCIe memory space for an other-party endpoint by the root complex.

Configuration requests are made to be issued to the other-party endpoint devices by register access through the AXI slave interface.



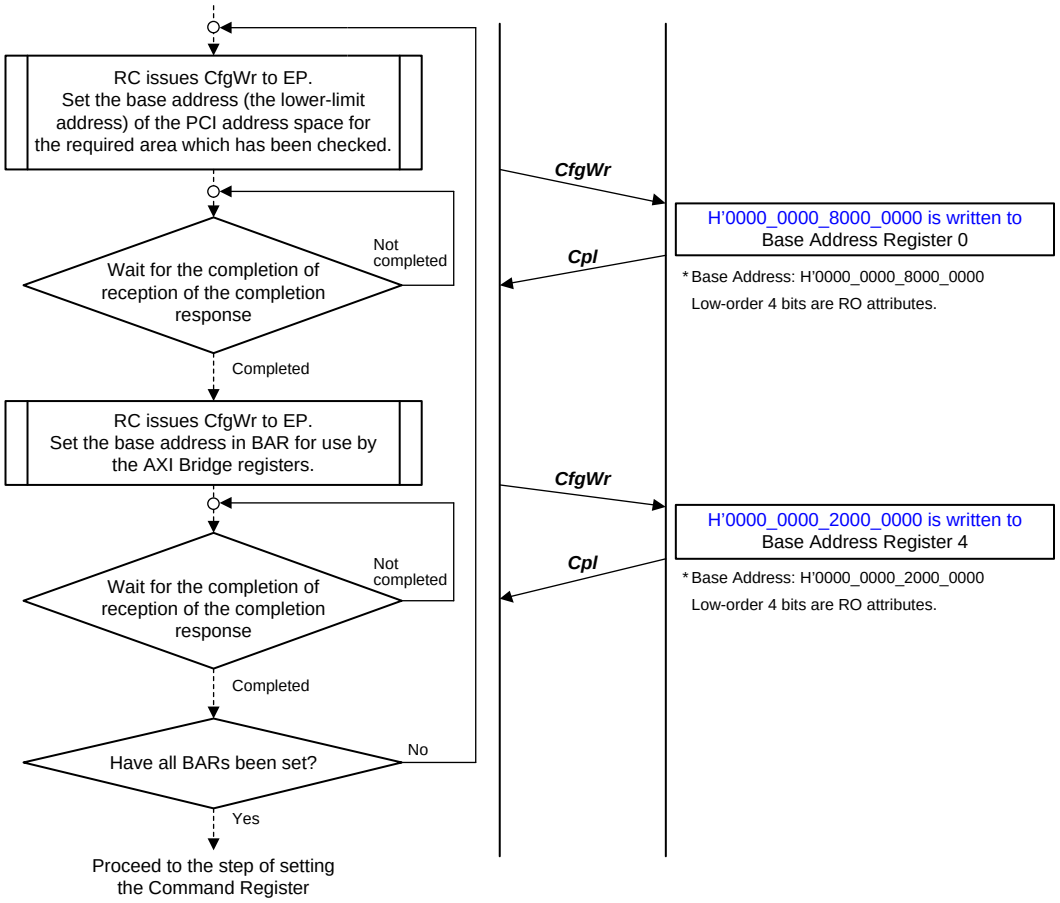
Note: The values assigned in the figure (values in blue) are examples.

Figure 34.8 Example Settings for the PCIe Address Space

After issuing a configuration write request for writing all 1s (H'FFFF_FFFF), a configuration read request is issued and if the result of reading is all 0s (H'0000_0000), the given base address register (BAR) is judged to be reserved and the corresponding space is considered to be unused.

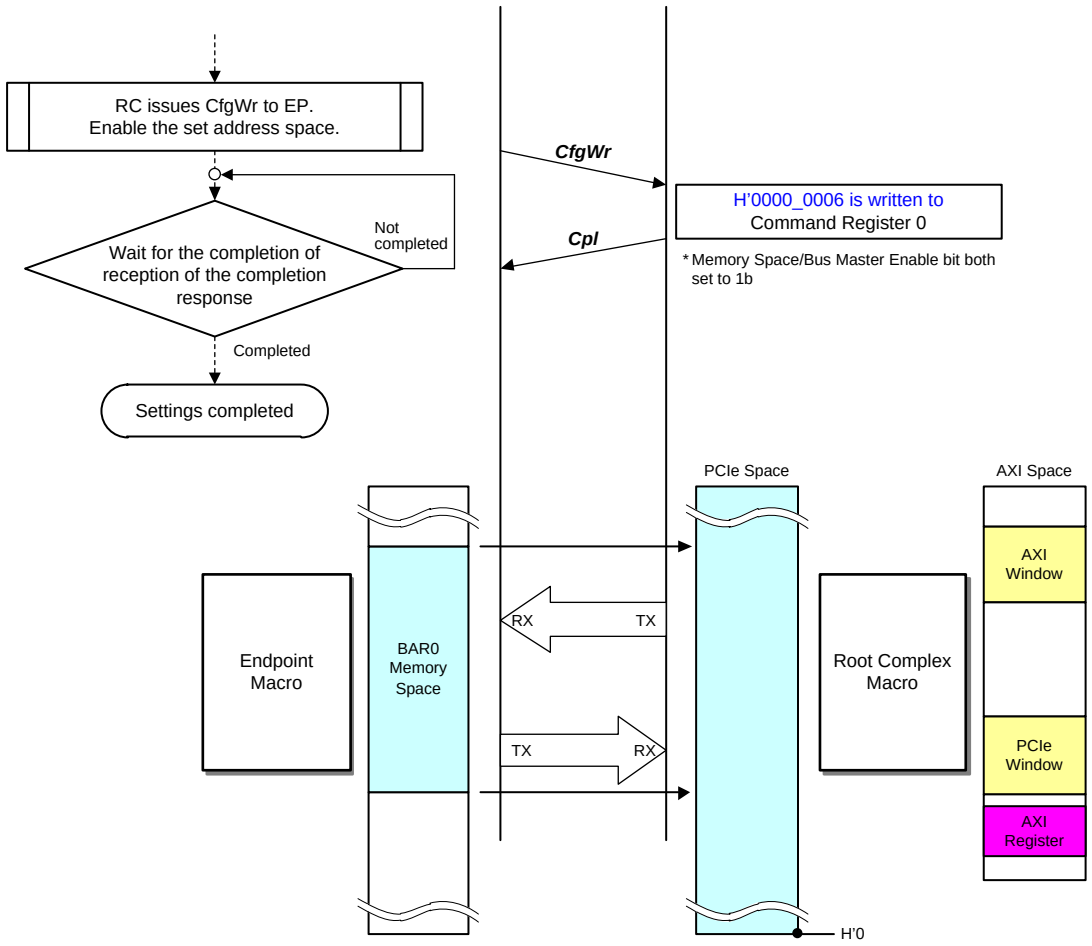
From the result of reading, software on the root complex side writes the base address (the lower-limit address) of the PCI address space to be allocated to the endpoint device by issuing a configuration write request.*[1] At this time, setting of a BAR for which the area requested by the endpoint device was found to be reserved and thus unused is not required. Also, if an address space which includes the other party has been prepared in advance, the above confirmation is not required. Set the base address directly.

Note 1. Setting a base address register to all 0s is prohibited.



Note: The values assigned in the figure (values in blue) are examples.

The completion of settings for the PCIe address space means that the root complex is ready for data transfer to the corresponding endpoint. Finally, set the Bus Master Enable bit and the Memory Space Enable bit of the given command register to enable the memory space.



Note: The values assigned in the figure (values in blue) are examples.

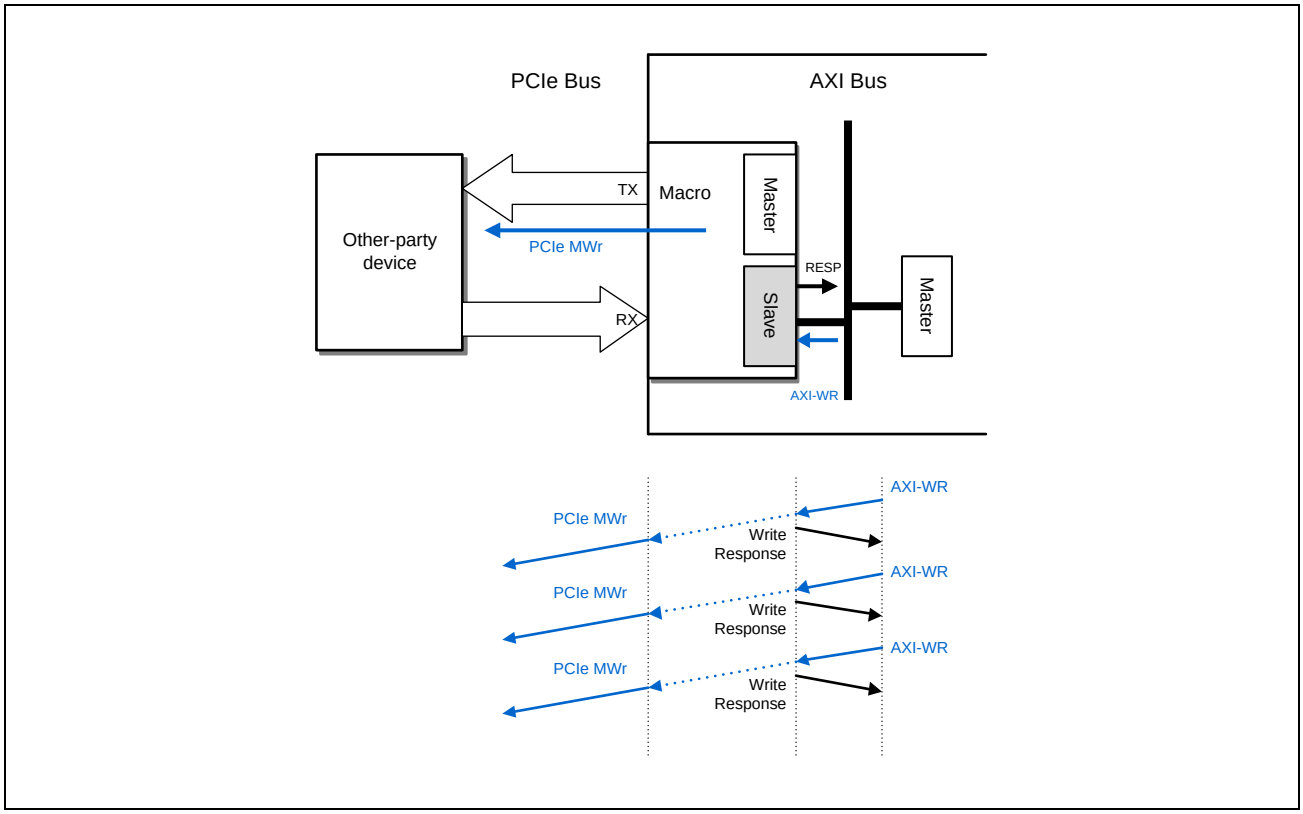
34.5.4 Data Transfer

This module has one port each for master and slave operation as an AXI interface. For PCIe requests which can be issued through the master and slave ports, see **Section 34.4.2, Issuing of PCIe Request and Register Access (From AXI)** and **Section 34.4.3, Issuing of AXI Transaction and Register Access (From PCIe)**.

The focus of this explanation is on normal memory data transfer.

34.5.4.1 PCIe MWr (when the AXI Slave is in Use)

A write transaction from the AXI bus (AXI-WR) via a window set as a PCIe window is converted into an MWr command (PCIe MWr) and then issued. If a PCIe MWr request is to be issued through the AXI interface slave port of the module by using a DMAC, etc. external to the module, the number of write transactions which can be accepted at a time is one, so the operation is as follows.



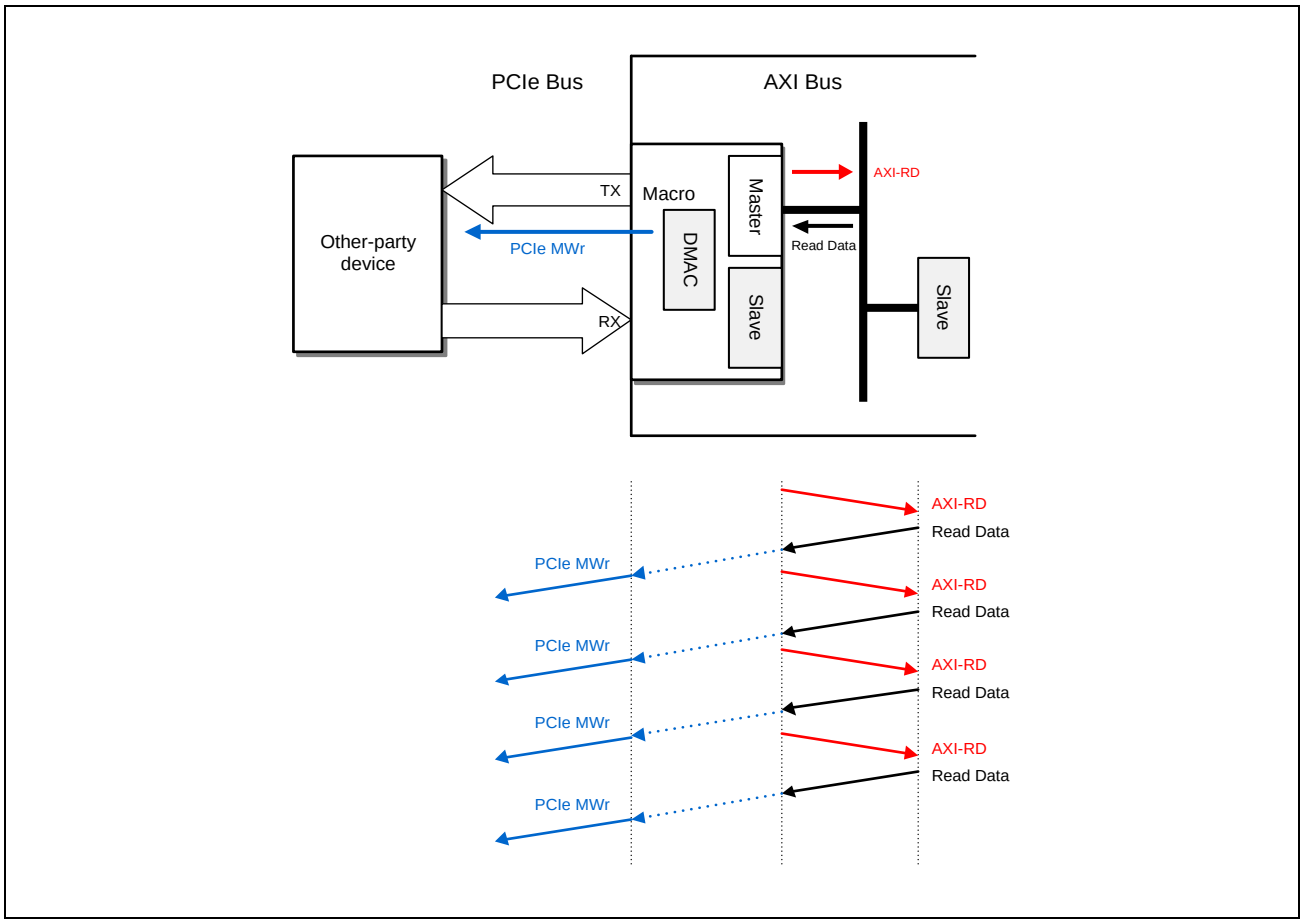
1. A write transaction from the AXI bus is issued through the AXI slave interface (write address channel, write data channel).
2. The transaction is converted into a PCIe MWr command and data are transferred to the other-party device via the PCIe bus.
3. After a wait for a response from the AXI slave interface (write response channel), a next AXI write transaction is issued.

A write response is issued after writing data to the transmission buffer (SRAM) within the module. If this transmission buffer is full, the module receives as much data as it can capture and then places the READY signal at the low level. Accordingly, the AXI bus may be placed in the hold state during transfer.

Since this depends not only on the specifications of the PCIe module (the number of lanes, rate, maximum payload size, etc.) but also on the size of the transmission buffer, the size of the reception buffer of the other-party device, and the external system configuration (the time for access to the external DRAM, etc.), care should be taken when considering the system configuration in general.

34.5.4.2 PCIe MWr (when the DMAC is in Use)

If a PCIe MWr request is to be issued through the AXI master port by using the DMAC within the module, the number of requests which can be read by the internal DMAC is one transaction per channel, so the operation is as follows.



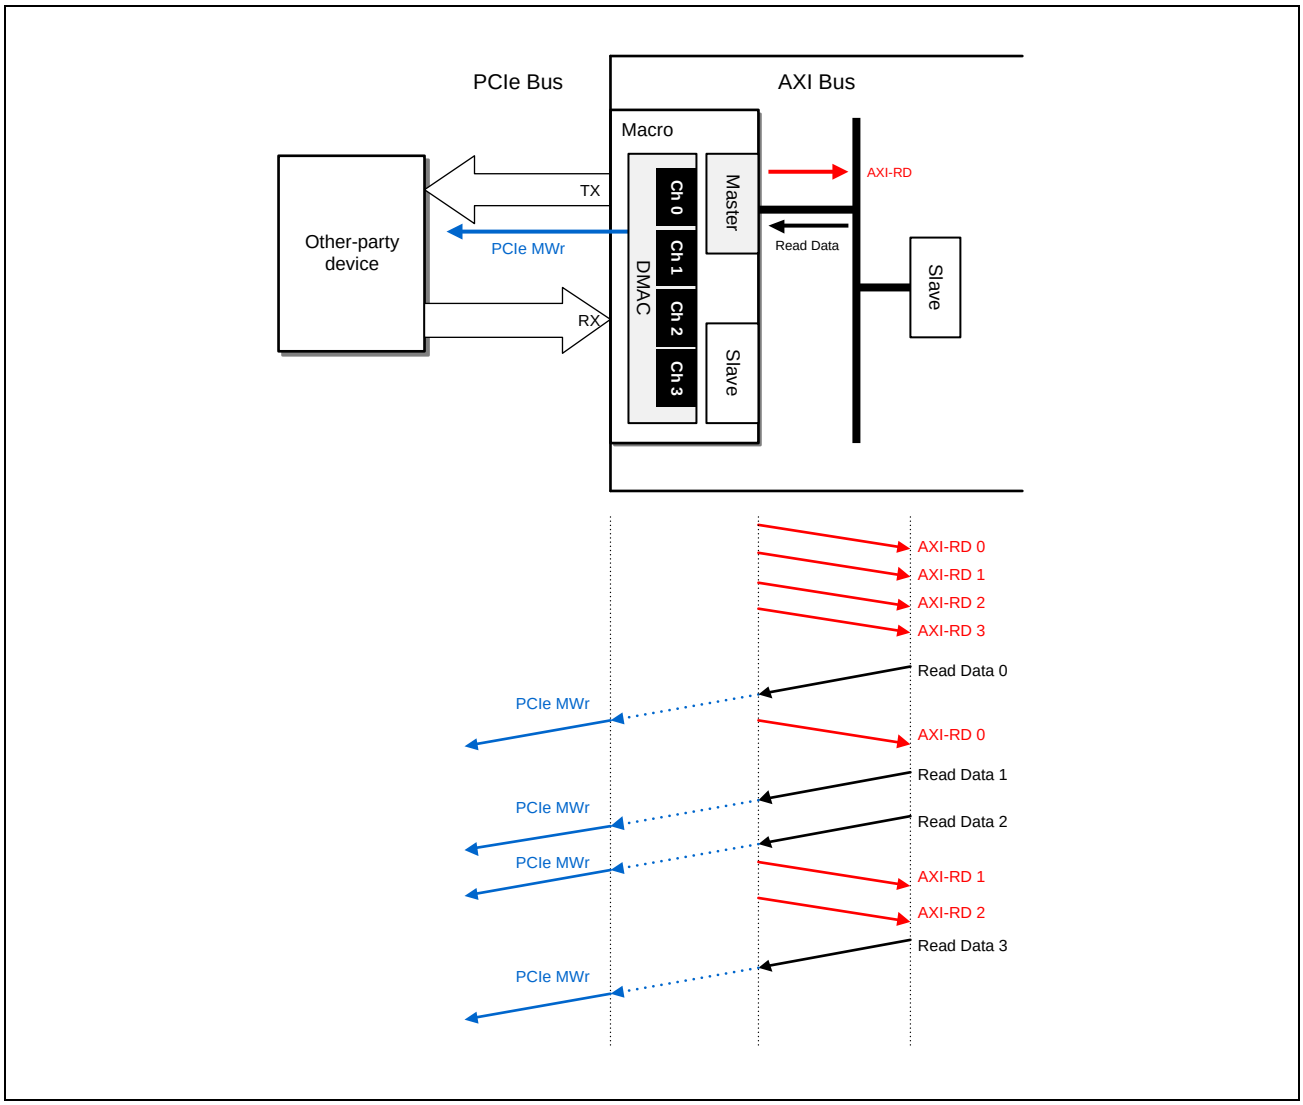
1. An AXI read (AXI-RD) request is issued through the AXI master interface (read address channel).
2. After the AXI master interface (read data channel) receives read data, this is converted into a PCIe MWr command and data are transferred to the other-party device via the PCIe bus.
3. Following the completion of the reception of read data, a next AXI-RD is issued.
4. The above steps are repeated until transfer of all bytes set in the DMA Size bits is completed.

The read data channel checks that the data that have been read are valid and indicates the readiness of the data for reception. Even when the transmission buffer (SRAM) within the module is full, the module issues read requests through the read address channel. Also, it receives as much data as it can capture and places subsequent data in the non-receivable state. Accordingly, depending on the state of the transmission buffer, data may not be transferred regardless of a request having been issued, or the AXI bus may be placed in the hold state during transfer. This lengthens the period of waiting for data that have been read, leading to the deterioration of transfer performance as well as the deterioration of overall system performance.

Likewise, contention with write access by the slave interface and contention in write access between channels may decrease performance in transfer.

Since this depends not only on the specifications of the PCIe module (the number of lanes, rate, maximum payload size, etc.) but also on the size of the transmission buffer, the size of the reception buffer of the other-party device, and the external system configuration (the time for access to the external DRAM, etc.), care should be taken when considering the system configuration in general.

The following is an example where the number of requests which can be read by the AXI master interfaced through four DMAC channels is 4.



1. An AXI read (AXI-RD0: DMAC ch. 0) request is issued through the AXI master interface (read address channel).
2. Since the number of requests which can be read by the module = 4, AXI read requests are subsequently issued through DMAC ch. 1, ch. 2, and ch. 3.

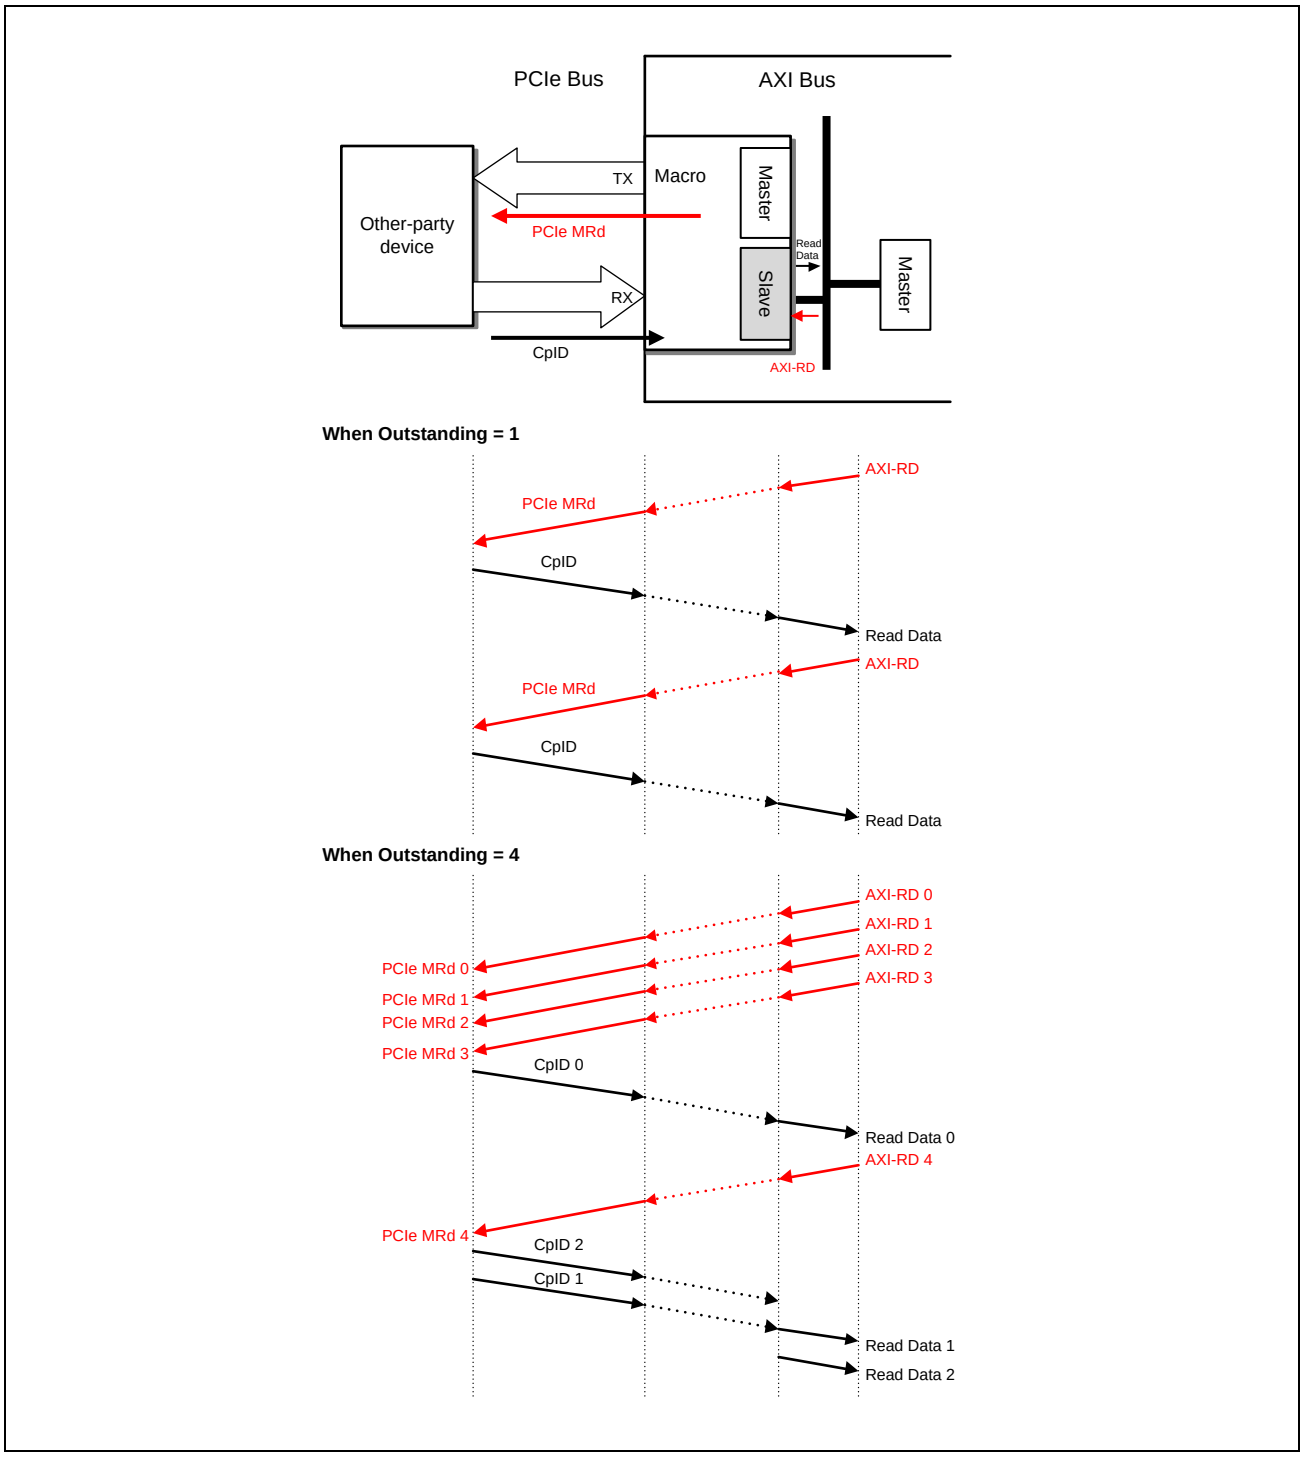
   Note: No order of priority applies to the issuing of requests through these channels.
3. Following the completion of the reception of data read in response to the read request through ch. 0, ch. 0 is able to issue a next AXI-RD0.
4. The above steps are repeated until transfer of all bytes set in the DMA Size bits for each channel is completed.

Configuring data transfer as described above allows increased performance, although such a configuration complicates software control.

34.5.4.3 PCIe MRd (when the AXI Slave is in Use)

In usage as an AXI slave, memory read requests (PCIe MRd) are issued to the PCIe interface, a completion (CplD) is received from the PCIe interface, and an AXI write transfer (AXI-WR) is initiated (this module supports eight outstanding transfers). Therefore, only the number of PCIe MRd requests that corresponds to this set number of outstanding transfers can be issued first, regardless of the reception of CplD. The received CplDs are stored in a data buffer (RAM) and then transferred through the AXI bus.

If a PCIe MRd is issued through the AXI interface slave port of the module, the number of read requests which can be accepted by the AXI slave at a time = 1 to 8 corresponding to the PCIe section.



When outstanding = 1

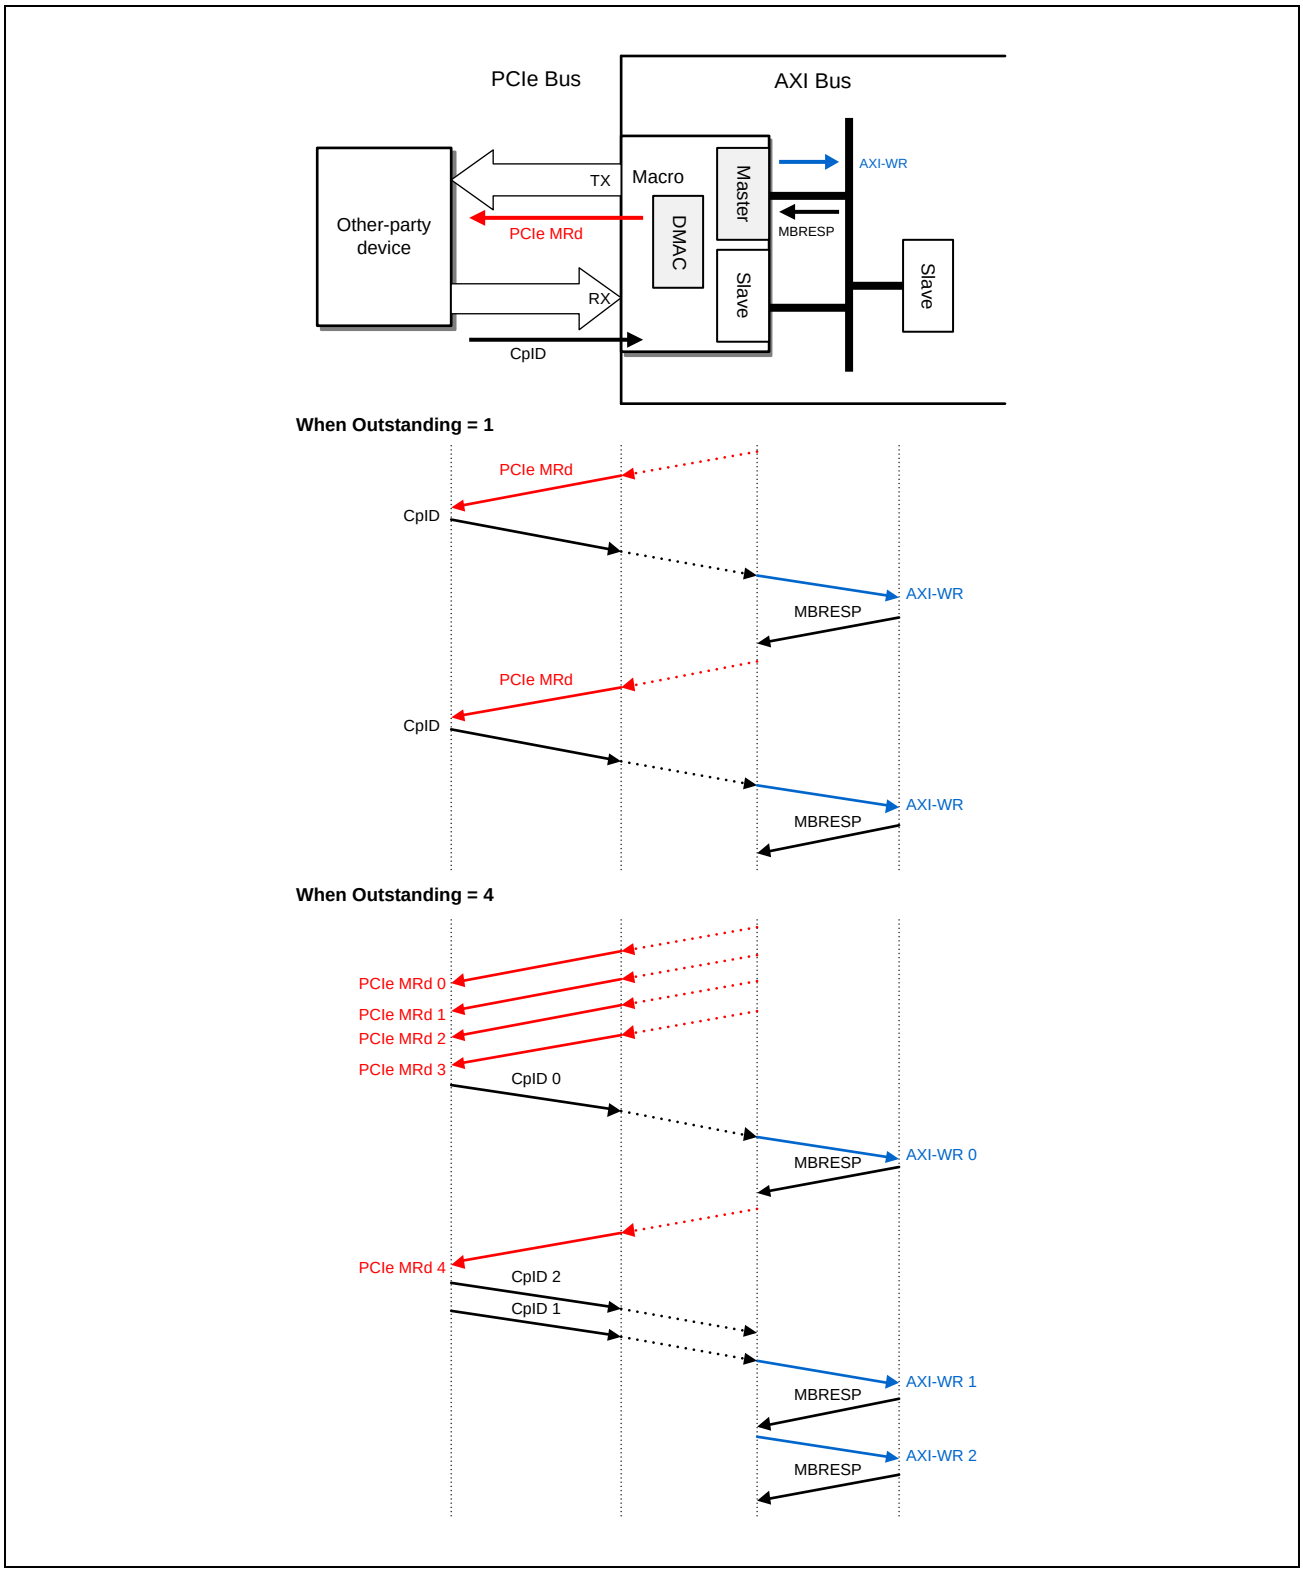
1. An AXI read transaction is issued through the AXI slave interface (read address channel).
2. A transaction is converted into a PCIe MRd command and the request for data reading is issued to the other-party device via the PCIe bus.
3. CplD is received from the other-party device and an AXI read response is issued through the AXI slave interface (read data channel).
4. Steps 1 to 3 are repeated.

When outstanding = 4

1. An AXI read transaction is issued through the AXI slave interface (read address channel).
2. A transaction is converted into a PCIe MRd command and the request for data reading is issued to the other-party device via the PCIe bus.
   Steps 1 and 2 can be repeated until up to four consecutive requests have been issued.
3. CplD is received from the other-party device and an AXI read response is issued through the AXI slave interface (read data channel).
   At this time, the PCIe module can operate with out-of-order transactions, so the order of CplDs from the other-party device may not be preserved. The module also includes a buffer to support in-order transactions with the AXI bus. If this is used and the CplD for a preceding PCIe MRd is never returned, however, the next request cannot be issued and performance deteriorates accordingly.
   After that, steps 1 to 3 are repeated.

34.5.4.4 PCIe MRd (when the DMAC is in Use)

If a PCIe MRd request is to be issued by using the DMAC within the module, the overall number of requests is also 1 to 8 when the DMAC is incorporated depending on the number of outstanding transfers.



1. Activate the internal DMAC through the AXI slave interface or from an other-party device.

When outstanding = 1

2. The DMAC issues a read request and this is converted to a PCIe MRd command within the module. The request for data reading is issued to the other-party device via the PCIe bus.
3. CplD is received from the other-party device and an AXI write transaction is issued through the AXI master interface (write address channel, write data channel).
4. Following the completion of the AXI write transfer, a next request is issued.
5. Steps 2 to 4 are repeated until transfer of all bytes set in the DMA Size bits is complete

When outstanding = 4

2. The DMAC issues a read request and this is converted to a PCIe MRd command within the module. The request for data reading is issued to the other-party device via the PCIe bus. Up to four consecutive requests can be issued.
3. CplD is received from the other-party device and an AXI write transaction is issued through the AXI master interface (write address channel, write data channel).
   At this time, the PCIe module can operate with out-of-order transactions, so the order of CplDs from the other-party device may not be preserved. The module also includes a buffer to support in-order transactions with the AXI bus. If this is used and the CplD for a preceding PCIe MRd is never returned, however, the next request cannot be issued and performance deteriorates accordingly.
4. Following the completion of the AXI write transfer, a next request is issued.
5. Steps 2 to 4 are repeated until transfer of all bytes set in the DMA Size bits is completed.

34.6 Usage Notes

34.6.1 Points for Caution and Prohibited Items in the Issuing of Requests

The following describes the restrictions in the issuing of various requests.

(1) Prohibition of fixed bursts of 2 or more beats

Fixed bursts for 2 or more beats are prohibited. If an attempt to use these is made, an OKAY response is returned to the AXI bus, but this may lead to issuing of the unexpected requests to the PCIe side, or unexpected register access which will change register values, and so on.

(2) Points for caution in the issuing of special requests

The requests listed below are issued by access to the internal registers. The registers are only accessible from the AXI side and writing to them while requests are being processed is prohibited. Attempted access from the PCIe side will be ignored.

[Special Requests]

- Zero-Length Memory Read Request
- Configuration Read
- Configuration Write
- Message Request
- Message Request with data payload

Remark Do not issue a special request for which issuing of the request is prohibited. Operation is not guaranteed if this is done.

34.6.2 Ordering Specifications of Received Non-Posted and Posted Requests

In the specifications of this module, a Non-Posted Request is not overtaken by a Posted Request on the receiving side. Requests received from another party are output to the higher-level bus in the order of reception.

34.6.3 Caution when Changing the Speed Spontaneously

Follow the procedure below. The following control bits are present in the PCI Core Control 2 Register and PCI Core Status 2 Register among the AXI-Bridge registers.

1. Wait until the home node is placed in the L0 state.
2. Read the value of the STATE_DATA_RATE_IDENTIFIER_RECEIVED bit to check the supported speed of the other-party node.
3. If the home node supports the speed to which the other-party node wants to change, set the UI_LINK_SPEED_CHANGE[1:0] bits and assert the UI_LINK_SPEED_CHANGE_REQ bit.
4. Wait for the UI_LINK_SPEED_CHANGE_DONE bit to be asserted (wait for the completion).

Remark UI_LINK_SPEED_CHANGE_REQ is retained until UI_LINK_SPEED_CHANGE_DONE is asserted. It should be de-asserted after checking the assertion of UI_LINK_SPEED_CHANGE_DONE.

34.6.4 Error Processing of Unsupported Requests

The following describes the flow of processing for error reporting and error logging.

(1) Access that straddles a 4-KB boundary

Data transfer to a memory space which straddles a 4-KB boundary cannot proceed (this is stipulated by the PCI Express Base Specification). In this module, the reception of a memory write or read request for a memory space which straddles a 4-KB boundary is handled as a malformed TLP.

(2) RCB violations

The PCI Express Base Specification states that error processing in response to violations of the read completion boundary (RCB) is optional. The PCIe module of this LSI chip does not support the detection of RCB violations at the time of the reception of completion responses. Support for this function should be handled by the user logic.

(3) Error processing in response to byte enable fields.

The PCI Express Base Specification states that error processing in response to Byte Enable fields is optional. This module does not support the detection of errors in the form of violations of Byte Enable rules. Support for this function should be handled by the user logic.

(4) Request that extends beyond the base address boundary

This module does not detect a request that starts within the range set in the Base Address Register but extends beyond the boundary from the base address as an error. Such a request should be handled by the user logic.

(5) Processing when a TPL that is ready to be transferred by the transmitter is a malformed TLP

Even if malformation of a TLP that is ready to be transferred by the transmitter is detected, due to the detection of parity errors when it is read from the FIFO buffer and so on, this unit does not suspend the transmission of such a TLP. Received malformed TLPs must be handled appropriately by other-party devices.

34.6.5 Processing on Reception of the Message

The following lists the messages to be detected as a silent drop or UR on reception of the given message.

Table 34.23 Operations on Message Reception

Received Message	Root Complex
Assert_INTx	Normal processing
Deassert_INTx	Normal processing
ERR_COR	Normal processing
ERR_NONFATAL	Normal processing
ERR_FATAL	Normal processing
UNLOCK	Silent Drop
Set_Slot_Power_Limit	Silent Drop
Vendor_Defined_Type0	UR
Vendor_Defined_Type1	Silent Drop
Ignore	Silent Drop
LTR	Normal processing
OBFF	UR
PM_PME	Normal processing
PME_TO_Ack	Normal processing
PM_Active_State_Nak	Silent Drop
PME_Turn_Off	Silent Drop
PTM_Request	UR
PTM_Response	UR
PTM_ResponseD	UR
Invalidate_Request	Silent Drop
Invalidate_Completion	Normal processing
Page_Request	UR
Page_Response	UR

Note: Silent Drop: Normal completion, data are not reflected
UR: Unsupported Request

34.6.6 Other Points for Caution

(1) Point for caution on register writing

In some cases of writing 2DW or more and skipping over with the use of byte enable to a register from the AXI side, writing might not proceed as expected.

Using a pin reset or register reset from the AXI side as a non-consecutive SWSTRB, restricts writing to no more than 1DW (32 bits).

(2) Point for caution on register reading

In the case of reading a register from the AXI side, values read from invalid byte lanes are from undefined outputs (meaningless garbage data).

(3) Generation of unexpected correctable errors

A correctable error may be detected at the time of EIOS reception following low power state transitions of this module such as from L0s to L1. If this happens, processing to send a message or assert an interrupt flag signal is to proceed. Take care on this point and respond appropriately so that a correctable error is not handled as a fatal error (a mask setting by a register to switch the notification of unexpected correctable errors off is recommended).

(4) Reset interval in transitions from a hot reset to detection in RC mode

In generations of PCI Express after Gen1, at the time of transitions from a hot reset to detection in accord with the operating rate, the base specification prescribes securing a 1-ms waiting interval for changes to the rate, so secure a reset interval of 1 ms.

(5) How to use the PCI_RST_OUT# terminal

By connecting this terminal to the “PERST#” input terminal on the Endpoint side of the opposite device in the Root Complex mode, initialization of the opposite device can be controlled by the Root Complex side.

(6) Retimer

One Retimer can be used.

(7) Point for caution on Window setting

Window addressing has the following precautions and limitations:

- When the BAR* register and the corresponding BAR Mask* register setting value are added, bit carry should not be allowed.
- When the AXI Window Base* register and the corresponding AXI Window Mask* register setting value are added, bit carry should not be allowed.
- When the PCIe Window Base* register and the corresponding PCIe Window Mask* register setting value are added, bit carry should not be allowed.
- When the AXI Window Mask* register and the corresponding AXI Destination* register setting value are added, bit carry should not be allowed.
- When the PCIe Window Mask* register and the corresponding PCIe Destination* register setting value are added, bit carry should not be allowed.

- The value of BAR Mask*, AXI Window Mask* and PCIe Window Mask* register should be set a power of 2 minus 1.

  Ex) H’0000_0007_FFFF_FFFF is OK. H’0000_0001_0FFF_FFFF is NG.
  – Each Window should be a single memory size with a power of 2.
  – The minimum space between BAR-BAR masks is 4 Kbytes.

35. Serial Sound Interface (SSIF-2)

35.1 Overview

The serial sound interface (SSIF-2) transmits and receives audio data to and from various devices that are compatible with I^2S format, monaural format and TDM format.

35.1.1 Features

Table 35.1 Features of SSIF-2

Item		Description
Number of interfaces		4
Communication mode		• Master/slave • Full-duplex communication is available in interfaces 0, 1, and 3. Half-duplex communication is only available in interface 2.
Communication format		• I^2S format • Monaural format • TDM format
Serial data		• MSB first • Data can be left-justified or right-justified. • Data delay (one clock cycle) or no delay selectable for the period from SSI_RCK to SSI_TXD/SSI_RXD • System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits • Data word length: 8, 16, 18, 20, 22, 24, or 32 bits • Padding polarity: Low or high
Bit clock (SSIBCK)	In master mode	• Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128. • Supply/stop of SSI_BCK is selectable while communication is halted.
	In slave mode	SSI_BCK input method: Direct input or via the noise canceller
	In master/slave mode	Polarity: Rising/falling edge canceler
Left and right clock/frame synchronization (SSILRCK/SSIFS)	In master mode	• Polarity: Low/high level selectable • Supply/stop of SSI_RCK is selectable while communication is halted.
	In slave mode	Two input methods: Direct input or via the noise canceller
Transmit data (SSITxD) and receive data (SSIRxD)	Transmission	Mute: Transmission of transmit FIFO data or fixed value 0 selectable
	Reception (in slave mode)	Two input methods: Direct input or via the noise canceller
FIFO	Capacity	• Transmit FIFO/receive FIFO: 4 bytes × 32 stages, • Receive FIFO: 4 bytes × 32 stages
	Data alignment	Method of data transfer between FIFO and shift register (Left-justification and right-justification) selectable.
Interrupt	Interrupt output	• Communication error/idle mode error (level) • Receive data full interrupt (edge) • Transmit data empty interrupt (edge) • Receive data full/transmit data empty interrupt (edge)
	Interrupt capture spilling solution function	Edge Interrupt supports inhibition function of capture spilling.
Low power consumption function		Supply/stop of audio clock is selectable in master-mode communication.

The definition of words and phrases used by the format of the communication of SSIF-2 is as follows.

Table 35.2 Word Definition List

Word	Definition
Start trigger	The first edge that reaches value that set to LRCKP in SSI_RCK pin after SSIF-2 permit communication.
Frame boundary	When SSIF-2 begins to transmit the first data of one frame. When SSIF-2 forwarding ends final data of one frame.
Frame word number	Sound channel number in one frame
System word length	Bit length in one frame.
Data word length	Effective bit length in one frame.
Control bit of communication format	• SSICR register: FRM,DWL,SWL,LRCKP,SPDP,SDTA,PDTA,DEL • SSIFCR register: BSW • SSIOFR register: OMOD • SSISCR register: TDES, RDFS

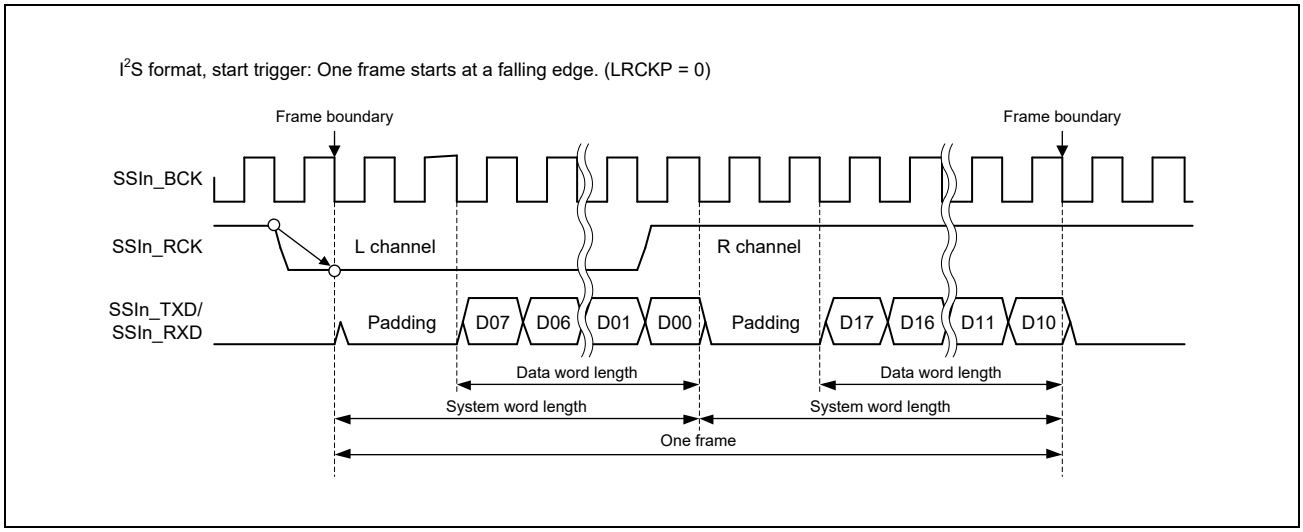


Figure 35.1 Communication Format Definition

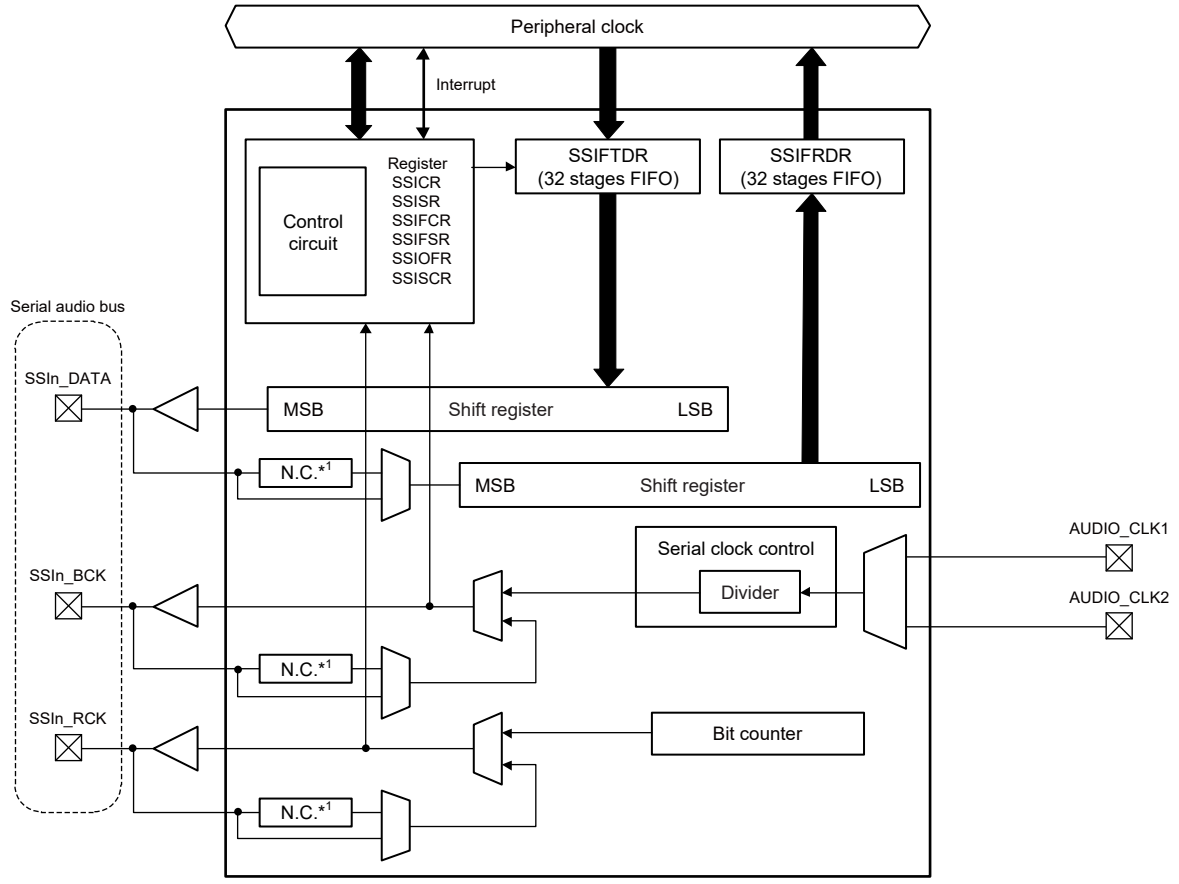
35.1.2 Block Diagram

Figure 35.2 shows the block diagram of SSIF-2.



[Legend]

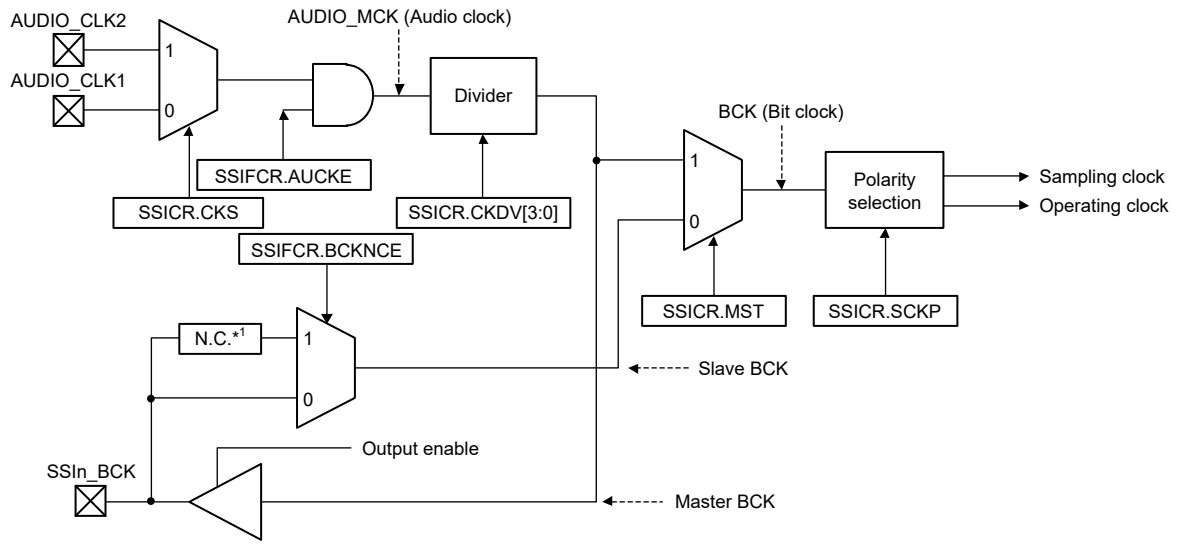
SSICR:	Control register
SSISR:	Status register
SSIFCR:	FIFO control register
SSIFSR:	FIFO status register
SSIOFR:	Audio format register
SSIFTDR:	Transmit FIFO data register
SSIFRDR:	Receive FIFO data register
SSISCR:	Status Control register

Note: In channels 0, 1, and 3, SSn_DATA can be used independently as SSIn_TXD for transmission and SSIn_RXD for reception.

Note 1. N.C.: Noise canceller

Figure 35.2 SSIF-2 Block Diagram

Figure 35.3 shows the clock configuration of SSIF-2.



[Legend]

SSICR: Control register

Note: Switch the above SFRs while communication is halted.

Note 1. N.C. (Noise canceller)

Figure 35.3 SSIF-2 Clock Configuration

35.2 Input/Output Pins

Table 35.3 shows the pin configuration

Table 35.3 Pin Configuration

Interface	Name	I/O	Function
0, 1, 3 (n = 0,1,3)	SSIn_BCK	I/O	Bit clock
	SSIn_RCK	I/O	LR clock/frame synchronization
	SSIn_TXD	Output	Serial data output
	SSIn_RXD	Input	Serial data input
2 (n = 2)	SSIn_BCK	I/O	Bit clock
	SSIn_RCK	I/O	LR clock/frame synchronization
	SSIn_DATA	I/O	Serial data I/O
Common	AUDIO_CLK1	Input	External clock1 for audio (The oversampling clock signal is input.)
	AUDIO_CLK2	Input	External clock2 for audio (The oversampling clock signal is input.)

35.3 List of Registers

Table 35.4 shows the register configuration of SSIF-2. The address of the SSIF-2 register is represented by the offset address from the base address. SSIF-2 base address is as follows:

- SSIF-2 base address: H'0_100A_8000 (ch0), H'0_100A_8400 (ch1), H'0_100A_8800 (ch2), H'0_100A_8C00 (ch3) (Overall Address Space)
- SSIF-2 base address: H'400A_8000 (ch0), H'400A_8400 (ch1), H'400A_8800 (ch2), H'400A_8C00 (ch3) (Cortex-M33/Cortex-M33_FPU Address Space Secure)
- SSIF-2 base address: H'500A_8000 (ch0), H'500A_8400 (ch1), H'500A_8800 (ch2), H'500A_8C00 (ch3) (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 35.4 List of Control Registers (1/2)

Channel	Register Name	Symbol	R/W	Initial Value	Address	Access Size
0	Control register	SSICR	RW	H'0000_0000	H'00	32 bits
	Status register *Note*: Bits 31, 30, and 25 to 0 are read only.	SSISR	RW	H'0200_0000	H'04	32 bits
	FIFO control register	SSIFCR	RW	H'0000_0000	H'10	32 bits
	FIFO status register *Note*: Bits 31 to 17 and 15 to 1 are read only.	SSIFSR	RW	H'0001_0000	H'14	32 bits

	Status control register	SSISCR	RW	H'0000_0000	H'24	32 bits

Table 35.4 List of Control Registers (2/2)

Channel	Register Name	Symbol	R/W	Initial Value	Address	Access Size
2	Control register	SSICR	RW	H'0000_0000	H'00	32 bits
	Status register *Note*: Bits 31, 30, and 25 to 0 are read only.	SSISR	RW	H'0200_0000	H'04	32 bits
	FIFO control register	SSIFCR	RW	H'0000_0000	H'10	32 bits
	FIFO status register *Note*: Bits 31 to 17 and 15 to 1 are read only.	SSIFSR	RW	H'0001_0000	H'14	32 bits
	Transmit FIFO data register	SSIFTDR	W	H'0000_0000	H'18	32 bits, 16 bits, 8 bits
	Receive FIFO data register	SSIFRDR	R	H'0000_0000	H'1C	32 bits, 16 bits, 8 bits
	Audio format register	SSIOFR	RW	H'0000_0000	H'20	32 bits
	Status control register	SSISCR	RW	H'0000_0000	H'24	32 bits
3	Control register	SSICR	RW	H'0000_0000	H'00	32 bits
	Status register *Note*: Bits 31, 30, and 25 to 0 are read only.	SSISR	RW	H'0200_0000	H'04	32 bits
	FIFO control register	SSIFCR	RW	H'0000_0000	H'10	32 bits
	FIFO status register *Note*: Bits 31 to 17 and 15 to 1 are read only.	SSIFSR	RW	H'0001_0000	H'14	32 bits
	Transmit FIFO data register	SSIFTDR	W	H'0000_0000	H'18	32 bits, 16 bits, 8 bits
	Receive FIFO data register	SSIFRDR	R	H'0000_0000	H'1C	32 bits, 16 bits, 8 bits
	Audio format register	SSIOFR	RW	H'0000_0000	H'20	32 bits
	Status control register	SSISCR	RW	H'0000_0000	H'24	32 bits

Note: Access to the addresses other than those listed above is prohibited.

35.4 Function Details

35.4.1 Register Descriptions

35.4.1.1 Control Register (SSICR)

This is a 32-bit readable/writable register. With this register, select an audio clock, control IRQ, select data formats, and set an operation mode.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CKS	TUIEN	TOIEN	RUIEN	ROIEN	IIEN	—	FRM[1:0]		DWL[2:0]			SWL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved. Write 0. The read value is 0.
30	CKS	0	RW	Selects an audio clock for master-mode communication*1 0: Selects the AUDIO_CLK2 input 1: Selects the AUDIO_CLK1 input
29	TUIEN	0	RW	Transmit underflow interrupt output enable 0: Disables transmit underflow interrupt output 1: Enables transmit underflow interrupt output
28	TOIEN	0	RW	Transmit overflow interrupt output enable 0: Disables transmit overflow interrupt output 1: Enables transmit overflow interrupt output
27	RUIEN	0	RW	Receive underflow interrupt output enable 0: Disables receive underflow interrupt output 1: Enables receive underflow interrupt output
26	ROIEN	0	RW	Receive overflow interrupt output enable 0: Disables receive overflow interrupt output 1: Enables receive overflow interrupt output
25	IIEN	0	RW	Idle mode interrupt output enable 0: Disables idle mode interrupt output 1: Enables idle mode interrupt output
24	—	0	R	Reserved. Write 0. The read value is 0.
23, 22	FRM[1:0]	00b	RW	Select frame word number*1

Communication format (SSIOFR.OMOD[1:0])

FRM[1:0]	I²S (00b)	Monaural (10b)	TDM (01b)
00b	2	1	Set prohibition
01b	Set	Set prohibition	4
10b	prohibition		6
11b			8

Bit	Bit Name	Initial Value	R/W	Description
21 to 19	DWL[2:0]	000b	R/W	Selects data word length*1 000: 8 bits 001: 16 bits 010: 18 bits 011: 20 bits 100: 22 bits 101: 24 bits 110: 32 bits 111: Setting prohibited
18 to 16	SWL[2:0]	000b	RW	Selects system word length*1 000: 8 bits 001: 16 bits 010: 24 bits 011: 32 bits 100: 48 bits 101: 64 bits 110: 128 bits 111: 256 bits
15	—	0	R	Reserved. Write 0. The read value is 0.
14	MST	0	RW	Master enable*1 0: Slave-mode communication 1: Master-mode communication
13	BCKP	0	RW	Selects bit clock polarity*1 0: SSILRCK/SSIFS and SSIFTxD/SSIFRxD change at a falling edge (sampling SSILRCK/SSIFS and SSIFRxD at a rising edge of SSIBCK). 1: SSILRCK/SSIFS and SSIFTxD/SSIFRxD change at a rising edge (sampling SSILRCK/SSIFS and SSIFRxD at a falling edge of SSIBCK).
12	LRCKP	0	RW	Selects the initial value and polarity of LRCK/FS*1 0: The initial value is at a high level For SSILRCK/SSIFS, one frame start trigger is falling edge of SSILRCK/SSIFS. 1: The initial value is at a low level For SSILRCK/SSIFS, one frame start trigger is rising edge of SSILRCK/SSIFS.
11	SPDP	0	RW	Selects serial padding polarity*1 0: Padding data is at a low level 1: Padding data is at a high level
10	SDTA	0	RW	Selects serial data alignment*1 0: Transmits and receives serial data first and then padding bits. 1: Transmit and receives padding bits first and then serial data.
9	PDTA	0	RW	Selects placement data alignment*1 0: Left-justifies placement data (SSIFTDR, SSIFRDR) 1: Right-justifies placement data (SSIFTDR, SSIFRDR)
8	DEL	0	RW	Selects serial data delay*1 0: Delay of one cycle of SSIBCK between SSILRCK/SSIFS and SSIFTxD/SSIFRxD. 1: No delay between SSILRCK/SSIFS and SSIFTxD/SSIFRxD. This bit control SSILRCK/SSIFS in monaural format (Refer to **Section 35.4.2.2, Monaural Format** for details).

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	CKDV[3:0]	H'0	RW	Selects bit clock division ratio*1 CKDV[3:0] 0000: AUDIO_MCK 0001: AUDIO_MCK/2 0010: AUDIO_MCK/4 0011: AUDIO_MCK/8 0100: AUDIO_MCK/16 0101: AUDIO_MCK/32 0110: AUDIO_MCK/64 0111: AUDIO_MCK/128 1000: AUDIO_MCK/6 1001: AUDIO_MCK/12 1010: AUDIO_MCK/24 1011: AUDIO_MCK/48 1100: AUDIO_MCK/96 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited
3	MUEN	0	RW	Mute (silent) enable 0: Disables muting on the next frame boundary. 1: Enables muting on the next frame boundary.
2	—	0	R	Reserved. Write 0. The read value is 0.
1	TEN	0	RW	Transmission and reception enable*2
0	REN	0	RW	(TEN, REN): Operating 00: Disables transmission and reception 01: Enables reception (starts reception) 10: Enables transmission (starts transmission) 11: Enables transmission and reception (starts transmission and reception)

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If written, the operation performed immediately after writing is not guaranteed. For example, after enabling operation, make sure that SSISR.IIRQ = 0 and after disabling operation, make sure that SSISR.IIRQ = 1.

CKS Bit

This bit sets the audio clock in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of this bit is invalid.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 35.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

TUIEN Bit

This bit enables/disables output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

TOIEN Bit

This bit enables/disables output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

RUIEN Bit

This bit enables/disables output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

ROIEN Bit

This bit enables/disables output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIRQ = 1.

IIEN Bit

This bit enables/disables output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

FRM[1:0] Bits

These bits set system word number in one frame of the communication formats.

Rewrite these bits when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 35.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

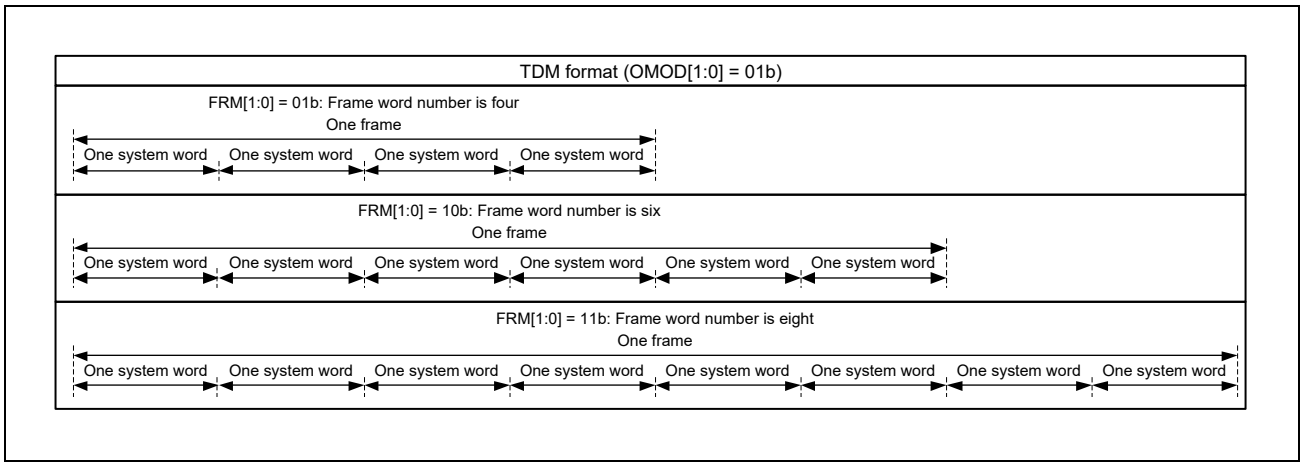

Figure 35.4 Frame Word Number

DWL[2:0] Bits

These bits set the number of bits in one data word. The setting whose number of data of system word lengths is shorter than that of the data word length is a prohibition. Refer to **Table 35.13** in **Section 35.4.2, Communication Formats** for details.

SWL[2:0] Bits

These bits set the number of bits in one system word. Padding bits are sent and received in relation with one data word set with DWL[2:0]. See **Table 35.13** in **Section 35.4.2, Communication Formats** for details.

Rewrite these bits when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 35.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

MST Bit

This bit sets master-/slave-mode communication.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 35.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

BCKP Bit

This bit sets the bit clock polarity (**Table 35.5**).

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 35.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

Table 35.5 Bit Clock Polarity

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	At SSILRCK/SSIFS sampling	SSIBCK rising edge	SSIBCK falling edge
	Master/slave	At SSIFRxD sampling	SSIBCK rising edge	SSIBCK falling edge
Transmission	Master	At change of SSILRCK/SSIFS output	SSIBCK falling edge	SSIBCK rising edge
	Master/slave	At change of SSIFTxD output	SSIBCK falling edge	SSIBCK rising edge

LRCKP Bit

This bit sets the initial value and polarity of SSILRCK/SSIFS. Set this bit according to the communication format to be used in SSIF-2 (**Table 35.6**). Only the start trigger is used at slave communication (MST=0).

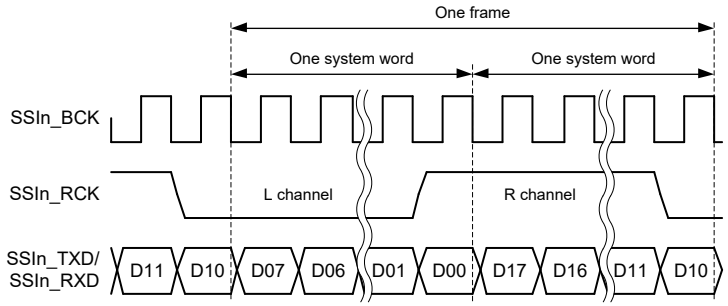
Rewrite this bit when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 35.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

Table 35.6 Initial Output Value and Polarity of SSILRCK/SSIFS Pin

Communication Format	Expected Initial State	Setting Value of LRCKP
I^2S	H	0
Monaural	L	1
TDM	L	1

Note: Do the setting that can be communicated respectively to I^2S, monaural, and TDM at the compatible format.

System word length: 8 bits (SWL = 000b), Data word length: 8 bits (DWL = 000b),
LR clock polarity: L channel = low, R channel = high (LRCKP = 0)
Other control bits of communication format are at their initial values.



System word length: 8 bits (SWL = 000b), Data word length: 8 bits (DWL = 000b),
LR clock polarity: L channel = high, R channel = low (LRCKP = 1)
Other control bits of communication format are at their initial values.

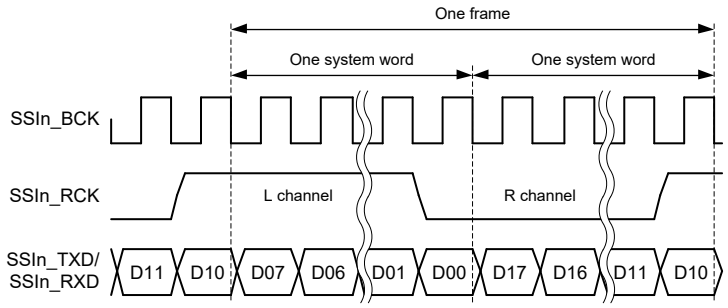


Figure 35.5 LRCK/FS Polarity Setting

SPDP Bit

This bit sets polarity of padding bits.

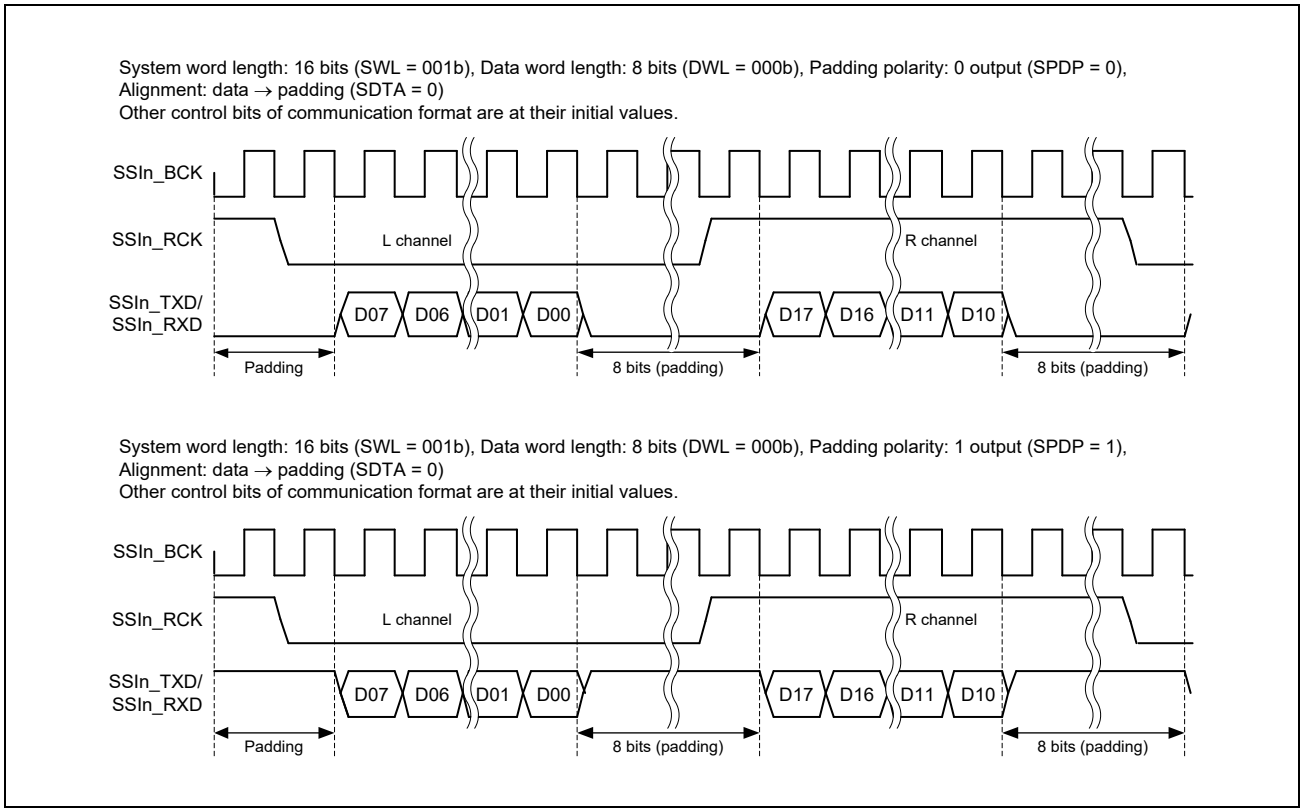

Figure 35.6 Padding Bit Polarity

SDTA Bit

This bit sets alignment of serial data (data bits and padding bits). For communication without padding bits, this bit is invalid.

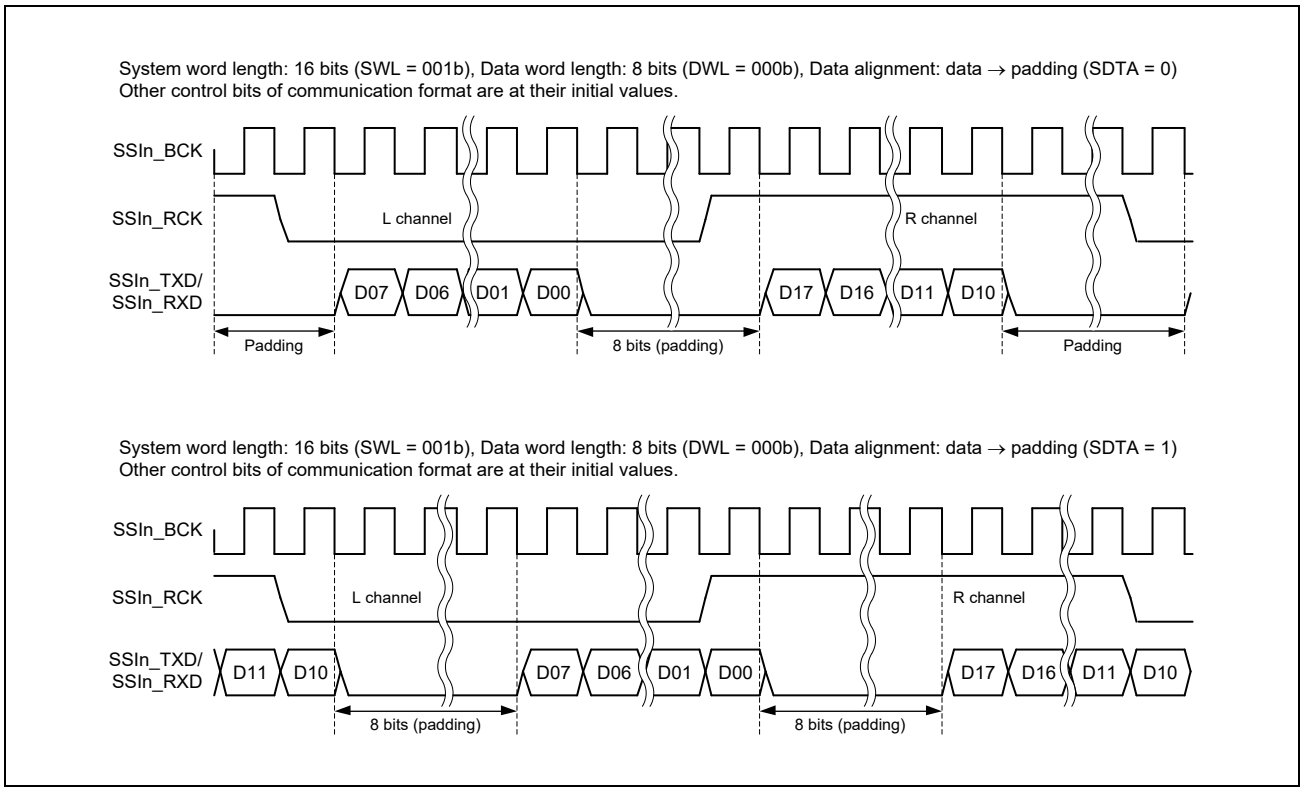

Figure 35.7 Alignment Setting of Serial Data with Padding Bits

PDTA Bit

This bit sets alignment of placement data. With the setting of data word length as 32 bits (DWL[2:0] = 110b), this bit is invalid.

- At transmission:

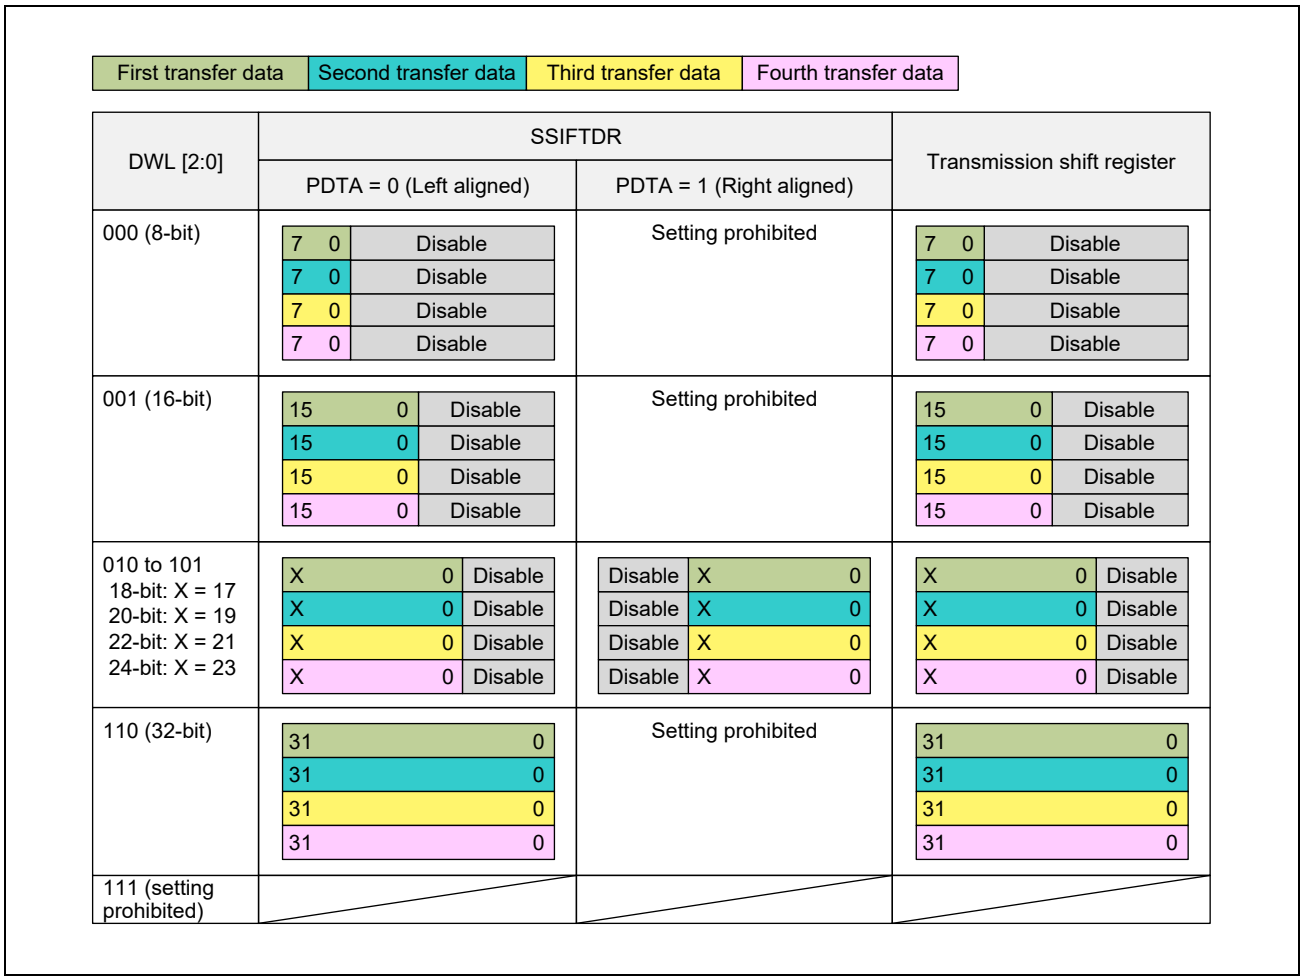

Figure 35.8 Alignment Setting of Placement Data in Transmission

- At reception:

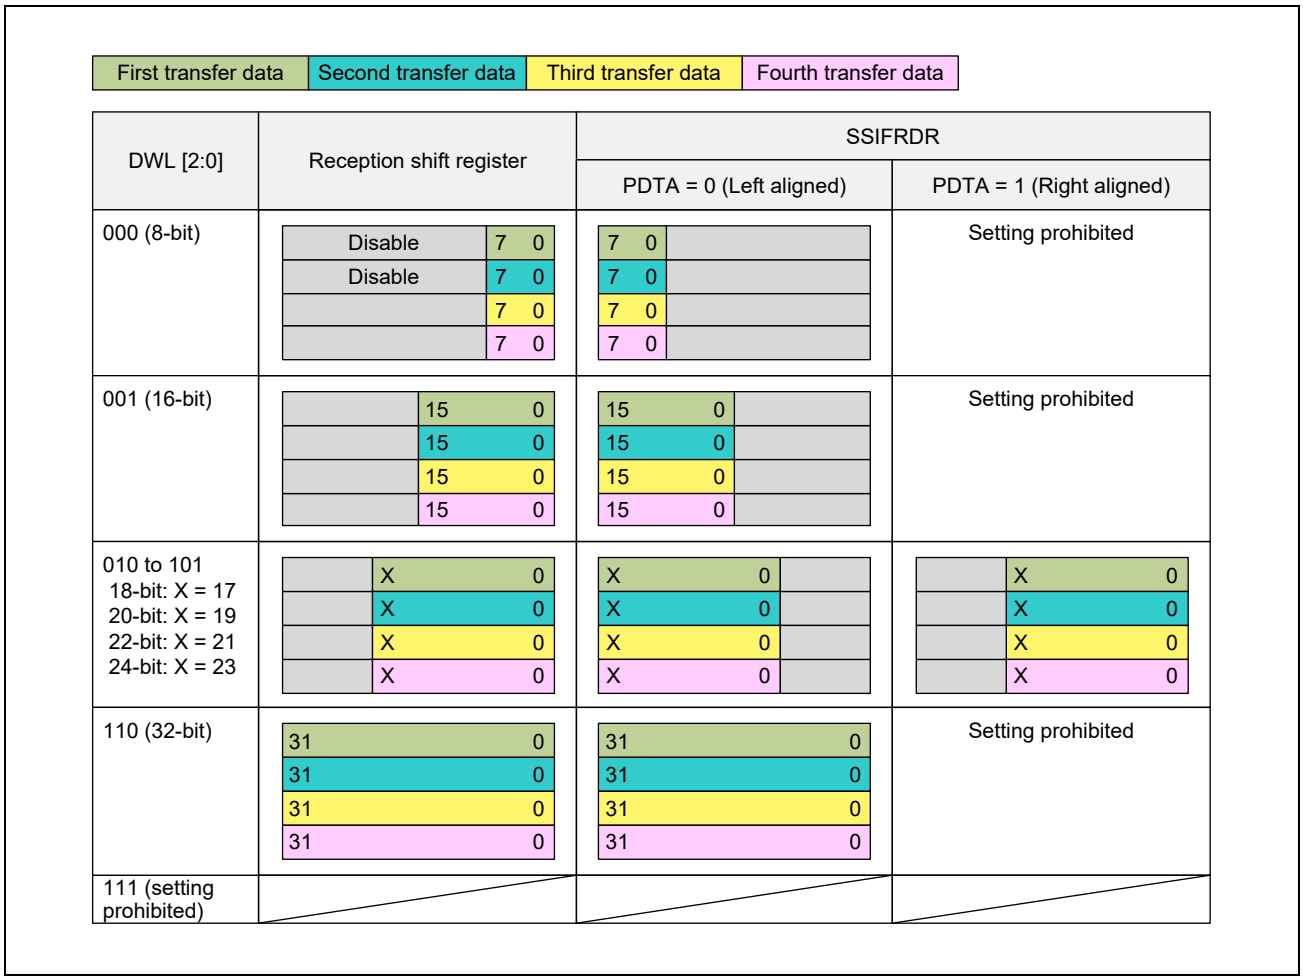

Figure 35.9 Alignment Setting of Placement Data in Reception

DEL Bit

This bit sets whether or not there will be a delay between SSILRCK/SSIFS and SSITxD/SSIRxD.

With the I²S format and TDM format, set 0 to DEL (**Figure 35.10**). With the monaural format, this bit changes the high period width. Refer to **Section 35.4.2.2, Monaural Format** for details. Do the setting that can be communicated at the compatible communication format.

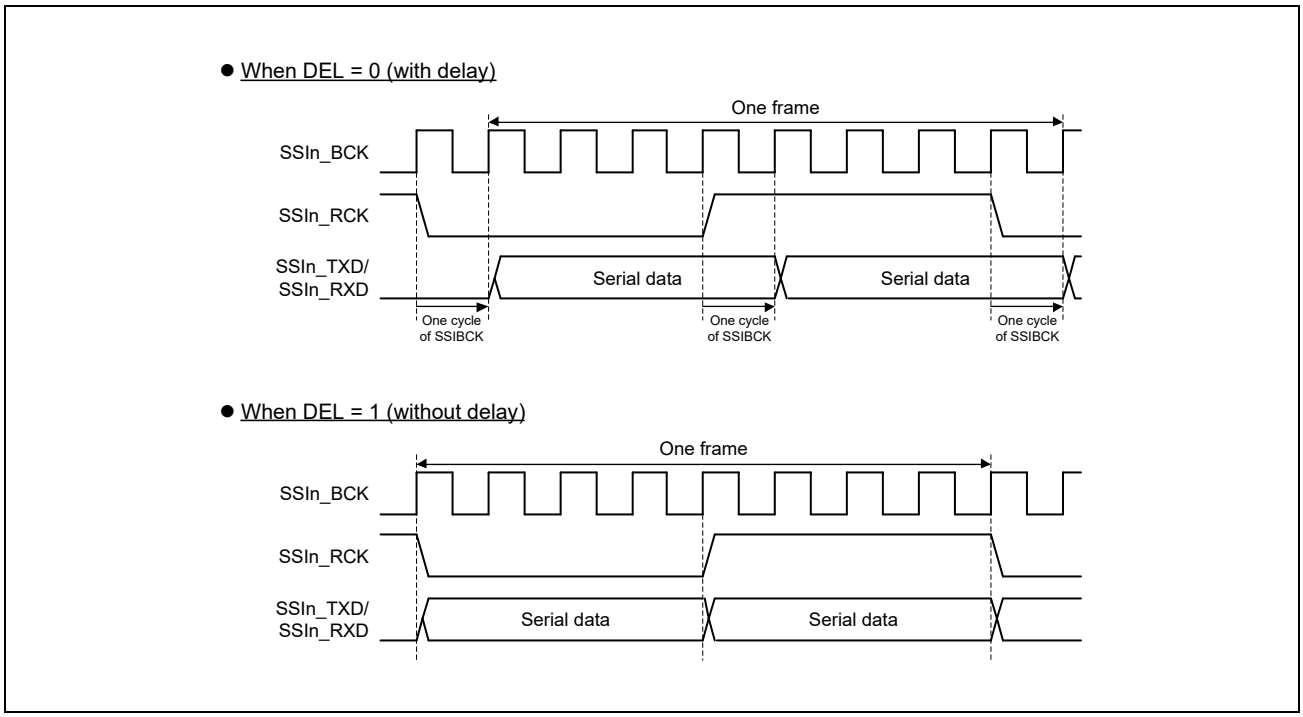

Figure 35.10 Setting of Delay in Serial Data

CKDV[3:0] Bits

These bits set the division ratio of the bit clock based on AUDIO_MCK in master-mode communication (MST = 1) (**Figure 35.11**). In slave-mode communication (MST = 0), setting of these bits are invalid.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 35.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

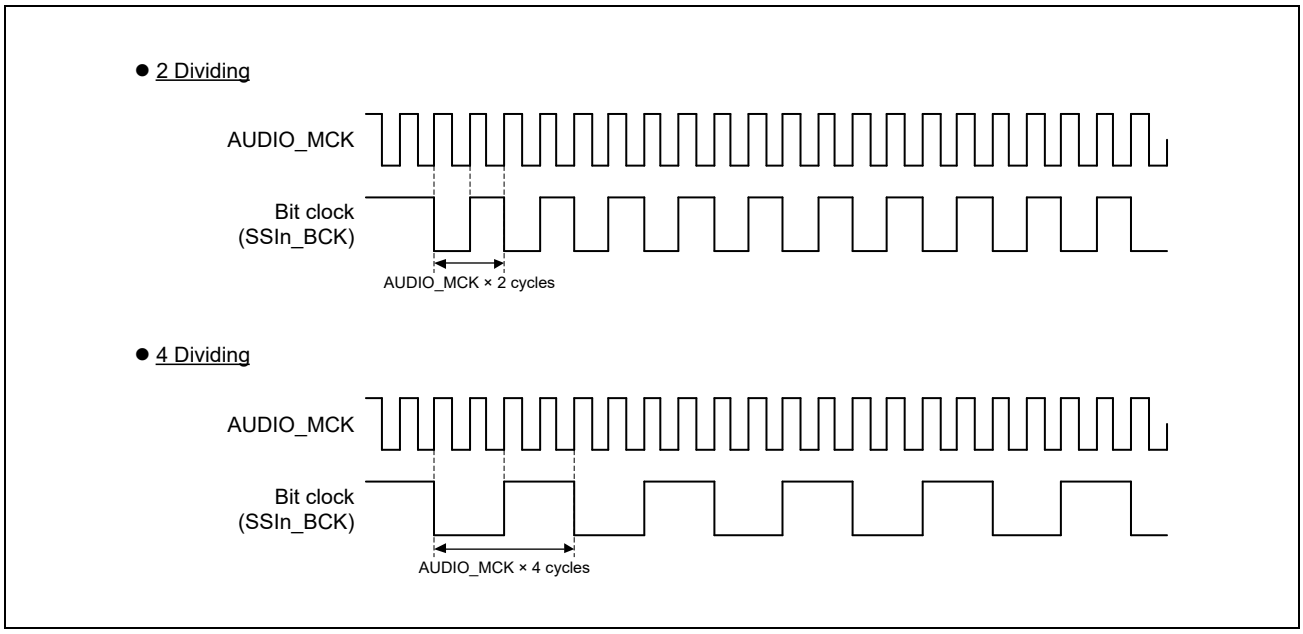

Figure 35.11 Sampling Frequencies in Master-mode Communication

MUEN Bit

This bit sets/clears the mute function for the data output from the terminal SSITxD. When you set this bit to 1, the output value of SSITxD becomes 0 from the next frame boundary. When you set this bit to 0, the output value of SSITxD can be made the data of the FIFO transmission data register from the following frame boundary.

Note that this bit controls data only. Status flags and interrupt signals are normally generated. Set this bit after setting completing the communication format.

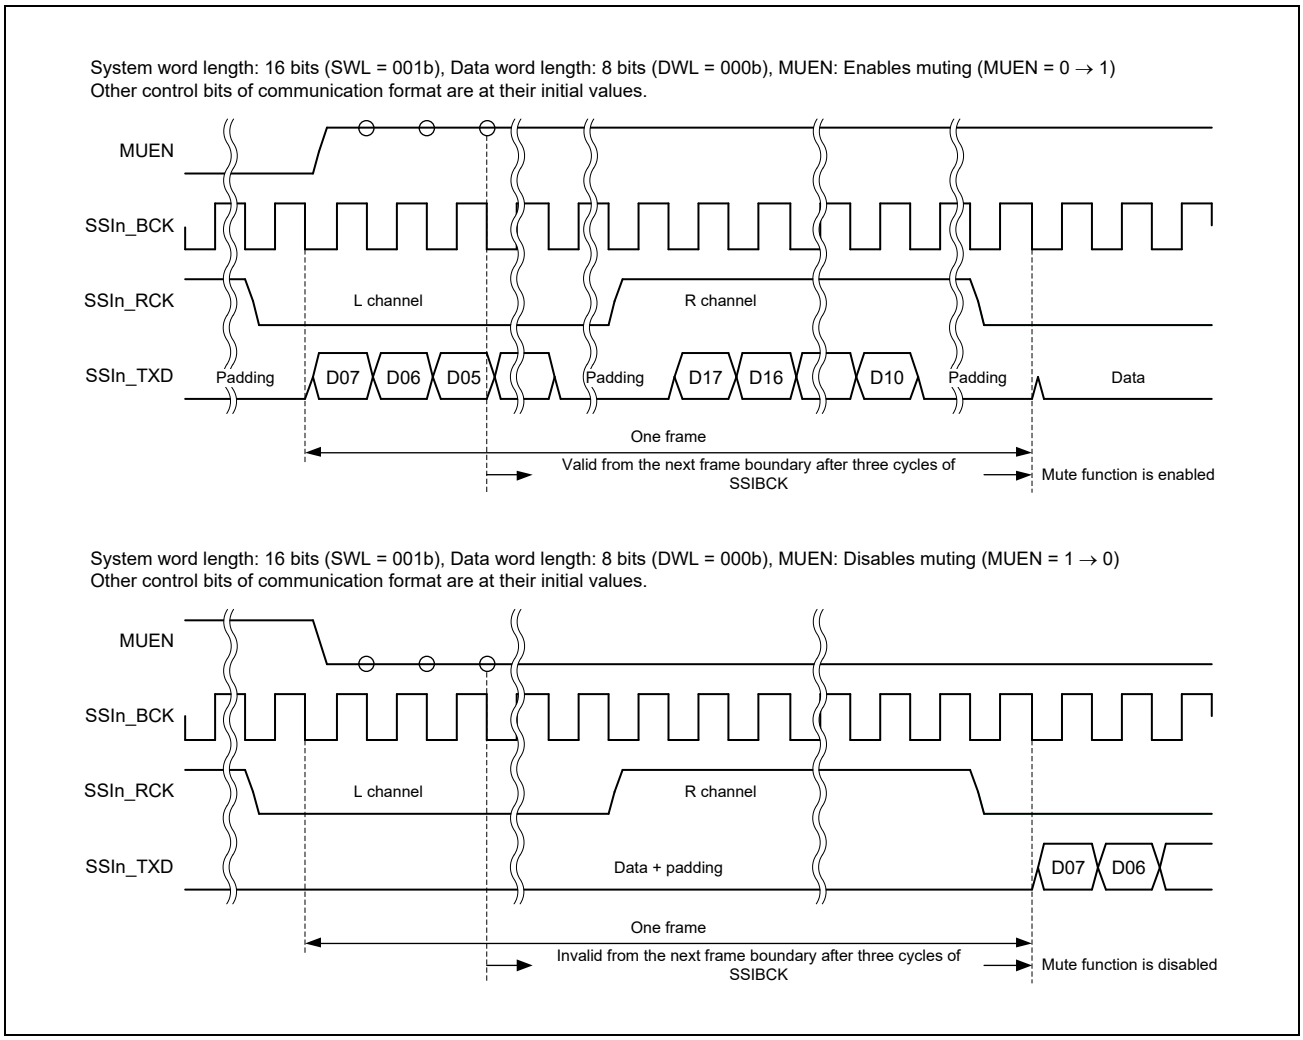

Figure 35.12 Transmit Data with the Mute Function Set

TEN and REN Bits

These bits enable/disable transmission and reception. Writing 1 to these bits, transmission starts in synchronization with start trigger. Refer to **Section 35.5.2.2, Transmission**, **Section 35.5.2.3, Reception**, and **Section 35.5.2.4, Transmission and Reception** for details. Writing 0 to these bits, transmission stops in synchronization with next frame boundary. Set 1 at the same time when you use SSIF-2 as transmission and reception. To stop communication, make sure to stop transmission and reception (TEN = 0 and REN = 0).

To stop communication without waiting for the frame boundary, follow the software reset procedure.

35.4.1.2 Status Register (SSISR)

This is a readable/writable 32-bit register. It is configured with status flags that indicate SSIF-2 operational state.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	TUIRQ	TOIRQ	RUIRQ	ROIRQ	IIRQ	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W0	R/W0	R/W0	R/W0	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved. Write 0. The read value is 0.
29	TUIRQ	0	RW0	Transmit underflow error status flag 0: No transmit underflow error is generated. 1: A transmit underflow error is generated.
28	TOIRQ	0	RW0	Transmit overflow error status flag 0: No transmit overflow error is generated. 1: A transmit overflow error is generated.
27	RUIRQ	0	RW0	Receive underflow error status flag 0: No receive underflow error is generated. 1: A receive underflow error is generated.
26	ROIRQ	0	RW0	Receive overflow error status flag 0: No receive overflow error is generated. 1: A receive overflow error is generated.
25	IIRQ	1	R	Idle mode status flag 0: In the communication state 1: In the idle state
24 to 0	—	H'000_0000	R	Reserved. Write 0. The read value is 0.

TUIRQ Bit

This is a status flag that indicates a transmit underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that writing serial data necessary for one frame to SSIFTDR was slower than one frame of the transmission operation. Even if this flag is cleared after this flag becomes '1', the output value of SSIFTxD is 0. Follow the communication stop procedure (**Figure 35.55**) and the error procedure (**Figure 35.56**) to output the data written in transmission FIFO data register (SSIFTDR) to the terminal SSIFTxD. See **Section 35.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by transmission FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.TEN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (**Figure 35.13**).

(2) Write 1 in SSICR.TEN, complete, and after one cycle of P0ϕ (**Figure 35.13**).

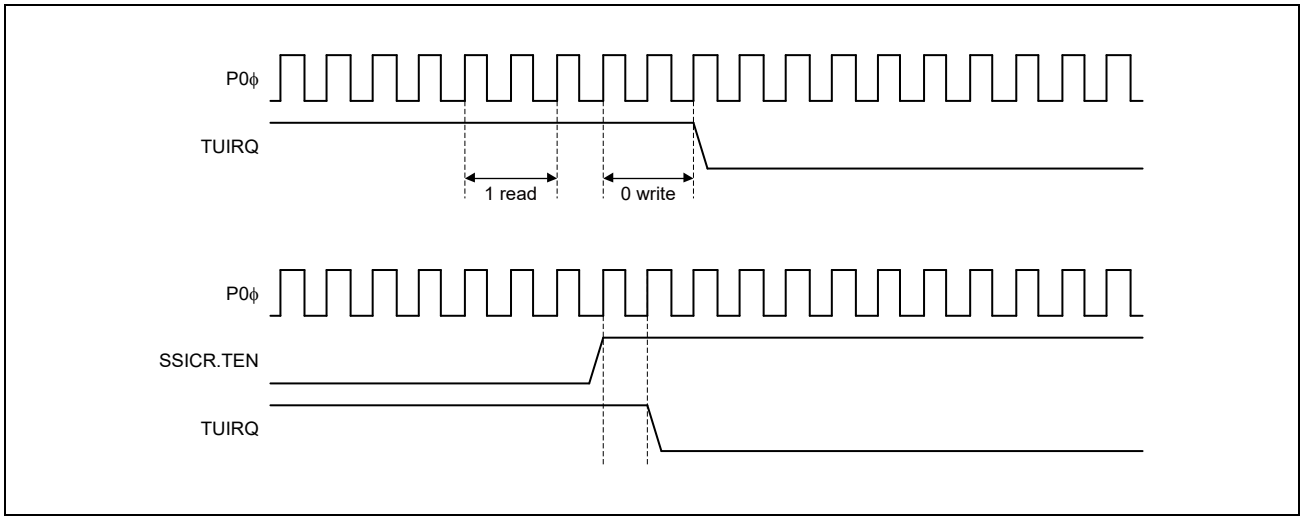

Figure 35.13 TUIRQ Clearing Timing

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

Remark After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

[Setting condition]

When data to be transmitted in the next frame is not fully written to SSIFTDR at the frame boundary of continuance communication.

[Setting timing]

After three cycles of P0ϕ from frame boundary (**Figure 35.14**).

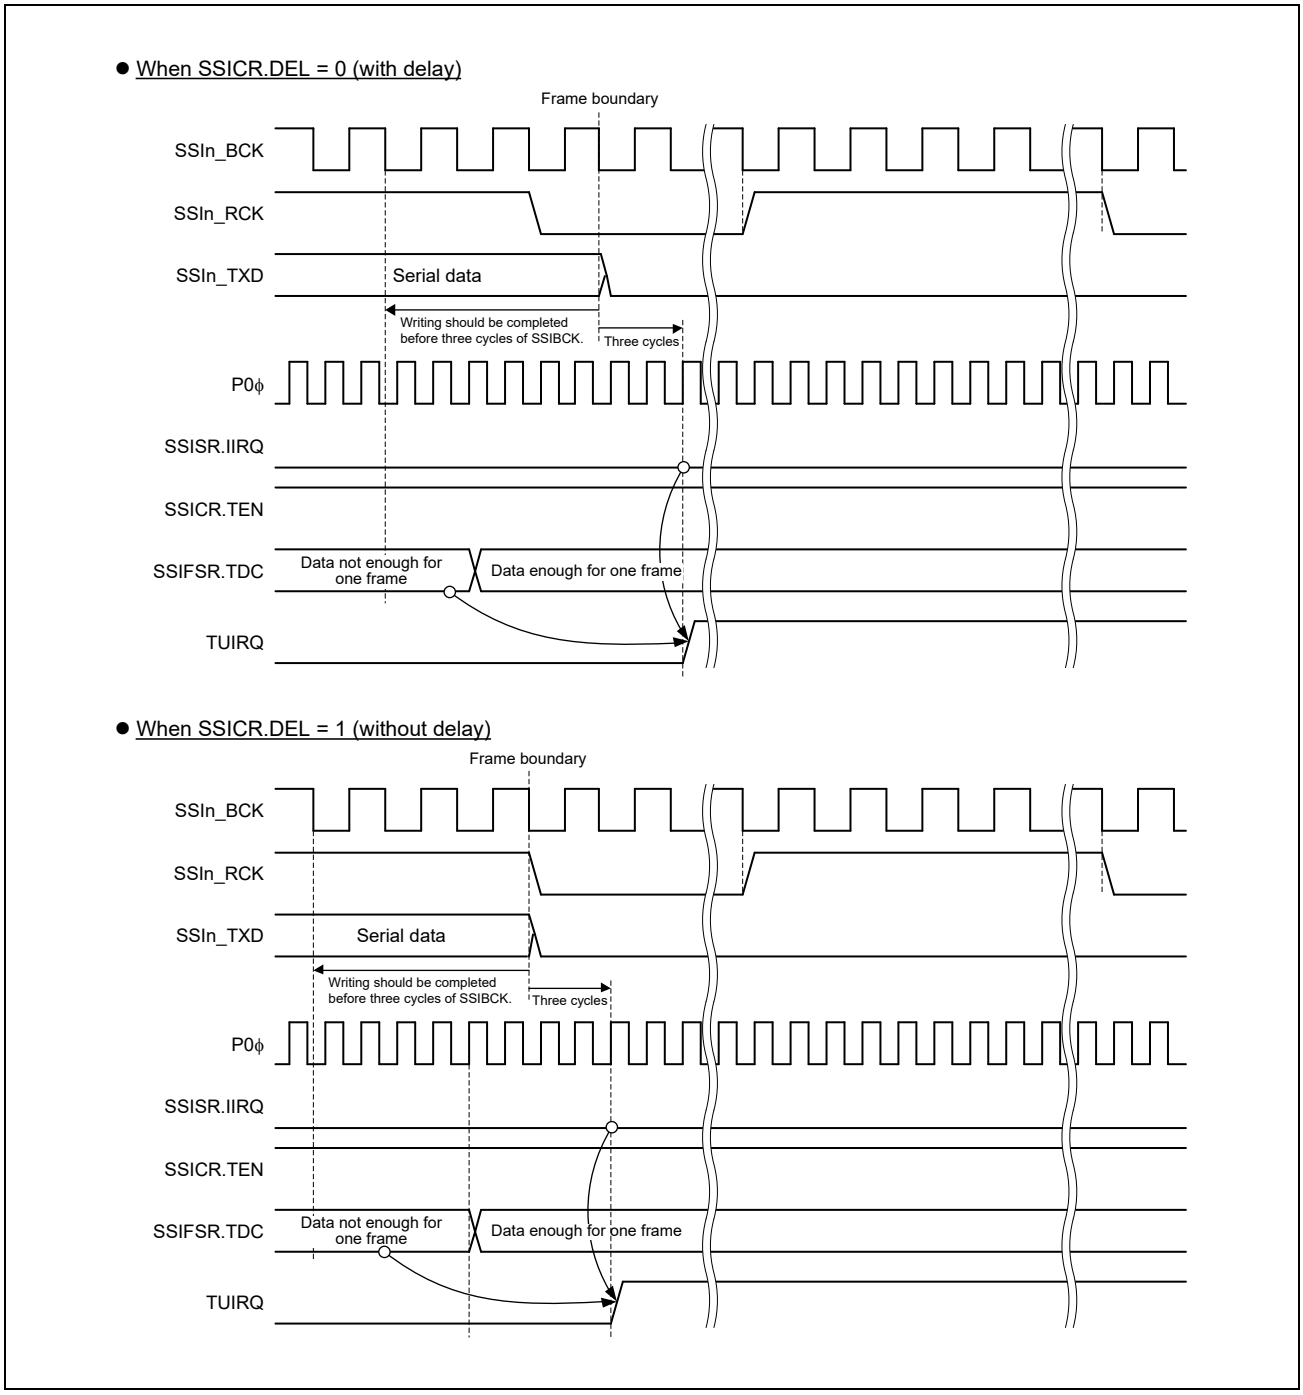

Figure 35.14 TUIRQ Setting Timing (when you continue communicating)

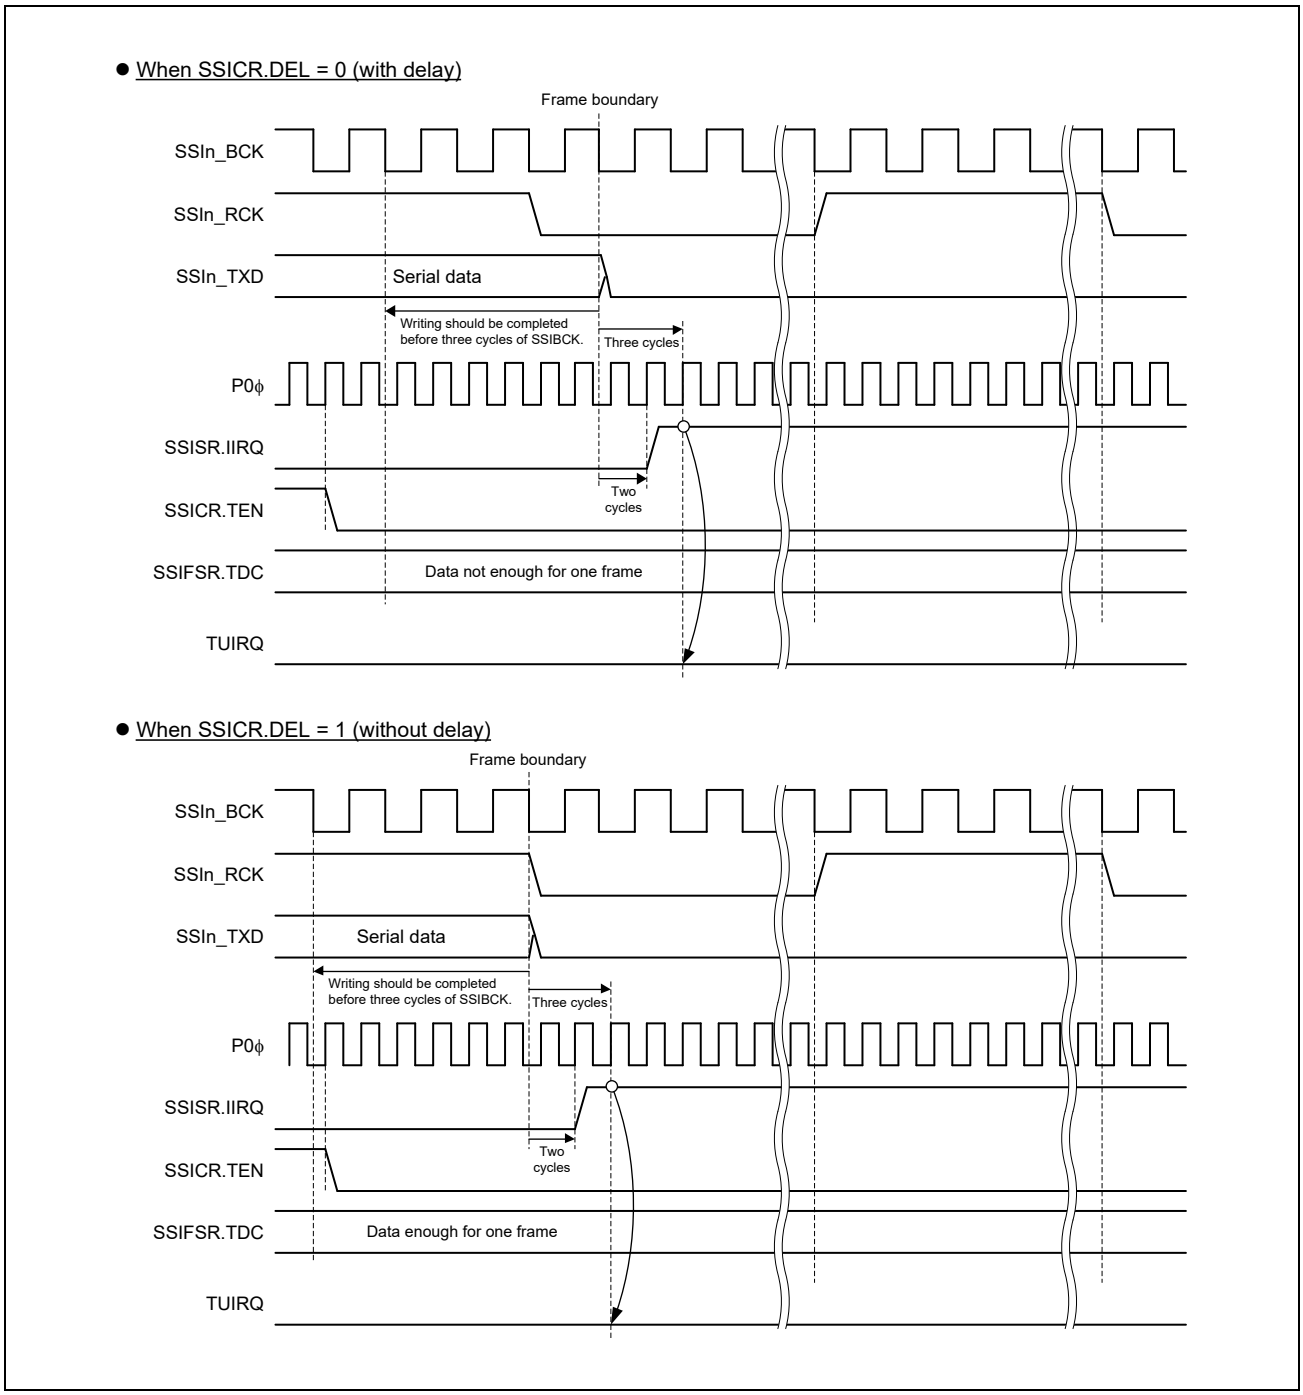

Figure 35.15 TUIRQ Setting Timing (when you stop communicating)

TOIRQ Bit

This is a status flag that indicates a transmit overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that serial data is written to SSIFTDR when it is full during transmission (SSICR.TEN=1). Data is not written to SSIFTDR where a transmit overflow error is generated. See **Section 35.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by transmission FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.TEN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as **Figure 35.13**).

(2) Write 1 in SSICR.TEN, complete, and after one cycle of P0ϕ (same as **Figure 35.13**).

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

Remark After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

[Setting condition]

During transmission operation (SSICR.TEN = 1), data is written to SSIFTDR while it is full.

[Setting timing]

At completion of writing to SSIFTDR (**Figure 35.16**)

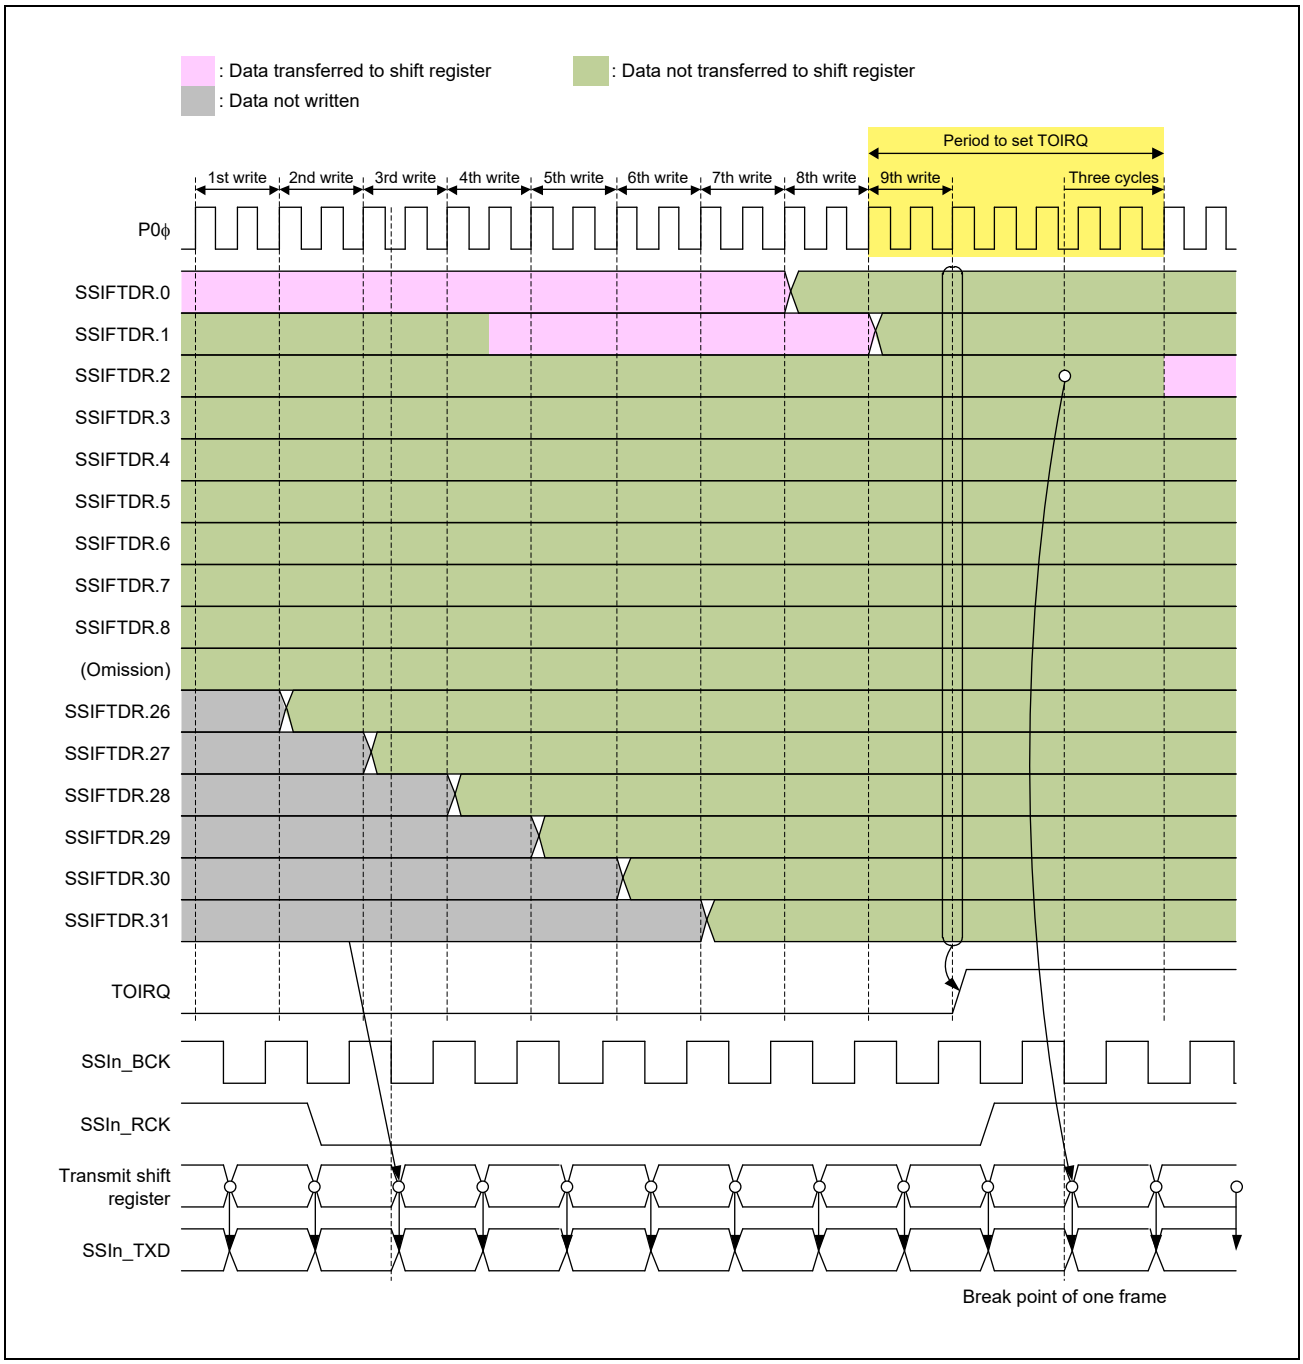

Figure 35.16 TOIRQ Setting Timing

RUIRQ Bit

This is a status flag that indicates a receive underflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. See **Section 35.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by reception FIFO data register reset (SSIFCR.RFRST). Even if SSIFRDR is read to (SSIFCR.RFRST=1) while resetting reception FIFO data register, it doesn't set 1.

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.REN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as **Figure 35.13**).

(2) Write 1 in SSICR.REN, complete, and after one cycle of P0ϕ (same as **Figure 35.13**).

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

Remark After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

[Setting condition]

Reading from SSIFRDR while it is empty.

[Setting timing]

At completion of reading from SSIFRDR (**Figure 35.17**).

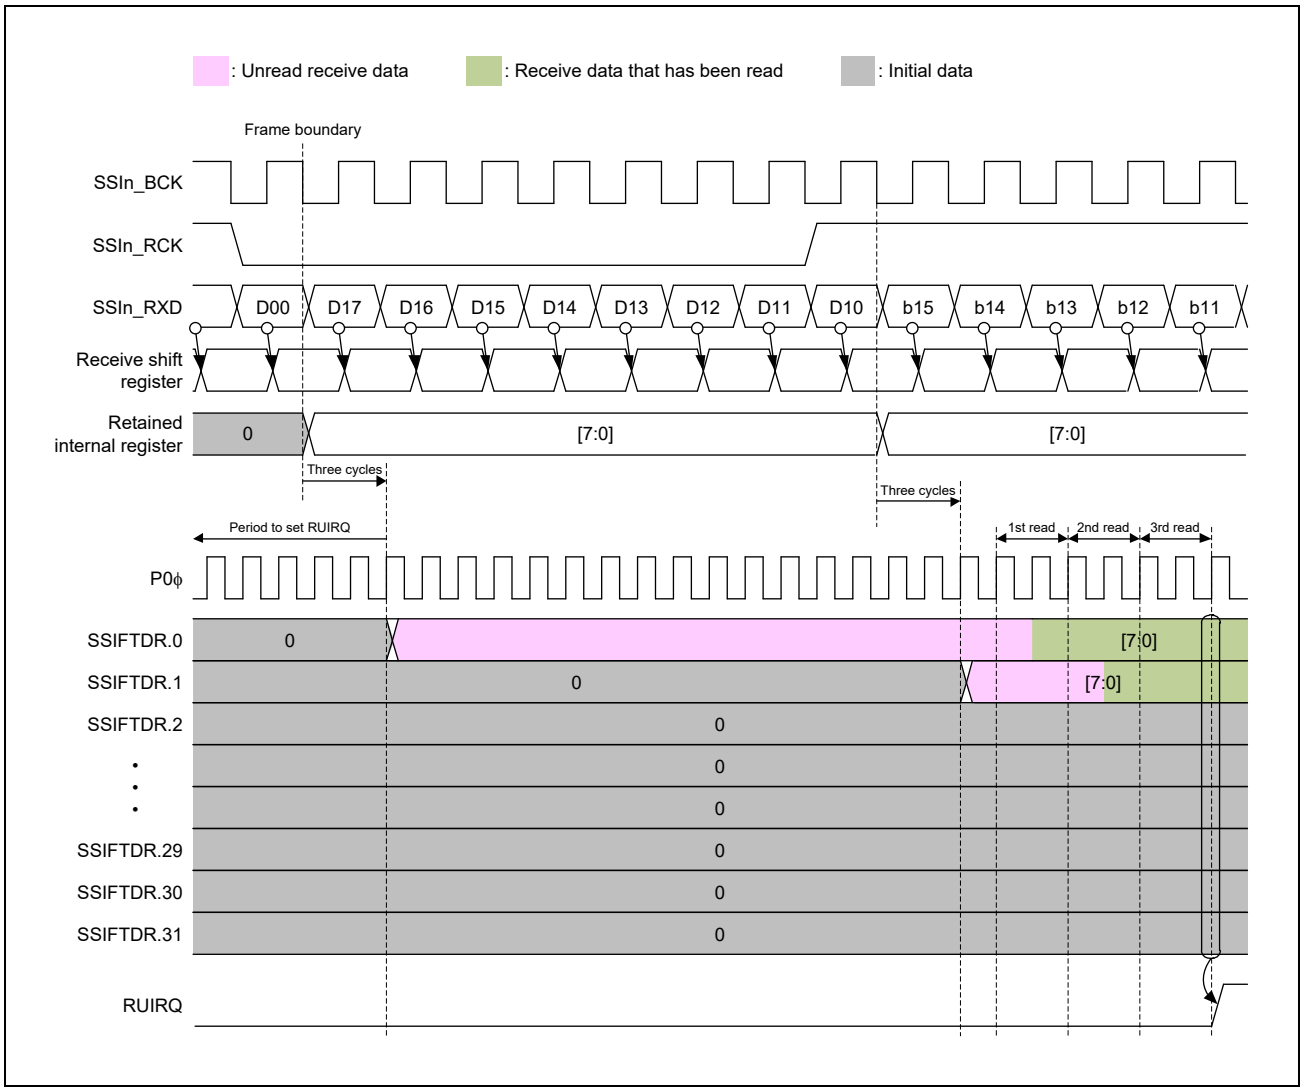

Figure 35.17 RUIRQ Setting Timing

ROIRQ Bit

This is a status flag that indicates a receive overflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the receive shift register to SSIFRDR where a receive overflow error is generated. See **Section 35.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by reception FIFO data register reset (SSIFCR.RFRST).

[Priority order for setting and clearing]

Setting is prioritized.

[Clearing condition]

Writing 0 to this flag after reading this flag as 1.

[Clearing timing]

At completion of writing 0 after reading 1 from an SFR (same as **Figure 35.13**).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.REN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as **Figure 35.13**).

(2) Write 1 in SSICR.REN, complete, and after one cycle of P0ϕ (same as **Figure 35.13**).

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

Remark After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

[Setting condition]

At completion of receiving new data while SSIFRDR is full.

[Setting timing]

Three cycles of P0ϕ after reception is completed (**Figure 35.18**).

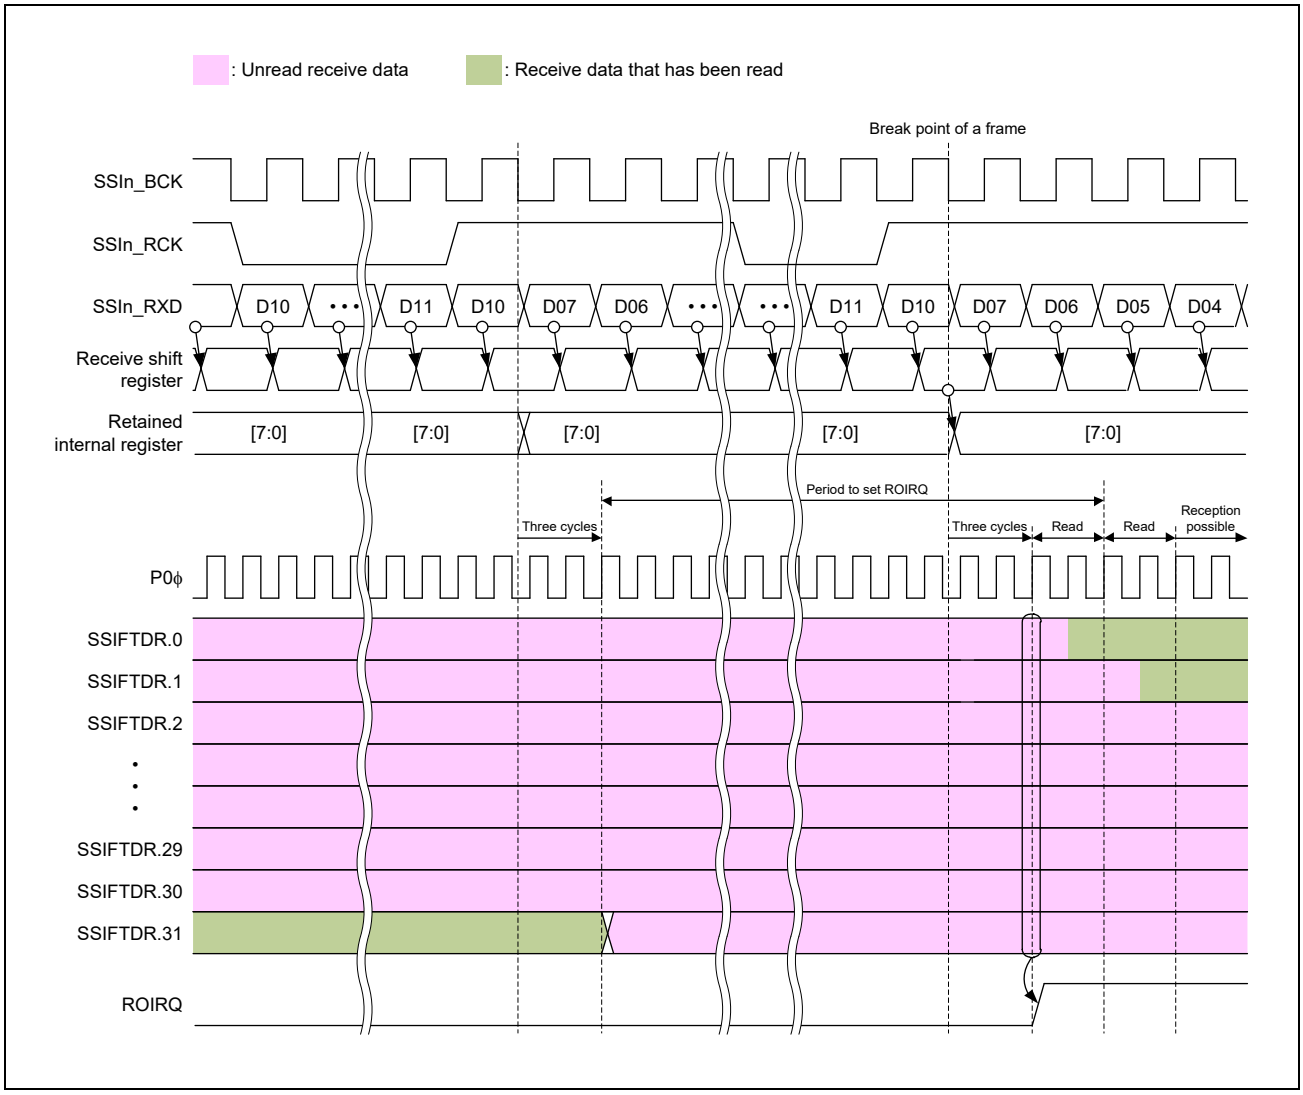

Figure 35.18 ROIRQ Setting Timing

IIRQ Bit

This is a status flag that indicates the idle state. It indicates whether SSIF-2 is in the idle state or communication state (**Figure 35.19** and **Figure 35.20**).

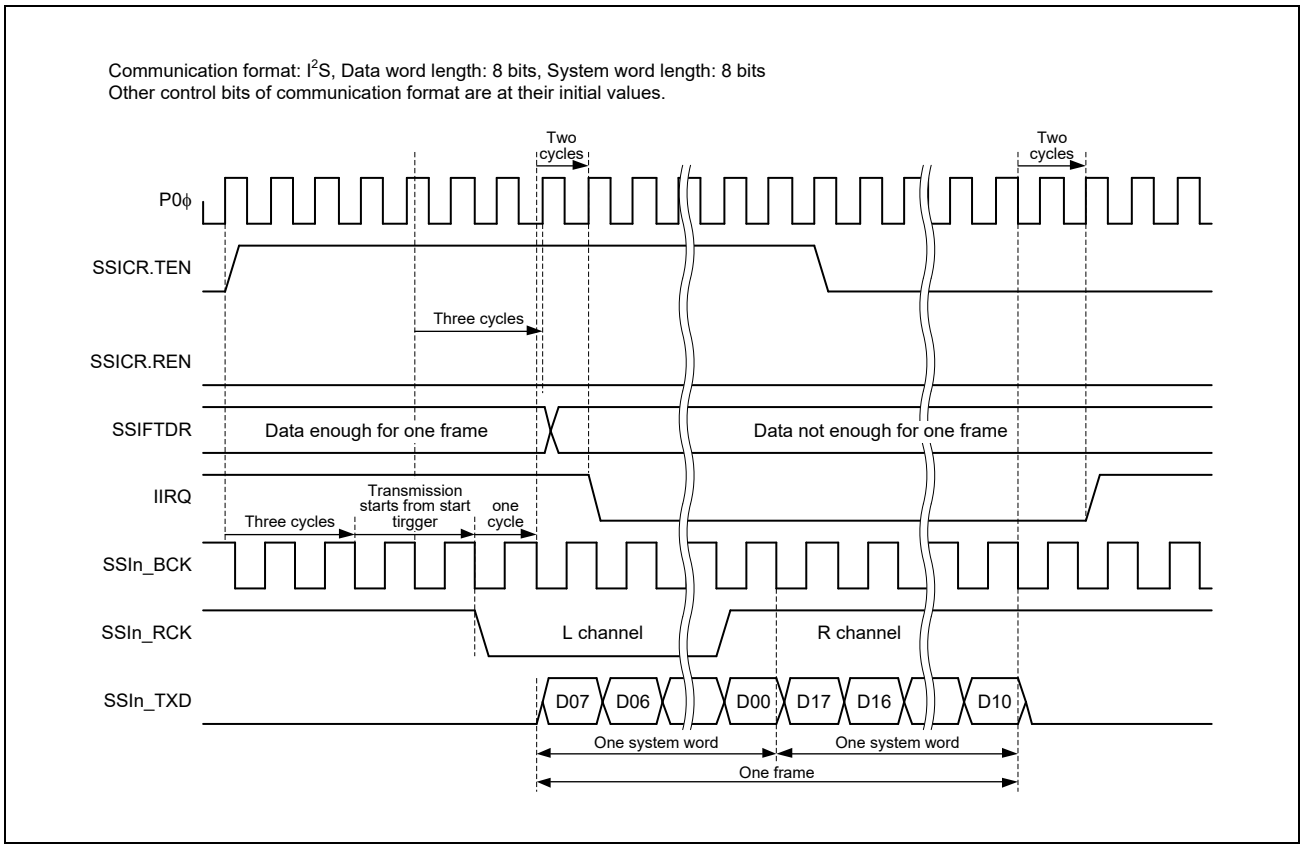

Figure 35.19 IIRQ Setting Timing (Transmission)

Transmitter (dedicated to transmission)

[Clearing condition]

While transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), one frame of data to be transmitted has been written to SSIFTDR, and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P0ϕ after one cycle of SSIBCK where a start trigger is generated.

[Setting condition]

One frame of data has been transmitted while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P0ϕ after transmission is complete according to the setting condition (frame boundary).

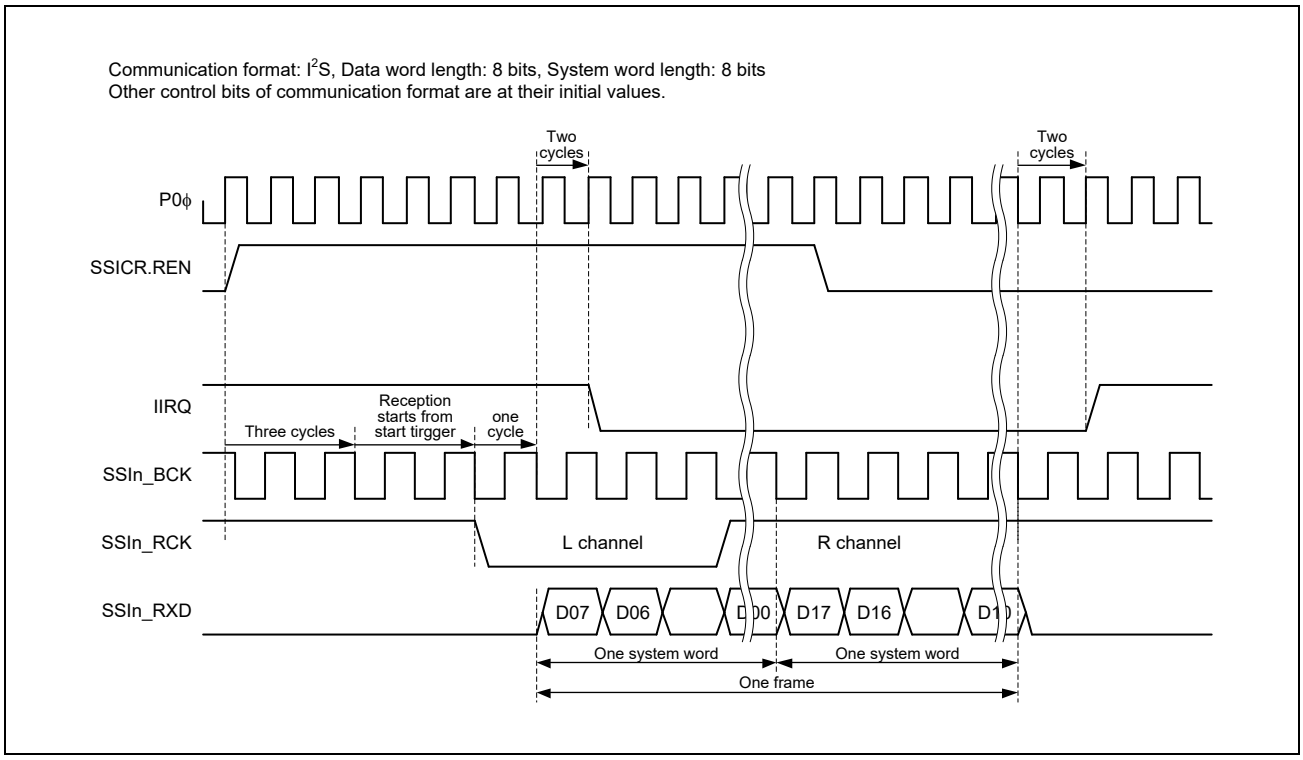

Figure 35.20 IIRQ Setting Timing (Reception)

Receiver (dedicated to reception)

[Clearing condition]

While reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P0ϕ after one cycle of SSIBCK when a start trigger of the clearing condition is generated.

[Setting condition]

One frame of data has been received while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P0ϕ after reception of the setting condition is completed (frame boundary).

Transceiver (transmission and reception)

[Clearing condition]

While transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), one frame of data to be transmitted has been written to SSIFTDR, and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P0ϕ after one cycle of SSIBCK when a start trigger of the clearing condition is generated.

[Setting condition]

One frame of data has been transmitted while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P0ϕ after transmission is completed according to the setting condition (frame boundary).

35.4.1.3 FIFO Control Register (SSIFCR)

This is a readable/writable 32-bit register. It sets a software reset, byte swap, noise canceller, and enable/disable of interrupt requests.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AUCKE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSIRST

2	RIE	0	RW	Receive Data Full Interrupt Output Enable 0: Disables receive data full interrupts 1: Enables receive data full interrupts
1	TFRST	0	RW	Transmit FIFO data register reset*1 0: Clears a transmit data FIFO reset condition 1: Sets a transmit data FIFO reset condition
0	RFRST	0	RW	Receive FIFO data register reset*1 0: Clears a receive data FIFO reset condition 1: Sets a receive data FIFO reset condition

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Note 2. This bit can only be set to 1 in slave-mode communication (SSICR.MST = '0') except in the case of transmission (SSICR.TEN = '1') while SSICR.DEL = '1'. Be sure to clear this bit to 0 in master-mode communication (SSICR.MST = '1') or during transmission in slave mode (SSICR.MST = '0', SSICR.TEN = '1') while SSICR.DEL = '1'. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

AUCKE Bit

This bit enables/disables supply to AUDIO_MCK while in master-mode communication (MST = 1). Select AUDIO_MCK (SSICR.CKS bit) before writing 1 to this bit.

Rewrite this bit after completing the setting (CKS, MST, BCKP, and CKDV of the SSICR register) that relates to AUDIO_MCK.

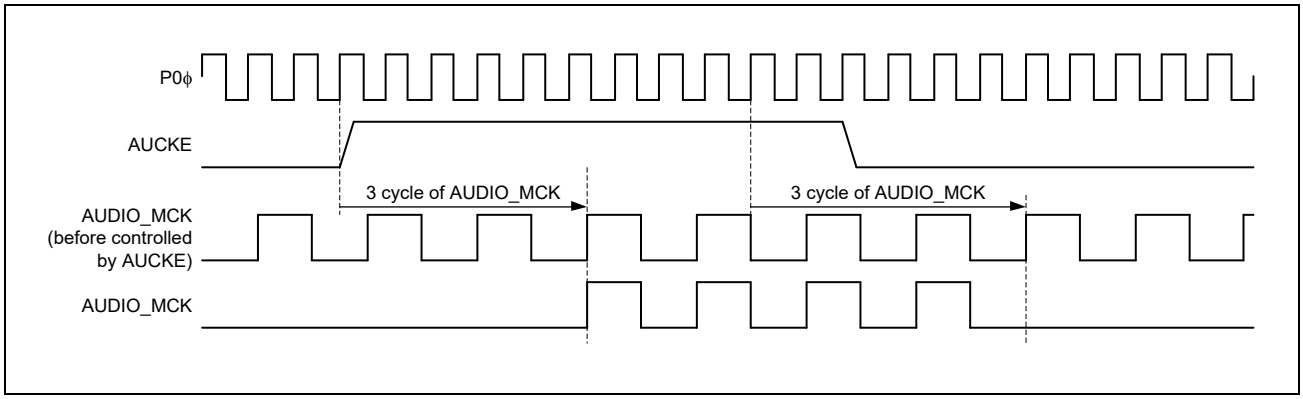

Figure 35.21 Stop/Resume of AUDIO_MCK

CAUTION

- In slave-mode communication (SSICR.MST = 0), SSIF-2 needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIF-2 becomes idle, take the procedure to start communication (**Figure 35.52**) or wait for an idle state by taking the procedure to resume communication (**Figure 35.57**).
- In master-mode communication (SSICR.MST = 1), SSIF-2 operates with the audio clock (AUDIO_MCK). To stop SSIF-2 completely, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIF-2 becomes idle, take the procedure to start communication (**Figure 35.52**) or wait for the idle state by taking the procedure to resume communication (**Figure 35.57**).

Figure 35.22 and **Figure 35.23** show timing until outputting it to the terminal SSIBCK after this bit is set to ‘1’.

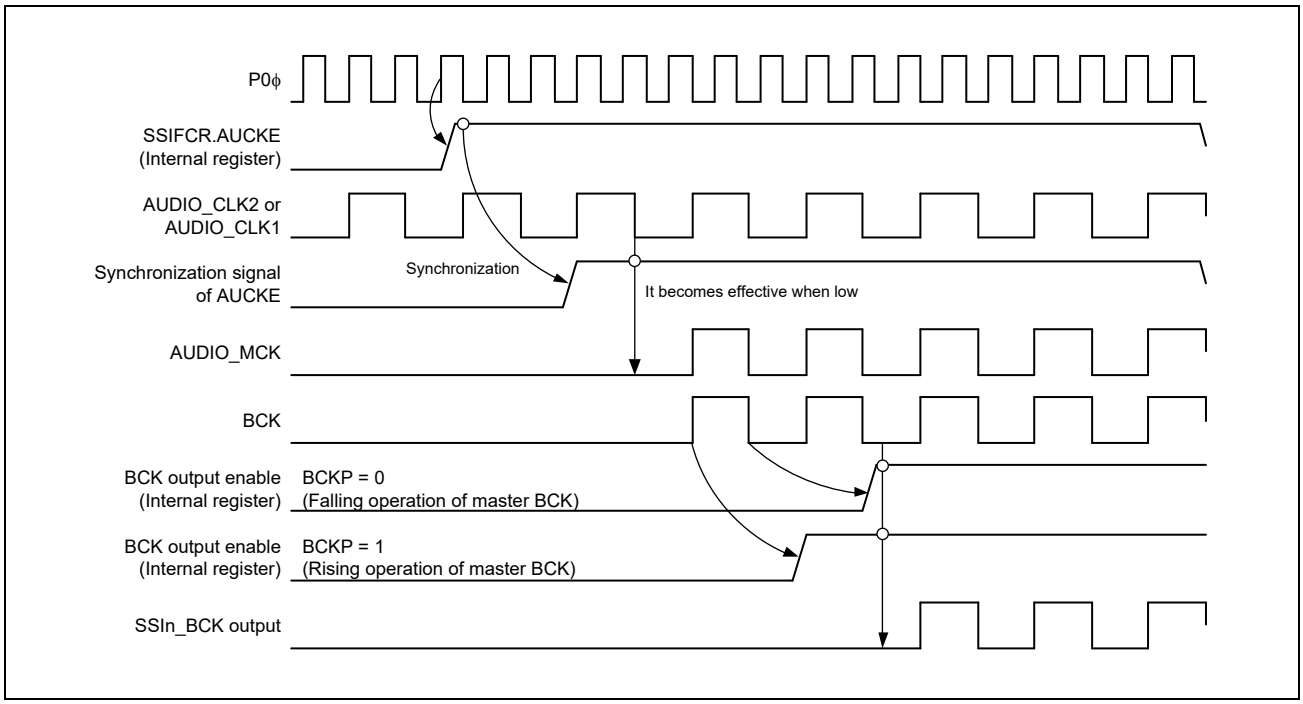

Figure 35.22 Timing Chart when It begins to Communicate Master from System Reset

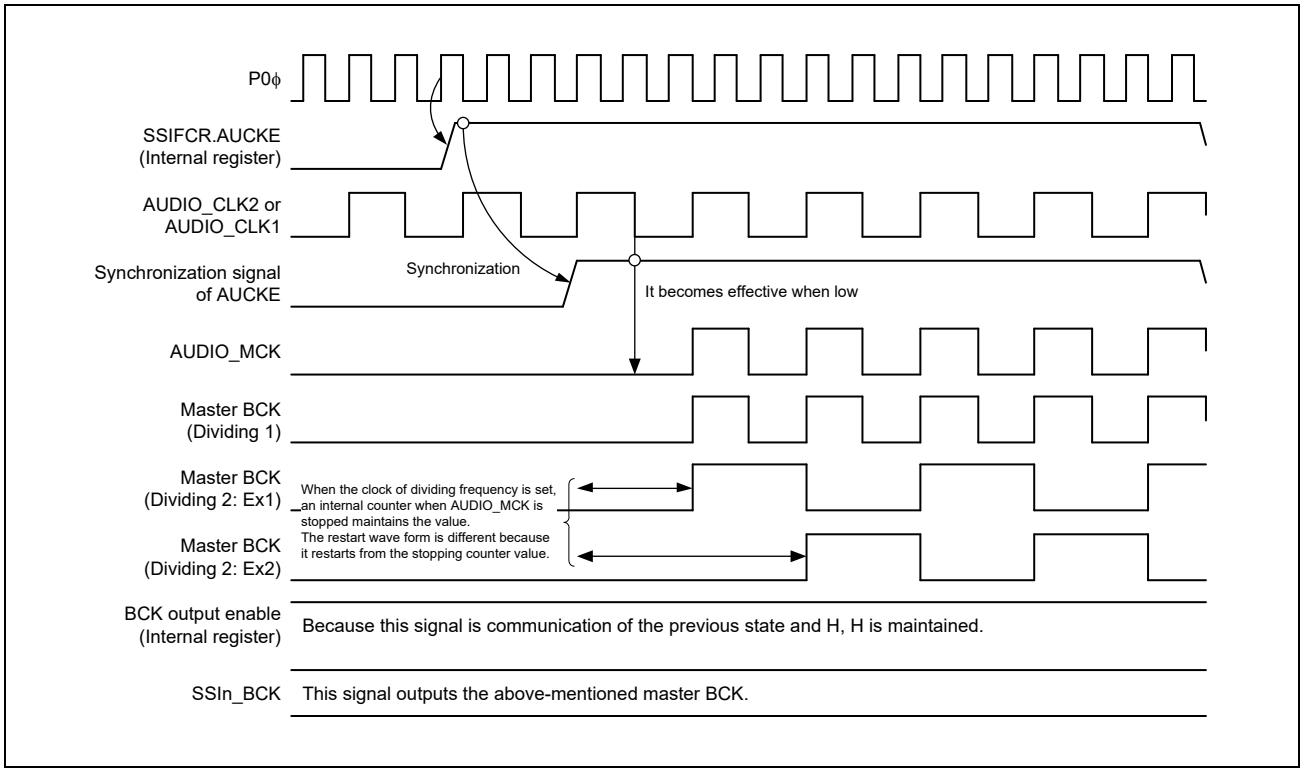

Figure 35.23 Timing Chart when It begins to Communicate Master from Communication Stop

Remark When the supply of AUDIO_MCK is stopped, the terminal SSIBCK maintains the value. The terminal SSIBCK might stop in the state of “H”.

SSIRST Bit

This bit sets a software reset of SSIF-2. Writing 1 to this bit initializes the internal state of SSIF-2. After a reset by writing 1, write 0 to release the reset because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.

To stop communication of SSIF-2 immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation with the bit clock.

Table 35.7 Bits Initialized by Software Reset of the SSIFCR.SSIRST Bit

Symbol	Address (Base+)		+0								+1

		+2	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				

BSW Bit

This bit enables/disables byte swap of register access for the transmit FIFO data register (SSIFTDR) and the receive FIFO data register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR (**Figure 35.24**).

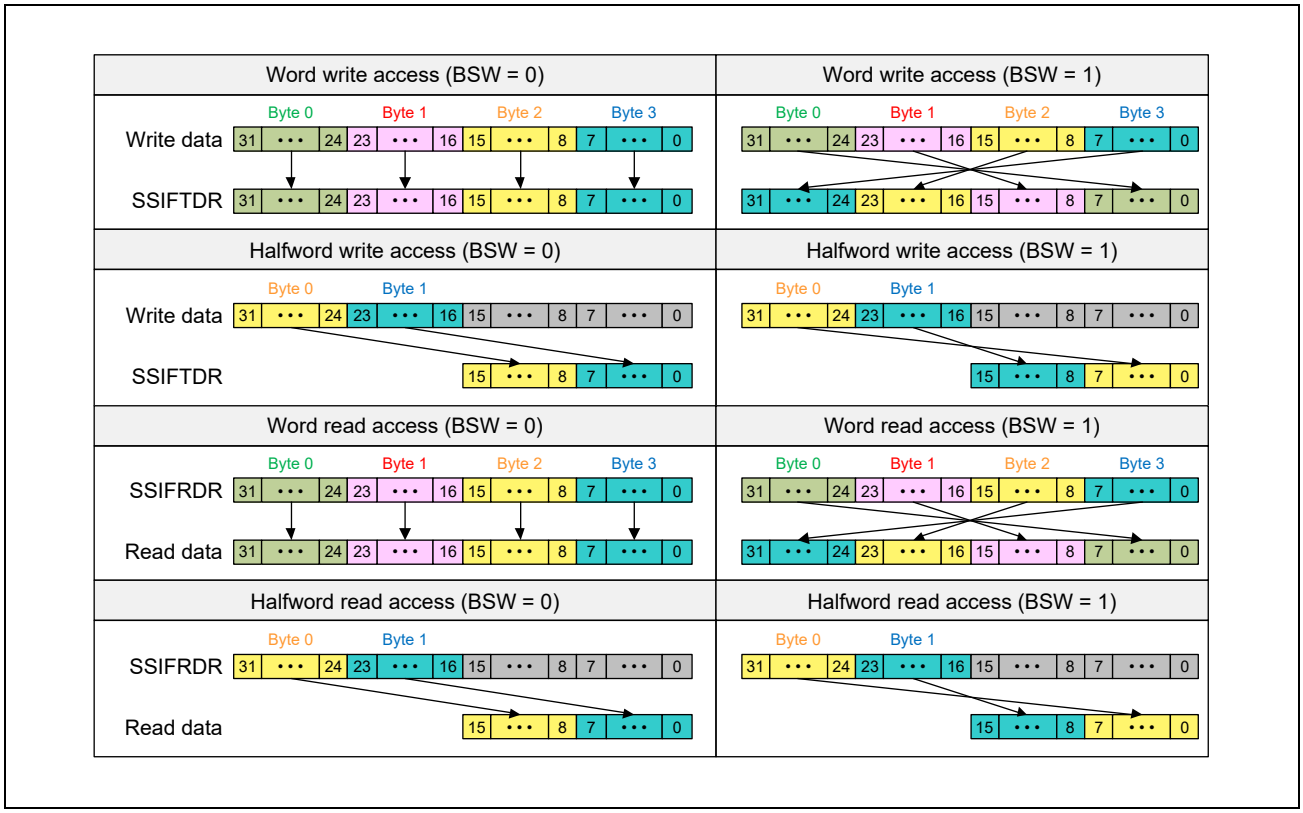

Figure 35.24 Operation Example of Byte Swap

BCKNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSIBCK pin in slave-mode communication (SSICR.MST = ‘0’) except in the case of transmission (SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. The setting of this bit in master-mode communication (SSICR.MST = ‘1’) is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = ‘0’, SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

LRCKNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSILRCK and SSIFS pins in slave-mode communication (SSICR.MST = ‘0’) except in the case of transmission (SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. The setting of this bit in master-mode communication (SSICR.MST = ‘1’) is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = ‘0’, SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

RXDNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSIRxD pin in slave-mode communication (SSICR.MST = ‘0’) except in the case of transmission (SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’ and while reception is enabled (SSICR.REN = ‘1’).

The setting of this bit in master-mode communication (SSICR.MST = ‘1’) or while reception is disabled (SSICR.REN = ‘0’) is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = ‘0’, SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

TIE Bit

This bit enables/disables output of transmit data empty interrupts. Transmission data empty interrupt is used as an interrupt factor written in the FIFO transmission data register. Set this bit to 1 after setting set condition (SSISCR.TDES) of transmission data empty interrupt. See **Figure 35.25** for the generation timing of a transmit data empty interrupt.

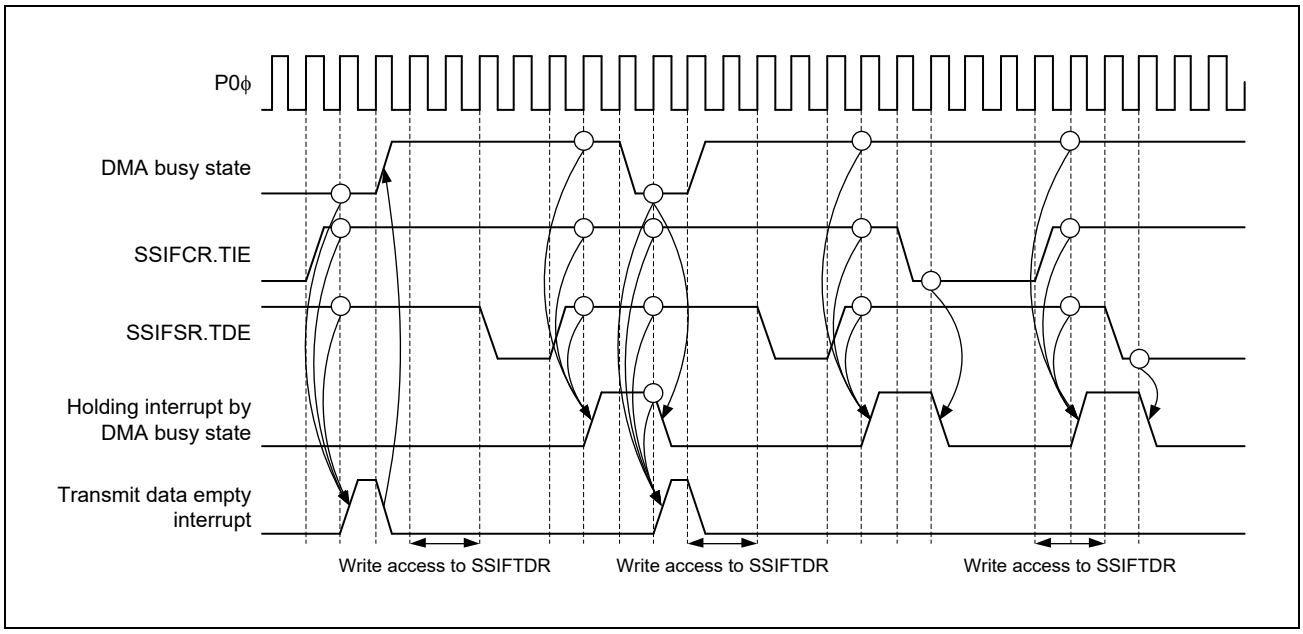

Figure 35.25 Generation Timing of Transmit Data Empty Interrupt

RIE Bit

This bit enables/disables output of receive data full interrupts. Receive data empty interrupt is used as an interrupt factor to read the FIFO receive data register. Set this bit to 1 after setting set condition (SSISCR.RDFS) of Receive data empty interrupt. See **Figure 35.26** for the generation timing of a receive data full interrupt.

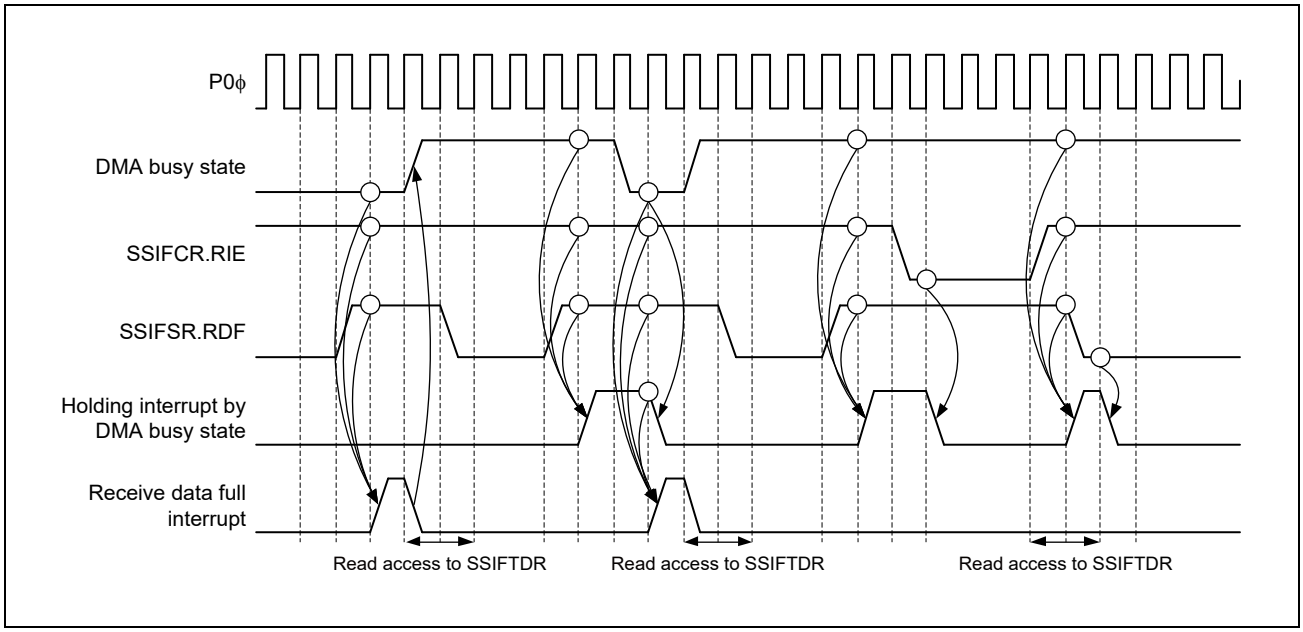

Figure 35.26 Generation Timing of Receive Data Empty Interrupt

TFRST Bit

This bit sets a software reset of the transmit FIFO data register (SSIFTDR). Writing 1 to this bit initializes the internal state related to SSIFTDR. See **Table 35.8** for the registers to which this software reset is applied. After a reset by writing 1, write 0 to clear the reset condition because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.

This bit is a bit of SSIRST for reset. Software reset by SSIRST becomes and writing this bit becomes invalid because of priority.

Table 35.8 Bits Initialized by Software Reset of the SSIFCR.TFRST Bit

RFRST Bit

This bit sets a software reset of the receive FIFO data register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. After a reset by writing 1, write 0 to clear the reset condition because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.

This bit is a bit of SSIRST for reset. Software reset by SSIRST becomes and writing this bit becomes invalid because of priority.

Table 35.9 Bits Initialized by Software Reset of the SSIFCR.TFRST Bit

Symbol	Address (Base+)		+0								+1

35.4.1.4 IFO Status Register (SSIFSR)

This register is configured with status flags that indicate the status of the transmit FIFO data register and the receive FIFO data register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	TDC[5:0]						—	—	—	—	—	—	—	TDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	RDC[5:0]						—	—	—	—	—	—	—	RDF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W0

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	H'0	R	Reserved. Write 0. The read value is 0.
29 to 24	TDC[5:0]	H'00	R	Number of Transmit FIFO Data Indication Flag
23 to 17	—	H'00	R	Reserved. Write 0. The read value is 0.
16	TDE	1	RW0	Transmit Data Empty Flag 0: The free space of SSIFTDR is not more than the value of SSISCR.TDES 1: The free space of SSIFTDR is not less than the value of SSISCR.TDES plus one.
15, 14	—	H'0	R	Reserved. Write 0. The read value is 0.
13 to 8	RDC[4:0]	H'00	R	Number of Receive FIFO Data Indication Flag
7 to 1	—	H'00	R	Reserved. Write 0. The read value is 0.
0	RDF	0	RW0	Receive Data Full Flag 0: The size of received data in SSIFRDR is not more than the value of SSISCR.RDFS 1: The size of received data in SSIFRDR is not less than the value of SSISCR.RDFS plus one.

TDC[5:0] Bits

These bits indicate the number of valid data that are stored in the transmit FIFO data register (SSIFTDR). With this flag as H'0, there is no data to be transmitted. With H'10, there is no space to write data.

TDE Bit

This bit indicates that the transmit FIFO data register (SSIFTDR) has free space not less than the amount set with the SSIFCR.TTRG bit plus one. This flag is set by automatic determination but it must be cleared by register access.
[Priority order for setting and clearing]

Clearing is prioritized.*1

[Clearing condition]

Either of the following two:

(1) Writing 0 to this bit after reading this bit as 1.*2

(2) When writing data to SSIFTDR.

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this bit after reading this bit as 1 (**Figure 35.13**).

(2) When writing data to SSIFTDR.

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1) and transmit FIFO data register reset (SSIFCR.TFRST = 1). The software reset and transmit FIFO data register reset have priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following four conditions being met:
- Software reset (SSIFCR.SSIRST = 1)
- Resetting of the transmit FIFO data register (SSIFCR.TFRST = 1)
- Completion of writing 0 to this flag after having read it as 1.
- When writing data to SSIFTDR.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

While operating on P0ϕ, SSIFTDR is found to have free space not less than “size set in the SSISCR.TDES bits + 1.”

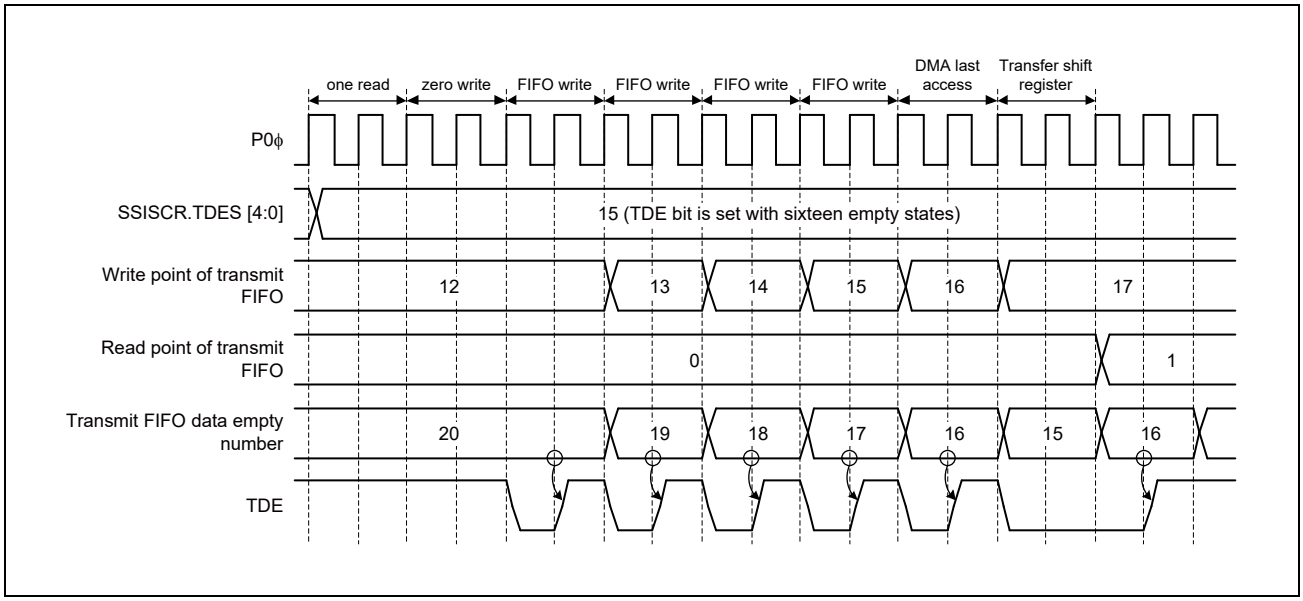

Figure 35.27 Set Timing and Clear Timing of TDE

RDC[5:0] Bits

These bits indicate the number of valid data that are stored in the receive FIFO data register (SSIFRDR). With this flag as H’0, there is no received data. With H’20, the register is filled with received data and there is no free space.

RDF Bit

This bit indicates that the receive FIFO data register (SSIFRDR) has unread received data not less than the amount set with the SSISCR.RDFS bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.*1

[Clearing condition]

Either of the following two:

(1) Writing 0 to this bit after reading this bit as 1.*2

(2) When reading data from SSIFRDR.

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this bit after reading this bit as 1 (**Figure 35.13**).

(2) After reading data from SSIFRDR.

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1) and receive FIFO data register reset (SSIFCR.RFRST = 1). Clearing conditions available for these bits are the software reset and receive FIFO data register reset as well as the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following four conditions being met:
- Software reset (SSIFCR.SSIRST = 1)
- Receive FIFO data register reset (SSIFCR.RFRST = 1)
- Completion of writing 0 to this flag after having read it as 1.
- When reading data from SSIFRDR.

[Setting condition]

SSIFRDR has data not less than the amount set with the SSISCR.RDFS bit plus one.

[Setting timing]

At completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set with the SSISCR.RDFS bit plus one.

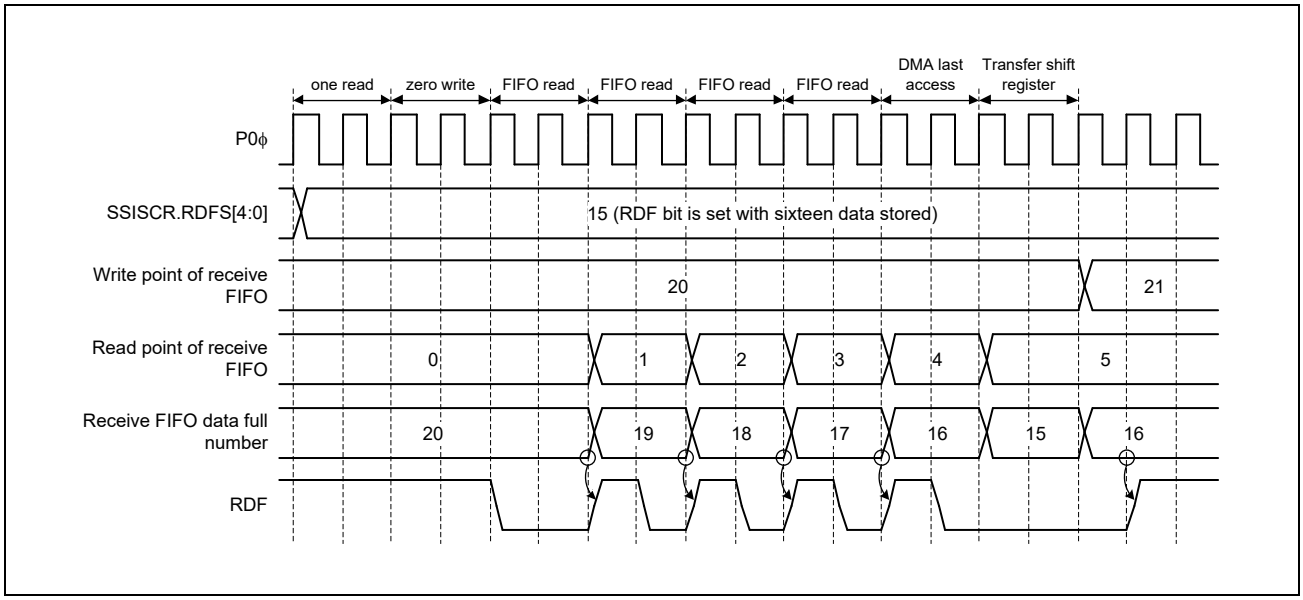

Figure 35.28 Set Timing and Clear Timing of RDF

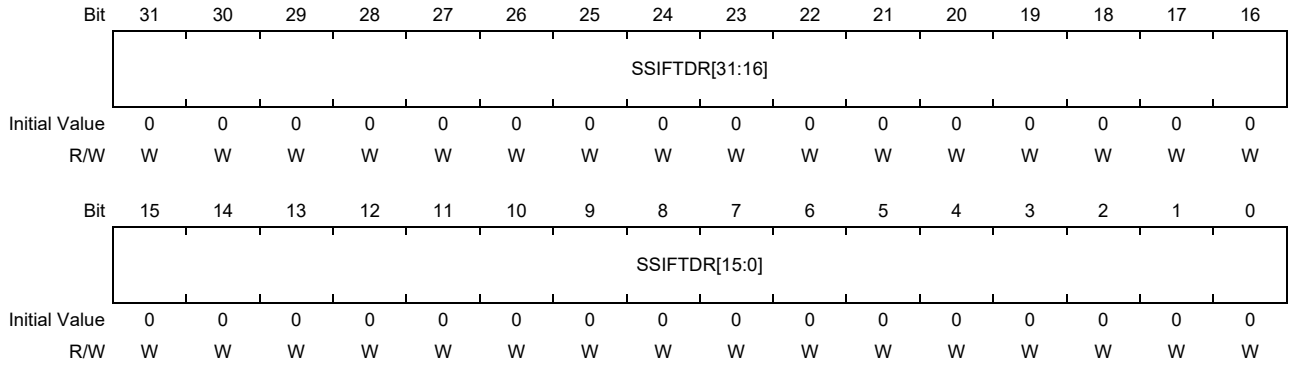
35.4.1.5 Transmit FIFO Data Register (SSIFTDR)

This is a 32-bit writable register. 0 is returned when this register is read. This register stores data to be serially transmitted.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSIFTDR[31:0]	H'0000_0000	W	Transmit FIFO data

To use this register for transmission, set DMA operation handling of a transmit data empty interrupt as writing to this register. Determine the access size to this register according to the data word length to be communicated (**Table 35.10**).

Table 35.10 Register Access Restriction to FIFOs

Access Size				
SSICR.DWL[2:0]	Data Word Length	Byte	Halfword	Word
000b	8	✓	—	—
001b	16	—	✓	—
010b	18	—	—	✓
011b	20	—	—	✓
100b	22	—	—	✓
101b	24	—	—	✓
110b	32	—	—	✓
111b	Setting prohibited	—	—	—

Figure 35.29 shows register access to the transmit FIFO data register.

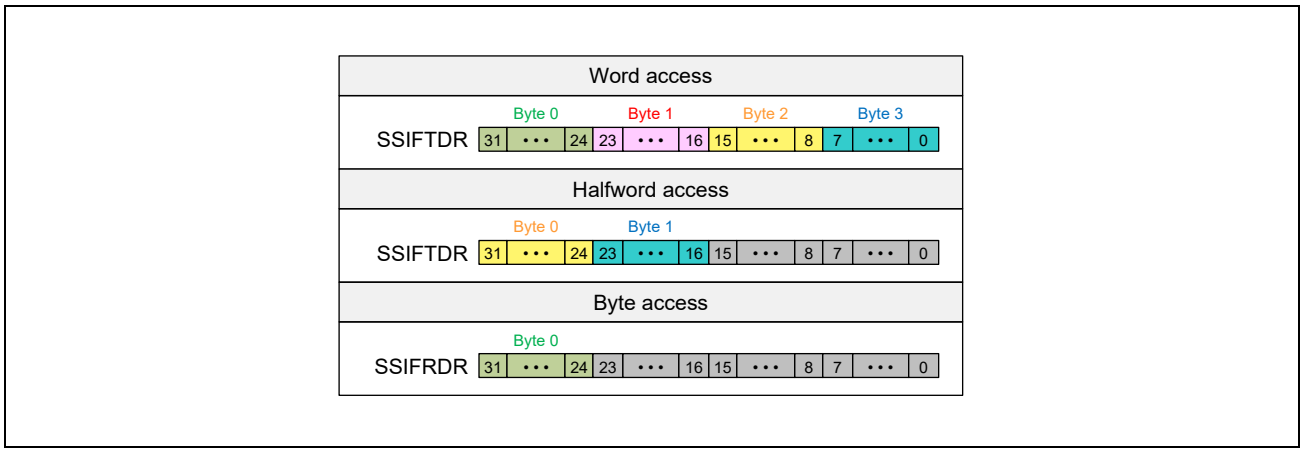


Figure 35.29 Example of Register Access to the Transmit FIFO Data Register

Figure 35.30 shows the configurations and operation examples of the transmit FIFO data register and transmit shift register. The configurations are for storing data to FIFO and not related with communication.

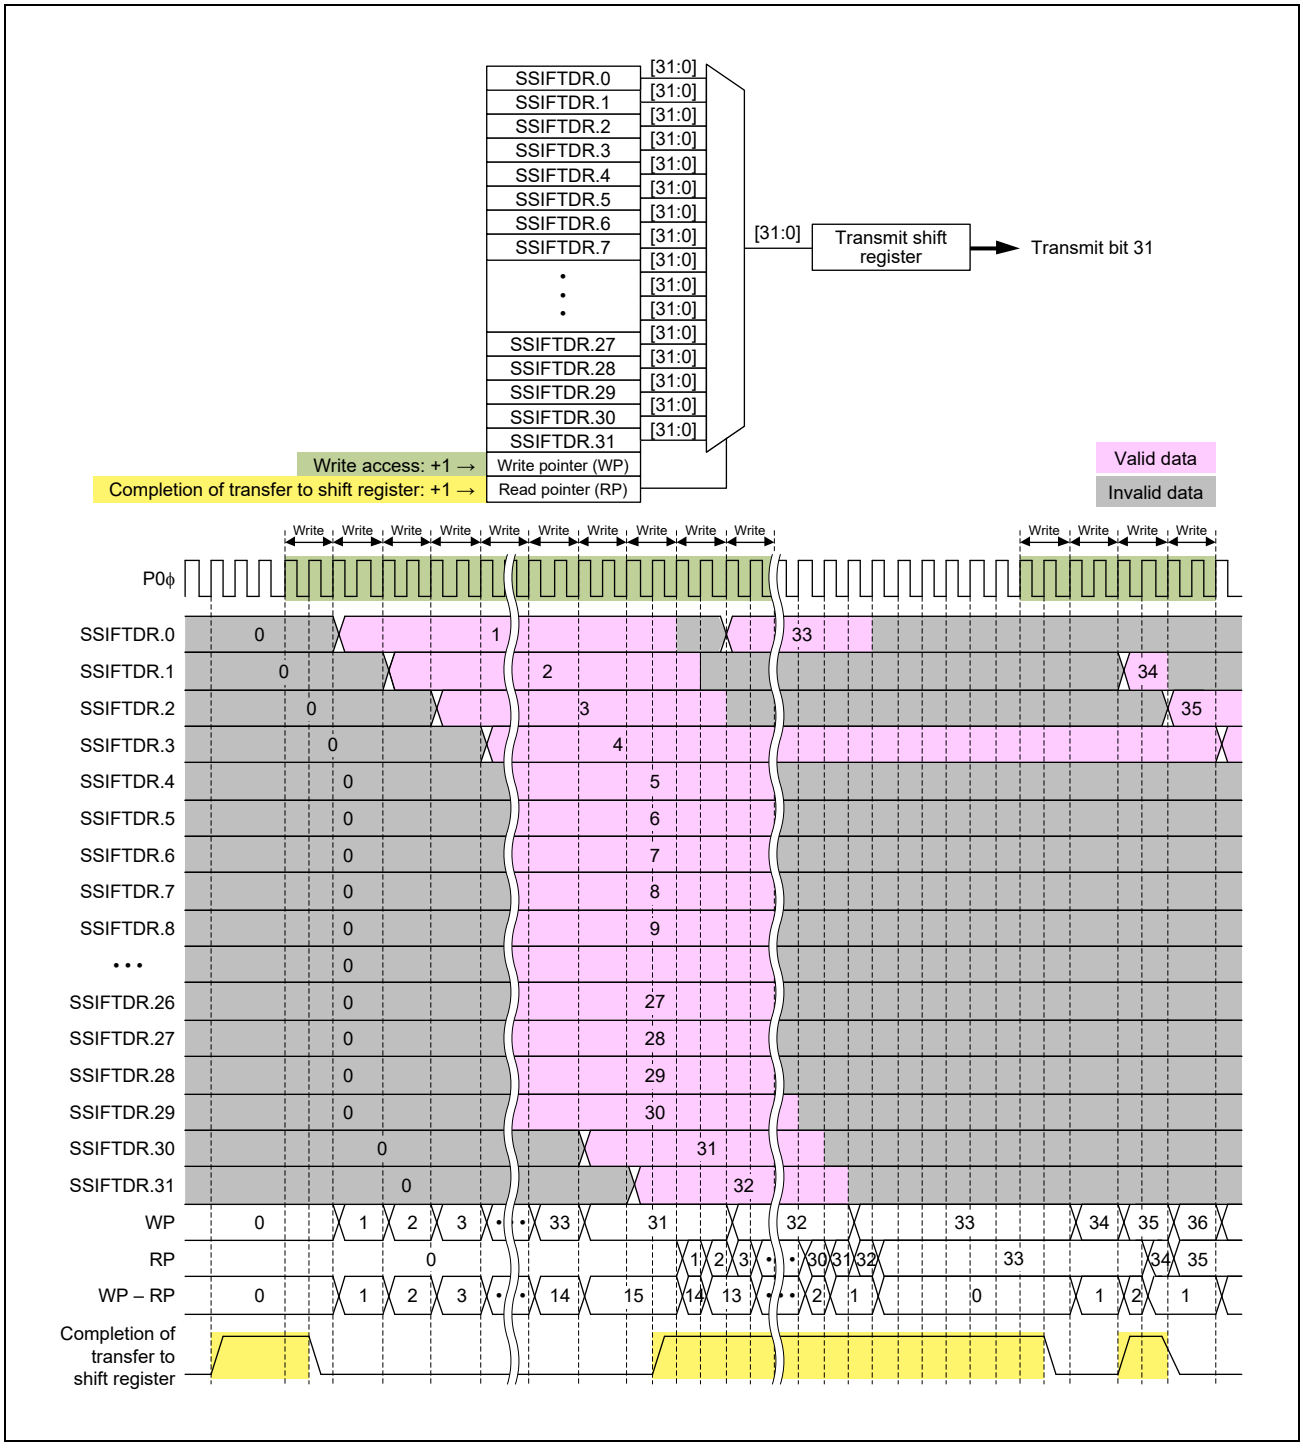

Figure 35.30 Configuration of the Transmit FIFO Data Register and Transmit Shift Register, and FIFO Operation Example

35.4.1.6 Receive FIFO Data Register (SSIFRDR)

This is a readable 32-bit register. This register stores received serial data.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSIFRDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSIFRDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSIFRDR [31:0]	H'0000_0000	R	Receive FIFO data

To use this register for reception, set DMA operation handling of a receive data full interrupt as reading from this register. Determine the access size to this register according to the data word length to be communicated (**Table 35.10**). Register access to the receive FIFO data register is same as for the transmit FIFO data register (**Figure 35.29**).

Figure 35.31 shows the configurations and operation examples of the receive FIFO data register and receive shift register.

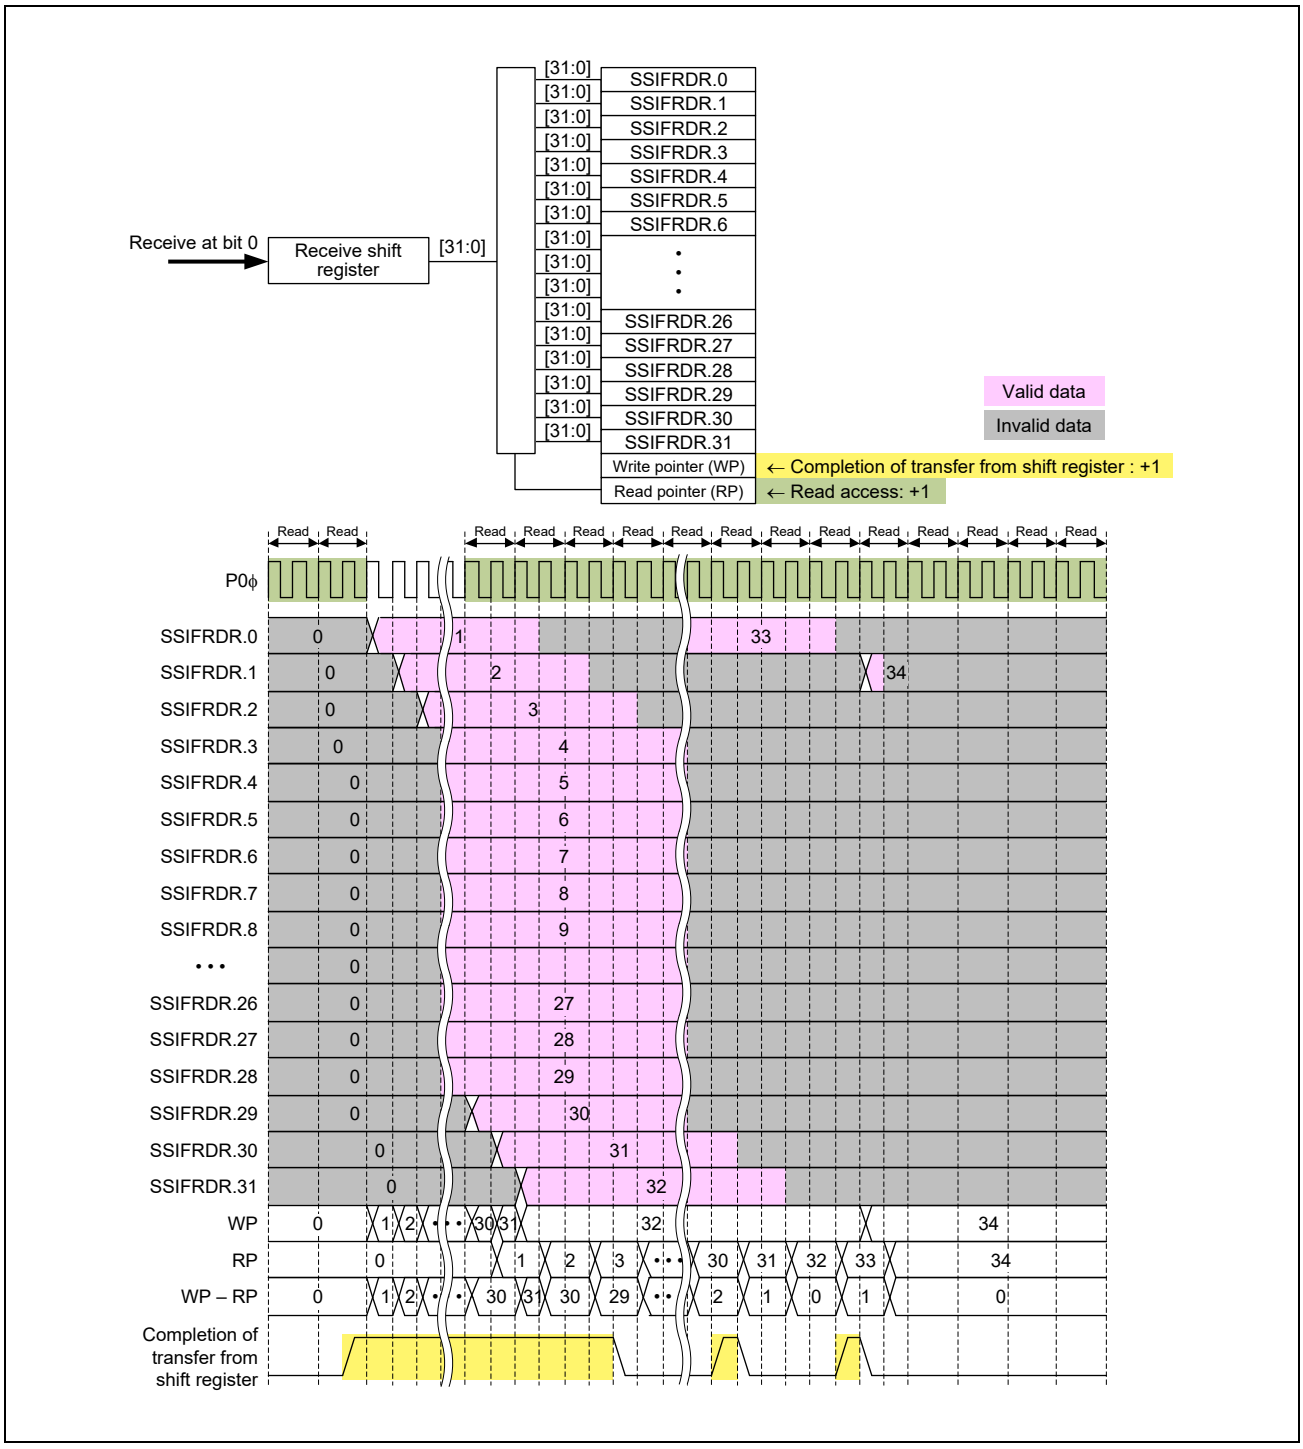

Figure 35.31 Configuration of the Receive FIFO Data Register and Receive Shift Register, and FIFO Operation Example

35.4.1.7 Audio Format Register (SSIOFR)

This is a readable/writable 32-bit register. It sets an audio format including the communication format, LRCK/FS continuation mode, and BCK output stop.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	BCKSTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	H'00_0000	R	Reserved. Write 0. The read value is 0.
9	BCKASTP	0	RW	BCK Output Stop Enable*1,*2 0: Enables output of BCK 1: Disables output of BCK
8	LRCONT	0	RW	LRCK/FS Continuation Enable*1,*2 0: Disables LRCK continuation 1: Enables LRCK continuation
7 to 2	—	H'00	R	Reserved. Write 0. The read value is 0.
1, 0	OMOD[1:0]	0	RW	Audio Format Select*3,*4 OMOD[1:0]: Format 00: I^{2}S format 01: TDM format 10: Monaural format 11: Setting prohibited

Note 1. This bit is valid only in master-mode communication (SSICR.MST = 1). The setting is invalid in slave-mode communication (SSICR.MST = 0).

Note 2. BCKASTP=1 and LRCONT=1 is prohibitions.

Note 3. Writing in this bit is a prohibition when SSIF-2 is communication state (SSISR.IIRQ=0). Operation is not guaranteed when rewriting it.

Note 4. Use the communication format setting that can be communicated when the format of the communication of the opposing device is compatible format of SSIF-2.

BCKASTP Bit

This bit turns on or off the function to output BCK to the SSIBCK pin according to the communication shown in **Figure 35.32** and **Figure 35.33** in master-mode communication (SSICR.MST = 1). Set this bit after setting completing the communication format.

This bit must defend the following usage. Start communication with BCKASTP = 0, and set 1 to BCKASTP while communicating. As a result, the bit clock output to the terminal SSIBCK stops by the automatic operation when the communication stop is done. When you will restart the communication, set 0 to BCKASTP with idle state (SSICR.IIRQ=1) and the AUDIO_MCK supply state (SSIFCR.AUCKE = 1)

When master communication (SSICR.MST=1) and idle state (SSICR.IIRQ=1).

Table 35.11 BCKASTP State, and Output state of SSIBCK Pin

BCKASTP bit	Output State of SSIBCK Pin
0	Enable
1	Disable

Note: When the opposing device who is the slave needs the clock of the terminal SSIBCK before the communication operates, it is not possible to use it. Use it to stop clocking after the communication ends (**Figure 35.33**). Refer to **Figure 35.32** for timing that the function becomes effective.

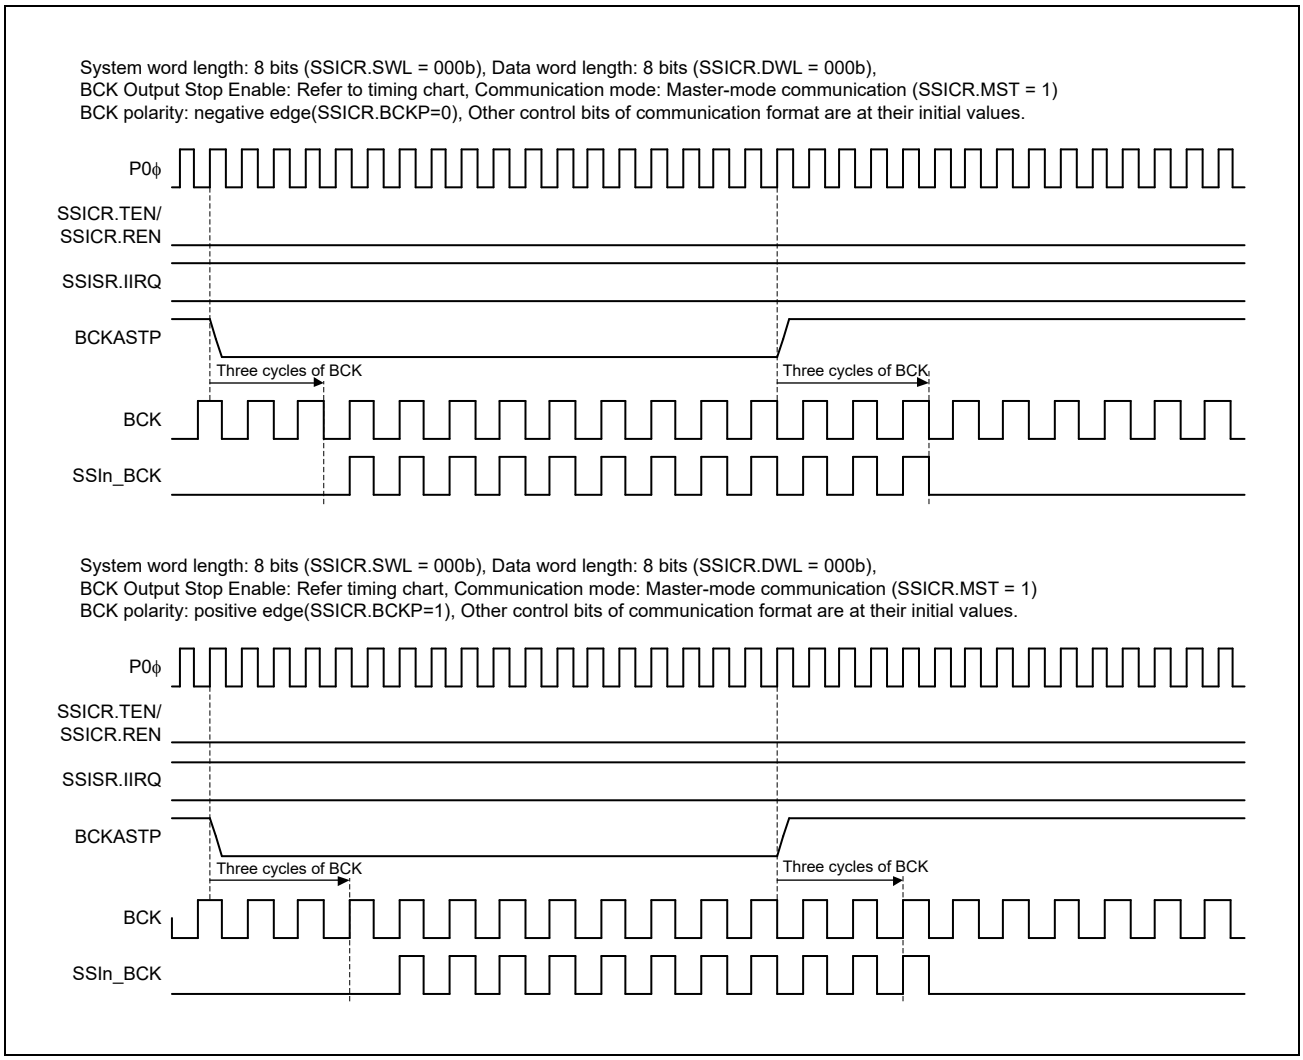

Figure 35.32 Example Operation of the BCKASTP Bit (in Idle State)

When master communication (SSICR.MST=1) and the BCK output automatic operation stop function (BCKASTP = 1) (**Figure 35.33**).

Details of the BCK output to SSIBCK pin are as follows.

- Output start timing: To generate an effective edge in timing that LRCK/FS is changed into the valid value, BCK is output.
- Output stop timing: Frame boundary from 1 to 1.5 clock

Refer to the timing chart of **Figure 35.33** for detailed timing.

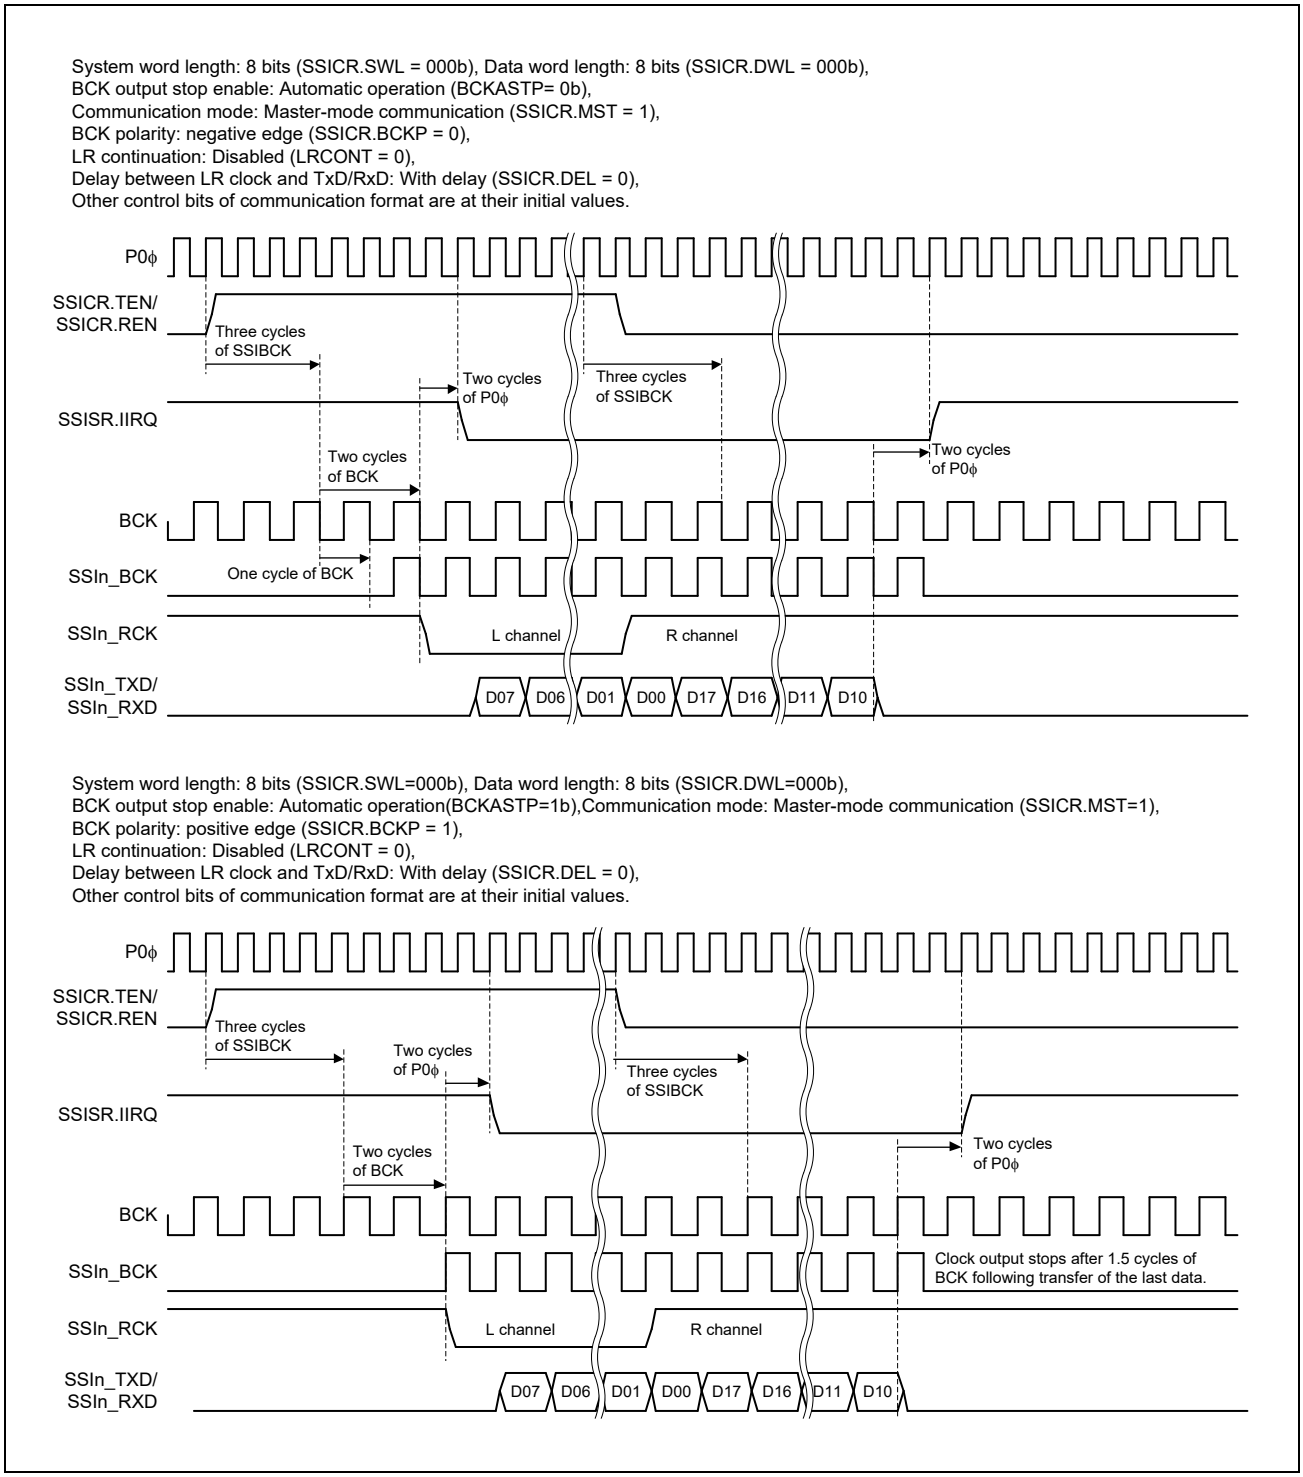

Figure 35.33 Example Operation of the BCKASTP Bit (Communication behavior in BCKASTP=1)

LRCONT Bit

This bit enables/disables the output from the SSILRCK/SSIFS pin when SSIF-2 is master communication (SSICR.MST=1) and idle state (SSISR.IIRQ=1). Writing 1 to this bit (enables LRCK/FS continuation) in master mode (SSICR.MST = 1) enables continuation of the output from the SSILRCK/SSIFS pins even when idle state.

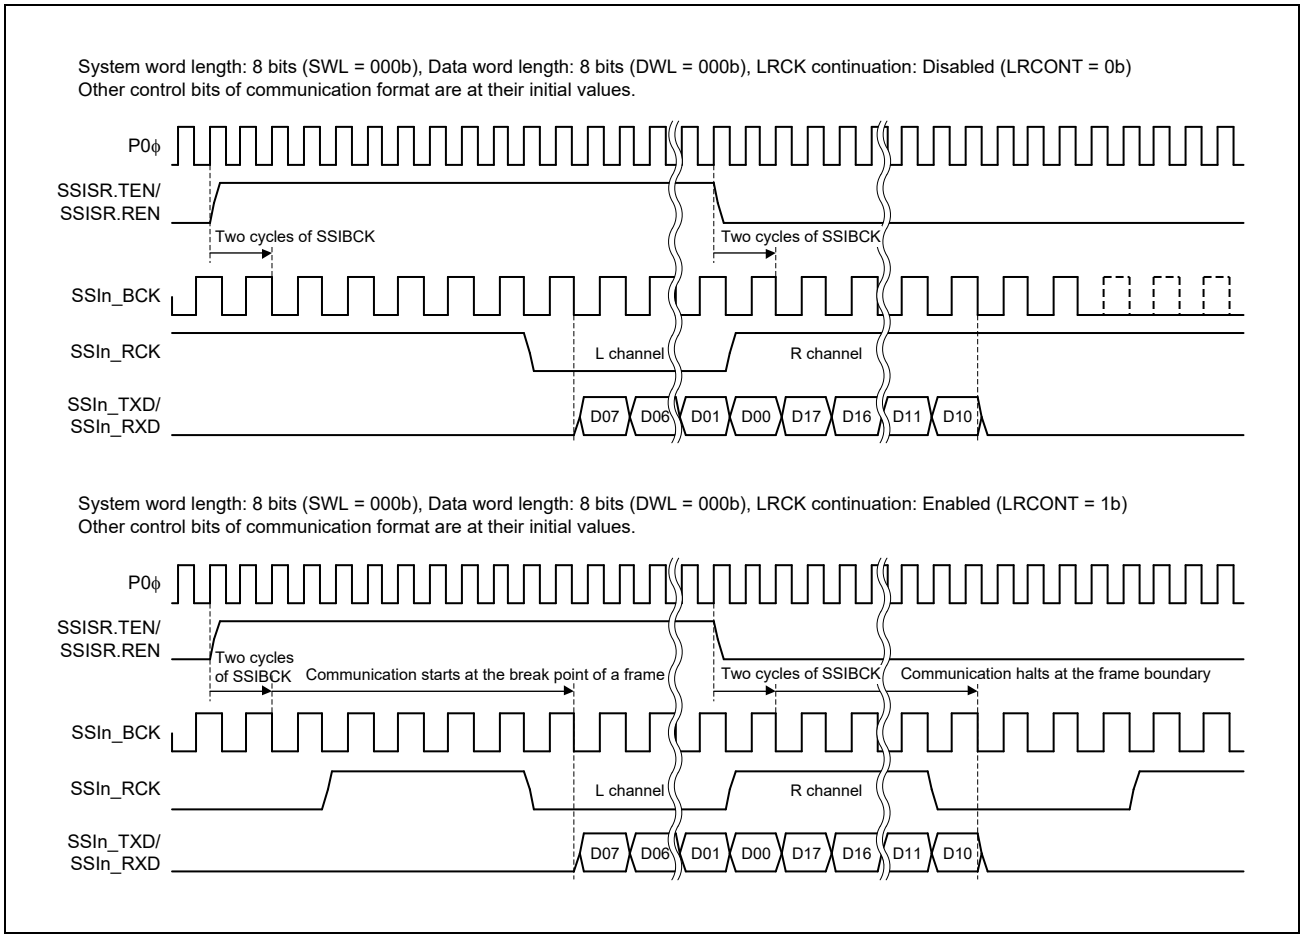

Figure 35.34 Operation Example of LRCK/FS Continuation (in Idle State)

OMOD[1:0] Bits

These bits set an audio format.

Rewrite this bit when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 35.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

35.4.1.8 Status Control Register (SSISCR)

This is a readable/writable 32-bit register. It sets the operation of the TDE and RDF flags.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	H'0_0000	R	Reserved. Write 0. The read value is 0.
12 to 8	TDES[4:0]	H'00	RW	TDE Setting Condition Select*1 TDES[4:0]: Operation 00000b: SSIFTDR has one stage or more free space 00001b: SSIFTDR has two stages or more free space (snip) 11110b: SSIFTDR has thirty-one stages or more free space 11111b: SSIFTDR has thirty-two stages or more free space
7 to 5	—	H'0	R	Reserved. Write 0. The read value is 0.
4 to 0	RDFS[4:0]	H'00	RW	RDF Setting Condition Select*1 RDFS[4:0]: Operation 00000b: SSIFRDR has one stage or more data size 00001b: SSIFRDR has two stages or more data size (snip) 01110b: SSIFRDR has thirty-one or more data size 01111b: SSIFRDR has thirty-two stages or more data size

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

TDES[4:0] Bits

These bits set the setting condition of the transmit data empty flag (TDE). Set these bits in byte units.

RDFS[4:0] Bits

These bits set the setting condition of the receive data full flag (RDF). Set these bits in byte units.

35.4.2 Communication Formats

SSIF-2 supports three communication formats (**Table 35.12**).

Table 35.12 Supported Communication Formats

Communication Format	SSIOFR.OMOD[1:0]
I^2S format	00
TDM format	01
Monaural format	10

The following figure shows the serial data configuration common to communication formats. Serial data is determined according to the system word length (SSICR.SWL[2:0]) and the data word length (SSICR.DWL[2:0]). When the system word length is longer than the data word length, padding bits are transferred (**Figure 35.35**).

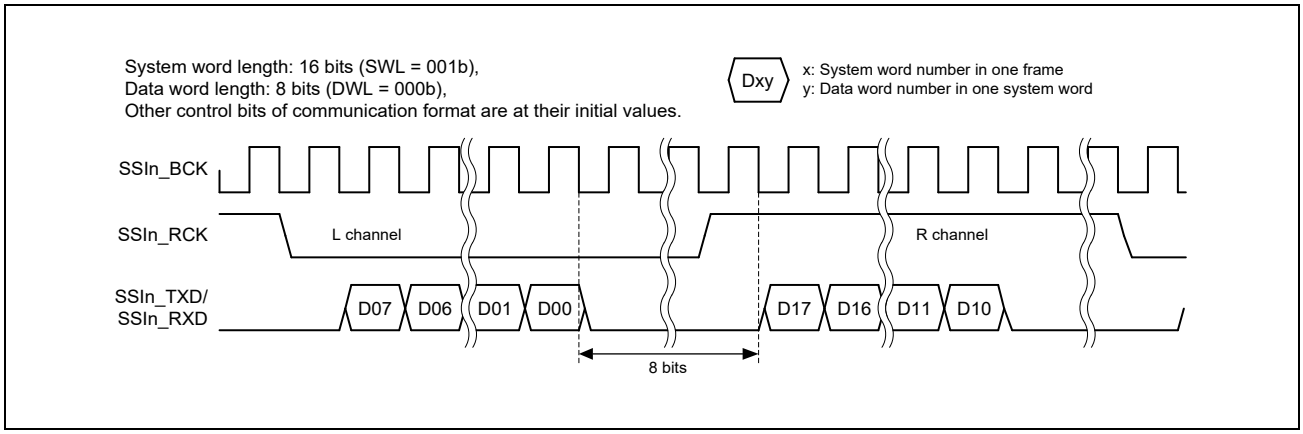

Figure 35.35 Example of Padding Bit Transfer (I^2S Format: System Word Length > Data Word Length)

Table 35.13 lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]). "-" indicates that the setting is prohibited.

Table 35.13 Number of Padding Bits

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	System Word Length	8	16	18	20	22	24	32	Set Prohibition
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—
100b	48	40	32	30	28	26	24	16	—
101b	64	56	48	46	44	42	40	32	—
110b	128	120	112	110	108	106	104	96	—
111b	256	248	240	238	236	234	232	224	—

35.4.2.1 I²S Format

The I²S format is a communication format used for connection with I²S-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 00b), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for the channel L and at a high level for the channel R. Set the polarity of the signals with the SSICR.LRCKP bit. **Figure 35.36** shows the I²S format without padding. See **Figure 35.35** for the format with padding.

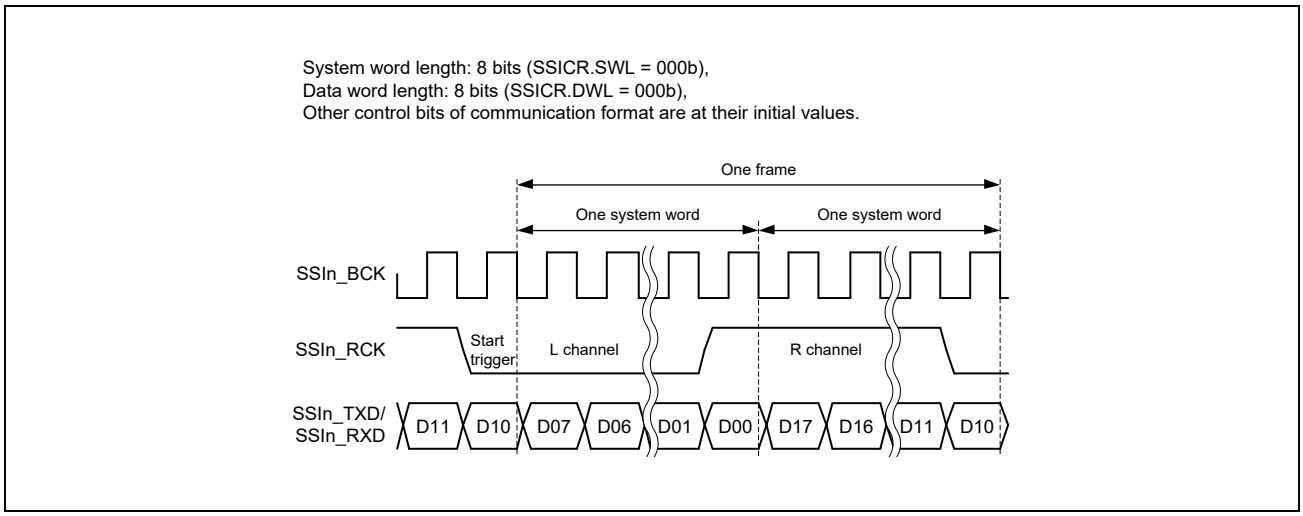

Figure 35.36 I²S Format (without Padding: System Word Length = Data Word Length)

For the state of external pins when SSIF-2 is in the idle state, see **Section 35.5.1.1, Idle State**.

NOTE

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/ SSIFS only as a communication start trigger.

35.4.2.2 Monaural Format

The monaural format is a communication format used for connection with monaural-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 10b), one frame is configured with the number of system words set with the SSICR.FLM[1:0] bits (**Figure 35.37**). A rising of the SSILRCK/SSIFS signal means a start trigger. **Figure 35.37** and **Figure 35.38** respectively show the monaural formats without and with padding.

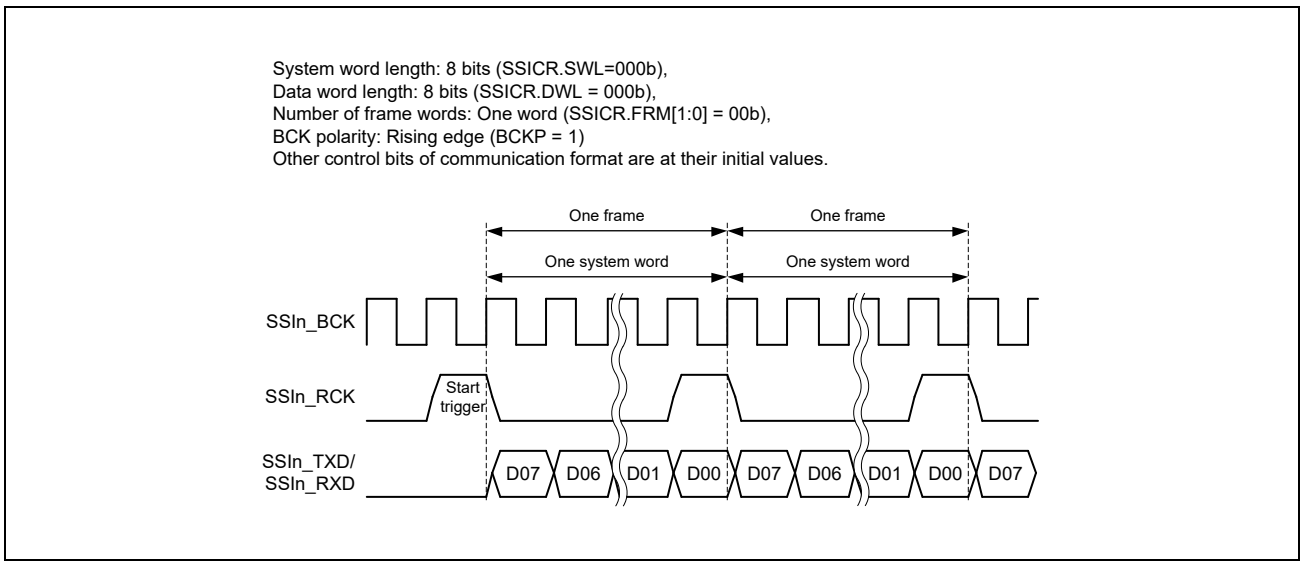

Figure 35.37 Short Frame in Monaural Format (without Padding: System Word Length = Data Word Length)

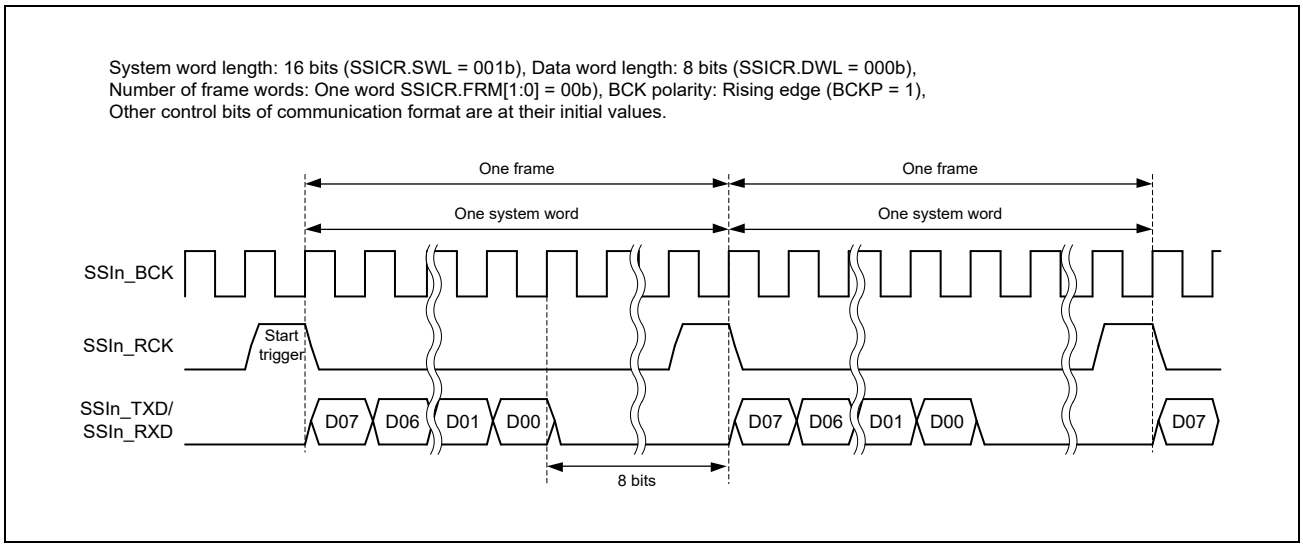

Figure 35.38 Short Frame in Monaural Format (with Padding: System Word Length > Data Word Length)

The monaural formats supported by SSIF-2 consist of short frames and long frames. See **Section 35.4.2.2(1), Short Frame** and **Section 35.4.2.2(2), Long Frame** for the difference between these two frames.

For the state of external pins state when SSIF-2 is in the idle state, see **Section 35.5.1.1, Idle State**.

NOTE

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

(1) Short Frame

With the short frame (SSICR.DEL = 0), the SSILRCK/SSIFS signal that indicates a start of serial data is at a high level for one cycle of SSIBCK. Data transfer starts at the falling edge of the signal (**Figure 35.37** and **Figure 35.38**).

(2) Long Frame

With the long frame (SSICR.DEL = 1), the SSILRCK/SSIFS signal that indicates a start of serial data is at a high level for two cycles of SSIBCK. Data transfer starts at the rising edge of the signal (**Figure 35.39**).

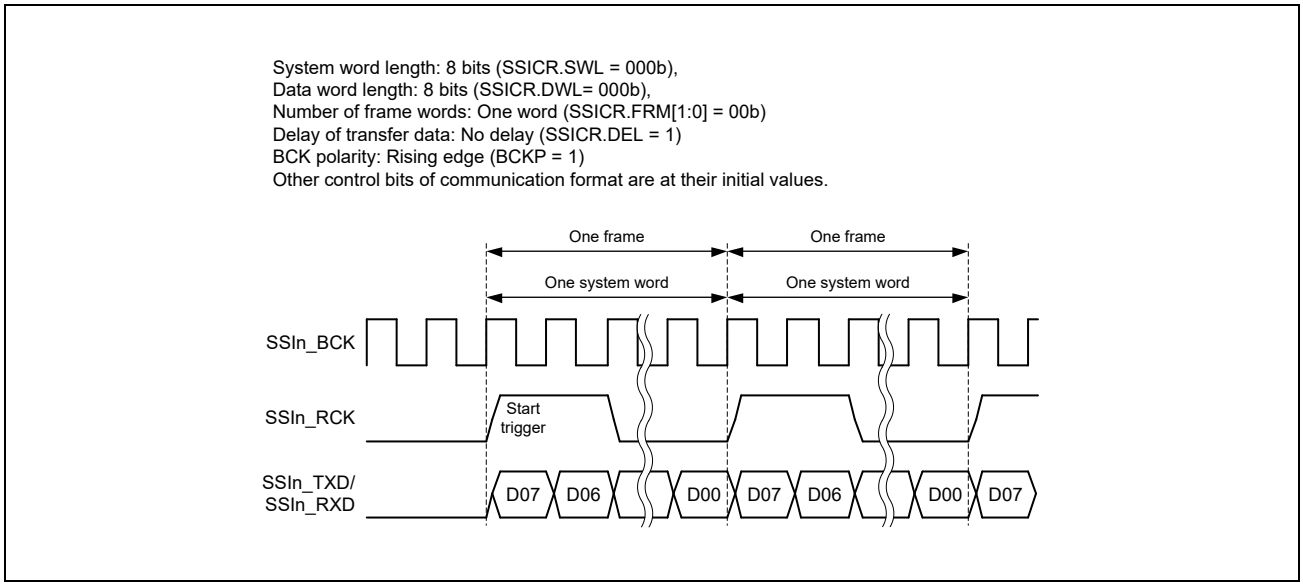

Figure 35.39 Long Frame in Monaural Format (without Padding)

35.4.2.3 TDM Format

The TDM format is a communication format used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01b), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge means a start of one frame. **Figure 35.40** and **Figure 35.41** respectively show the TDM formats with and without padding.

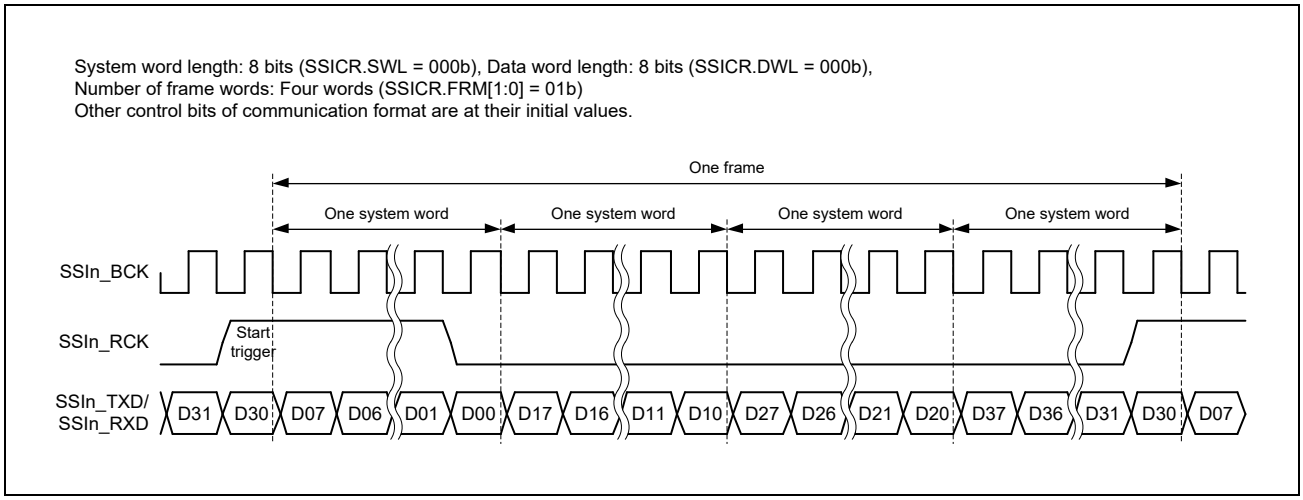

Figure 35.40 TDM Format (without Padding: System Word Length = Data Word Length)

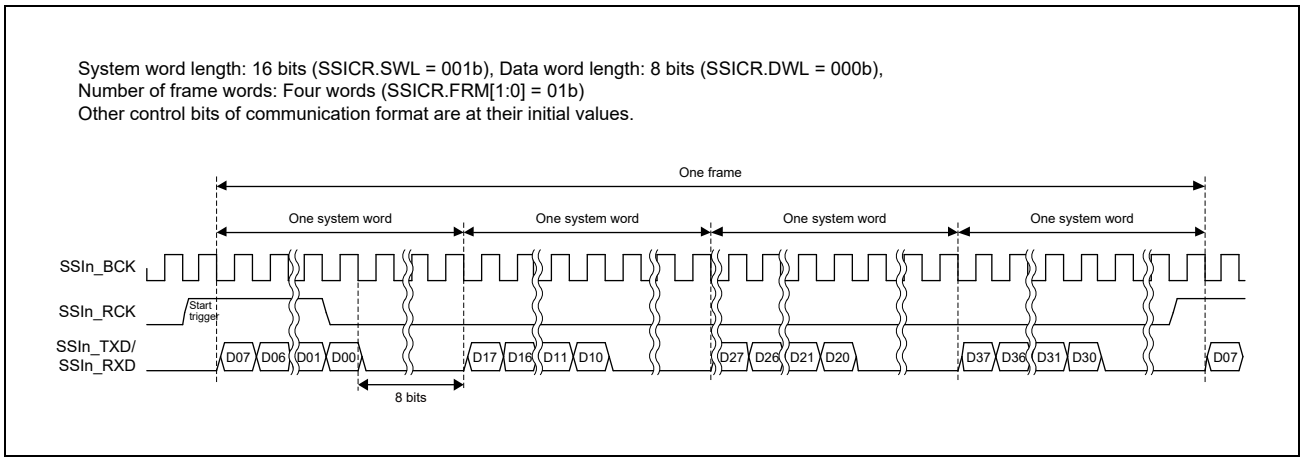

Figure 35.41 TDM Format (with Padding: System Word Length > Data Word Length)

For the state of external pins when SSIF-2 is in the idle state, see **Section 35.5.1.1, Idle State**.

NOTE

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

35.4.3 Communication Modes

SSIF-2 supports the following communication modes. **Table 35.15** lists the control bits that are not available with each communication mode. See **Section 35.4.3.1** to **Section 35.4.3.5** for details of these communication modes.

Table 35.14 Communication Modes

Communication Mode	SSICR.MST Bit	SSICR.REN Bit	SSICR.TEN Bit
Slave-mode transmission	0	0	1
Slave-mode reception	0	1	0
Slave-mode transmission and reception	0	1	1
Master-mode transmission	1	0	1
Master-mode reception	1	1	0
Master-mode transmission and reception	1	1	1

Table 35.15 Control Bits that Cannot be Used in Each Communication Mode

Communication Mode Control Bit	Slave-mode Reception	Slave-mode Transmission	Slave-mode Transmission and Reception	Master-mode Reception	Master-mode Transmission	Master-mode Transmission and Reception
SSICR.CKS	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.CKDV	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.MUEN	Invalid	Available	Available	Invalid	Available	Available

Note 1. Disabled when SSICR.DEL = ‘1’

Note 2. Note 2. Disabled during transmission (SSICR.TEN = ‘1’) when SSICR.DEL = ‘1’

35.4.3.1 Slave-Mode Communication

SSIF-2 operates in slave mode with SSICR.MST = 0. Supply the SSIBCK signal and the SSILRCK/SSIFS signal used for the serial data communication from external devices. If these signals do not match the communication format set for SSIF-2, operation is not guaranteed.

35.4.3.2 Master-Mode Communication

SSIF-2 operates in master mode with SSICR.MST = 1. The SSIBCK signal and SSILRCK/SSIFS signal used for the serial data communication are internally generated from the audio clock. These signals use the format according to the setting of SSIF-2. If the communication format of another device working as the slave device does not match the communication format set for SSIF-2, operation is not guaranteed.

35.4.3.3 Transmission

SSIF-2 transmits serial data to opposing device when SSICR.TEN = 1 and SSICR.REN = 0. If the communication format of the opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

35.4.3.4 Reception

SSIF-2 receives serial data from opposing device when SSICR.TEN = 0 and SSICR.REN = 1. If the communication format of the opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

35.4.3.5 Transmission and Reception

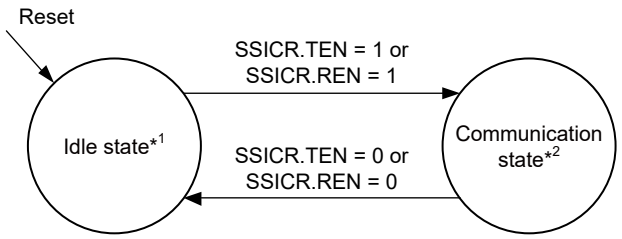
SSIF-2 transmits and receives serial data to and from opposing device when SSICR.TEN = 1, SSICR.REN = 1. If the communication format of opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

35.5 Operation

35.5.1 Operational State

SSIF-2 has the following two main operation states (**Figure 35.42**).

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0)



Note 1. See **Section 35.5.1.1** for details of the idle state.

Note 2. See **Section 35.5.1.2** for details of the communication state.

Figure 35.42 SSIF-2 State Transition

35.5.1.1 Idle State

In this state, communication of SSIF-2 is halted. However, when SSICR.MST = 1, output of BCK and LRCK/FS to external pins is enabled depending on the settings in the SSIOFR.BCKASTP bit and the SSIOFR.LRCONT bit (**Table 35.16**). This function is common to all formats.

Table 35.16 Output from External Pins in the Idle State

			Output from Pins		
SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	SSIBCK	SSILRCK/SSIFS	SSITxD
0	—	—	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop
1	1	1	Stop	Supply	Stop

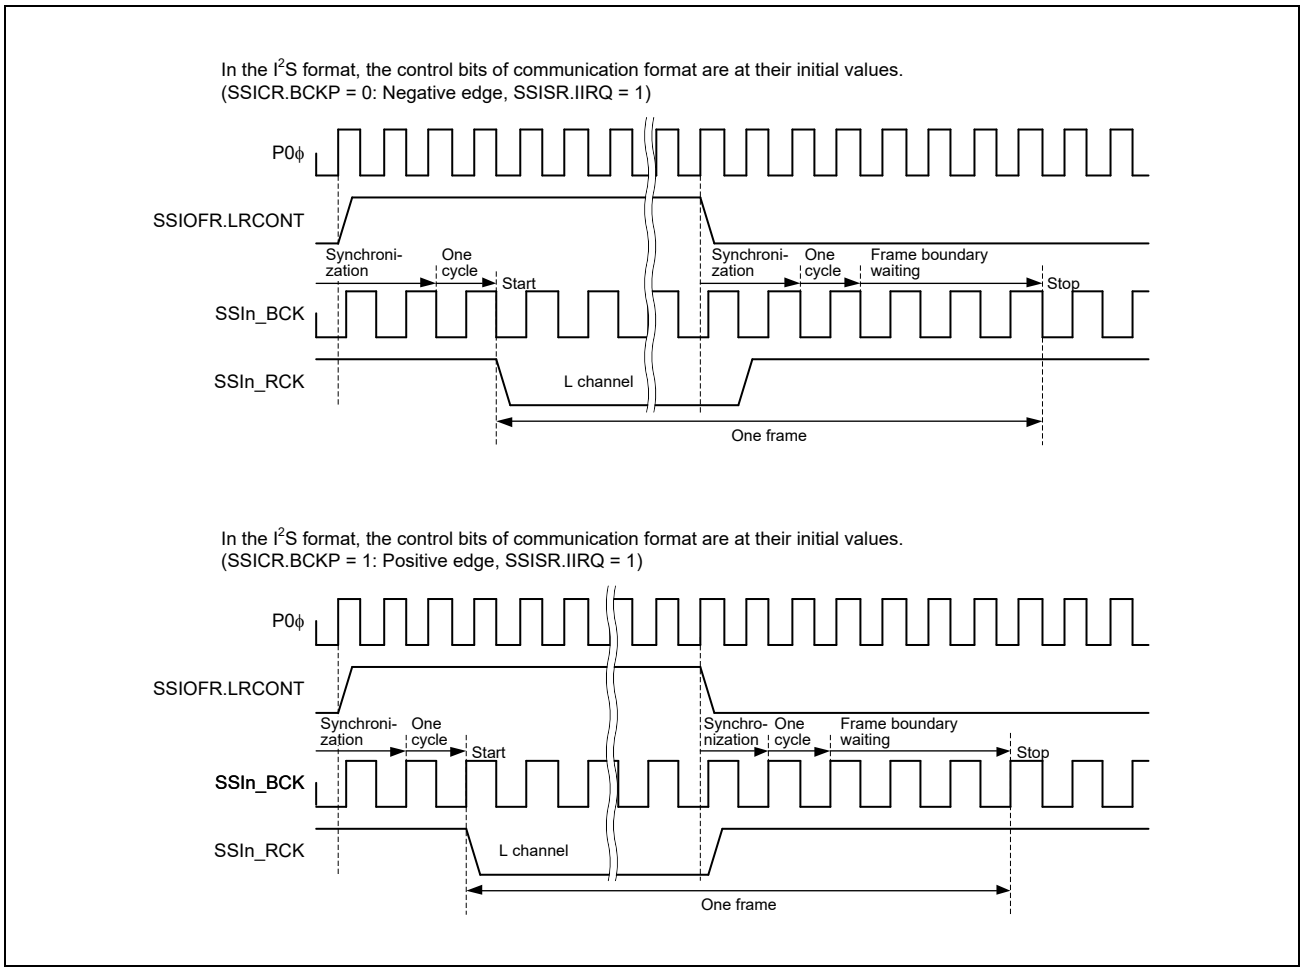


Figure 35.43 Example of LRCK/FS Continuation Release with SSIOFR.LRCONT

NOTE

To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIF-2 is in the idle state in master- mode communication (SSICR.MST = 1), note the following: The output stops when 0 is written from 1 to SSIOFR.LRCONT. (**Figure 35.43**). Make sure that the remote device is not affected.

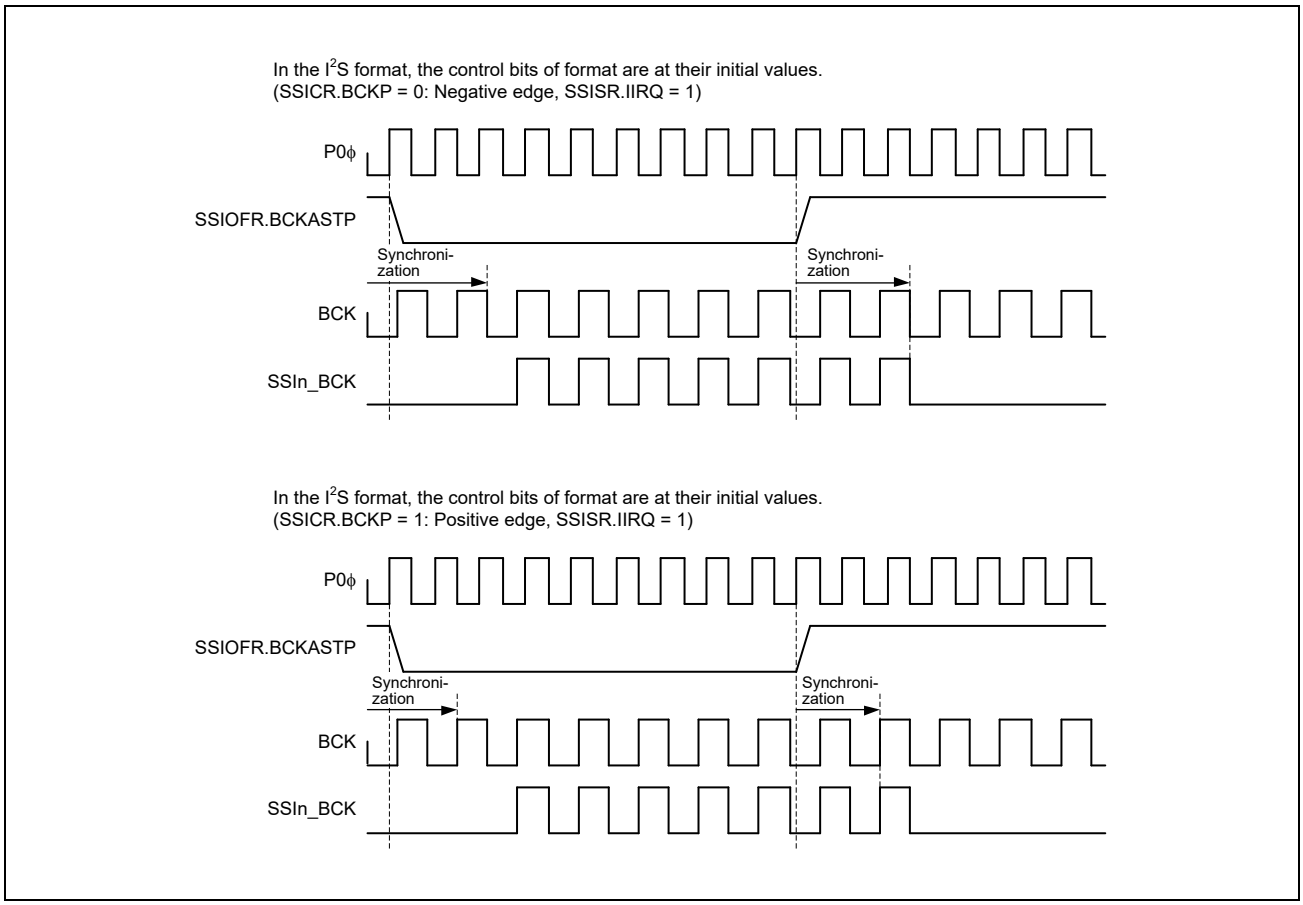

Figure 35.44 Example of Stopping SSIBCK with SSIOFR.BCKASTP

NOTE

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIF-2 is in the idle state, note the following; By writing 0 to SSIOFR.BCKASTP while it is 1, the output stops immediately (**Figure 35.44**). So, make sure that the remote device is not affected.

35.5.1.2 Communication States

In this state, SSIF-2 is during communication. **Figure 35.45** shows transitions of communication states and **Table 35.17** lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

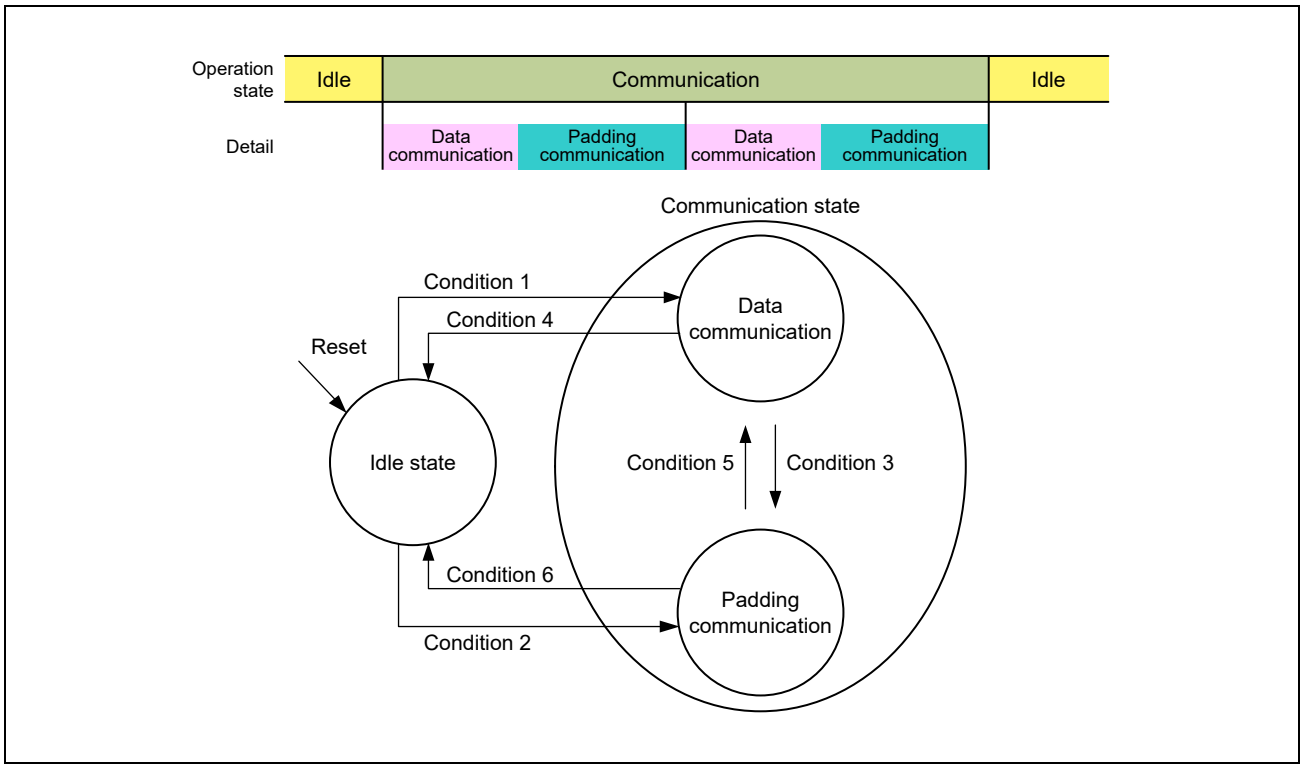

Figure 35.45 Communication State Transition

Table 35.17 Condition for Communication State Transition

Condition No.	Condition for Transition
1	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0 or in the setting without padding bits.
2	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1 and in the setting with padding bits.
3	The following all of three conditions are satisfied: ● SSICR.TEN = 1 or SSICR.REN = 1 ● In the setting without padding bits ● Transfer data words of the last data bit is completed.
4	The following all of two conditions are satisfied: ● SSICR.SDTA = 1 or without padding bits ● Transfer data words of the last data bit of one frame is completed while SSICR.TEN = 0 and SSICR.REN = 0
5	Transfer of the last padding bit is completed while SSICR.TEN = 1 or SSICR.REN = 1
6	The following all of two conditions are satisfied: ● SSICR.SDTA = 0 and with padding bits ● Transfer of the last data bit of one frame is completed while SSICR.TEN = 0 and SSICR.REN = 0.

See **Table 35.13** for the setting with/without padding bits.

(1) Data Communication State

In this state, SSIF-2 is during communication. Data of the data word length set with the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

State Transition in the Setting without Padding Bits

During communication (SSISR.IIRQ = 0), SSIF-2 is during data communication for all the time (**Figure 35.46**). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0), SSIF-2 transits to the idle state (**Figure 35.47**).

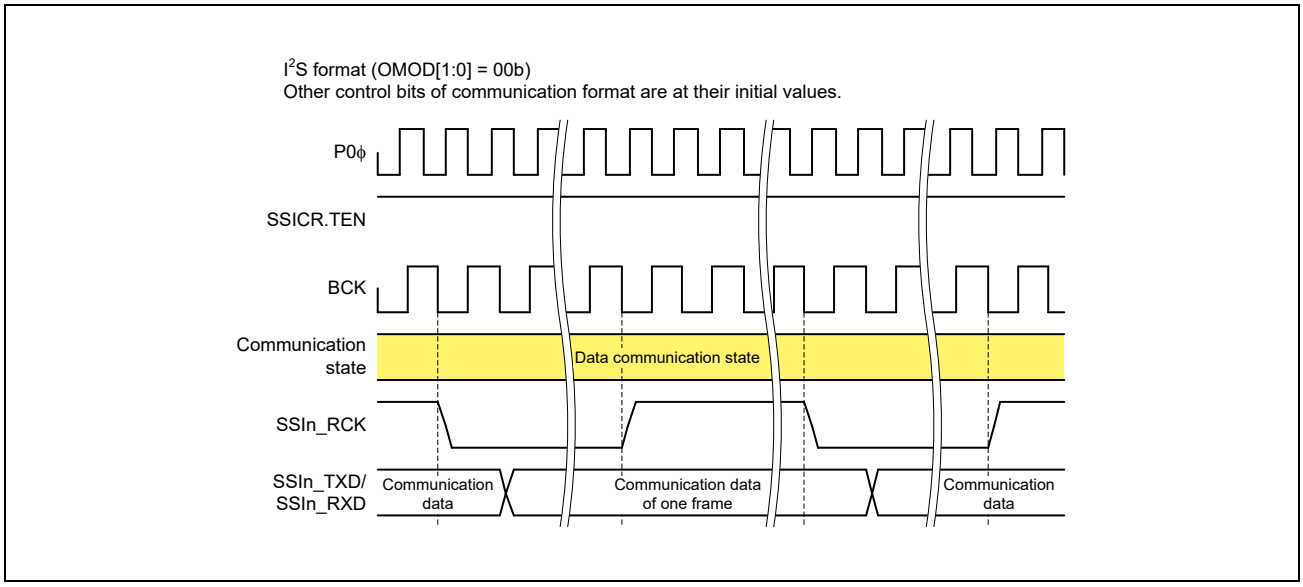

Figure 35.46 Continuation of the Data Communication State

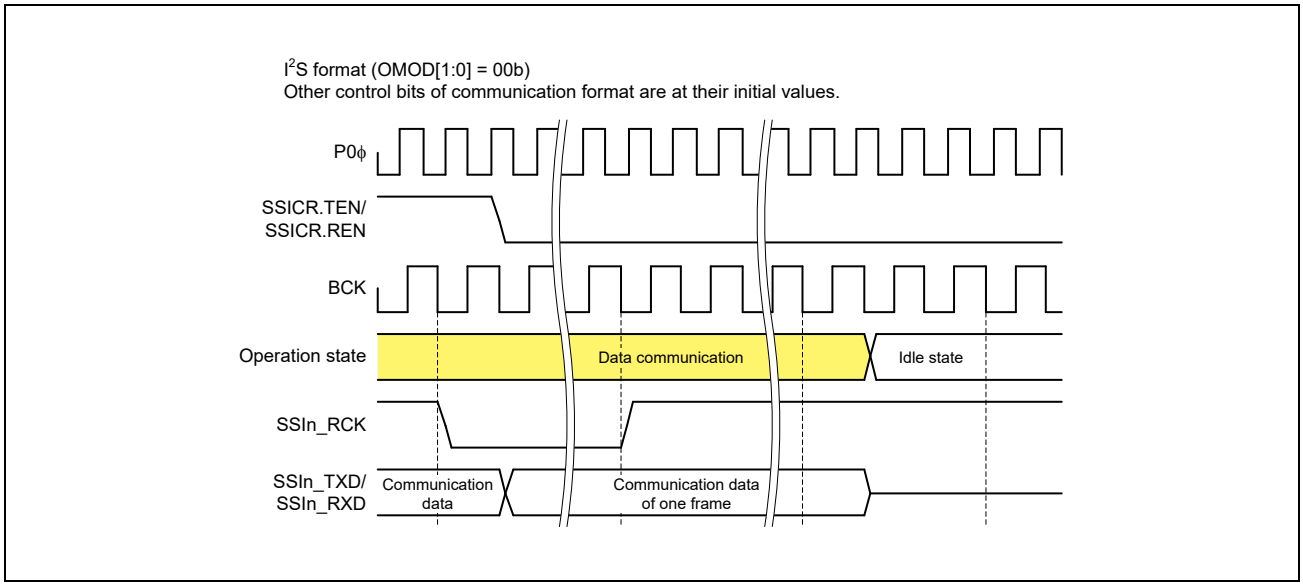

Figure 35.47 Halt from the Data Communication State (without Padding Bits)

State Transition in the Setting with Padding Bits

During communication (SSISR.IIRQ = 0), after completing transfer of the last bit of a data word, SSIF-2 transits to the padding communication state from data communication state (**Figure 35.48**). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0) while SSICR.SDTA = 1, SSIF-2 transits to the idle state from data communication state when the communication stop is done. (**Figure 35.49**).

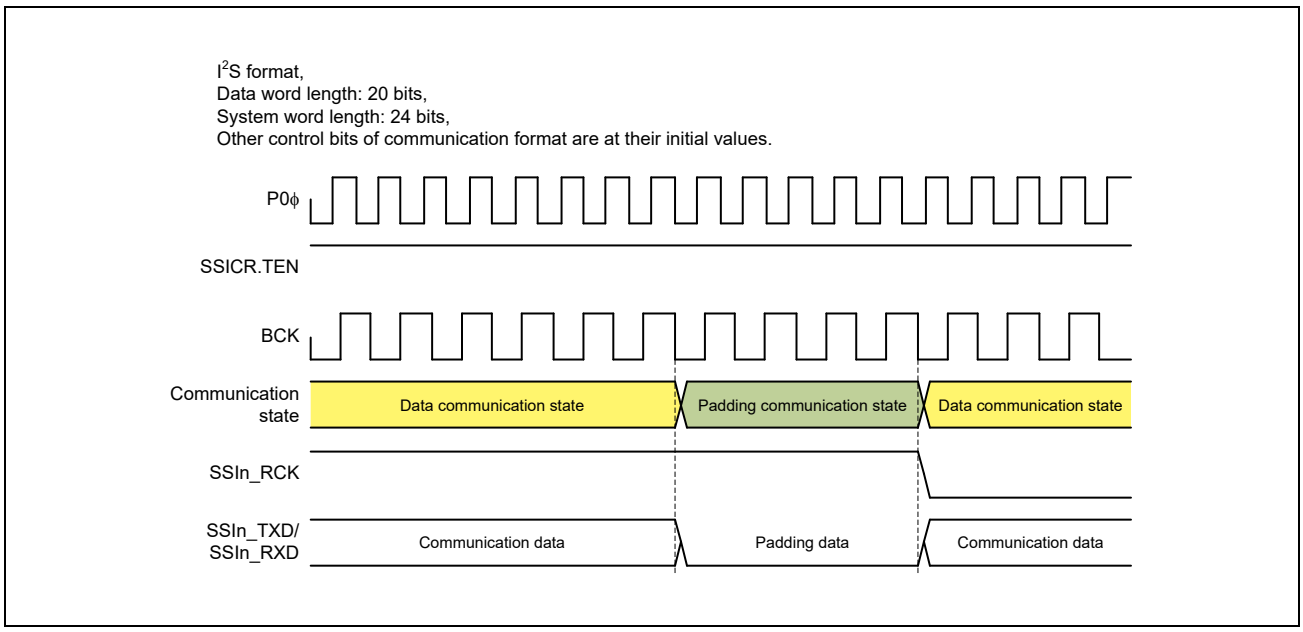

Figure 35.48 Transition from Data Communication to Padding Communication

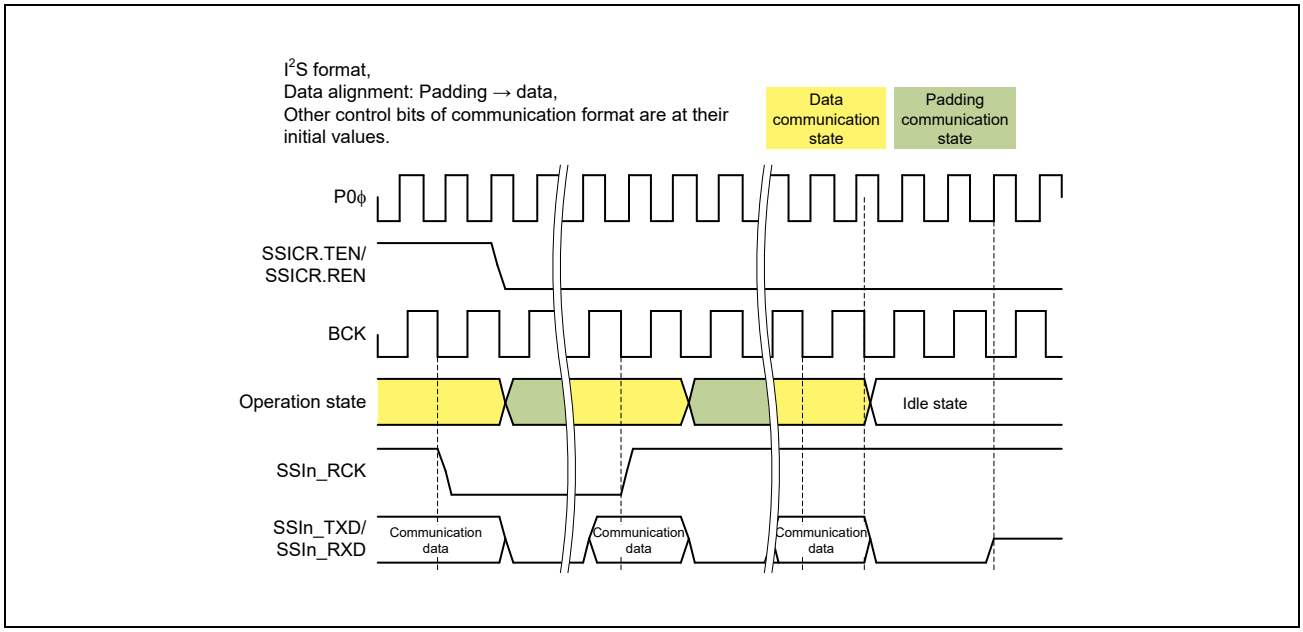

Figure 35.49 Halt from Data Communication (with Padding Bits)

(2) Padding Communication State

In this state, SSIF-2 is during communication. The padding bits set with the SSICR.SWL[2:0] bits and SSICR.DWL[2:0] bits are transmitted, received, or transmitted and received.

State Transition in the Setting with Padding Bits

During communication (SSISR.IIRQ = 0), after completing transfer of the last padding bit, SSIF-2 transits to data communication state (**Figure 35.48**). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0) while SSICR.SDTA = 0, SSIF-2 transits to the idle state from padding communication when the communication stop is done. (**Figure 35.50**).

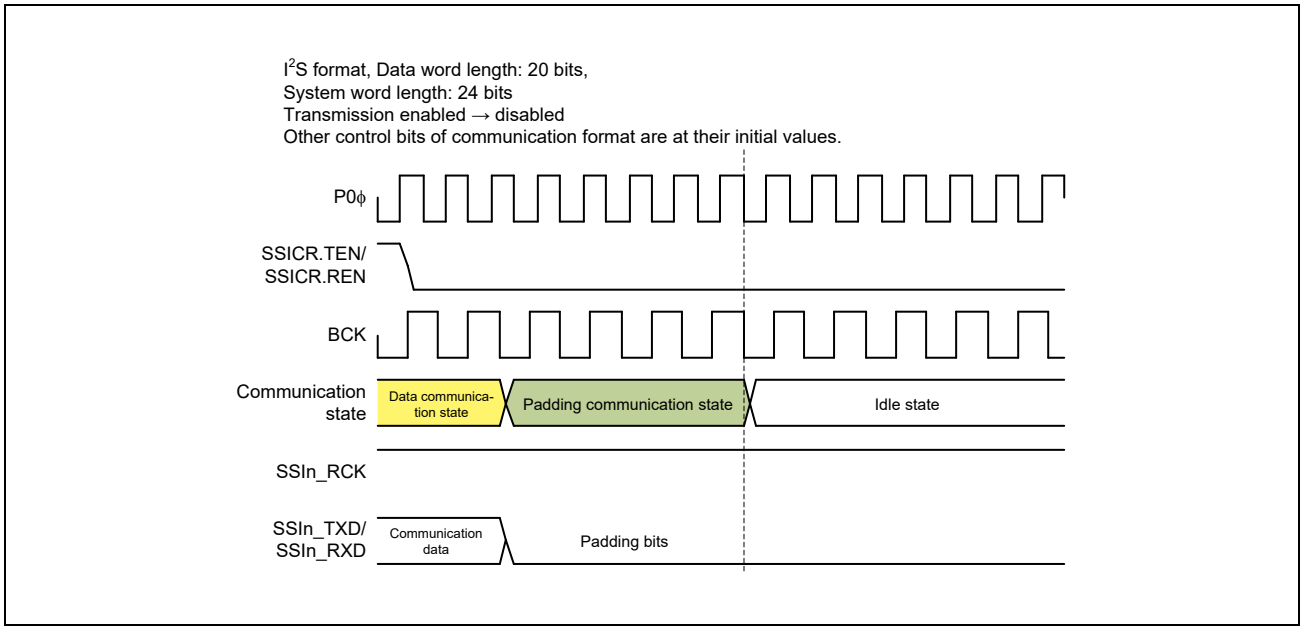

Figure 35.50 Halt from the Padding Communication State

35.5.2 Communication Operation

Figure 35.51 shows the communication flow of SSIF-2.

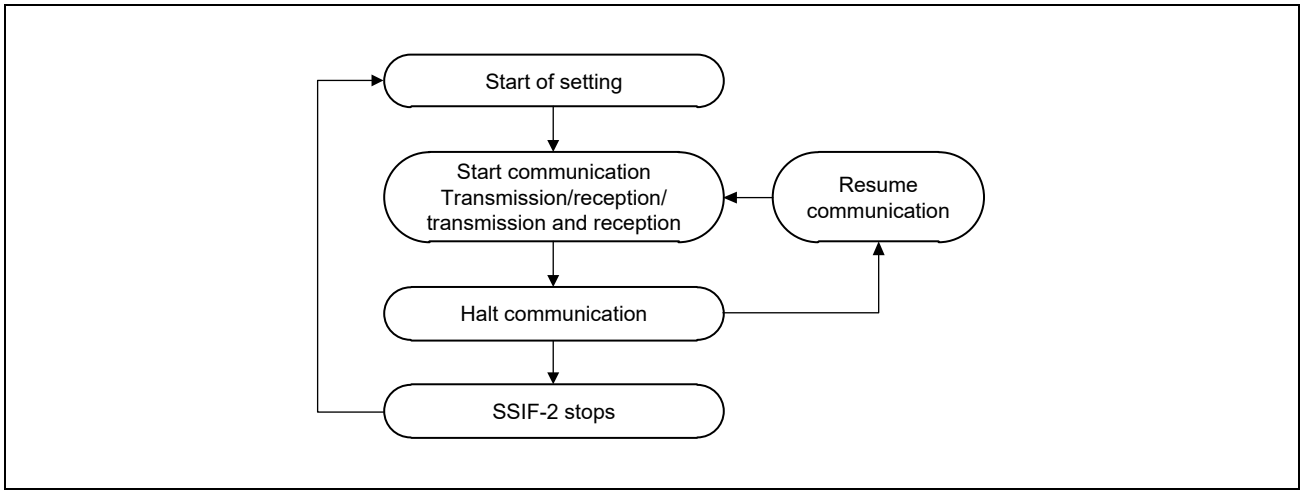

Figure 35.51 SSIF-2 Communication Operation

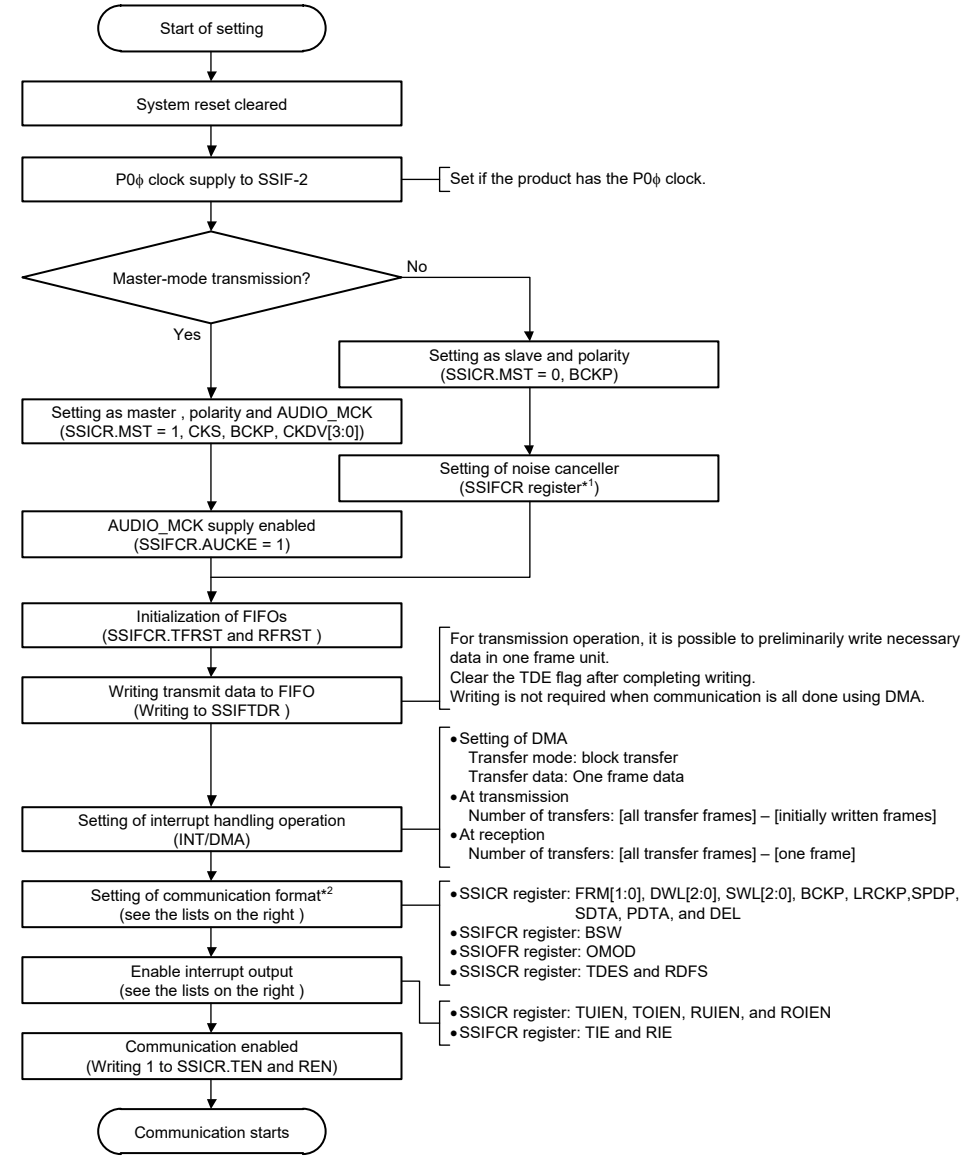
The procedure of each operation is described in **Section 35.5.2.1, Start Communication** to **Section 35.5.2.7, Resume Communication**.

35.5.2.1 Start Communication

This section describes how to start communication of SSIF-2. **Figure 35.52** shows the procedure to start communication. Be sure to follow the procedure. See **Section 35.5.2.2** for transmission operation and **Section 35.5.2.3** for reception operation.



Note 1. BCKNCE, LRCKNCE, LRCKNCE
Change all the settings of the noise cancellation to the same setting.

Note 2. Set SSICR.MUEN, SSIOFR.BCKASTP, and SSIOFR.LRCONT after completing the setting of the communication format.

Figure 35.52 Procedure to Start Communication (CPU Procedure)

For SSIF-2 communication, continuous communication is possible with DMA interrupt handling. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIEN. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.

35.5.2.2 Transmission

Follow the transmission operation procedure (**Figure 35.53**) while the transmission is operating.

Transmission starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0) and while there is one or more frame of serial data in the transmit FIFO data register (SSIFTDR).

SSIF-2 outputs a transmit data empty interrupt to DMA according to the setting condition of TDE (SSISCR.TDES) and transmit data empty interrupt (SSIFCR.TIE) being enabled.

This interrupt requests writing to the transmit FIFO data register (SSIFTDR). By writing to SSIFTDR at each generation of an interrupt, serial data transmission is realized.

In the procedure to start communication, set DMA handling for transmit data empty interrupts as writing to the transmit FIFO data register (SSIFTDR). As a result, SSIF-2 is able not to mediate CPU and to transmit continuous data. When it becomes empty capacity of transmission FIFO data register set with SSISCR.TDES, transmission data empty interrupt is generated. Set the writing number of times according to empty capacity of transmission FIFO data register that transmission data empty interrupt shows. In a case of an error, stop receive procedure (**Section 35.5.2.5**) and then take the error procedure (**Section 35.5.2.6**).

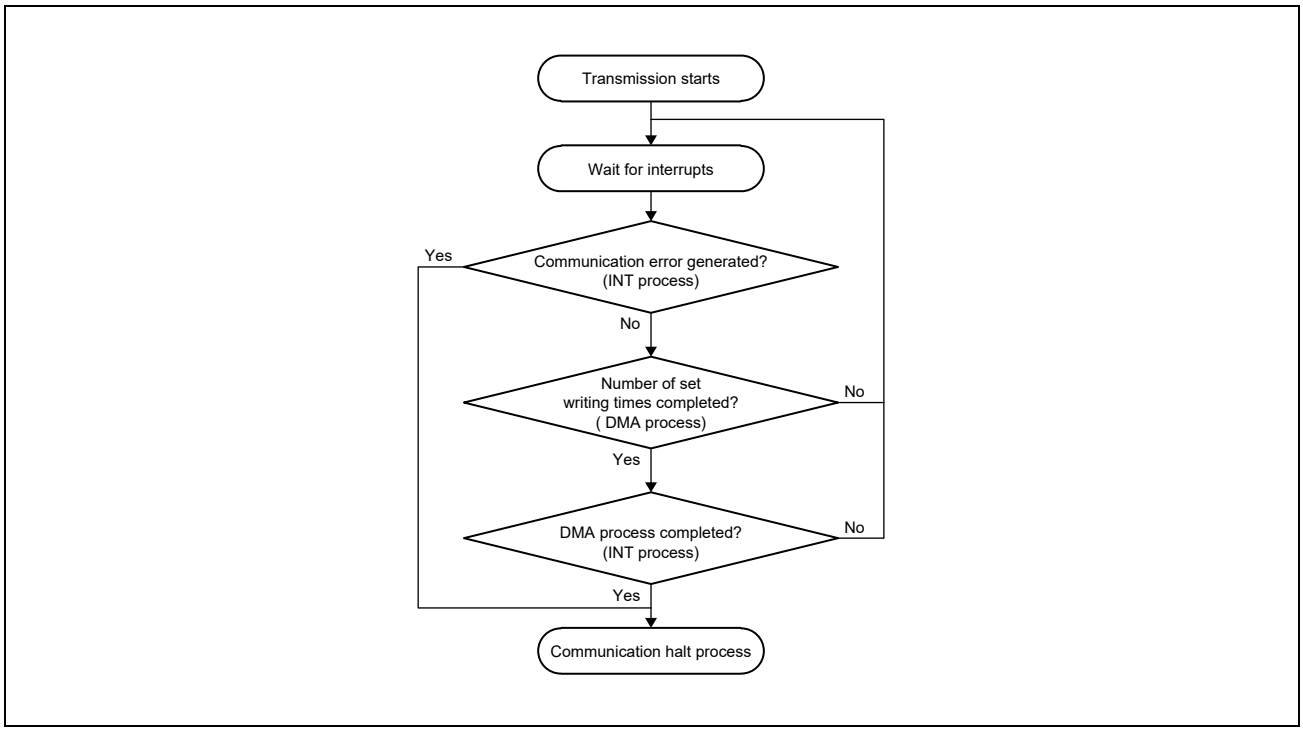


Figure 35.53 Transmission Procedure

NOTE

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe one of SSIFSR.TDE, and write it in SSIFTDR. Follow empty capacity of transmission FIFO data register set with SSISCR.TDES about the number of times written in SSIFTDR detecting 1 of SSIFSR.TDE. After writing the transmission data corresponding to the free space to SSIFTDR, polling ‘1’ of SSIFSR.TDE and repeating this enables continuous transmission operation.

35.5.2.3 Reception

Follow the reception operation procedure (**Figure 35.54**) while the reception is operating.

Reception starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1). SSIF-2 outputs a receive data full interrupt to DMA according to the setting of RDF (SSISCR.RDFS) and receive data empty interrupt (SSIFCR.RIE) being enabled. This interrupt requests reading from the receive FIFO data register (SSIFRDR). By reading from SSIFRDR at each generation of an interrupt, serial data reception is realized.

In the procedure to start communication, set DMA handling for receive data full interrupts as reading from receive FIFO data register (DDIFRDR). As a result, SSIF-2 is able not to mediate CPU and to receive continuous data. If the data capacity of reception FIFO data register set with SSISCR.RDFS is stored, receive data full interrupt is generated. Set the writing number of times according to the data capacity of reception FIFO data register that receive data full interrupt shows.

In the case of an error, stop the receive operation (**Section 35.5.2.6**) and then take the error procedure (**Section 35.5.2.6**).

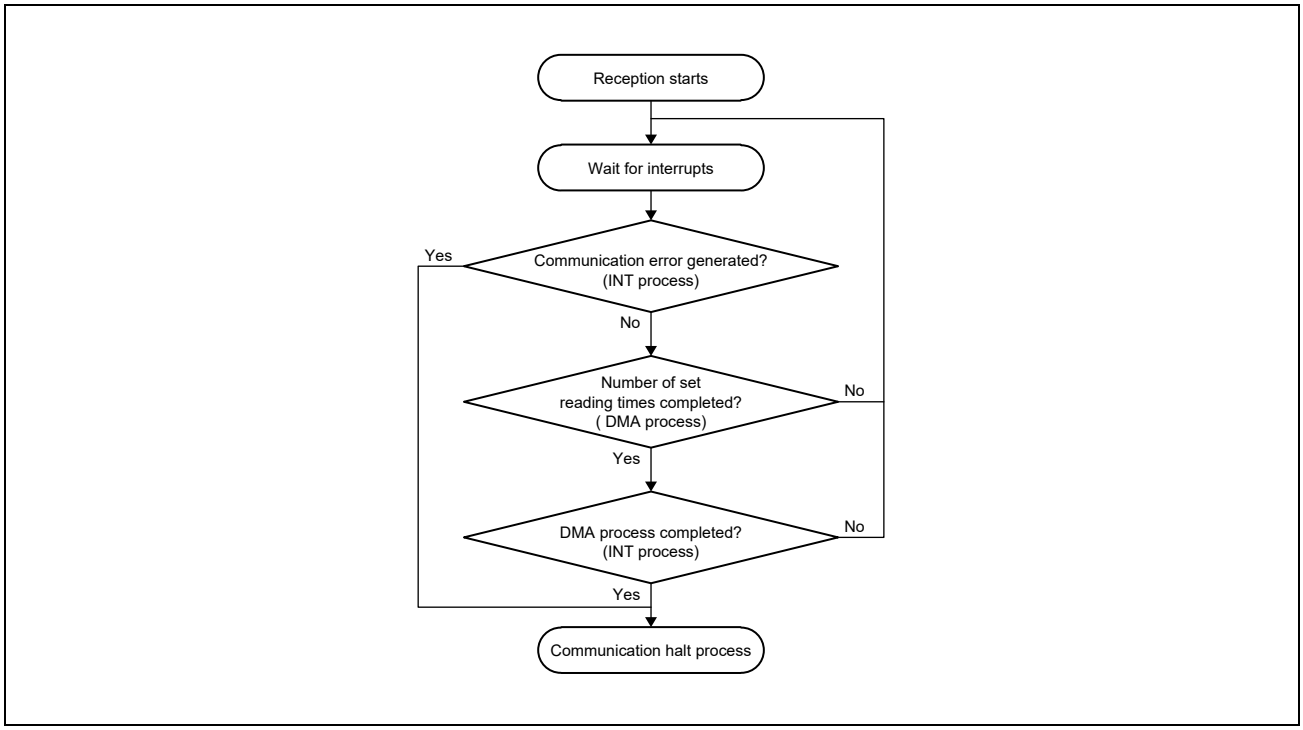

Figure 35.54 Reception Procedure

NOTE

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe 1 of SSIFSR.RDF, and read SSIFRDR. Follow the receive data capacity of reception FIFO data register set with SSISCR.RDFS about the number of times in which SSIFRDR is read detecting 1 of SSIFSR.RDF. After reading the received data from SSIFRDR, Continuous reception operation is possible by polling ‘1’ of SSIFSR.RDF and repeating this.

35.5.2.4 Transmission and Reception

Transmission and reception starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1) and while there is one or more frames of serial data in the transmit FIFO data register (SSIFTDR). The transmission and reception operation of SSIF-2 can be transmitted and received continuously by each doing the procedure for showing in the transmission operation (**Section 35.5.2.2**) and the reception operation (**Section 35.5.2.3**). As transmission and reception are independent in SSIF-2, see sections of transmission and reception respectively. See **Section 35.5.2.5, Halt Communication** to halt communication.

35.5.2.5 Halt Communication

This section describes how to halt communication of SSIF-2. **Figure 35.55** shows the procedure to halt communication. Be sure to follow the procedure.

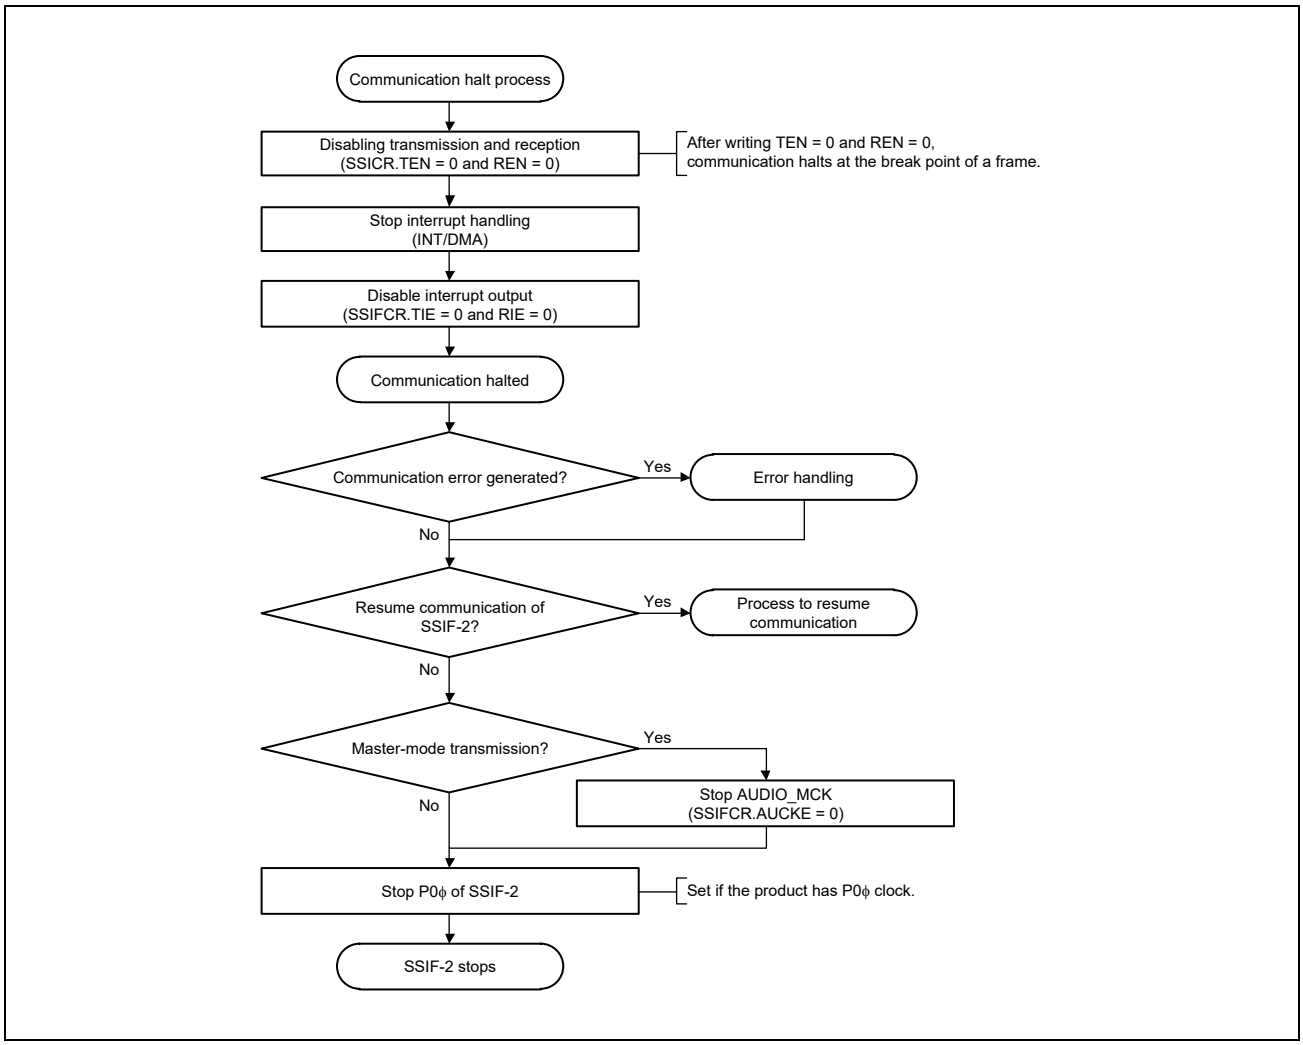

Figure 35.55 Procedure to Halt Communication (CPU Procedure)

To halt the communication of SSIF-2, supply of the following clocks are required until the SSISR.IIRQ bit indicates an idle state.

- Input clock from the SSIBCK pin when SSICR.MST = 0
- AUDIO_MCK when SSICR.MST = 1

To resume communication of SSIF-2 in the previous setting, see **Section 35.5.2.7, Resume Communication**.

NOTE

When communication of SSIF-2 is halted according to the procedure to halt communication in **Figure 35.55**, resume communication according to the procedure to start communication in **Figure 35.52**.

35.5.2.6 Error Handling

SSIF-2 has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIF-2 need to be restarted. Take the error procedure (**Figure 35.56**) according to the procedure to halt communication (**Figure 35.55**).

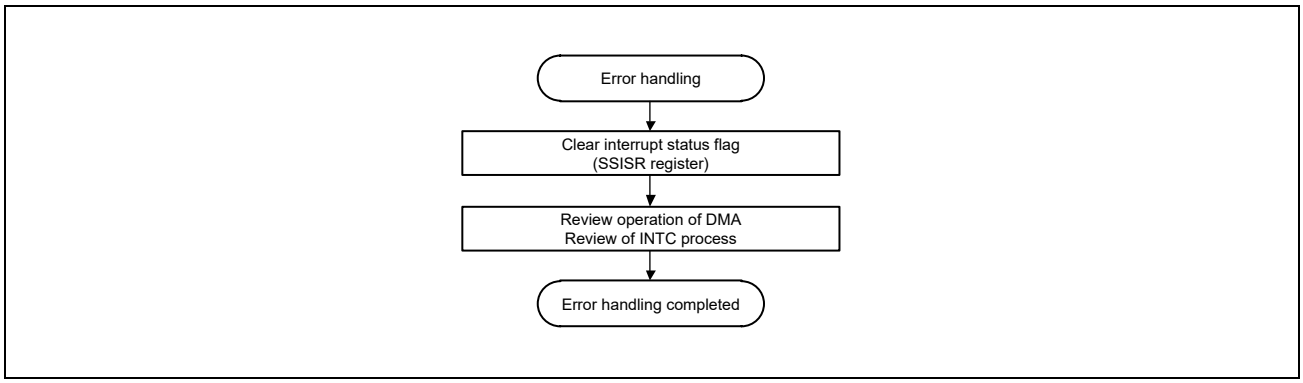

Figure 35.56 Error Handling Procedure

Four error operations are described as follows. When the interrupt output enable bit of the SSICR register is enabled and error flags are set, an error interrupt is generated. See descriptions of flags in **Section 35.4.1.2, Status Register (SSISR)** for the setting conditions of error flags.

(1) Transmit Underflow Error

In the case a transmit underflow error is generated during transmission (SSICR.TEN = 1, SSISR.IIRQ = 0), review the number of write operations to the transmit FIFO data register (SSIFTDR) according to serial data empty interrupts. After generation of a transmit underflow error, data to be transmitted from SSIF-2 are 0 output. To transmit data written to SSIFTxD pin normally, run the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**). When this error is generated, serial data is consumed as usual. To resume transmission of SSIF-2, write data from the beginning of one frame.

(2) Transmit Overflow Error

In the case a transmit overflow error is generated, review the number of write operations to the transmit FIFO data register (SSIFTDR) according to transmit data empty interrupts. Data is not written to SSIFTDR where a transmit overflow error is generated. This error is generated regardless of while the transmission is operating. To resume transmission of SSIF-2, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**). When communication is resumed, consider the lost serial data.

(3) Receive Underflow Error

In the case a receive underflow error is generated, review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. The value read from SSIFRDR is undefined where a receive underflow error is generated. This error is generated regardless of while the reception is operating. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**).

(4) Receive Overflow Error

In the case a receive overflow error is generated during reception (SSICR.REN = 1, SSISR.IIRQ = 0), review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. Data is not stored in SSIFRDR when a receive overflow error is generated. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 35.55**) and then take the error handling procedure (**Figure 35.56**).

35.5.2.7 Resume Communication

To resume communication of SSIF-2, follow the procedure shown in **Figure 35.57**. After communication is halted, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication (**Figure 35.52**). For communication after resume, see **Section 35.5.2.2** and **Section 35.5.2.3**.

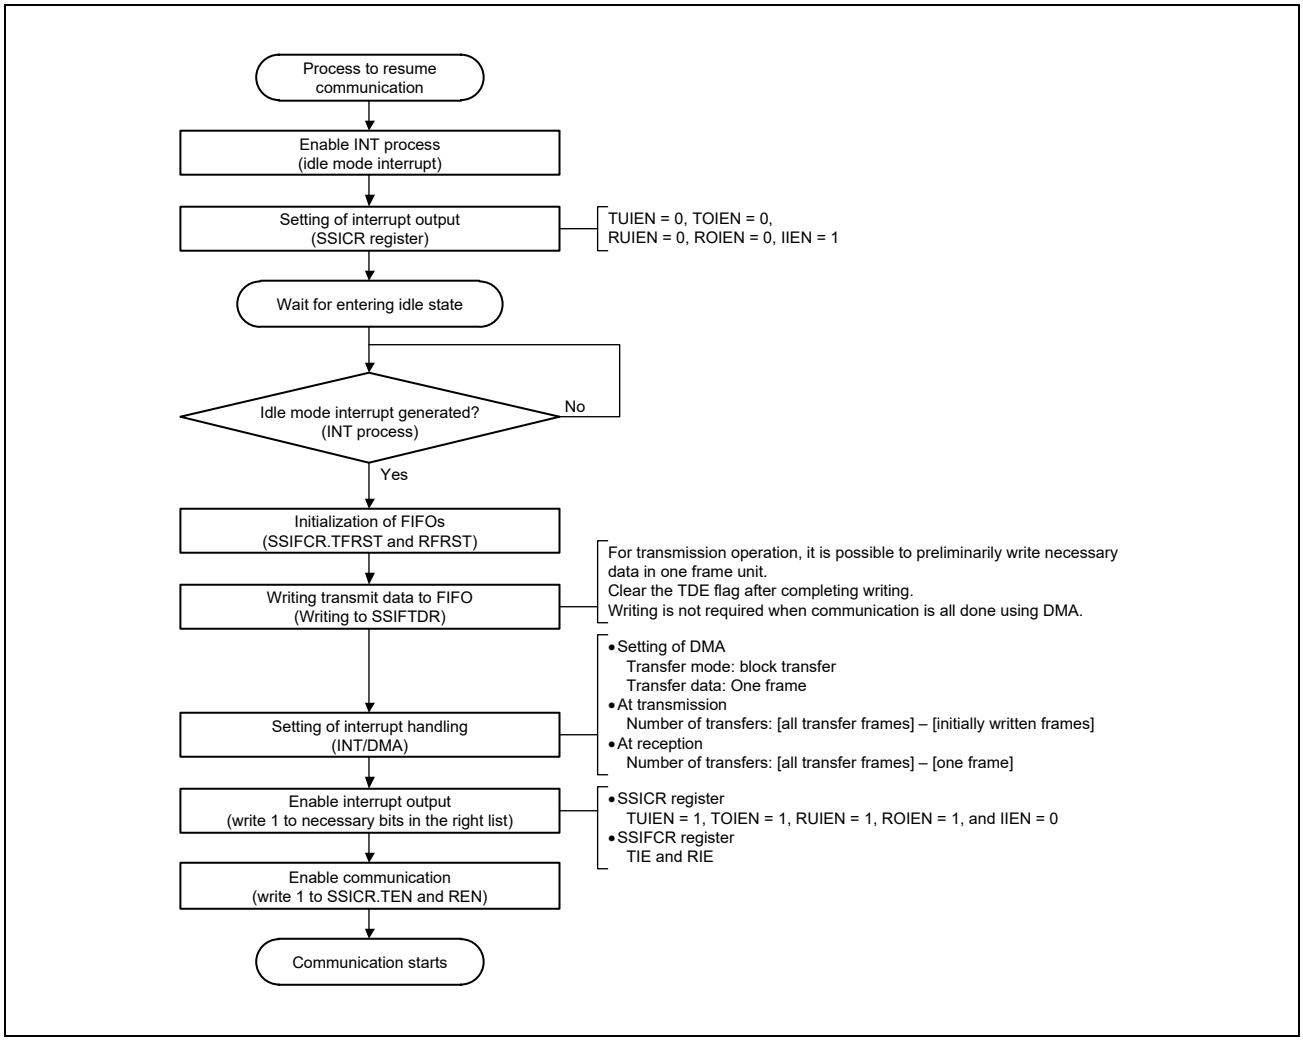

Figure 35.57 Procedure to Resume Communication (CPU Procedure)

35.5.3 Interrupt Sources

Table 35.18 lists the interrupt sources. Set enable/disable of interrupt output of each source with the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register and the TIE and RIE bits in the SSIFCR register.

Table 35.18 Interrupt Sources

Interrupt Source	Interrupt	Interrupt Flag	Interrupt Sense	DMA Activation
INT_ssif_int_req	Transmit underflow interrupt/ Transmit overflow interrupt/ Receive underflow interrupt/ Receive overflow interrupt/ Idle mode interrupt	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	Level	Not available
INT_ssif_dma_tx	Transmit data empty interrupt	SSIFSR.TDE	Edge	Available
INT_ssif_dma_rx	Receive data full interrupt	SSIFSR.RDF	Edge	Available
INT_ssif_dma_rt	Receive data full interrupt/ Transmit data empty interrupt	SSIFSR.TDE/SSIFSR.RDF	Edge	Available

35.5.3.1 INT_ssif_int_req Interrupt

This interrupt source combines five interrupts. Enable output of necessary interrupts before using SSIF-2. This interrupt moves from the flag and the output enable permission that five factors have respectively (**Figure 35.58**). To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

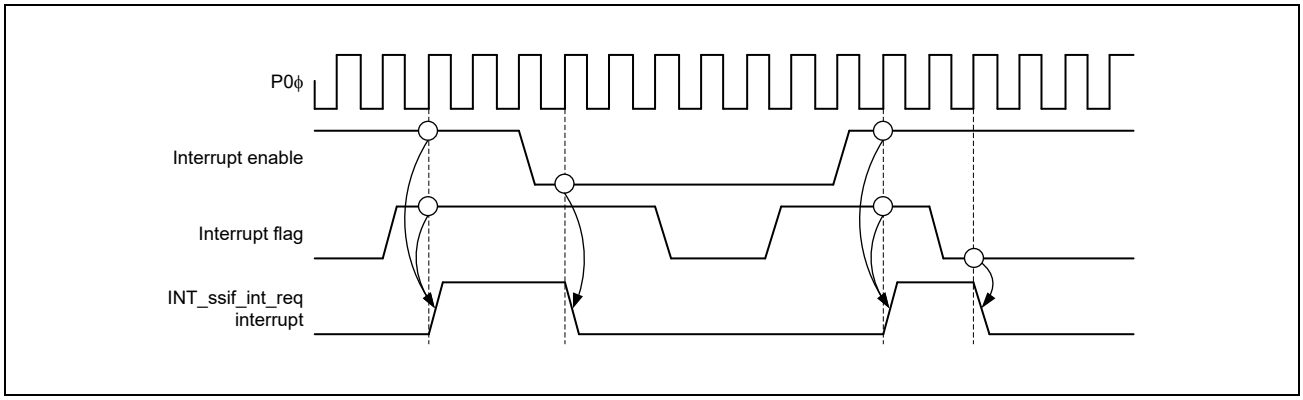

Figure 35.58 Timing Chart of the Common Interrupt Source, INT_ssif_int_req

(1) Transmit Underflow Interrupt

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. To restart transmission (SSICR.TEN = 1), enable the output of this interrupt (SSICR.TUIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**).

(2) Transmit Overflow Interrupt

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. To restart transmission (SSICR.TEN = 1), enable the output of this interrupt (SSICR.TOIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**).

(3) Receive Underflow Interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. To restart reception (SSICR.REN = 1), enable the output of this interrupt (SSICR. RUIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**).

(4) Receive Overflow Interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. To restart reception (SSICR.REN = 1), enable the output of this interrupt (SSICR. ROIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**).

(5) Idle Mode Interrupt

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. When the thing that the communication has stopped completely is confirmed, this interrupt is used (**Figure 35.57**).

35.5.3.2 INT_ssif_dma_tx Interrupt [full-duplex communication]

As the transmit data empty interrupt, a pulse interrupt is output by the following condition.

- SSIFSR.TDE and SSIFCR.TIE becomes 1.
  SSIF-2 operation: SSIFSR.TDE becomes 1 from 0 while SSIFCR.TIE = 1
  CPU operation: SSIFCR.TIE is changed to 1 from 0 while SSIFSR.TDE = 1

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable (**Figure 35.59**).

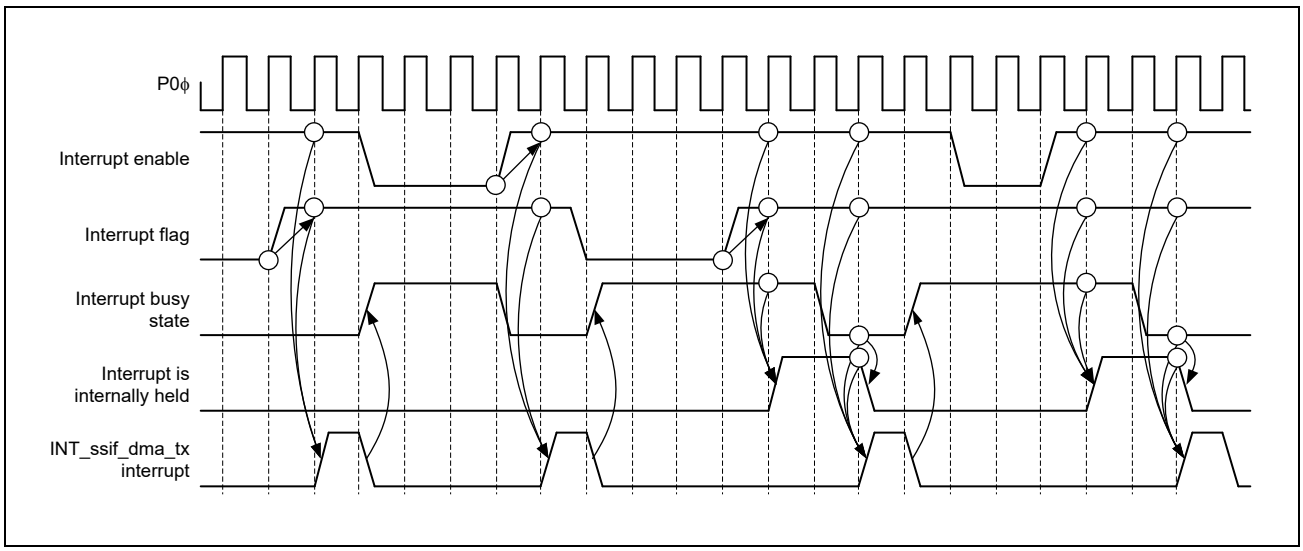

Figure 35.59 INT_ssif_dma_tx Interrupt Timing Chart

35.5.3.3 INT_ssif_dma_rx Interrupt [full-duplex communication]

As the receive data full interrupt, a pulse interrupt is output by the following condition.

- SSIFSR.RDF and SSIFCR.RIE becomes 1.
  SSIF-2 operation: SSIFSR.RDF becomes 1 from 0 while SSIFCR.RIE = 1.
  CPU operation: SSIFCR.RIE is changed to 1 from 0 while SSIFSR.RDF = 1.

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable. It operates in the same way as in **Figure 35.59**.

35.5.3.4 INT_ssif_dma_rt Interrupt [half-duplex communication]

This interrupt is output by two sources, transmit data empty interrupt and receive data full interrupt. When this interrupt is generated, read the interrupt flag and specify the interrupt source.

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable (**Figure 35.59**).

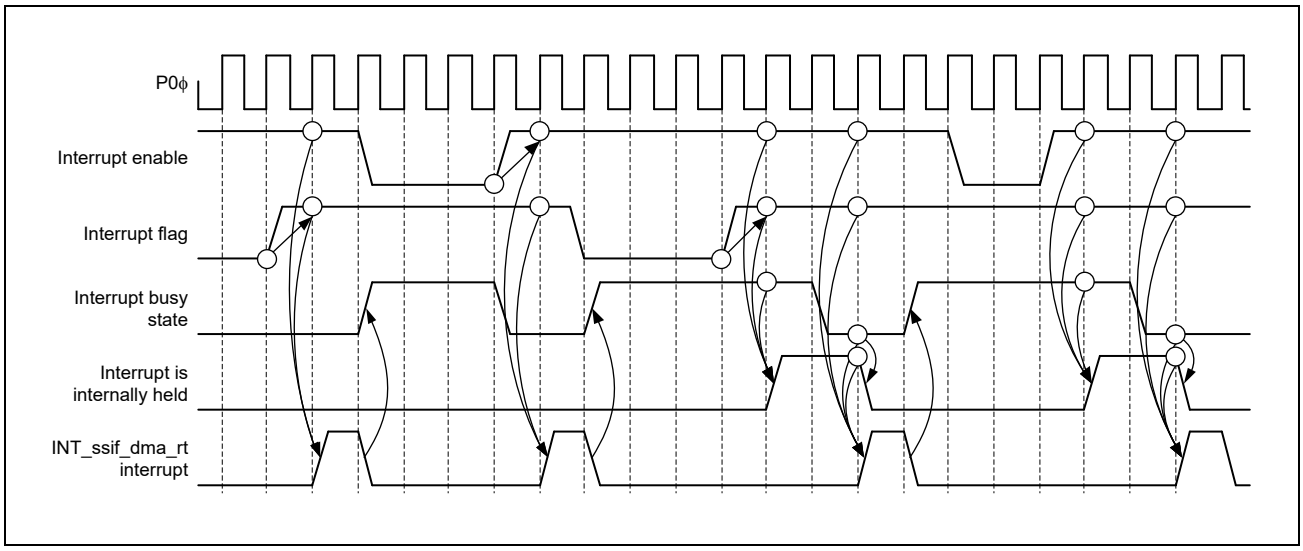

Figure 35.60 INT_ssif_dma_tx Interrupt Timing Chart

35.5.4 Software Resets

SSIF-2 has three software reset bits to reset its states.

- SSIF-2 software reset (SSIFCR.SSIRST)
- Transmit FIFO data register reset (SSICR.TFRST)
- Receive FIFO data register reset (SSIFCR.RFRST)

It explains the procedure of three software reset.

35.5.4.1 Software Reset Procedure

(1) SSIF-2 Software Reset

For the SSIF-2 software reset bit (SSIFCR.SSIRST), follow the procedure shown in **Figure 35.61**. After a reset, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication (**Figure 35.52**). See **Section 35.5.2.2, Transmission** and **Section 35.5.2.3, Reception** respectively for transmission and reception after communication is resumed.

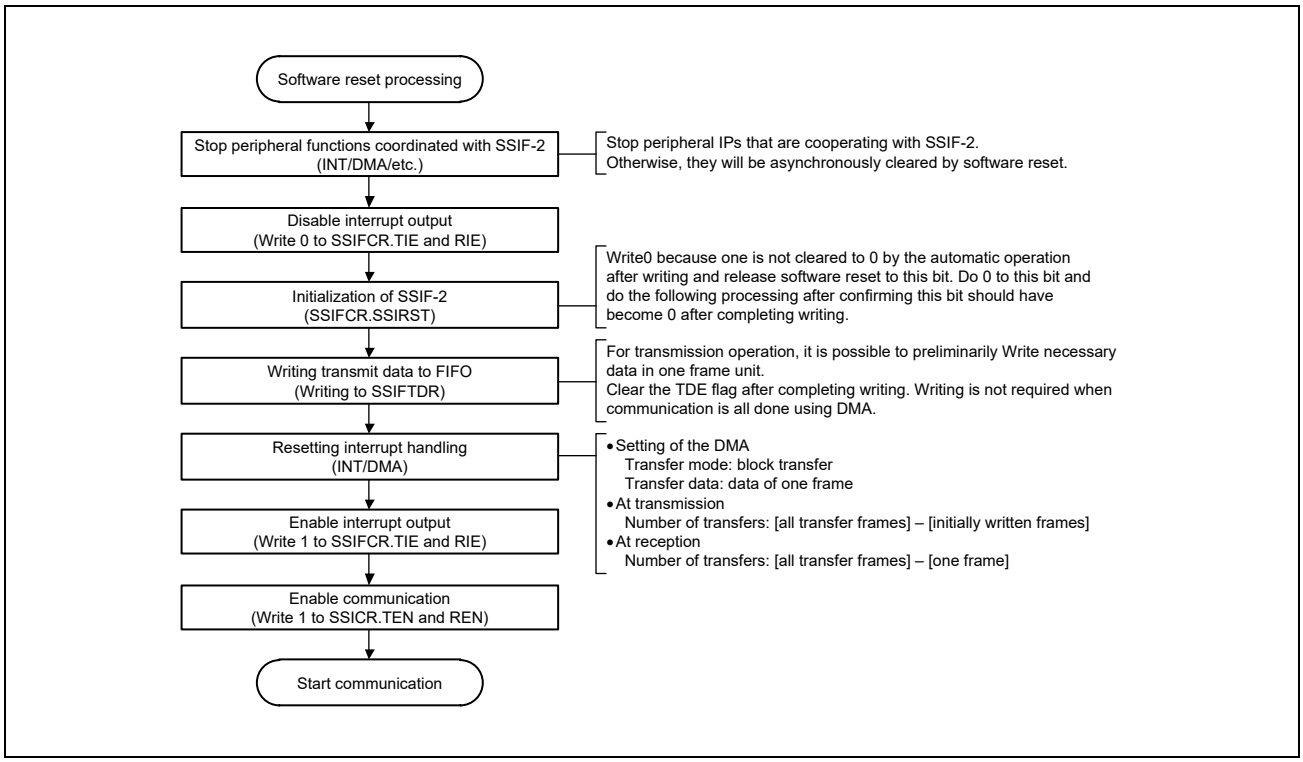

Figure 35.61 Software Reset Procedure (CPU Procedure)

(2) Transmit FIFO Data Register Reset

To initiate a transmit FIFO data register reset, follow the procedure to start communication (**Figure 35.52**) and resume communication (**Figure 35.57**).

(3) Receive FIFO Data Register Reset

To initiate a receive FIFO data register reset, follow the procedure to start communication (**Figure 35.52**) and resume communication (**Figure 35.57**).

35.6 Notes

35.6.1 Notes

35.6.1.1 Attention by Communication Using DMA

SSIF-2 assumes the DMA access as follows.

Table 35.19 Interrupt to Expect DMA Access

Communication Operation	Interrupt	DMA Access	LSI Specification	Remarks
Transmission	INT_ssif_dma_tx	Write to SSIFTDR	Full duplex transmission	
	INT_ssif_dma_rt		Half duplex transmission	
Reception	INT_ssif_dma_rx	Read SSIFRDR	Full duplex transmission	
	INT_ssif_dma_rt		Half duplex transmission	
Transmission and Reception	INT_ssif_dma_tx	Write to SSIFTDR	Full duplex transmission	
	INT_ssif_dma_rx	Read SSIFRDR	Half duplex transmission	

35.6.1.2 Notes for Slave-Mode Communication

(1) ADCKE Control

In slave-mode communication (SSICR.MST = 0), SSIF-2 needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIF-2 becomes idle, take the procedure to start communication (**Figure 35.52**) or wait for an idle state by taking the procedure to resume communication (**Figure 35.57**).

(2) SSI_RCK

SSIF-2 has the terminal SSI_RCK that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSI_RCK only as a communication start trigger.

35.6.1.3 Notes for Master-Mode Communication

(1) ADCKE Control

In master-mode communication (SSICR.MST = 1), SSIF-2 operates with the audio clock (AUDIO_MCK). To stop SSIF- 2 completely, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIF-2 becomes idle, take the procedure to start communication (**Figure 35.52**).

(2) LRCONT Control

To stop the output to the SSI_RCK pin with SSIOFR.LRCONT when SSIF-2 is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when 0 is written from 1 to SSIOFR.LRCONT. (**Figure 35.43**). Make sure that the remote device is not affected.

(3) BCKASTP Control

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIF-2 is in the idle state, note the following; By writing 0 to SSIOFR.BCKASTP while it is 1, the output stops immediately (**Figure 35.44**). So, make sure that the remote device is not affected.

NOTE

When the opposing device who is the slave needs the clock of the terminal SSI_BCK before the communication operates, it is not possible to use it.

35.6.1.4 Notes for Communication Flow

(1) When an Error Interrupt is Generated

SSIF-2 has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIF-2 need to be restarted. Take the error procedure (**Figure 35.56**) according to the procedure to halt communication (**Figure 35.55**).

(a) Transmit Underflow Error

In the case a transmit underflow error is generated during transmission (SSICR.TEN = 1, SSISR.IIRQ = 0), review the number of write operations to the transmit FIFO data register (SSIFTDR) according to serial data empty interrupts. After generation of a transmit underflow error, data to be transmitted from SSIF-2 are 0 output. To transmit data written to SSIFTxD pin normally, run the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**). When this error is generated, serial data is consumed as usual. To resume transmission of SSIF-2, write data from the beginning of one frame.

(b) Transmit Overflow Error

In the case a transmit overflow error is generated, review the number of write operations to the transmit FIFO data register (SSIFTDR) according to transmit data empty interrupts. Data is not written to SSIFTDR where a transmit

overflow error is generated. This error is generated regardless of while the transmission is operating. To resume transmission of SSIF-2, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**). When communication is resumed, consider the lost serial data.

(c) Receive Underflow Error

In the case a receive underflow error is generated, review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. The value read from SSIFRDR is undefined where a receive underflow error is generated. This error is generated regardless of while the reception is operating. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 35.55**) and then take the error procedure (**Figure 35.56**).

(d) Receive Overflow Error

In the case a receive overflow error is generated during reception (SSICR.REN = 1, SSISR.IIRQ = 0), review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. Data is not stored in SSIFRDR when a receive overflow error is generated. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 35.55**) and then take the error handling procedure (**Figure 35.56**).

(2) Transmit Data Empty Interrupt

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe one of SSIFSR.TDE, and write it in SSIFTDR. Follow empty capacity of transmission FIFO data register set with SSISCR.TDES about the number of times written in SSIFTDR detecting 1 of SSIFSR.TDE. Clear the transmission data that corresponds to empty capacity and clear the SSIFSR.TDE flag to SSIFTDR after writing. Transmission operation consecutive by the repeated thing is possible. SSIFSR.TDE is not cleared when not clearing.

(3) Receive Data Full Interrupt

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe 1 of SSIFSR.RDF, and read SSIFRDR. Follow the receive data capacity of reception FIFO data register set with SSISCR.RDFS about the number of times in which SSIFRDR is read detecting 1 of SSIFSR.RDF. Clear data that does the reception completion and clear the SSIFSR.RDF flag from SSIFRDR after reading. Reception operation consecutive by the repeated thing is possible. SSIFSR.RDF is not cleared when not clearing.

(4) Switching Transfer Modes

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm it is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

(5) Resume Communication after Halting SSIF-2

When communication of SSIF-2 is halted according to the procedure to halt communication in **Figure 35.55**, resume communication according to the procedure to resume communication in **Figure 35.52**.

35.6.1.5 Write Access Restriction

(1) SSICR Register

If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If written, the operation performed immediately after writing is not guaranteed. For example, after enabling operation, make sure that SSISR.IIRQ = 0 and after disabling operation, make sure that SSISR.IIRQ = 1.

(a) TEN Bit and REN Bit

Writing 1 to these bits, transmission starts in synchronization with start trigger. Refer to **Section 35.5.2.2, Transmission**, **Section 35.5.2.3, Reception**, and **Section 35.5.2.4, Transmission and Reception** for details. Writing 0 to these bits, transmission stops in synchronization with next frame boundary. Set 1 at the same time when you use SSIF-2 as transmission and reception. To stop communication, make sure to stop transmission and reception (TEN = 0 and REN = 0).

(2) SSICR Register

(a) Clear operation of TUIRQ and TOIRQ

After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

(b) Clear operation of RUIRQ and ROIRQ

After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

(3) Communication State

Writing to the bits with shaded area in **Table 35.20** is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Table 35.20 Bits Protected from Writing during Communication

Symbol	Address (Base+)		+0								+1

36. Sampling Rate Converter (SRC)

The sampling rate converter (SRC) handles sampling rate conversion.

36.1 Features

The following lists the features of the SRC.

■ Data format

16-bit stereo/16-bit monaural

■ Sampling rates

- Input:
  Selectable from 8 kHz, 11.025 kHz, 12 kHz, 16 kHz, 22.05 kHz, 24 kHz, 32 kHz, 44.1 kHz, and 48 kHz
- Output:
  Selectable from 8 kHz*1, 16 kHz*1, 32 kHz, 44.1 kHz, and 48 kHz

Note 1. This frequency is only available when the input sampling rate is 44.1 kHz.

■ Processing capacity

A sample output interval is a minimum of 4.62 µs (462 clock cycles at Pϕ = 100 MHz).

■ SNR

80 dB or higher

■ Five interrupt sources

Input data FIFO buffer empty, output data FIFO buffer full, output data FIFO buffer overwrite, output data FIFO buffer underflow, and conversion end

■ Two DMA transfer sources

Input data FIFO buffer empty and output data FIFO buffer full

Figure 36.1 shows the configuration of the SRC.

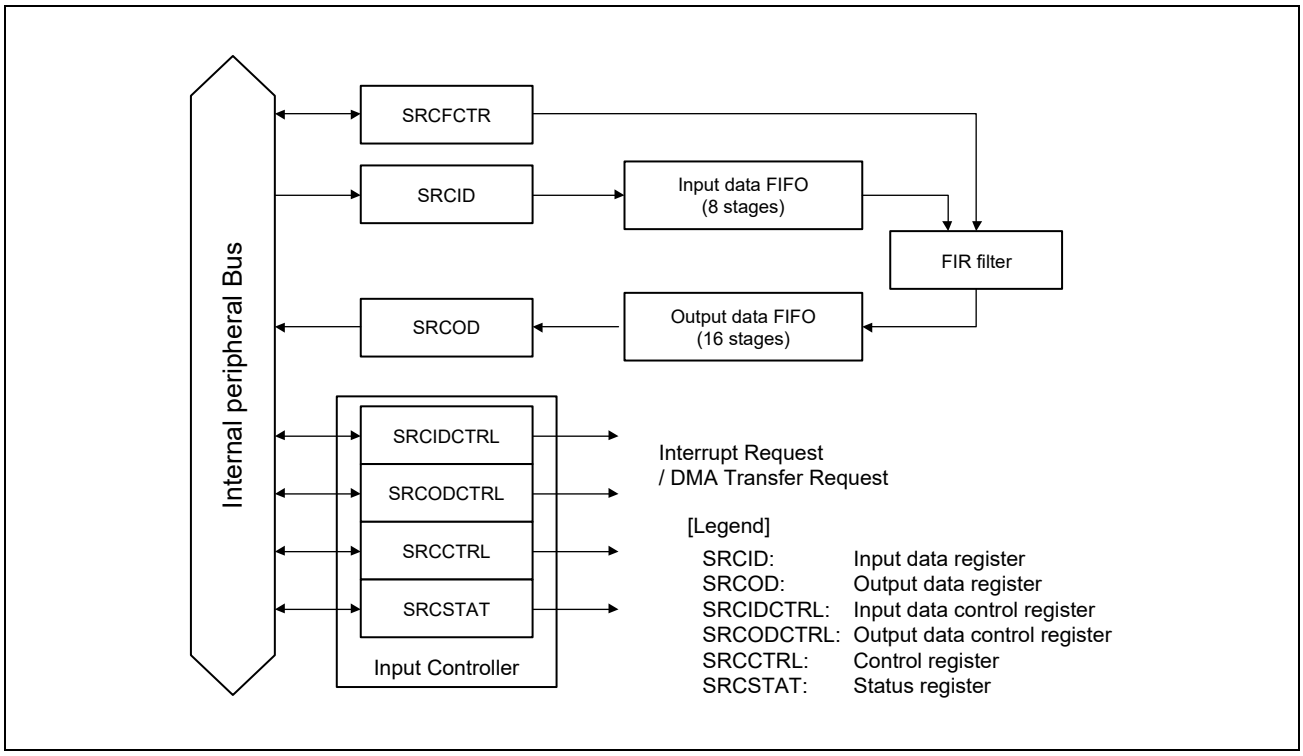

Figure 36.1 Block Diagram of SRC

36.2 Register Configuration

Table 36.1 shows the register configuration. The SRC address space is offset from the base address. The base address of SRC is as follows.

SRC base address: H'0_100A_0000 (Overall Address Space)

SRC base address: H'400A_0000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)

SRC base address: H'500A_0000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 36.1 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Higher-order bits in the input data register	SRCID*3	R/W	H'0000	H'7000	16
Lower-order bits in the input data register			H'0000	H'7002	16
Higher-order bits in the output data register	SRCOD*4	R	H'0000	H'7004	16
Lower-order bits in the output data register			H'0000	H'7006	16
Input data control register	SRCIDCTRL	R/W	H'0000	H'7008	16
Output data control register	SRCODCTRL	R/W	H'0000	H'700A	16
Control register	SRCCTRL	R/W	H'0000	H'700C	16
Status register	SRCSTAT	R/(W)*1	H'0002	H'700E	16
Filter coefficient tables	SRCFCTRs	R/W	Undefined	H'0000 to H'56BF	32*2

Note 1. Bits 15 to 6 and 4 are read-only. Only 0 can be written to bits 5, 3, 1 and 0 after having read as 1.

Note 2. The actual width of read and written data is 22 bits.

Note 3. For the input data register (SRCID), the 16 higher-order bits and the 16 lower-order bits must be written in that order.

Note 4. For the output data register (SRCOD), the 16 higher-order bits and the 16 lower-order bits must be read in that order.

36.3 Register Descriptions

36.3.1 Input Data Register (SRCID)

SRCID is a 32-bit readable and writable register that is used to input the data before sampling rate conversion. All the bits are read as 0. The data input to SRCID is stored in the 8-stage input data FIFO buffer. When the number of data units in the input data FIFO buffer is 8, writing to SRCID has no effect.

For stereo data, bits 31 to 16 are for Lch data, and bits 15 to 0 are for Rch data. For monaural data, data in bits 31 to 16 is valid, and data in bits 15 to 0 is invalid.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The data subject to sampling rate conversion is aligned differently depending on the IED bit setting in SRCIDCTRL. **Table 36.2** shows the relationship between the IED bit setting and data alignment.

Table 36.2 Alignment of Data before Sampling Rate Conversion

IED	Left channel [15:8]	Left channel [7:0]	Right channel [15:8]*1	Right channel [7:0]*1
0	SRCID[31:24]	SRCID[23:16]	SRCID[15:8]	SRCID[7:0]
1	SRCID[23:16]	SRCID[31:24]	SRCID[7:0]	SRCID[15:8]

Note 1. When processing monaural data, the data in these bits is invalid.

36.3.2 Output Data Register (SRCOD)

SRCOD is a 32-bit read-only register used to output the data after sampling rate conversion. The data in the output data FIFO buffer is read through SRCOD. When the number of data units in the 16-stage output data FIFO buffer is zero after the start of conversion, the value previously read is read again.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

The data in SRCOD is aligned differently depending on the OCH and OED bit setting in SRCODCTRL. **Table 36.3** shows the correspondence between the OCH and OED bit setting and data alignment in SRCOD.

Table 36.3 Alignment of Data in SRCOD

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:7]	SRCOD[7:0]
0	0	Left channel [15:8]	Left channel [7:0]	Right channel [15:8]*2	Right channel [7:0]*2
	1	Left channel [7:0]	Left channel [15:8]	Right channel [7:0]*2	Right channel [15:8]*2
1*1	0	Right channel [15:8]	Right channel [7:0]	Left channel [15:8]	Left channel [7:0]
	1	Right channel [7:0]	Right channel [15:8]	Left channel [7:0]	Left channel [15:8]

Note 1. When processing monaural data, do not set the bit to 1.

Note 2. When processing monaural data, the data in these bits is invalid.

36.3.3 Input Data Control Register (SRCIDCTRL)

SRCIDCTRL is a 16-bit readable and writable register that specifies the endian format of input data, enables or disables the interrupt requests, and specifies the triggering number of data units.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IED	IEN	—	—	—	—	—	—	IFTRG[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	IED	0	R/W	Input Data Endian Specifies the endian format of the input data. 0: Little endian 1: Big endian *Note*: This bit must be rewritten while the setting of the SRCEN bit is 0.
8	IEN	0	R/W	Input Data FIFO Buffer Empty Interrupt Enable Enables or disables the input data FIFO buffer empty interrupt request to be issued when the number of data units in the input FIFO buffer becomes equal to or smaller than the triggering number specified by the IFTRG1 and IFTRG0 bits, thus resulting in the IINT bit in the status register (SRCSTAT) being set to 1. 0: Input data FIFO buffer empty interrupt is disabled. 1: Input data FIFO buffer empty interrupt is enabled.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	IFTRG[1:0]	00	R/W	Input FIFO Buffer Data Triggering Number Specifies the condition in terms of the number on which the IINT bit in the status register (SRCSTAT) is set to 1. When the number of data units in the input FIFO buffer becomes equal to or smaller than the triggering number listed below, the IINT bit is set to 1. 00: 0 01: 2 10: 4 11: 6

36.3.4 Output Data Control Register (SRCODCTRL)

SRCODCTRL is a 16-bit readable and writable register that specifies whether to exchange the channels for the output data, specifies the endian format of output data, enables or disables the interrupt requests, and specifies the triggering number of data units.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OCH	OED	OEN	—	—	—	—	—	—	OFTRG[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	OCH	0	R/W	Output Data Channel Exchange Specifies whether to exchange the channels for the output data register (SRCOD). 0: Does not exchange the channels (the same order as data input) 1: Exchanges the channels (the opposite order from data input) *Note 1.* When processing monaural data, do not set this bit to 1. *Note 2.* This bit must be rewritten while the setting of the SRCEN bit is 0.
9	OED	0	R/W	Output Data Endian Specifies the endian format of the output data. 0: Little endian 1: Big endian *Note*: This bit must be rewritten while the setting of the SRCEN bit is 0.
8	OEN	0	R/W	Output Data FIFO Buffer Full Interrupt Enable Enables or disables the output data FIFO buffer full interrupt request to be issued when the number of data units in the output FIFO buffer becomes equal to or greater than the number specified by the OFTRG1 and OFTRG0 bits, thus resulting in the OINT bit in the status register (SRCSTAT) being set to 1. 0: Output data FIFO buffer full interrupt is disabled. 1: Output data FIFO buffer full interrupt is enabled.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	OFTRG[1:0]	00	R/W	Output FIFO Buffer Data Trigger Number Specifies the condition in terms of the number on which the OINT bit in the status register (SRCSTAT) is set to 1. When the number of data units in the output FIFO buffer becomes equal to or greater than the number listed below, the OINT bit is set to 1. 00: 1 01: 4 10: 8 11: 12

36.3.5 Control Register (SRCCTRL)

SRCCTRL is a 16-bit readable and writable register that enables or disables access to the filter coefficient tables, enables or disables module operation, enables or disables the interrupt requests, specifies processing to flush or clear the internal working memory, and sets the input and output sampling rates.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FICRAE	—	CEEN	SRCEN	UDEN	OVEN	FL	CL	IFS[3:0]				—	OFS[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	FICRAE	0	R/W	Access to the Filter Coefficient Tables Enable Enables or disables reading from and writing to the filter coefficient table RAMs. 0: Disables reading from and writing to the filter coefficient table RAMs. 1: Enables reading from and writing to the filter coefficient table RAMs. *Note*: This bit must be rewritten while the setting of the SRCEN bit is 0.
14	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	CEEN	0	R/W	Conversion End Interrupt Enable Enables or disables the conversion end interrupt to be generated when the CEF bit in SRCSTAT is set to 1 after flush processing is completed and all the output data is read. 0: Disables conversion end interrupt requests. 1: Enables conversion end interrupt requests. *Note*: For details of flush processing, see the description of the FL bit in this register.
12	SRCEN	0	R/W	Module Enable Enables or disables this module operation. Writing 1 while SRCEN = 0 clears the internal working memory. 0: Disables this module operation. 1: Enables this module operation. *Note*: When SRCEN = 1, do not change the settings of the following bits. Register / Bit / Bit Name SRCIDCTRL / 9 / IED SRCODCTRL / 10, 9 / OCH, OED SRCCTRL / 15, 7 to 4, 2 to 0 / FICRAE, IFS[3:0], OFS[2:0]
11	UDEN	0	R/W	Output Data FIFO Buffer Underflow Interrupt Enable Enables or disables the output data FIFO buffer underflow interrupt to be generated when output data FIFO buffer is read and the UDF bit in SRCSTAT is set to 1 while the number of data units in the output data FIFO buffer is zero. 0: Disables output data FIFO buffer underflow interrupt requests. 1: Enables output data FIFO buffer underflow interrupt requests.

Bit	Bit Name	Initial Value	R/W	Description
10	OVEN	0	R/W	Output Data FIFO Buffer Overwrite Interrupt Enable Enables or disables the output data FIFO buffer overwrite interrupt request to be issued when the conversion for the next data has been completed while the number of data units in the output FIFO buffer is eight, thus setting the OVF bit in the status register (SRCSTAT) to 1. 0: Output data FIFO buffer overwrite interrupt is disabled. 1: Output data FIFO buffer overwrite interrupt is enabled. • When OVEN = 1: Conversion processing is stopped until the OVF bit is cleared by the CPU accessing to SRCSTAT when the output data FIFO buffer overwrite interrupt is generated. At this time, conversion result writing to the output data FIFO buffer is also stopped. • OVEN = 0: The OVF bit is automatically cleared when the output data FIFO buffer has space, and conversion processing can be continued.
9	FL	0	R/W	Internal Working Memory Flush Writing 1 to this bit starts converting the sampling rate of all the data in the input FIFO buffer, input buffer memory, and intermediate memory (i.e., flush processing). After all external input data are eliminated, sampling rate conversion processing proceeds for the data left in the internal memory. This bit is always read as 0. When SRCEN = 0, writing 1 to this bit does not trigger flush processing. In addition, when 1 is written to the FL bit while the number of data units in the input buffer memory is less than the values shown in **Table 36.6**, valid output data cannot be received. Thus the internal working memory is cleared without triggering the flush processing.
8	CL	0	R/W	Internal Working Memory Clear Writing 1 to this bit clears the input FIFO buffer, output FIFO buffer, input buffer memory, intermediate memory, and accumulator, after which this bit is cleared to 0. This bit is always read as 0. Even when SRCEN = 0, writing 1 to this bit clears the processing.
7 to 4	IFS[3:0]	0000	R/W	Input Sampling Rate Specifies the input sampling rate. 0000: 8.0 kHz 0001: 11.025 kHz 0010: 12.0 kHz 0011: Setting prohibited 0100: 16.0 kHz 0101: 22.05 kHz 0110: 24.0 kHz 0111: Setting prohibited 1000: 32.0 kHz 1001: 44.1 kHz 1010: 48.0 kHz 1011: Setting prohibited 1100: Setting prohibited 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited
3	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	OFS[2:0]	000	R/W	Output Sampling Rate Specifies the output sampling rate. 000: 44.1 kHz 001: 48.0 kHz 010: 32.0 kHz 011: Setting prohibited 100: 8.0 kHz*1 101: 16.0 kHz*1 110: Setting prohibited 111: Setting prohibited *Note 3.* This setting of OFS[2:0] is only valid when the setting of IFS[3:0] is 1001.

After flush processing has been completed, the number of output data units obtained as a result of conversion can be calculated by using the following formula.

$$\frac{\text{Number of output data units} - 1}{\text{Output sampling rate}} = \frac{\text{Number of input data units} \times \text{n} - 1}{\text{Input sampling rate} \times \text{n}}$$

$$\text{Number of output data units} = \left[(\text{Number of input data units} \times \text{n} - 1) \times \frac{\text{Output sampling rate}}{\text{Input sampling rate} \times \text{n}}\right] + 1$$

Table 36.4 Values of the n in the Formula Above

OFS Setting (Output Sampling Rate [kHz])	IFS Setting (Input Sampling Rate [kHz])								
	0000 (8.0)	0001 (11.025)	0010 (12.0)	0100 (16.0)	0101 (22.05)	0110 (24.0)	1000 (32.0)	1001 (44.1)	1010 (48.0)
000 (44.1)	6	4	4	3	2	2	3	—	1
001 (48.0)	6	4	4	3	2	2	3	1	—
010 (32.0)	4	8	4	2	4	2	—	2	1
100 (8.0)	—	—	—	—	—	—	—	1	—
101 (16.0)	—	—	—	—	—	—	—	1	—

Conversion processing by this module does not start and thus output data are not obtained until the specified number of data units have been input. The minimum number of input data units required for both obtaining the first output data and performing flush processing depends on the IFS and OFS bit settings.

Table 36.5 and **Table 36.6** show the relation between the settings of the IFS and OFS bits and the number of input data units required.

Table 36.5 Relation between Sampling Rate Settings and Number of Initial Input Data Units Required

OFS Setting (Output Sampling Rate [kHz])	IFS Setting (Input Sampling Rate [kHz])								
	0000 (8.0)	0001 (11.025)	0010 (12.0)	0100 (16.0)	0101 (22.05)	0110 (24.0)	1000 (32.0)	1001 (44.1)	1010 (48.0)
000 (44.1)	38	40	40	43	48	48	43	—	63
001 (48.0)	38	40	40	43	48	48	43	32	—
010 (32.0)	40	37	40	48	40	48	—	48	63
100 (8.0)	—	—	—	—	—	—	—	63	—
101 (16.0)	—	—	—	—	—	—	—	63	—

Table 36.6 Relation between Sampling Rate Settings and Number of Input Data Units Required for Flush Processing

000 (44.1)	27	24	24	22	16	16	22	—	1
001 (48.0)	27	24	24	22	16	16	22	32	—
010 (32.0)	24	29	24	16	24	16	—	16	1
100 (8.0)	—	—	—	—	—	—	—	1	—
101 (16.0)	—	—	—	—	—	—	—	1	—

36.3.6 Status Register (SRCSTAT)

SRCSTAT is a 16-bit readable and writable register that indicates the number of data units in the input and output data FIFO buffers, whether the various interrupt sources have been generated or not, and the flush processing status.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFDN[4:0]					IFDN[3:0]				—	CEF	FLF	UDF	OVF	IINT	OINT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R/(W)*1	R	R/(W)*1	R/(W)*1	R/(W)1*	R/(W)1*

Note 3. Only 0 can be written after having read as 1.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	OFDN[4:0]	00000	R	Output FIFO Buffer Data Count Indicates the number of data units in the output FIFO buffer.
10 to 7	IFDN[3:0]	0000	R	Input FIFO Buffer Data Count Indicates the number of data units in the input FIFO buffer.
6	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	CEF	0	R/(W) *1	Conversion End Flag Indicates that all the output data is read after flush processing is completed. [Clearing conditions] • 0 has been written to the CEF bit after reading CEF = 1 • 1 has been written to the CL bit in SRCCTRL • 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0 [Setting condition] • The number of data units in the output data FIFO buffer is zero on completion of flush processing
4	FLF	0	R	Flush Processing Status Flag Indicates whether flush processing is in progress or not. [Clearing conditions] • Flush processing has been completed • 1 has been written to the CL bit in SRCCTRL • 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0 [Setting condition] • 1 has been written to the FL bit in SRCCTRL Note that this bit will never be set when flush processing is not performed.
3	UDF	0	R/(W) *1	Output FIFO Buffer Underflow Interrupt Request Flag Indicates that the output data FIFO buffer is read when the number of data units in the output data FIFO buffer is zero. [Clearing conditions] • 0 has been written to the UDF bit after reading UVF = 1 • 1 has been written to the CL bit in SRCCTRL • 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0 [Setting condition] • The output data FIFO buffer is read while the number of data units in the output FIFO buffer is zero

Bit	Bit Name	Initial Value	R/W	Description
2	OVF	0	R/(W) *1	Output Data FIFO Buffer Overwrite Interrupt Request Flag Indicates that the sampling rate conversion for the next data has been completed when the output data FIFO buffer is full. The conversion is stopped until the OVF flag is cleared. [Clearing conditions] • 0 has been written to the OVF bit after reading OVF = 1 while the OVEN bit in SRCCTRL is 1 • The number of data units in the output FIFO buffer decreases after reading SRCOD while the OVEN bit in SRCCTRL is 0, that is, empty space is available in the output FIFO buffer • 1 has been written to the CL bit in SRCCTRL • 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0 [Setting condition] • The sampling rate conversion for the next data has been completed when the output FIFO buffer is full
1	IINT	1	R/(W) *1	Input Data FIFO Buffer Empty Interrupt Request Flag Indicates that the number of data units in the input FIFO buffer has become equal to or smaller than the triggering number specified by the IFTRG[1:0] bits in the input data control register (SRCIDCTRL). [Clearing conditions] • 0 has been written to the IINT bit after reading IINT = 1 • Handling of the last transfer by DMA transfer [Setting conditions] • The number of data units in the input FIFO buffer has become equal to or smaller than the specified triggering number • 1 has been written to the CL bit in SRCCTRL • 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0
0	OINT	0	R/(W) *1	Output Data FIFO Buffer Full Interrupt Request Flag Indicates that the number of data units in the output FIFO buffer has become equal to or greater than the triggering number specified by the OFTRG[1:0] bits in the output data control register (SRCODCTRL). [Clearing conditions] • 0 has been written to the OINT bit after reading OINT = 1 • Handling of the last transfer by DMA transfer • 1 has been written to the CL bit in SRCCTRL • 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0 [Setting condition] • The number of data units in the output FIFO buffer has become equal to or greater than the specified triggering number

Note 1. Only 0 can be written after having read as 1.

36.3.7 Filter Coefficient Tables (SRCFCTRs)

SRCFCTRs are 32-bit readable and writable random access memory (RAMs) that hold the filter coefficients to be used in the sampling rate conversion processing. The peripheral bus only has access to the RAMs when the FICRAE and SRCEN bits in the control register (SRCCTRL) are set to 1 and 0, respectively. Bits 31 to 22 are reserved and always read as 0. Bits 21 to 0 are used as the register that holds filter coefficient values, of which the initial values are undefined.

Each filter coefficient table can only hold 22 bits × 5552 words of coefficient data. The sampling rate conversion operation and its characteristics are only guaranteed when the separately provided coefficient data are used.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	SRCFCOE[21:16]					
Initial Value	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

	SRCFCOE[15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

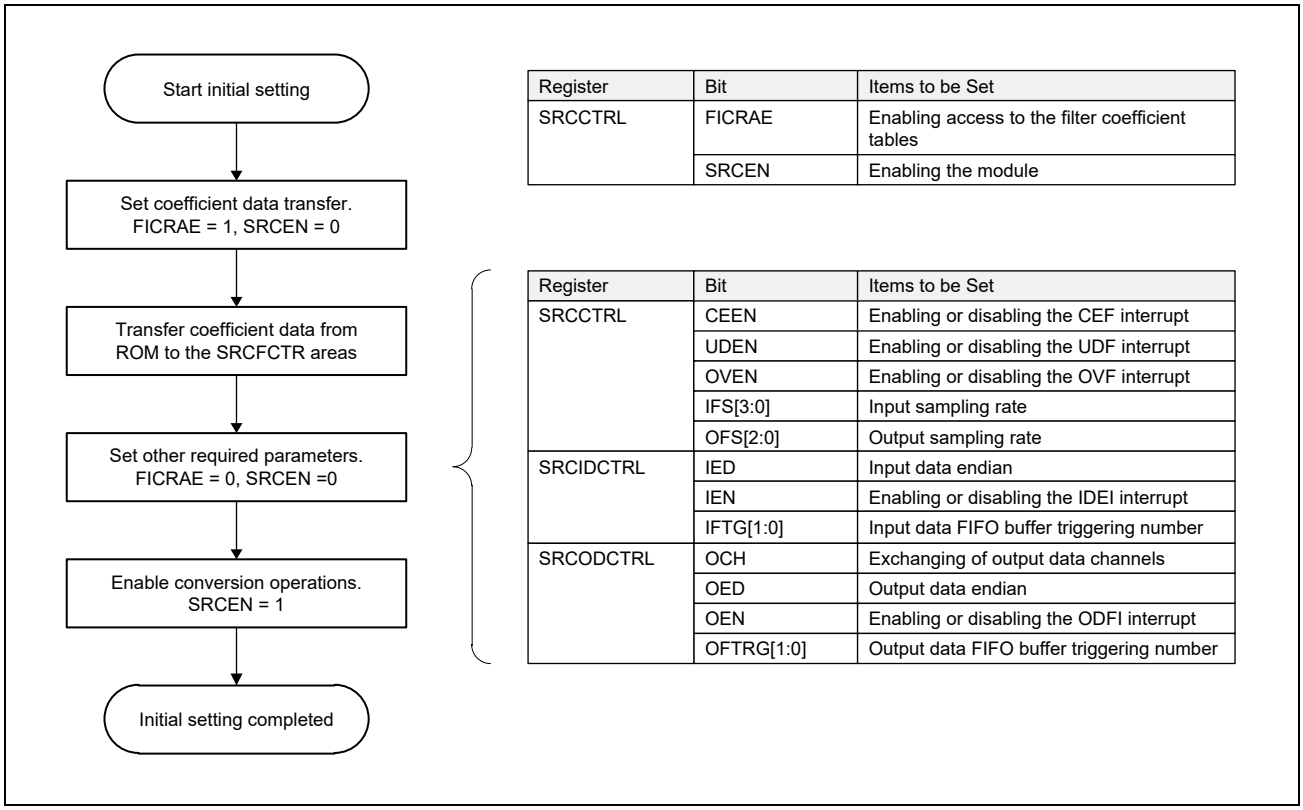
x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21 to 0	SRCFCOE [21:0]	Undefined	R/W	Filter coefficient tables

36.4 Operation

36.4.1 Initial Setting

Figure 36.2 shows a sample flowchart for initial setting. After the reset release and before conversion operations in the SRC start, the filter coefficient data stored in a medium such as flash memory (ROM) must be transferred to the filter coefficient tables (SRCFCTRs). When the coefficient data have already been stored in the filter coefficient tables, the required parameters can be set immediately.



Register	Bit	Items to be Set
SRCCTRL	FICRAE	Enabling access to the filter coefficient tables
	SRCEN	Enabling the module

Register	Bit	Items to be Set
SRCCTRL	CEEN	Enabling or disabling the CEF interrupt
	UDEN	Enabling or disabling the UDF interrupt
	OVEN	Enabling or disabling the OVF interrupt
	IFS[3:0]	Input sampling rate
	OFS[2:0]	Output sampling rate
SRCIDCTRL	IED	Input data endian
	IEN	Enabling or disabling the IDEI interrupt
	IFTG[1:0]	Input data FIFO buffer triggering number
SRCODCTRL	OCH	Exchanging of output data channels
	OED	Output data endian
	OEN	Enabling or disabling the ODFI interrupt
	OFTRG[1:0]	Output data FIFO buffer triggering number

Figure 36.2 Sample Flowchart for Initial Setting

36.4.2 Data Input

Figure 36.3 is a sample flowchart for data input.

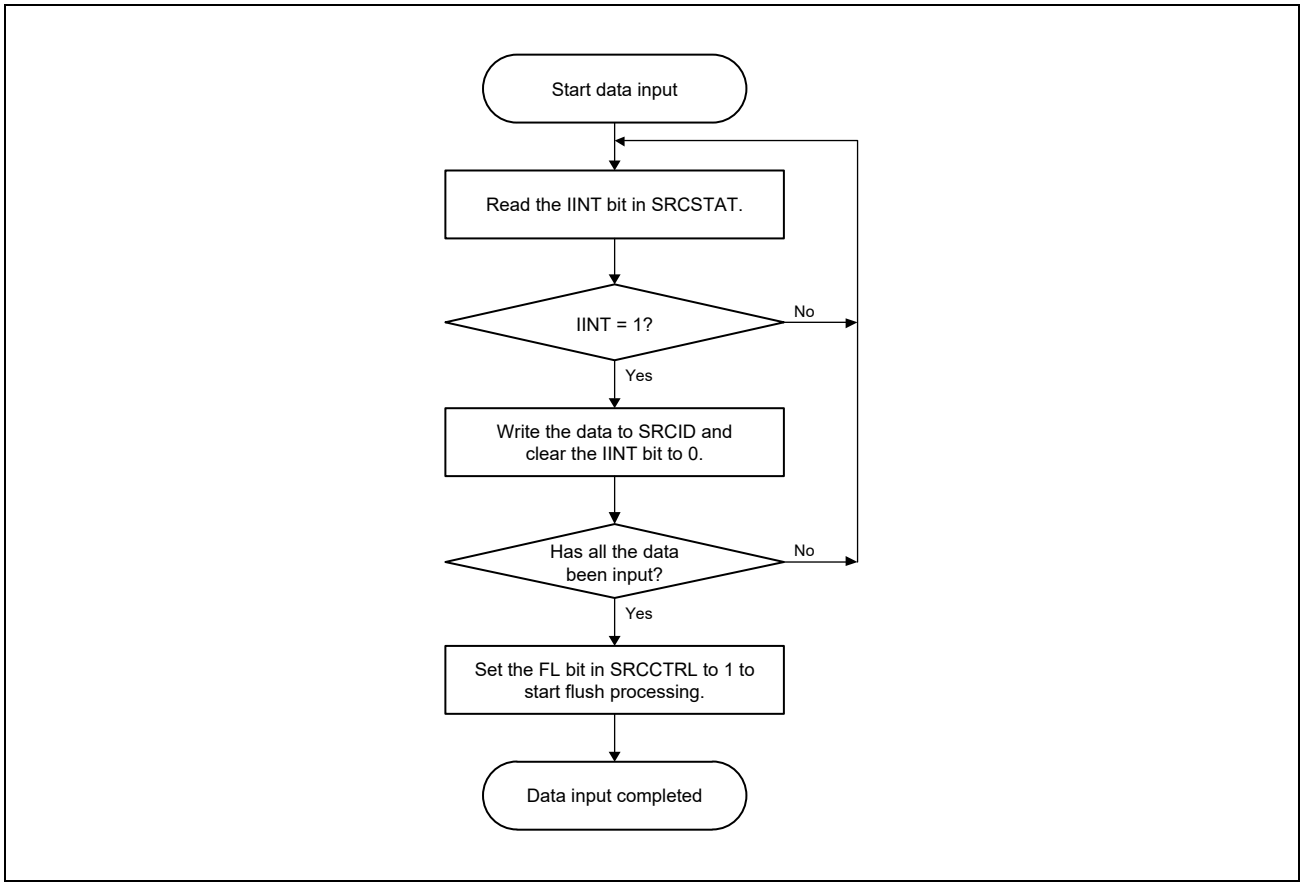


Figure 36.3 Sample Flowchart for Data Input

(1) When Interrupts are Issued to CPU

1. Set the IEN bit in SRCIDCTRL to 1.
2. When the IINT bit in SRCSTAT is set to 1, an IDEI interrupt request is issued. In the interrupt processing routine, read the IINT bit and confirm that it is 1, write data to SRCID. Then return from the interrupt processing routine.
3. Transfer the data by repeating step 2 as many times as required.
4. When all data have been input, write 1 to the FL bit in SRCCTRL.

(2) When Interrupts are Used to Activate Direct Memory Access Controller

1. Assign the IDEI interrupt request of this module to one channel of the direct memory access controller.
2. Set the IEN bit in SRCIDCTRL to 1.
3. When the IINT bit in SRCSTAT is set to 1, an IDEI interrupt request, that is, a DMA transfer request, is issued thus activating the direct memory access controller. When the direct memory access controller has written data to the SRCID thus resulting in the last data unit having been written, the IINT bit is cleared to 0.
4. Transfer the data by repeating step 3 as many times as required.
5. When all data have been input, write 1 to the FL bit in SRCCTRL.

NOTE

The number of stages of the input FIFO buffer is eight. Moreover, the possible number of data units that can be transferred in response to an IDEI interrupt request, that is, the number of empty FIFO buffer stages, depends on the setting of the IFTRG[1:0] bits in SRCCTRL. As the input FIFO buffer has no functionality to avoid or detect being overwritten, the data in it will be destroyed when it is overwritten. The number of contiguous data units to be transferred by DMA transfer, therefore, must be set in consideration of the setting of the IFTRG[1:0] bits.

36.4.3 Data Output

Figure 36.4 is a sample flowchart for data output.

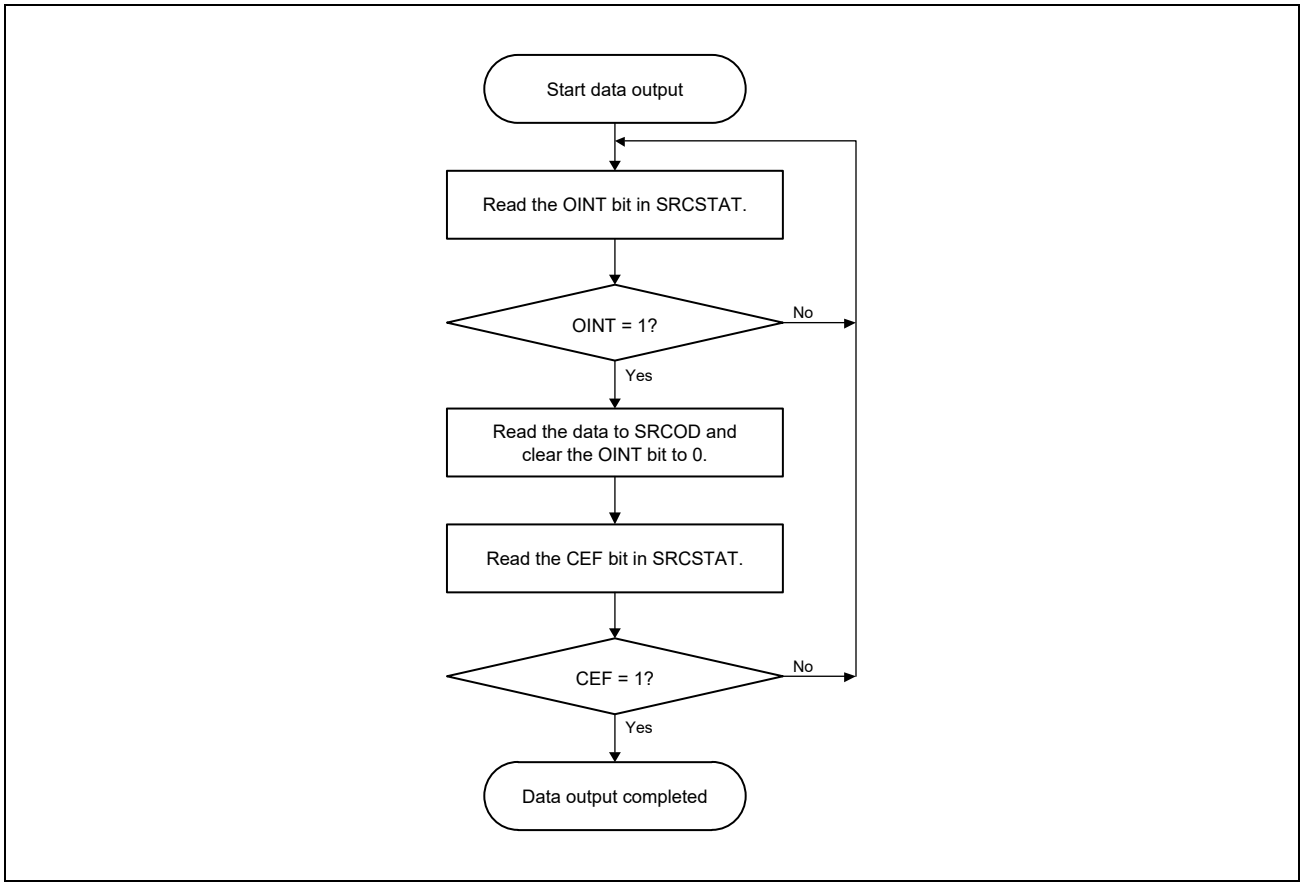

Figure 36.4 Sample Flowchart for Data Output

(1) When Interrupts are Issued to CPU

1. Set the OEN bit in SRCODCTRL to 1.
2. When the OINT bit in SRCSTAT is set to 1, an ODFI interrupt request is issued. In the interrupt processing routine, read the OINT bit and confirm that it is 1, read data from SRCOD. Then return from the interrupt processing routine.
3. Read the data by repeating step 2 as many times as required.
4. When all data have been read after flush processing starts, the CEF bit in SRCSTAT is set to 1. When the CEF bit is read as 1, the data output has been completed.

(2) When Interrupts are Used to Activate Direct Memory Access Controller

1. Assign the ODFI interrupt request of this module to one channel of the direct memory access controller.
2. Set the OEN bit in SRCODCTRL to 1.
3. When the OINT bit in SRCSTAT is set to 1, an ODFI interrupt request, that is, a DMA transfer request, is issued thus activating the direct memory access controller. When the direct memory access controller has read data from SRCOD thus resulting in the last data unit having been read, the OINT bit is cleared to 0.
4. Read the data by repeating step 3 as many times as required.
5. When all data have been read after flush processing starts, the CEF bit in SRCSTAT is set to 1. When the CEF bit is read as 1, the data output has been completed.

NOTES

1. The number of stages of the output FIFO buffer is sixteen. When the output FIFO buffer overflows, that is, when it is overwritten without data in it having been read, conversion processing is stopped. Though the output FIFO buffer can be read even when it has overflowed, resuming conversion processing requires additional processing that depends on the setting of the OVEN bit. For details, see the description of the OVEN bit in SRCCTR.
2. When the output FIFO buffer is read while the number of data units in it is zero, the value read is invalid. The number of contiguous data units to be read by DMA transfer must be set in consideration of the setting of the OFTRG[1:0] bits.

36.4.4 Interrupts

This module has five interrupt sources. **Table 36.7** summarizes the interrupts.

Table 36.7 Interrupt Requests and Generation Conditions

Interrupt Request	Abbreviation	Interrupt Condition	Direct Memory Access Controller Activation	Interrupt Request Signal
Input data FIFO buffer empty	IDEI	IINT = 1, IEN = 1, and SRCEN = 1	Possible	Edge
Output data FIFO buffer full	ODFI	OINT = 1, OEN = 1, and SRCEN = 1	Possible	Edge
Output data FIFO buffer overwrite	OVF	OVF = 1, OVEN = 1, and SRCEN = 1	Not possible	Level
Output data FIFO buffer underflow	UDF	UDF = 1, UDEN = 1, and SRCEN = 1	Not possible	Level
Conversion end	CEF	CEF = 1, CEEN = 1, and SRCEN = 1	Not possible	Level

When one of the interrupt conditions is met, the corresponding pin outputs an interrupt request signal that is detected as an edge or level. In response to the signal, the CPU executes the corresponding interrupt exception handling routine. The corresponding interrupt source flag, IINT, OINT, OVF, UDF, or CEF should be cleared from within the routine.

The IDEI and ODFI interrupts can activate the direct memory access controller (DMA) when the DMA is set to allow this. The IINT and OINT flags must not be cleared by writing from the CPU during DMA transfer. Clearing here refers to writing 0 to a bit after having read it as 1.

36.5 Usage Notes

36.5.1 Note on Accessing Registers

After the following write access to SRCCTRL, three cycles of the peripheral clock elapse before the corresponding bit in SRCSTAT is updated.

- Before the FLF bit in SRCSTAT is set after 1 is written to the FL bit in SRCCTRL
- Before each bit in SRCSTAT is initialized after 1 is written to the CL bit in SRCCTRL
- Before each bit in SRCSTAT is initialized after 1 is written to the SRCEN bit in SRCCTRL while the SRCEN bit is 0

As the CPU executes any subsequent instruction without waiting for the completion of the register writing, an instruction that immediately follows that used to write to SRCCTRL cannot accurately detect the updated state of SRCSTAT. To check the updated SRCSTAT state, dummy-read SRCCTRL or SRCSTAT after the instruction used to write to SRCCTRL.

36.5.2 Note on Flush Processing

When 1 is written to the FL bit in SRCCTRL, this module continues conversion processing by adding 0-data to the input data end point. Flush processing, therefore, should be performed when the audio data end point is input and there is no subsequent data.

To perform conversion again after flush processing, clear the internal working memory in either of the following ways.

- Write 1 to the CL bit in SRCCTRL.
- Write 0 and then 1 to the SRCEN bit in SRCCTRL.

36.5.3 Note on CPU Operations during Transfer by the DMAC

When the DMAC is used for the data transfer to the input and from the output data registers (SRCID and SRCOD), the IINT and OINT bits (bits 1 and 0) in the status register (SRCSTAT) must not be cleared by the CPU during transfer. Clearing here refers to writing 0 to a bit after having read it as 1.

36.5.4 Note on Access while the SRC is Operating

Access to the filter coefficient tables must not proceed while the SRC is operating, that is, while the setting of the SRCEN bit is 1.

36.5.5 Note on After rest

The coefficient data is not initialized by reset, so reloading of the coefficient data is not necessary.

37. PDM Interface (PDM)

This section describes the PDM interface.

37.1 Overview

This PDM interface is a unit for receiving voice data from an external PDM (pulse density modulation) device. For features and configuration, see the following sections.

37.1.1 Feature

Table 37.1 lists the features of this PDM interface.

Table 37.1 PDM Interface Specifications

Item	Description
Number of channels	3 channels
Functions	• Capable of filtering 1-bit digital input data PDM_DATn (n = 0, 1, 2) and converting them into 20-bit or 16-bit digital data. The bit order is little-endian. • This unit supports stereo microphone (L/R sampling by rising/falling clock edge). • This unit supports sound activity detector. • Each channel includes programmable filters: 4th order sinc filter, high-pass filter (for suppression of DC bias), correction filter (for sinc passband distortion), half-band decimation filter (for aliasing distortion). – This unit supports programmable and flexible decimation ratios. – The sinc filter is selectable as first-, second-, third-, and fourth-order. • This unit supports DMA operation through APB. • Each channel has an internal buffer. – 64 stages when designed – Capable of storing voice data during low power mode • Error detection functions can be used for debugging.
Interrupt sources	7 sources 1. Data reception interrupt per channel (Maximum 3 interrupts) 2. Sound detection interrupt (shared between channels) 3. Error detection interrupt per channel (Maximum 3 interrupts)
Low power consumption function	This unit supports microphone low power configuration (slower clock). This unit can switch to the higher clock speed after sound detection recognized.
Bus interface	This unit has an APB interface which is confirmed to APB4.

37.1.2 Block Diagram

The following is a block diagram of the PDM interface.

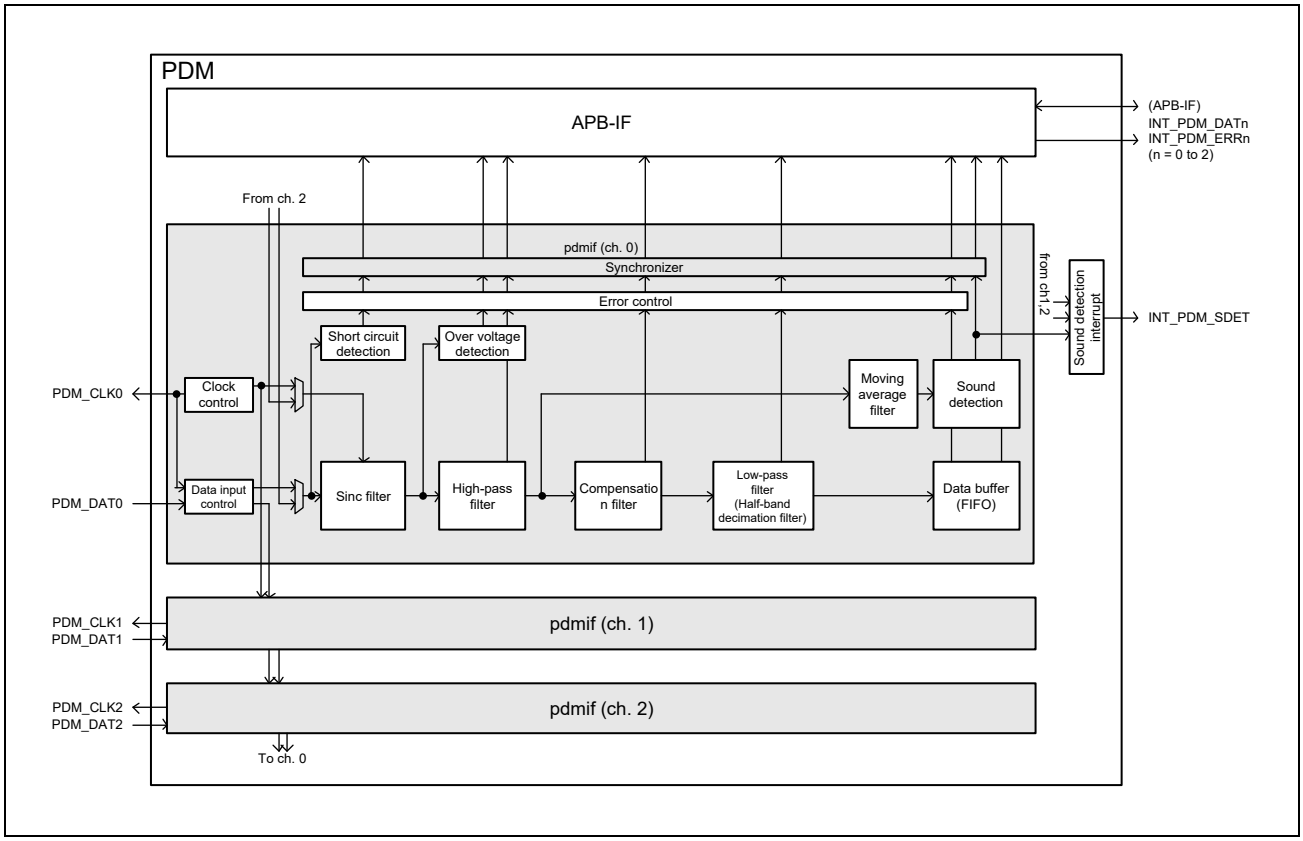

Figure 37.1 Three-Channel PDM-IF Block Diagram

Each channel of PDM-IF consists of following blocks:

- Clock control: Generates PDM_CLKn (n = 0, 1, 2) to the microphone, and internal timing signals to the sinc filter.
- Data input control: Receives PDM_DATn (n = 0, 1, 2) from the microphone.
- Sinc filter: Converts the 1-bit digital data stream input from PDM_DATn (n = 0, 1, 2) to 34-bit signed data. Then, the 34-bit signed data is clipped to 20-bit signed data.
- High-pass filter: A filter for suppression of DC bias
- Compensation filter: A filter for sinc passband distortion
- Low-pass (half-band decimation) filter: A filter for aliasing distortion
- Moving average filter: A simple filter for noise reduction before sound detection
- Sound detection: Generates the wakeup interrupt to recover from low power mode.
- Data buffer: Stores 20-bit or 16-bit data filtered by some filters.
- Short circuit detection: Detects the short circuit error which indicates consecutive 0's or 1's input from PDM_DATn (n = 0, 1, 2).
- Overvoltage detection: Detects the overvoltage error.

- Error control: Generates error flags from other blocks.

The 1-bit digital data stream input from PDM_DATn pin (n = 0, 1, 2) is converted to 34-bit signed data by the sinc filter and then the data is clipped to 20-bit signed data. The 20-bit singed data is used for sound detection and data storing in buffer.

The sound detection block receives 20-bit signed data through high-pass filter block and moving average filter block. The block compares received data to the programmed thresholds and generates a wakeup interrupt in case that the data is above the upper threshold or below the lower threshold.

The data buffer block receives 20-bit signed data through high-pass filter, compensation filter, and low-pass filter. The block stores the 20-bit signed data or the clipped 16-bit signed data. And then the block sends the 20-bit signed data or 16-bit signed data to APB-IF once APB read access occurs.

37.1.3 External Pins

Table 37.2 lists the PDM external pin specifications.

Table 37.2 Pin Configuration

External Pin Name	I/O	Function	Pin Name in This Section
PDM0_DAT	Input	External PDM Ch0 data reception pin	PDM_DAT0
PDM1_DAT	Input	External PDM Ch1 data reception pin	PDM_DAT1
PDM2_DAT	Input	External PDM Ch2 data reception pin	PDM_DAT2
PDM0_CLK	Output	External PDM Ch0 clock output pin	PDM_CLK0
PDM1_CLK	Output	External PDM Ch1 clock output pin	PDM_CLK1
PDM2_CLK	Output	External PDM Ch2 clock output pin	PDM_CLK2

37.1.4 Connected Unit

Table 37.3 lists the connected units.

Table 37.3 Connected Unit

Unit Name	Connected Unit Name	Function of Connected Unit
PDMm	CPG	Clock pulse generator (CPG)
	LSI Internal Bus	LSI Internal Bus
	Interrupt Controller	Interrupt control unit
	GPIO	Pin function controller

37.2 Registers

The register addresses of PDM are given as offsets from the individual base addresses <PDMm_base>. The register base addresses of each PDM are listed in the following table.

Table 37.4 Register Base Addresses

Base Address Name	Unit	Base Address
<PDM0_base>	PDM0	H'0_1005_A000 (H'5005_A000*1, H'4005_A000*2)

Note 1. Cortex-M33 address space (non-secure)

Note 2. Cortex-M33 address space (secure)

Note: Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

37.2.1 List of Registers

The list of PDM registers and the memory addresses are as follows.

For the actual addresses, the offset values indicated in the following table are added to the base addresses.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size (bits)
Channel Software Start Trigger Register	PDMm_PDCSTRTR	H'0000_0000	H'0000	32
Channel Software Stop Trigger Register	PDMm_PDCSTPTR	H'0000_0000	H'0004	32
Channel Software Change Trigger Register	PDMm_PDCCHGTR	H'0000_0000	H'0008	32
Channel Interrupt Control Register	PDMm_PDCICR	H'0000_0000	H'000C	32
Channel Status Register	PDMm_PDCSR	H'0000_0000	H'0010	32
Channel Status Clear Register	PDMm_PDCSCR	H'0000_0000	H'0014	32
Reserve	—	—	H'0018 to H'001F	—
Channel Sound Detection Control Register	PDMm_PDCSDCR	H'0000_0000	H'0020	32
Channel Data Read Control Register	PDMm_PDCDRCR	H'0000_0000	H'0024	32
Channel Data Clear Register	PDMm_PDCDCR	H'0000_0000	H'0028	32
Reserve	—	—	H'002C to H'007F	—
Version Register	PDMm_PDVR	H'0000_0010	H'0080	32
Reserve	—	—	H'0084 to H'00FF	—
Software Start Trigger Register Channel n	PDMm_PDSTRTRCHn	H'0000_0000	H'0100 + n × H'0100	32
Software Stop Trigger Register Channel n	PDMm_PDSTPTRCHn	H'0000_0000	H'0104 + n × H'0100	32
Software Change Trigger Register Channel n	PDMm_PDCHGTRCHn	H'0000_0000	H'0108 + n × H'0100	32
Interrupt Control Register Channel n	PDMm_PDICRCHn	H'0000_0000	H'010C + n × H'0100	32

37.2.2 Register Description

The prefix (PDMm_) of the register names is omitted in this and subsequent sections.

37.2.2.1 Channel Software Start Trigger Register (PDMm_PDCSTRTR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0000

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	STRTRG[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	STRTRG[2:0]	H'0	R0W	The read value is always 0b. Channel n start trigger 0b: Do nothing 1b: Start channel n

37.2.2.2 Channel Software Stop Trigger Register (PDMm_PDCSTPTR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0004

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	STPTRG[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	STPTRG[2:0]	H'0	R0W	The read value is always 0b. Channel n stop trigger 0b: Do nothing 1b: Stop channel n

37.2.2.3 Channel Software Change Trigger Register (PDMm_PDCCHGTR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0008

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CHGTRG[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0W	R0W	R0W	R0	R0	R0	R0	R0	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10 to 8	—	All 0	R0W	Reserved. This register is readable and the initial value can be written to it.
7 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	CHGTRG[2:0]	H'0	R0W	The read value is always 0b. Channel n change trigger 0b: Do nothing 1b: Change clock (PDM_CLKn) setting

37.2.2.4 Channel Interrupt Control Register (PDMm_PDCICR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'000C

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IEDE[2:0]			—	—	—	—	—	IDRE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	RW	RW	RW	R0	R0	R0	R0	R0	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ISDE[2:0]			—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	RW	RW	RW	R0	R0	R0	R0	R0	R0	R0	R0

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	IEDE[2:0]	H'0	RW	Channel n error detection interrupt enable bit 0b: Don't allow to issue INT_PDM_ERRn interrupt 1b: Allow to issue INT_PDM_ERRn interrupt
23 to 19	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	IDRE[2:0]	H'0	RW	Channel n data reception interrupt enable bit 0b: Don't allow to issue INT_PDM_DATn interrupt 1b: Allow to issue INT_PDM_DATn interrupt
15 to 11	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10 to 8	ISDE[2:0]	H'0	RW	Channel n sound detection interrupt enable bit 0b: Don not allow to issue INT_PDM_SDET interrupt when the sound for channel n is detected. 1b: Allow to issue INT_PDM_SDET interrupt when the sound for channel n is detected.
7 to 0	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.

37.2.2.5 Channel Status Register (PDMm_PDCSR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0010

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	EDF[2:0]			—	—	—	—	—	DRF[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R	R	R	R0	R0	R0	R0	R0	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SDF[2:0]			—	—	—	—	—	STATE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R	R	R	R0	R0	R0	R0	R0	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	EDF[2:0]	H'0	R	Channel n error detection flag 0b: Indicates that no data is detected. 1b: Indicates that an error is detected. Refer to the PDSRCHn register for details of errors.
23 to 19	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	DRF[2:0]	H'0	R	Channel n data reception flag 0b: Indicates that the number of data stored in buffer does not exceed the threshold. 1b: Indicates that the number of data stored in buffer exceeded the threshold.
15 to 11	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10 to 8	SDF[2:0]	H'0	R	Channel n sound detection flag 0b: Indicates that the sound which exceeded the threshold is not detected. 1b: Indicates that the sound which exceeded the threshold is detected.
7 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	STATE[2:0]	H'0	R	Channel n state 0b: Channel n stop 1b: Channel n in operation

EDFn

[Condition to become "1b"]

- When any error occurs. Refer to the PDSRCHn register for the kind of error.

[Condition to become "0b"]

- When all error flags are cleared by writing the PDSCRCHn, this flag is also cleared.

DRFn

Refer to **Section 37.3.7, Data Buffer** for details.

[Condition to become “1b”]

- When PDCDRCR.DATREn = 1b and PDDSRCHn.DATNUM[7:0] is greater than or equal to a threshold which is configured by PDDBCRCHn.DATRITHR[2:0].

[Condition to become “0b”]

- When PDCDRCR.DATREn = 0b or PDDSRCHn.DATNUM[7:0] is less than a threshold.

SDFn

Refer to **Section 37.3.6, Sound Detection** for details.

[Conditions to become “1b”]

- When PDCSDCR.SDEn = 1b and a moving average filter result is greater than or equal to PDSDUTRCHn.SDETU[19:0].
- When PDCSDCR.SDEn = 1b and a moving average filter result is less than or equal to PDSDLTRCHn.SDETL[19:0].

[Condition to become “0b”]

- When writing 1b to a flag clear register bit (PDCSCR.SDFCn).

STATEn

Refer to **Section 37.3.2, Channel Start and Channel Stop** for details.

[Condition to become “1b”]

- When “1b” is written to PDCSTRTR.STRTRGn.

[Condition to become “0b”]

- When “1b” is written to PDCSTPTR.STPTRGn.

37.2.2.6 Channel Status Clear Register (PDMm_PDCSCR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0014

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SDFC[2:0]			—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0W	R0W	R0W	R0	R0	R0	R0	R0	R0	R0	R0

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
10 to 8	SDFC[2:0]	H'0	R0W	The read value is always 0b. Channel n sound detection flag clear 0b: Do nothing 1b: Clear PDCSR.SDFn
7 to 0	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.

37.2.2.7 Channel Sound Detection Control Register (PDMm_PDCSDCR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0020

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	SDE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	SDE[2:0]	H'0	RW	Channel n sound detection enable bit 0b: Do not allow to detect sound 1b: Allow to detect sound

37.2.2.8 Channel Data Read Control Register (PDMm_PDCDRCR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0024

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DATRE[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	DATRE[2:0]	H'0	RW	Channel n data read enable bit 0b: Do not allow to read data from data buffer 1b: Allow to read data from data buffer

37.2.2.9 Channel Data Clear Register (PDMm_PDCDCR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0028

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DATC[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	DATC[2:0]	H'0	R0W	The read value is always 0b. Channel n data clear 0b: Do nothing 1b: Clear data

37.2.2.10 Version Register (PDMm_PDVR) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0080

Initial Value: H'0000_0010

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VER[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R0	R0	R0	R0	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VER[11:0]	H'010	R	IP version is shown.

37.2.2.11 Software Start Trigger Register Channel n (PDMm_PDSTRTRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0100

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRTRG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STRTRG	H'0	R0W	The read value is always 0b. Start trigger 0b: Do nothing 1b: Start the channel

37.2.2.12 Software Stop Trigger Register Channel n (PDMm_PDSTPTRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0104

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STPTRG	H'0	R0W	The read value is always 0b. Stop trigger 0b: Do nothing 1b: Stop the channel

37.2.2.13 Software Change Trigger Register Channel n (PDMm_PDCHGTRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0108

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CHGTRG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0W	R0	R0	R0	R0	R0	R0	R0	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	—	H'0	R0W	Reserved This register is readable and the initial value can be written to it.
7 to 1	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	CHGTRG	H'0	R0W	The read value is always 0b. Change trigger 0b: Do nothing 1b: Change settings of PDM_CLKn and sinc filter

37.2.2.14 Interrupt Control Register Channel n (PDMm_PDICRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'010C

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IEDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	RW

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27	BFOWDE	H'0	RW	Buffer overwriting detection enable bit 0b: Do not allow to detect buffer overwriting. 1b: Allow to detect buffer overwriting.
26 to 19	—	All 0	RW	Reserved This register is readable and the initial value can be written to it.
18	OVUDE	H'0	RW	Overvoltage upper limit exceeded detection enable bit 0b: Do not allow to detect data exceeding the upper limit. 1b: Allow to detect data exceeding the upper limit
17	OVLDE	H'0	RW	Overvoltage lower limit exceeded detection enable bit 0b: Do not allow to detect data falling below the lower limit. 1b: Allow to detect data falling below the lower limit
16	SCDE	H'0	RW	Short circuit detection enable bit 0b: Do not allow to detect the PDM_DATn pin short circuit 1b: Allow to detect the PDM_DATn pin short circuit
15 to 2	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	SDE	H'0	RW	Sound detection enable bit 0b: Do not allow to detect sound 1b: Allow to detect sound
0	—	H'0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.

37.2.2.16 Status Register Channel n (PDMm_PDSRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0114

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	BFOWDF	—	—	—	—	—	—	—	—	OVUDF	OVLDF	SCDF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DRF	SDF	STATE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27	BFOWDF	H'0	R	Buffer overwriting detection flag 0b: Indicates that buffer overwriting does not occur. 1b: Indicates that buffer overwriting occurred.
26 to 19	—	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	OVUDF	H'0	R	Overvoltage upper limit exceeded detection flag 0b: Indicates that the data is not above the upper limit 1b: Indicates that the data has exceeded the upper limit
17	OVLDF	H'0	R	Overvoltage lower limit exceeded detection flag 0b: Indicates that the data is not below the lower limit 1b: Indicates that the data has falling below the lower limit
16	SCDF	H'0	R	Short circuit detection flag 0b: Indicates that the PDM_DATn pin short circuit is not detected 1b: Indicates that a short circuit on the PDM_DATn pin has been detected
15 to 3	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	DRF	H'0	R	Data reception flag 0b: Indicates that the number of data stored in buffer is less than a threshold 1b: Indicates that the number of data stored in buffer is greater than or equal to a threshold
1	SDF	H'0	R	Sound detection flag 0b: Indicates that the sound is not detected 1b: Indicates that the sound is detected
0	STATE	H'0	R	State 0b: Channel stop 1b: Channel in operation

BFOWDF

Refer to **Section 37.3.7, Data Buffer** for details.

[Condition to become “1b”]

- When PDSDCRCHn.BFOWDE = 1b and data buffer is full and data is written to the buffer without reading.

[Condition to become “0b”]

- When writing 1b to a flag clear register bit (PDSCRCHn.BFOWDFC).

OVUDF

Refer to **Section 37.3.9, Overvoltage Detection** for details.

[Condition to become “1b”]

- When PDSDCRCHn.OVUDE = 1b and a clipped sinc filter result is larger than an upper limit (PDOVUTRCHn.OVDU[19:0]).

[Condition to become “0b”]

- When writing 1b to a flag clear register bit (PDSCRCHn.OVUDFC).

OVLDF

Refer to **Section 37.3.9, Overvoltage Detection** for details.

[Condition to become “1b”]

- When PDSDCRCHn.OVLDE = 1b and a clipped sinc filter result is smaller than a lower limit (PDOVLTRCHn.OVDL[19:0]).

[Condition to become “0b”]

- When writing 1b to a flag clear register bit (PDSCRCHn.OVLDFC).

SCDF

Refer to **Section 37.3.8, Short-Circuit Detection** for details.

[Conditions to become “1b”]

- When PDSDCRCHn.SCDE = 1b and 1b is continuously input to the PDM_DATn pin, exceeding the number of times set in PDSCTSRCHn.SCDH[12:0].
- When PDSDCRCHn.SCDE = 1b and 0b is continuously input to the PDM_DATn pin, exceeding the number of times set in PDSCTSRCHn.SCDL[12:0].

[Condition to become “0b”]

- When writing 1b to a flag clear register bit (PDSCRCHn.SCDFC).

DRF

Refer to **Section 37.3.7, Data Buffer** for details.

[Condition to become “1b”]

- When PDDRCRCHn.DATRE = 1b and PDDSRCHn.DATNUM[7:0] is greater than or equal to a threshold which is configured by PDDBCRCHn.DATRITHR[2:0].

[Condition to become “0b”]

- When PDDRCRCHn.DATRE = 0b or PDDSRCHn.DATNUM[7:0] is less than a threshold.

SDF

Refer to **Section 37.3.6, Sound Detection** for details.

[Conditions to become “1b”]

- When PDSDCRCHn.SDE = 1b and a moving average filter result is PDSDUTRCHn.SDETU[19:0] or greater.
- When PDSDCRCHn.SDE = 1b and a moving average filter result is PDSDLTRCHn.SDETL[19:0] or less.

[Condition to become “0b”]

- When writing 1b to a flag clear register bit (PDSCRCHn.SDFC).

STATE

Refer to **Section 37.3.2, Channel Start and Channel Stop** for details.

[Condition to become “1b”]

- When “1b” is written to PDSTRTRCHn.STRTRG.

[Condition to become “0b”]

- When “1b” is written to PDSTPTRCHn.STPTRG.

37.2.2.17 Status Clear Register Channel n (PDMm_PDSCRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0118

Initial Value: H'0000_0000

Note: S: Signed bit.
When the overflow occurs, H'7FFFF is output. When the underflow occurs, H'80000 is output.

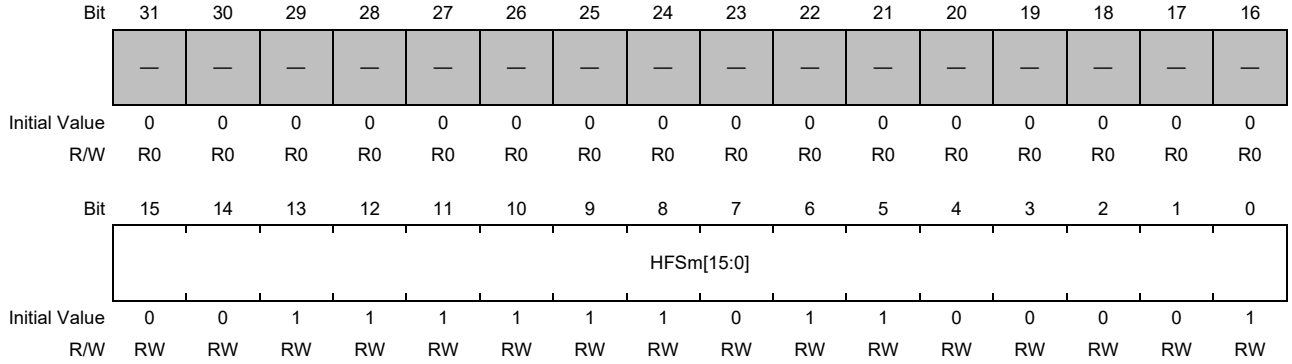
Bit	Bit Name	Initial Value	R/W	Description
23 to 16	SINCDEC [7:0]	H'7C	RW	Sinc filter decimation ratio M indicates the decimation ratio. Decimation ratio M is set as follows. M = SINCDEC + 1 H'00: M = 1 (prohibited) H'01: M = 2 (prohibited) H'02: M = 3 (prohibited) H'03: M = 4 … H'7C: M = 125 (default) … H'FF: M = 256 Setting a value less than M = 4 is prohibited. If such a value is set, operation of the sinc filter is not guaranteed. The setting should satisfy D × M > 12. Otherwise, operation of other filters is not guaranteed. *Note*: D: PDM_CLKn's division ratio
15 to 4	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	CKDIV[3:0]	H'0	RW	PDM_CLKn's division ratio to core clock 0000b: 1/2 (default) 0001b: 1/4 0010b: 1/6 … 1101b: 1/28 1110b: 1/30 1111b: 1/32

37.2.2.20 High-Pass Filter Coefficient s(0) Register Channel n (PDMm_PDHFCS0RCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'0128

Initial Value: H'0000_3F61



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	HFSm[15:0]	H'3F61	RW	High-pass filter coefficient s0 16-bit signed data (Fraction bit [13:0]) For the initial value, see Value after Reset of Each Coefficient.

● Value after Reset of Each Coefficient

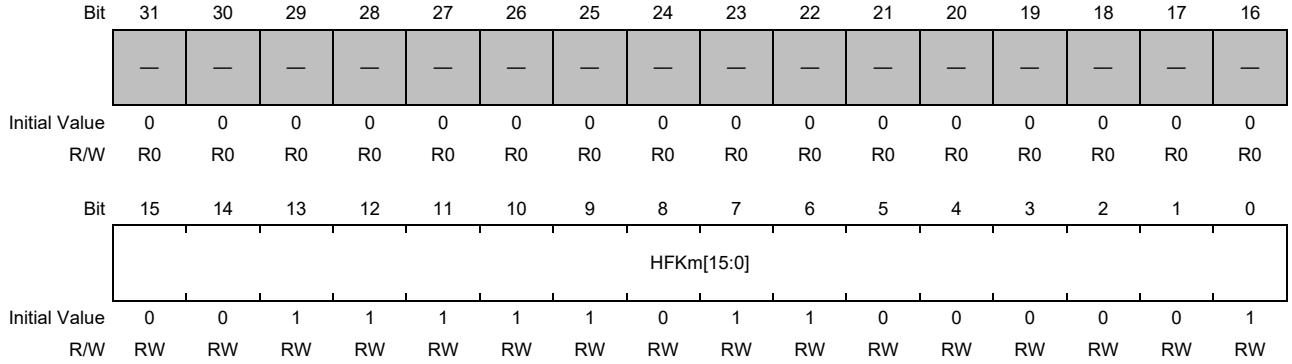
Symbol Name	Coefficient Name	Value after Reset		Comment
		Hex	Decimal	
HFS0	s(0)	H'3F61	0.99029541015625	Cut-off 100 Hz

37.2.2.21 High-Pass Filter Coefficient k(1) Register Channel n (PDMm_PDHFCK1RCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'012C

Initial Value: H'0000_3EC1



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	HFKm[15:0]	H'3EC1	RW	High-pass filter coefficient k1 16-bit signed data (Fraction bit [13:0]) For the initial value, see Value after Reset of Each Coefficient.

31 to 24	—	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19 to 0	DAT[19:0]	All 0	R	Data 20-bit signed sound data or 16-bit signed sound data is read out. In case of 20-bit mode (PDMDSRCHn.DBIS[3:0] = 0xxxb), the signed bit is [19]. In case of 16-bit mode (PDMDSRCHn.DBIS[3:0] = 1xxxb), the signed bits are [19:15]. Writing is invalid.

37.2.2.35 Data Status Register Channel n (PDMm_PDDSRCHn) (m = 0)

Access Size: 32 bits

Address(es): <PDMm_base> + H'01EC

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0	R0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DATNUM[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0	R0	R0	R0	R0	R0	R0	R0	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R0	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	DATNUM[7:0]	All 0	R	Number of data stored in buffer When PDDRCRCHn.DATRE = 0b, 0b is read out. When PDDRCRCHn.DATRE = 1b, the number of data stored in buffer is read out. In case that buffer size is 64 stages, the maximum value is 63.

37.2.3 Mirroring Register

The common registers except for the version register have mirroring registers in each channel. PDCSR.EDFn is a register which ORs all the error flags of the mirroring registers in each channel.

Use the common registers for synchronous control between channels.

Table 37.5 Mirroring Register

Common Register		Mirroring Register in Each Channel	
Register Name	Bit Name	Register Name	Bit Name
PDCSTRTR	STRTRGn	PDSTRTRCHn	STRTRG
PDCSTPTR	STPTRGn	PDSTPTRCHn	STPTRG
PDCCHGTR	CHGTRGn	PDCHGTRCHn	CHGTRG
PDCICR	ISDEn	PDICRCHn	ISDE
	IDREn		IDRE
	IEDEn		IEDE
PDCSR	STATEn	PDSRCHn	STATE
	SDFn		SDF
	DRFn		DRF
	EDFn		SCDF or OVLDF or OVUDF or BFOWDF
PDCSCR	SDFCn	PDSCRCHn	SDFC
PDCSDCR	SDEn	PDSDCRCHn	SDE
PDCDRCR	DATREn	PDDRCRCHn	DATRE
PDCDCR	DATCn	PDDCRCHn	DATC

37.3 Operation

This section describes the PDM basic control method. See **Section 37.4.6, Setting PDM_CLKn (n = 0, 1, 2) Frequency and Sampling Frequency Generated by the Unit** for information on setting the PDM_CLKn (n = 0, 1, 2) frequency and the sampling frequency generated by the PDM unit, and see **Section 37.4.7, DMA Transfer Method** for information on transferring data with the DMA master.

37.3.1 Clock Specifications

The frequency-divided core clock is generated and output to PDM_CLKn.

Table 37.6 lists the guaranteed clock frequency and clock mode in PDM-IF. Core clock (CCLK) and PCLK are asynchronous.

In this section, read “PCLK” as “PDM_PCLK”, “CCLK” as “PDM_CCLK”.

Table 37.6 Guaranteed Clock Frequency and Clock Mode

CCLK	PCLK PCLK_SFR	PDM_CLKn		
Frequency (MHz)	Frequency (MHz)	Frequency (MHz)	Supported Core Clock Division Ratio	Setting Value (PDSFCRCHn.CKDIV[3:0])
8	1 to 100	4	2	0000b
		2	4	0001b
		1.33	6	0010b
		1	8	0011b
		0.8	10	0100b
		0.67	12	0101b
		0.57	14	0110b
		0.5	16	0111b
		0.44	18	1000b
		0.4	20	1001b
		0.36	22	1010b
		0.33	24	1011b
		0.31	26	1100b
		0.29	28	1101b
		0.27	30	1110b
		0.25	32	1111b

37.3.2 Channel Start and Channel Stop

The channel start and the channel stop is controlled by the registers listed in **Table 37.7**.

Set the channels to be synchronized to 1 at the same time by using the common registers.

Set the channel start according to **Section 37.4.1, Start Flow**.

Set the channel stop according to **Section 37.4.2, Stop Flow**.

Table 37.7 Channel Start Trigger and Channel Stop Trigger

	Register Bit Name	
Category	Common Register	Channel Register
Channel start	PDCSTRTR.STRTRG0	PDSTRTRCH0.STRTRG
	PDCSTRTR.STRTRG1	PDSTRTRCH1.STRTRG
	PDCSTRTR.STRTRG2	PDSTRTRCH2.STRTRG
Channel stop	PDCSTPTR.STPTRG0	PDSTPTRCH0.STPTRG
	PDCSTPTR.STPTRG1	PDSTPTRCH1.STPTRG
	PDCSTPTR.STPTRG2	PDSTPTRCH2.STPTRG

37.3.3 PDM_CLKn's Frequency Change

The external microphone transitions the power mode according to the input clock frequency. PDM-IF enables the transition of microphone's power mode by changing PDM_CLKn's operating frequency which is output to the microphone when operating. The PDM_CLKn's operating frequency can be changed by using the PDSFCRCHn.CKDIV[3:0] bits. When the frequency is changed, the decimation ratio of the sinc filter also needs to be changed. Set PDSFCRCHn.SINCDEC[7:0] in accordance with the sampling frequency after the decimation. Furthermore, when the decimation ratio of the sinc filter is changed, its output range is changed. Set PDSFCRCHn.SINCRNG[4:0] together in accordance with the output range. Refer to **Table 37.8,** which lists example settings when the sampling frequency after the decimation is 30 kHz*[1].

For the method of calculating the set values of PDSFCRCHn.CKDIV[3:0], PDSFCRCHn.SINCDEC[7:0], and PDSFCRCHn.SINCRNG[4:0] for the expected sampling frequency of PDM_CLKn, refer to **Section 37.4.6, Setting PDM_CLKn (n = 0, 1, 2) Frequency and Sampling Frequency Generated by the Unit**.

After changing the configuration of these registers, software needs to wait for the settling time of microphone and PDM-IF channel. Refer to **Section 37.4.4, Low Power Mode Transition Flow** and **Section 37.4.5, Normal Mode Transition Flow** for details.

Note 1. If the same filter coefficient has been set in filtering after the sinc filter, the characteristics of the filter changes with the change of the sampling frequency.

37.3.4 Filter

37.3.4.1 Data Clipping and Shifting between Filters

Voice sample data is clipped or shifted between filters. **Figure 37.2** shows this operation.

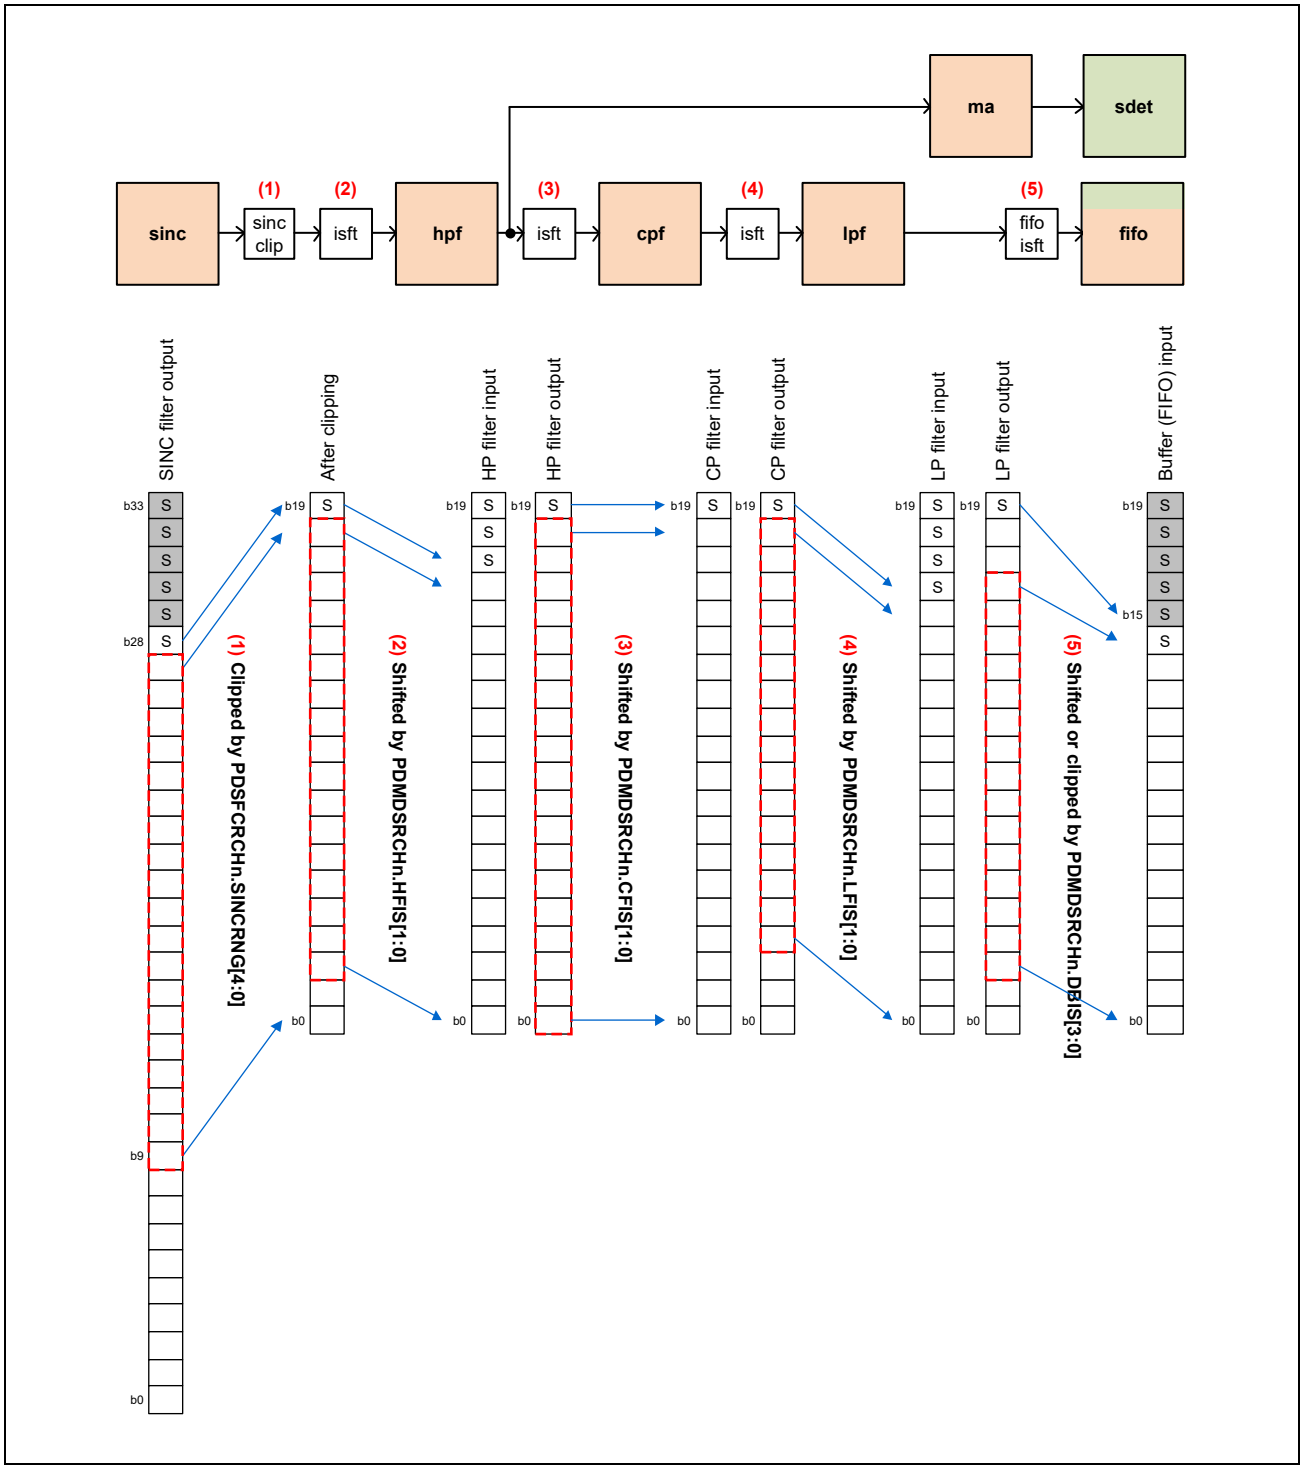

Figure 37.2 Data Clipping and Shifting between Filters

a) Sinc filter output clip

Table 37.8 lists the available settings of the sinc filter and data clipping.

It is controlled by PDSFCRCHn.SINCRNG[4:0].
It is prohibited to set other than those in **Table 37.8**.

Table 37.8 Sinc Filter Output Clip (1/2)

CCLK (MHz)	Sinc Filter Order	PDMDSRCHn. SFMD[2:0]	PDM_CLK's Division Ratio	PDSFCRCHn. CKDIV[3:0]	Sinc filter Decimation Ratio	PDSFCRCHn. 			30	H'E	8	H'07	b4 to b0	b4 to b0, 000000000000000b	11101b	5	0.27	33.33
			32	H'F	8	H'07	b4 to b0	b4 to b0, 000000000000000b	11101b	5	0.25	31.25

An overflow or an underflow never occurs as long as the combinations which are shown in **Table 37.8** are set to PDMDSRCHn.SFMD[2:0], PDSFCRCHn.CKDIV[3:0], PDSFCRCHn.SINCDEC[7:0] and PDSFCRCHn.SINCRNG[4:0]. However, when other combinations are set to them, the overflow or the underflow might occur. When the overflow occurs, H'7FFFF is output. When the underflow occurs, H'80000 is output. Use the overvoltage detection function if you want to know if the overflow or the underflow occurs.

b) High-pass filter input shift

The clipped sinc filter output is right-shifted and input to the high-pass filter.

It is controlled by PDMDSRCHn.HFIS[1:0].

Table 37.9 High-pass Filter Input Shift

PDMDSRCHn.HFIS[1:0]	Function	Shifted Data*1
H'0	No shift	S, b18-b0
H'1	1-bit right-shift	S, S, b18-b1
H'2	2-bit right-shift	S, S, S, b18-b2
H'3	3-bit right-shift	S, S, S, S, b18-b3

Note 1. S: Signed bit (= bit 19)

c) Compensation filter input shift

The high-pass filter output is right-shifted and input to the compensation filter.

It is controlled by PDMDSRCHn.CFIS[1:0].

Table 37.10 Compensation Filter Input Shift

PDMDSRCHn.CFIS[1:0]	Function	Shifted Data*1
H'0	No shift	S, b18-b0
H'1	1-bit right-shift	S, S, b18-b1
H'2	2-bit right-shift	S, S, S, b18-b2
H'3	3-bit right-shift	S, S, S, S, b18-b3

Note 1. S: Signed bit (= bit 19)

d) Low-pass filter input shift

The compensation filter output is right-shifted and input to the low-pass (half-band decimation) filter.

It is controlled by PDMDSRCHn.LFIS[1:0].

Table 37.11 Low-pass Filter Input Shift

PDMDSRCHn.LFIS[1:0]	Function	Shifted Data*1
H'0	No shift	S, b18-b0
H'1	1-bit right-shift	S, S, b18-b1
H'2	2-bit right-shift	S, S, S, b18-b2
H'3	3-bit right-shift	S, S, S, S, b18-b3

Note 1. S: Signed bit (= bit 19)

e) Buffer input shift or clip

The compensation filter output is right-shifted, or 16-bit data is clipped from the compensation filter output. Then, the shifted or clipped data is input to buffer.

It is controlled by PDMDSRCHn.DBIS[3:0].

Table 37.12 Buffer Input Shift or Clip

PDMDSRCHn.DBIS[3:0]	Function	Valid Data Width	Shifted or Clipped Data*1
0000b	No shift	20-bit	S, b18-b0
0001b	1-bit right-shift	20-bit	S, S, b18-b1
0010b	2-bit right-shift	20-bit	S, S, S, b18-b2
0011b	3-bit right-shift	20-bit	S, S, S, S, b18-b3
1000b	Signed bit and b18-b4 is clipped	16-bit	S, b18-b4
1001b	Signed bit and b17-b3 is clipped*2	16-bit	S, b17-b3
1010b	Signed bit and b16-b2 is clipped*2	16-bit	S, b16-b2
1011b	Signed bit and b15-b1 is clipped*2	16-bit	S, b15-b1
1100b	Signed bit and b14-b0 is clipped*2	16-bit	S, b14-b0

Note 1. S: Signed bit (= bit 19)

Note 2. When an overflow occurs, H'7FFF is input to the buffer.
When an underflow occurs, H'8000 is input to the buffer.

37.3.4.2 Sinc Filter

The operating clock of the sinc filter is CCLK. Sinc filter is operated by using the 1-bit stream data latched with PDM_CLKn's rise-edge or fall-edge. Refer to **Section 37.3.5, Data Input Control for Stereo Sound** for details.

Figure 37.3 shows a sinc filter block diagram.

The differentiation stage is operated by decimation clock (the frequency is 1/M of PDM_CLKn). M is the decimation ratio and is set in the PDSFCRCHn.SINCDEC[7:0] bits. The filter result is output in register every decimation clock.

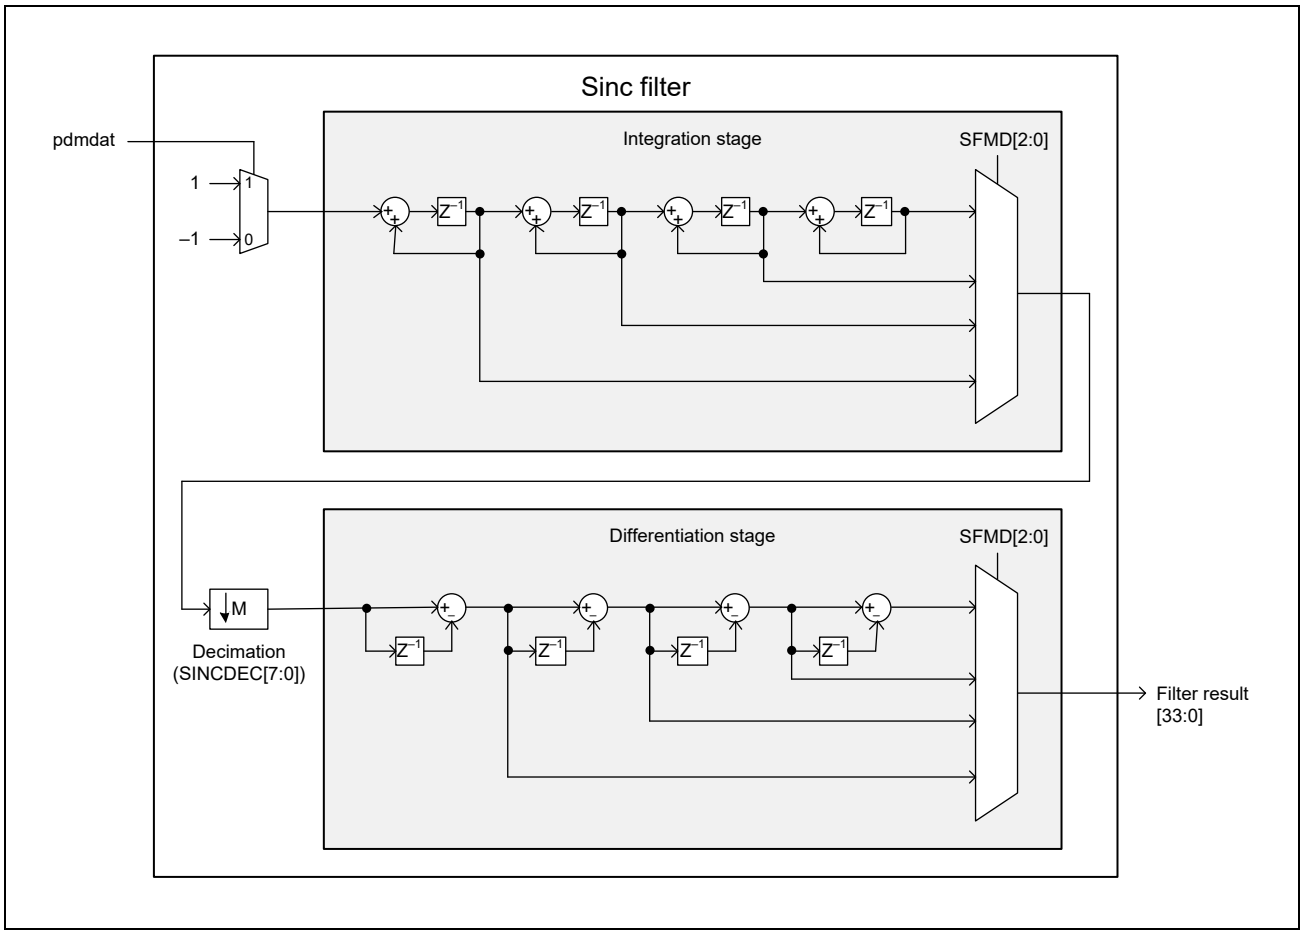

Figure 37.3 Sinc Filter Block Diagram

37.3.4.3 High-pass Filter

The operating clock of the high-pass filter is CCLK. The high-pass filter is operated by using the result of the sinc filter.

Figure 37.4 shows a high-pass filter block diagram.

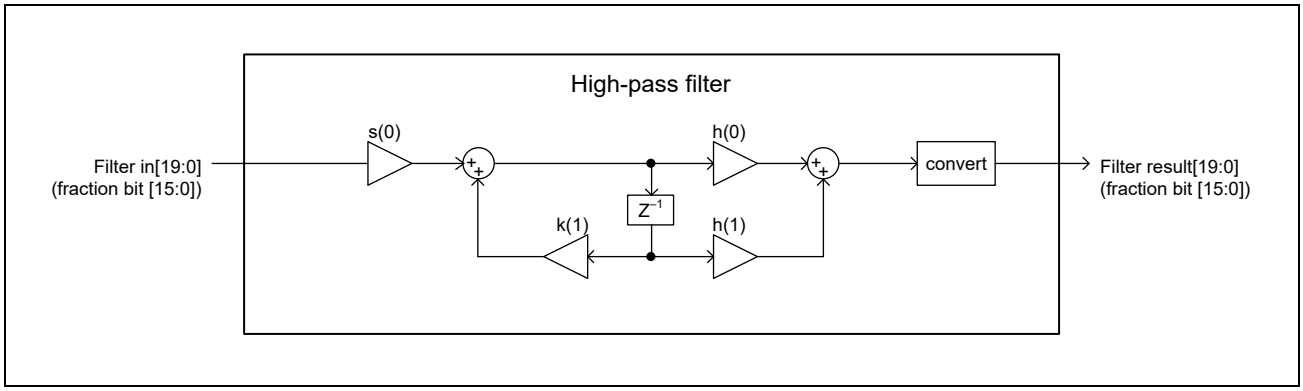

Figure 37.4 High-pass Filter Block Diagram

Table 37.13 lists the high-pass filter specification.

Table 37.13 High-pass Filter Specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Coefficient	Bit width	Signed 16-bit (fraction 14-bit) Refer to **Section 37.2.2.20, High-Pass Filter Coefficient s(0) Register Channel n (PDMm_PDHFCS0RCHn) (m = 0)**, **Section 37.2.2.21, High-Pass Filter Coefficient k(1) Register Channel n (PDMm_PDHFCK1RCHn) (m = 0)**, and **Section 37.2.2.22, High-Pass Filter Coefficient h(p) Register Channel n (PDMm_PDHFCHpRCHn) (m = 0, p = 0, 1)** for details.
Delay Z	Bit width	Signed 32-bit (fraction 18-bit)
Multiplier	Input A bit width	Signed 32-bit (fraction 18-bit)
	Input B bit width	Signed 16-bit (fraction 14-bit)
	Output bit width	Signed 47-bit (fraction 32-bit)
Adder	Input A bit width	Signed 32-bit (fraction 18-bit)
	Input B bit width	Signed 32-bit (fraction 18-bit)
	Output bit width	Signed 33-bit (fraction 18-bit)
Output conversion	Input bit width	Signed 32-bit (fraction 18-bit)
	Output bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at functional unit input or final output.

37.3.4.4 Compensation Filter

The operating clock of the compensation filter is CCLK. The compensation filter is operated by using the result of the high-pass filter.

Figure 37.5 shows a compensation filter block diagram.

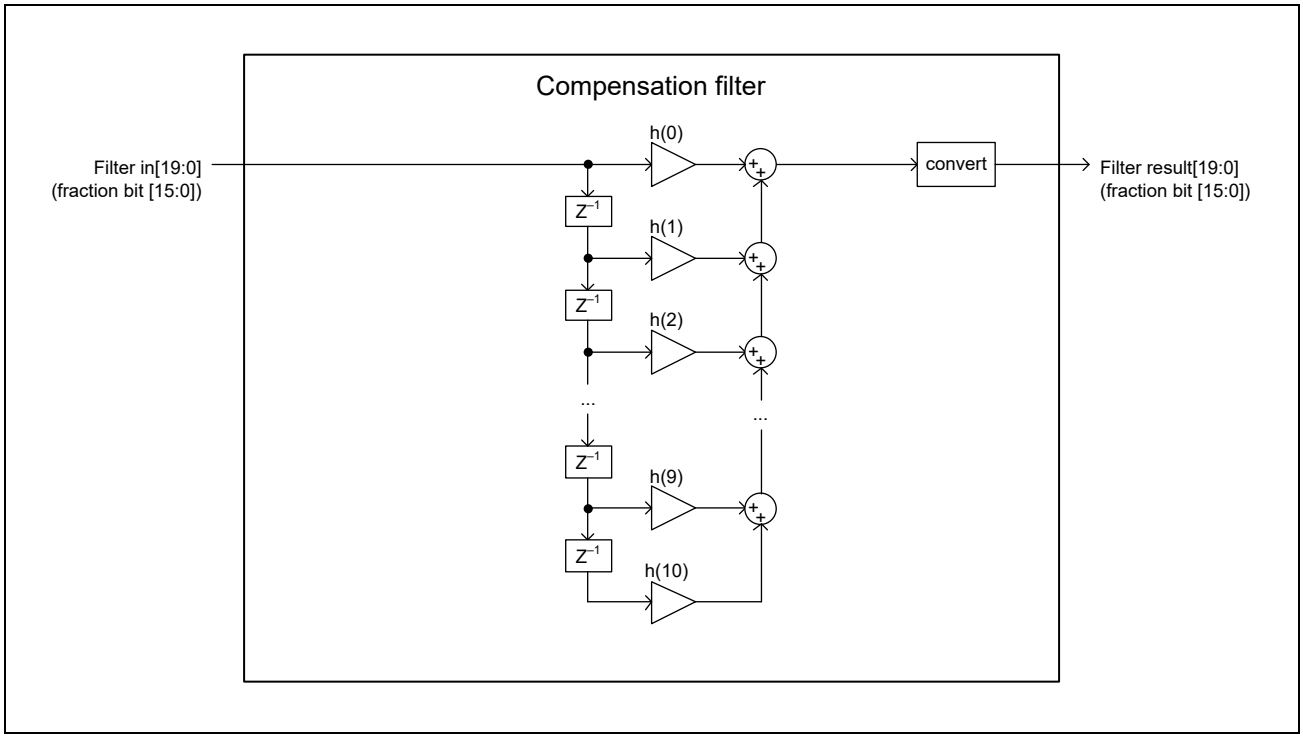

Figure 37.5 Compensation Filter Block Diagram

Table 37.14 shows a compensation filter specification.

Table 37.14 Compensation Filter Specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Coefficient	Bit width	Signed 13-bit (fraction 11-bit) Refer to **Section 37.2.2.23, Compensation Filter Coefficient h(p) Register Channel n (PDMm_PDCFCHpRCHn) (m = 0, p = 00 to 10)** for details.
Delay Z	Bit width	Signed 20-bit (fraction 16-bit)
Multiplier	Input A bit width	Signed 20-bit (fraction 16-bit)
	Input B bit width	Signed 13-bit (fraction 11-bit)
	Output bit width	Signed 32-bit (fraction 27-bit)
Adder	Input A bit width	Signed 22-bit (fraction 18-bit)
	Input B bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 23-bit (fraction 18-bit)
Output conversion	Input bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at functional unit input or final output.

37.3.4.5 Low-Pass (Half-Band Decimation) Filter

The operating clock of the low-pass filter is CCLK. The low-pass filter is operated by using the result of the compensation filter. Output data is decimated to a half of input data.

Figure 37.6 shows a low-pass filter block diagram.

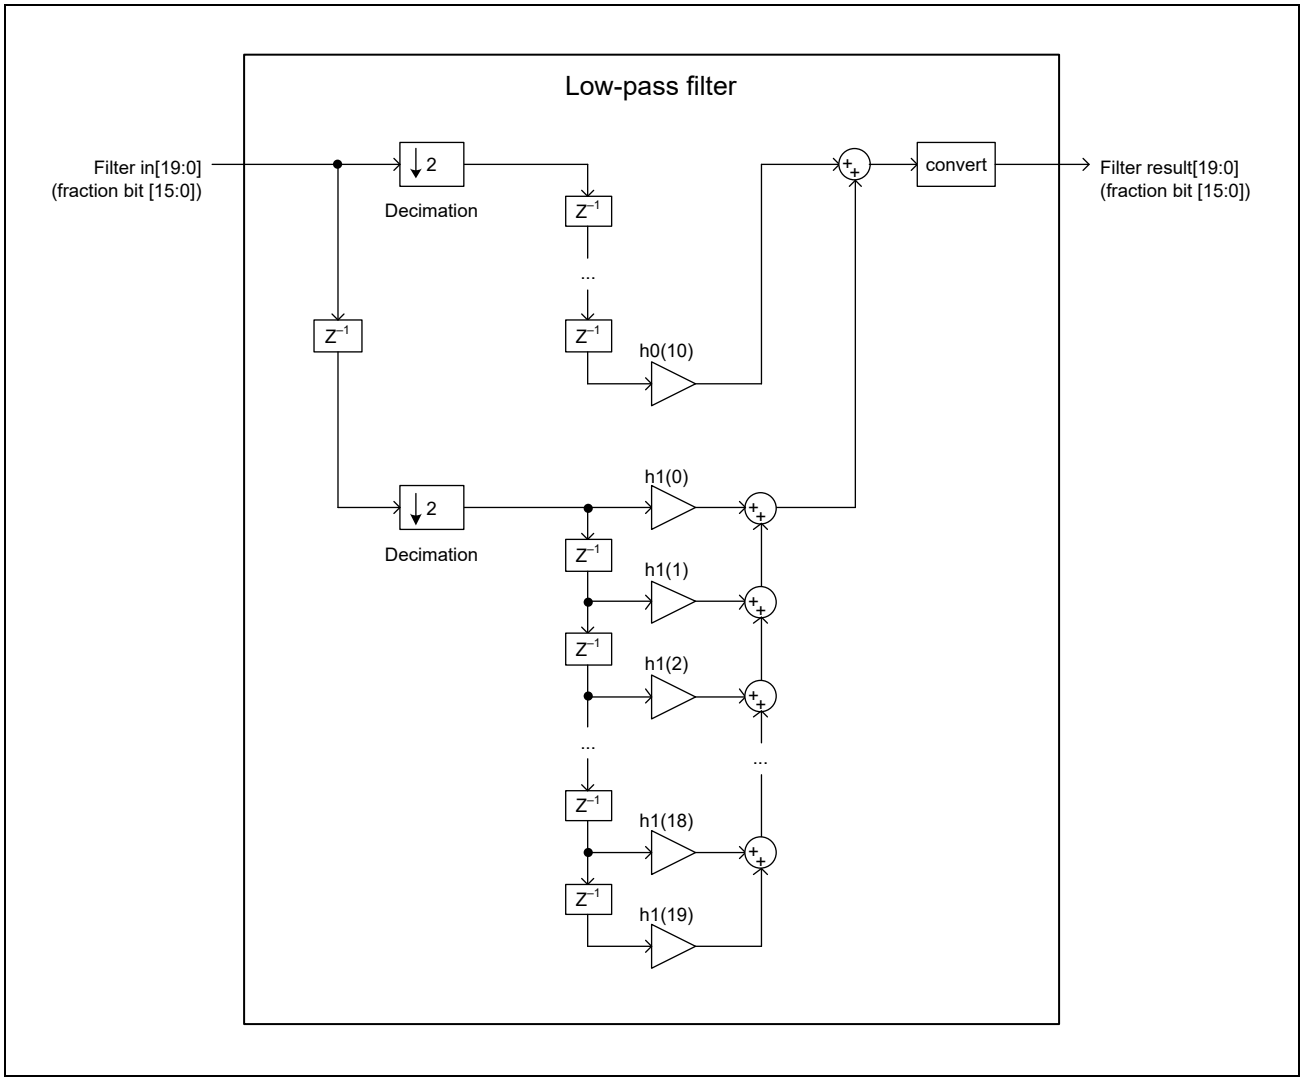

Figure 37.6 Low-Pass Filter Block Diagram

Table 37.15 lists a low-pass filter specification.

Table 37.15 Low-Pass Filter Specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Coefficient	Bit width	Signed 13-bit (fraction 11-bit) Refer to **Section 37.2.2.33, Data Clear Register Channel n (PDMm_PDDCRCHn) (m = 0)** for detail.
Delay Z	Bit width	Signed 20-bit (fraction 16-bit)
Multiplier	Input A bit width	Signed 20-bit (fraction 16-bit)
	Input B bit width	Signed 13-bit (fraction 11-bit)
	Output bit width	Signed 32-bit (fraction 27-bit)
Adder	Input A bit width	Signed 22-bit (fraction 18-bit)
	Input B bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 23-bit (fraction 18-bit)
Output conversion	Input bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at functional unit input or final output.

37.3.4.6 Moving Average Filter

The operating clock of the moving average filter is CCLK. The moving average filter is operated by using the result of the high-pass filter. The order of the moving average filter can be changed by the setting of the PDMDSRCHn.SDMAMD[1:0] bits.

Figure 37.7 shows a moving average filter block diagram.

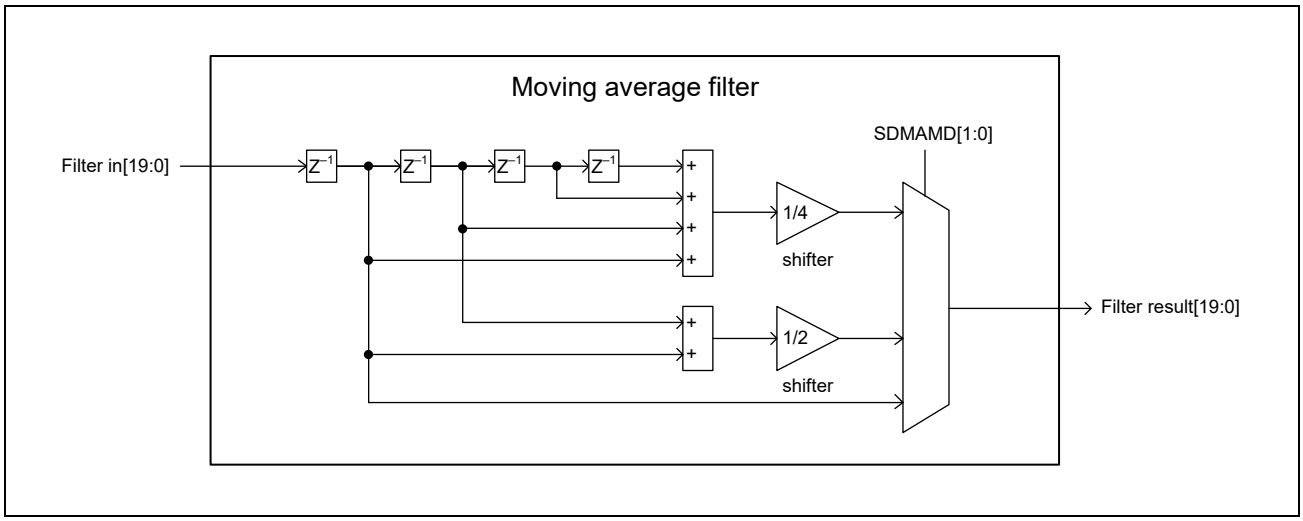

Figure 37.7 Moving Average Filter Block Diagram

Table 37.16 lists a moving average filter specification.

Table 37.16 Moving Average Filter Specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Delay Z	Bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at shifter.

37.3.4.7 Settling Time of Channel Activation / Setting Change

The settling time of channel activation is the time after a start trigger PDCSTRTR.STRTRGn (or PDSTRTRCHn.STRTRG) is set before the filter result is stable and output. The settling time of channel setting change is the time after a change trigger PDCCHGTR.CHGTRGn (or PDCHGTRCHn.CHGTRG) is set before the filter result is stable and output. **Figure 37.8** shows the settling time measurement point.

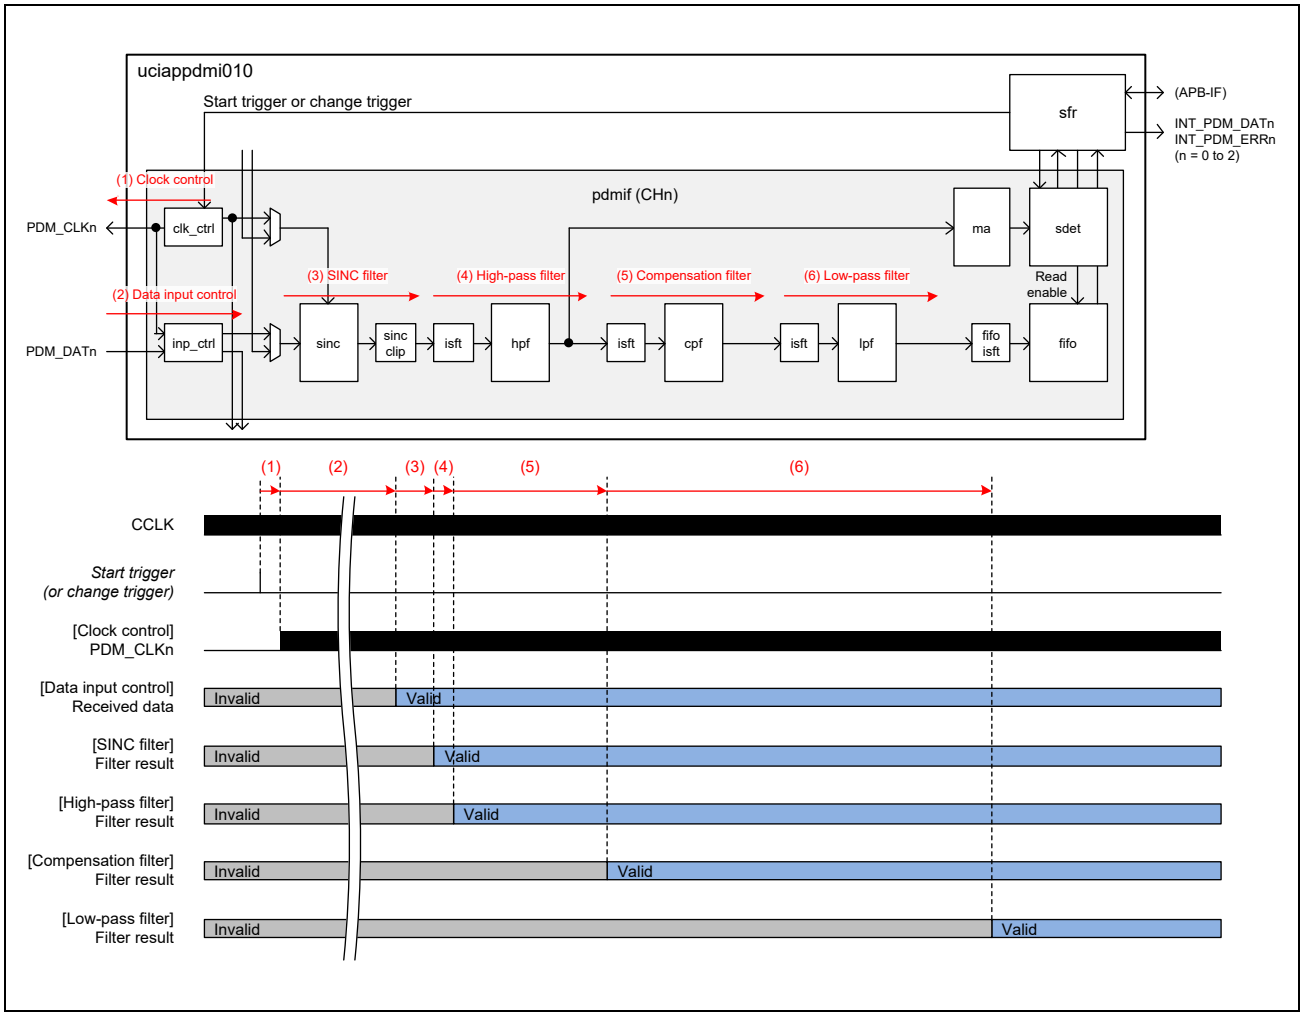

Figure 37.8 Settling Time of Channel Activation

The settling time is calculated as shown in **Table 37.17**.

Table 37.17 Settling Time of Channel Activation / Setting Change

No.	Function	Settling Time	
		Channel Activation	Channel Setting Change
(1)	Clock control	(4 + (D/2)) × Cp	(3 + Do + (D/2)) × Cp
(2)	Data input control	(D/2) × Cp + (Stable time for microphone*1)	
(3)	Sinc filter	(K × D × M) × Cp	
(4)	High-pass filter	(D × M + 5) × Cp	
(5)	Compensation filter	(10 × D × M + 12) × Cp	
(6)	Low-pass filter	(38 × D × M + 22) × Cp	

Note: Cp: CCLK period
D: PDM_CLKn's division ratio
Do: PDM_CLKn's division ratio (old setting)
K: Sinc filter order
M: Sinc filter decimation ratio

Note 1. Wakeup time from low power mode, Switching time, etc. Refer to the datasheet of microphone for details.

37.3.5 Data Input Control for Stereo Sound

The microphone which supports the stereo sound outputs the right sound synchronized with PDM_CLKn's rise-edge and the left sound synchronized with PDM_CLKn's fall-edge.

PDM-IF can process the right sound and the left sound using different channels.

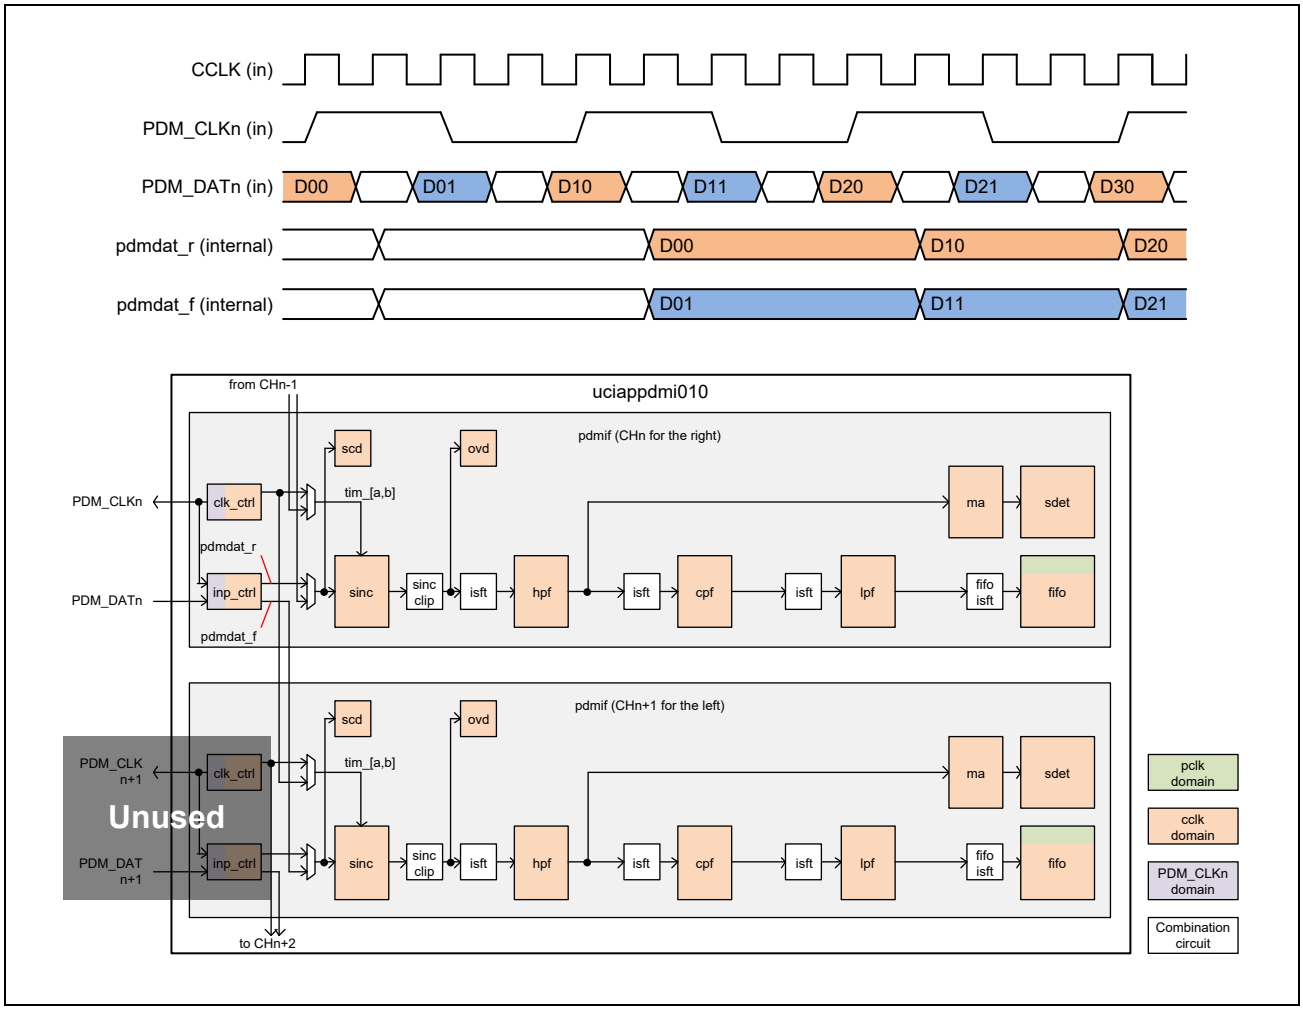

Figure 37.9 Data Input Control for Stereo Sound

Table 37.18 lists the channel combinations of stereo sound processing.

Table 37.18 Channel Combinations of Stereo Sound Processing

Input	Three Channels PDM-IF		Two Channels PDM-IF	
	Data Processing Latched at Rise-Edge (Right Sound)	Data Processing Latched at Fall-Edge (Left Sound)	Data Processing Latched at Rise-Edge (Right Sound)	Data Processing Latched at Fall-Edge (Left Sound)
PDM_CLK0 PDM_DAT0	Channel 0	Channel 1	Channel 0	Channel 1
PDM_CLK1 PDM_DAT1	Channel 1	Channel 2	Channel 1	Channel 0
PDM_CLK2 PDM_DAT2	Channel 2	Channel 0	Not implemented	

Table 37.19 lists an example of register settings for stereo sound processing using channel 0 and channel 1.

Table 37.19 Register Settings for Stereo Sound Processing

Register	Bit	Channel 0 Setting	Channel 1 Setting
PDICRCHn	All bits	Channel unique settings	Channel unique settings
PDSDCRCHn	All bits	Channel unique settings	Channel unique settings
PDMDSRCHn	INPSEL	0 (Use channel 0 data synchronized with rise-edge)	1 (Use channel 0 data synchronized with fall-edge)
	SFMD[2:0]	Same settings for channel 0 and channel 1 (Mandatory)	
	HFIS[1:0]	Channel unique settings	Channel unique settings
	HFMD	Same settings for channel 0 and channel 1 (Mandatory)	
	CFIS[1:0]	Channel unique settings	Channel unique settings
	CFMD	Same settings for channel 0 and channel 1 (Mandatory)	
	LFIS[1:0]	Channel unique settings	Channel unique settings
	LFMD	Same settings for channel 0 and channel 1 (Mandatory)	
	SDHFMD	Same settings for channel 0 and channel 1 (Mandatory)	
	SDMAMD[1:0]	Same settings for channel 0 and channel 1 (Mandatory)	
	DBIS[3:0]	Channel unique settings	Channel unique settings
PDSFCRCHn	CKDIV[3:0]	Setting of the clock which is supplied to the microphone connected to channel 0	Unuse
	SINCDEC[7:0]	Same settings for channel 0 and channel 1 (Mandatory)	
	SINCRNG[4:0]	Same settings for channel 0 and channel 1 (Mandatory)	
PDHFCS0RCHn	All bits	Channel unique settings	Channel unique settings
PDHFCK1RCHn	All bits	Channel unique settings	Channel unique settings
PDHFCH0RCHn	All bits	Channel unique settings	Channel unique settings
PDHFCH1RCHn	All bits	Channel unique settings	Channel unique settings
PDCFCHmRCHn	All bits	Channel unique settings	Channel unique settings
PDLFCH0mRCHn	All bits	Channel unique settings	Channel unique settings
PDLFCH1mRCHn	All bits	Channel unique settings	Channel unique settings
PDSDLTRCHn	All bits	Channel unique settings	Channel unique settings
PDSDUTRCHn	All bits	Channel unique settings	Channel unique settings
PDDBCRCHn	All bits	Same settings for channel 0 and channel 1 (Mandatory)	
PDSCTSRCHn	All bits	Channel unique settings	Channel unique settings
PDOVLTRCHn	All bits	Channel unique settings	Channel unique settings
PDOVUTRCHn	All bits	Channel unique settings	Channel unique settings

37.3.6 Sound Detection

The operating clock of the sound detection function is CCLK. When PDSDCRCHn.SDE = 1b, the function judges the sound detection using the moving average filter results.

A sound detection flag (PDSRCHn.SDF) is set to 1b when the result is above the upper limit PDSDUTRCHn.SDETU[19:0]. The sound detection flag is also set to 1b when the result is below the lower limit PDSDLTRCHn.SDETL[19:0]. The sound detection flag is cleared to 0b when 1b is written to PDSCRCHn.SDFC.

Figure 37.10 shows the sound detection function.

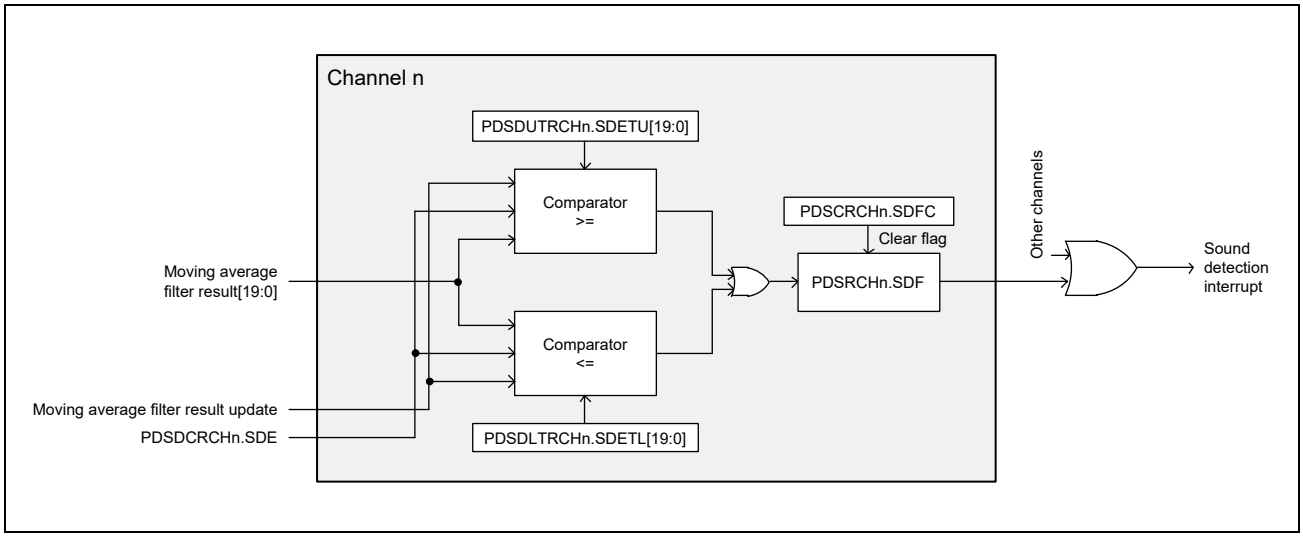

Figure 37.10 Sound Detection Function

37.3.7 Data Buffer

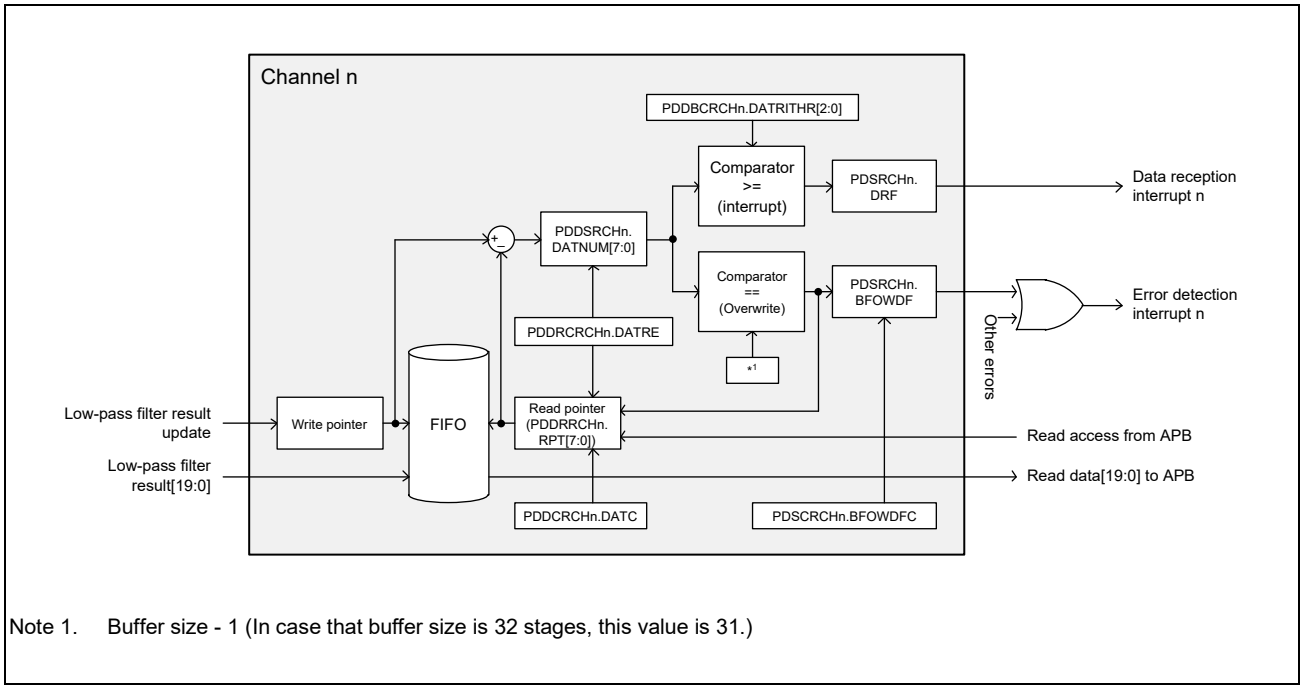
Data buffer writes sound data to FIFO synchronizing with CCLK and reads sound data from FIFO synchronizing with PCLK. Data buffer stores sound data in FIFO until it is read out.

While PDDRCRCHn.DATRE = 0b (hereinafter, DATRE), PDDSRCHnDATNUM[7:0] (hereinafter, DATNUM[7:0]) shows 0 and PDM-IF does not allow to read sound data. After DATRE is changed from 0b to 1b, DATNUM[7:0] shows the buffer size minus 2 and PDM-IF allows to read sound data. While DATRE = 1b, data buffer increments DATNUM[7:0] when data is written and decrements DATNUM[7:0] when data is read.

When DATNUM[7:0] is greater than or equal to a threshold which is configured by PDDBCRCHn.DATRITHR[2:0], a data reception flag PDSRCHn.DRF (hereinafter, DRF) is set to 1b. When DATNUM[7:0] is less than the threshold by reading data or etc., a data reception flag DRF is cleared to 0b.

When DATNUM[7:0] is the buffer size minus 2 and data is written without reading, data buffer overwrites the oldest data with a new one and a buffer overwriting detection flag PDSRCHn.BFOWDF (hereinafter, BFOWDF) is set to 1b. And then DATNUM[7:0] is set to the buffer size minus 2 again after overwriting. However, data buffer overwrites but BFOWDF is not set after DATRE changes from 0b to 1b to before the first data is read.

Figure 37.11 shows the data buffer function.



Note 1. Buffer size - 1 (In case that buffer size is 32 stages, this value is 31.)

Figure 37.11 Data Buffer Function

37.3.8 Short-Circuit Detection

When Short-circuit detection enable (PDSDCRCHn.SCDE) is valid, the short-circuit detection can operate.

A dedicated 13-bit counter counts consecutive 0's or 1's input from pdm_dat which is outputs by data input control block of channel n or channel n+1.

When the number of consecutive 0's exceeds the value set in the PDSCTSRCHn.SCDL[12:0] register or the number of consecutive 1's exceeds the value set in the PDSCTSRCHn.SCDH[12:0] register, a short-circuit detection interrupt request is generated.

Figure 37.12 shows the configuration for the short-circuit detection function.

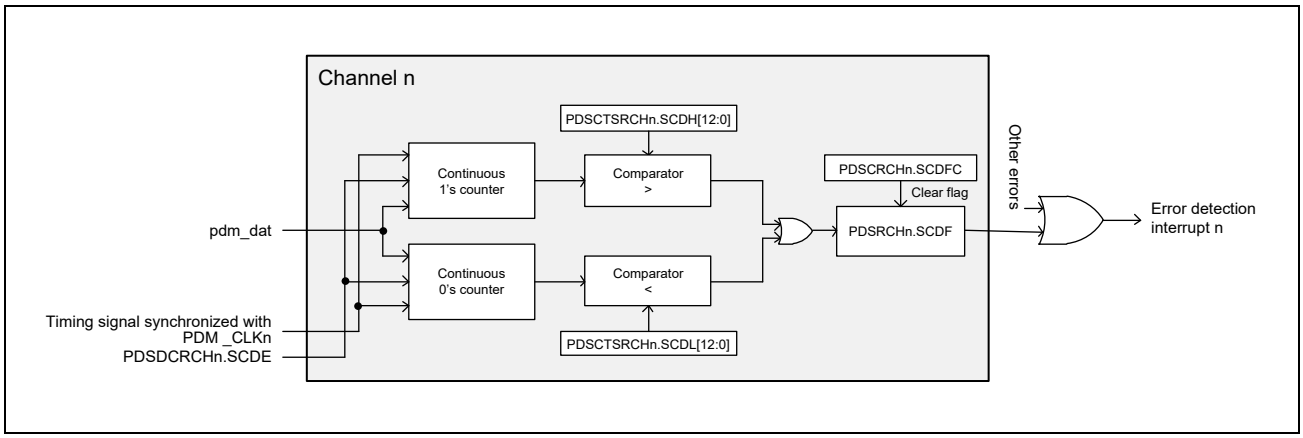


Figure 37.12 Short-Circuit Detection Function

37.3.9 Overvoltage Detection

When the overvoltage upper limit detection enable (PDSDCRCHn.OVUDE) is valid, the overvoltage upper limit detection can operate. When the overvoltage lower limit detection enable (PDSDCRCHn.OVLDE) is valid, the overvoltage lower limit detection can operate.

The sound data is clipped as a 20-bit data from 34-bit data output from sinc filter by the setting of the PDSFCRCHn.SINCRNG[4:0] bits. Refer to **Table 37.8** for details.

An overvoltage upper limit detection flag is set to 1b when the clipped sound data is greater than PDOVUTRCHn.OVDU[19:0].

An overvoltage lower limit detection flag is set to 1b when the clipped sound data is less than PDOVLTRCHn.OVDL[19:0].

Figure 37.13 shows the overvoltage detection function.

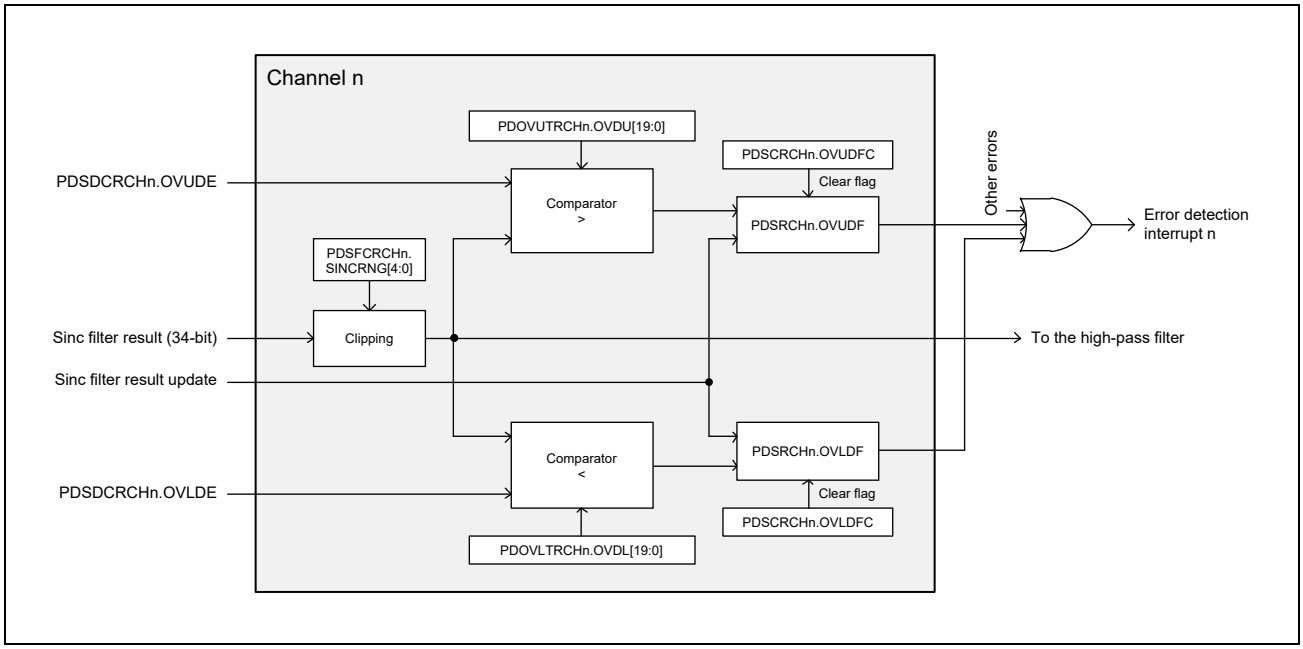

Figure 37.13 Overvoltage Detection Function

37.3.10 Error

Table 37.20 shows a PDM-IF error list.

Table 37.20 PDM-IF Error List

No.	Register Name	Description	Comment	Function (Related Section)
1	PDSRCHn.SCDF	Short circuit detection flag		**Section 37.3.8, Short-Circuit Detection**
2	PDSRCHn.OVLDF	Overvoltage lower limit detection flag		**Section 37.3.9, Overvoltage Detection**
3	PDSRCHn.OVUDF	Overvoltage upper limit detection flag		**Section 37.3.9, Overvoltage Detection**
4	PDSRCHn.BFOWDF	Buffer overwriting detection flag	For debugging	**Section 37.3.7, Data Buffer**

The errors in No.4 are for debugging. Software needs to set registers and operate PDM-IF so that these errors do not occur. If any of these error occur, stop PDM-IF following **Section 37.4.2, Stop Flow** and change the settings.

37.3.11 Interrupt Function

PDM-IF has the following interrupt function.

Table 37.21 PDM-IF Interrupt List

No.	Signal Name	Interrupt Name	Number of Signals	Pulse or Level	Related Register Bit Name		Function (Related Section)
					Common Register	Channel Register	
1	INT_PDM_DATn (n = 0, 1, 2)	Data reception interrupt CHn	3	Level	PDCSR.DRFn	PDSRCHn.DRF	**Section 37.3.7, Data Buffer**
2	INT_PDM_SDET	Sound detection interrupt (3-channel status flags are ORed.)	1	Level	PDCSR.SDFn	PDSRCHn.SDF	**Section 37.3.6, Sound Detection**
3	INT_PDM_ERRn (n = 0, 1, 2)	Error detection interrupt CHn	3	Level	PDCSR.EDFn	PDSRCHn.SCDF	**Section 37.3.8, Short-Circuit Detection**
						PDSRCHn.OVLDF	**Section 37.3.9, Overvoltage Detection**
						PDSRCHn.OVUDF	**Section 37.3.9, Overvoltage Detection**
						PDSRCHn.BFOWDF	**Section 37.3.7, Data Buffer**

37.4 Setting Flow

Figure 37.14 and **Figure 37.15** show the example of the main procedure of PDM-IF.

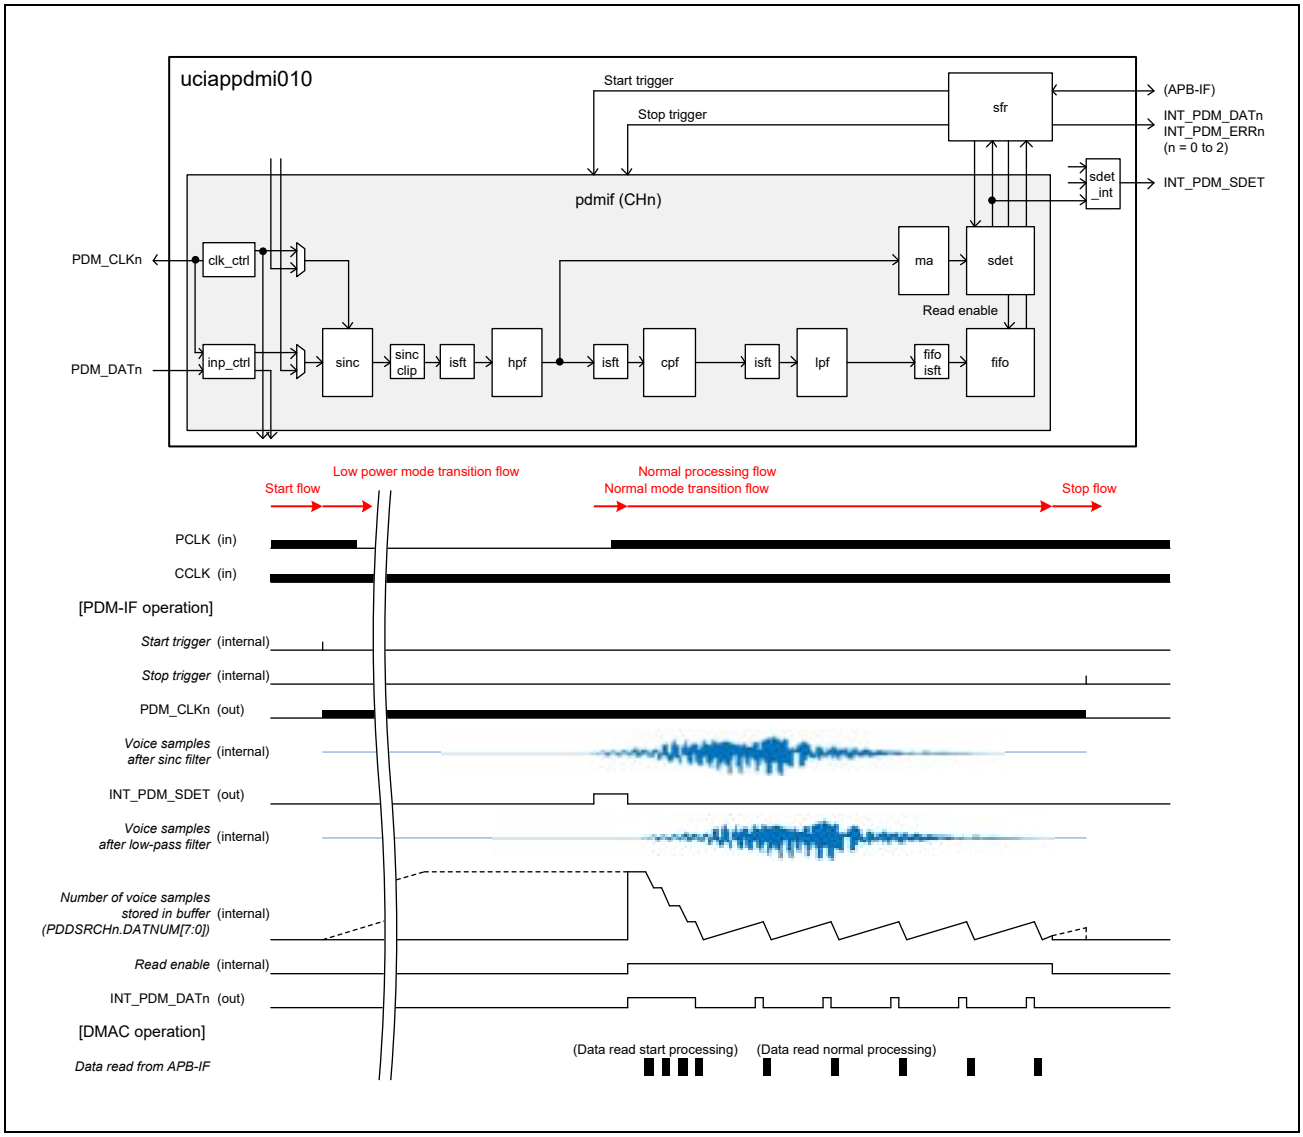

Figure 37.14 PDM-IF Operation Example

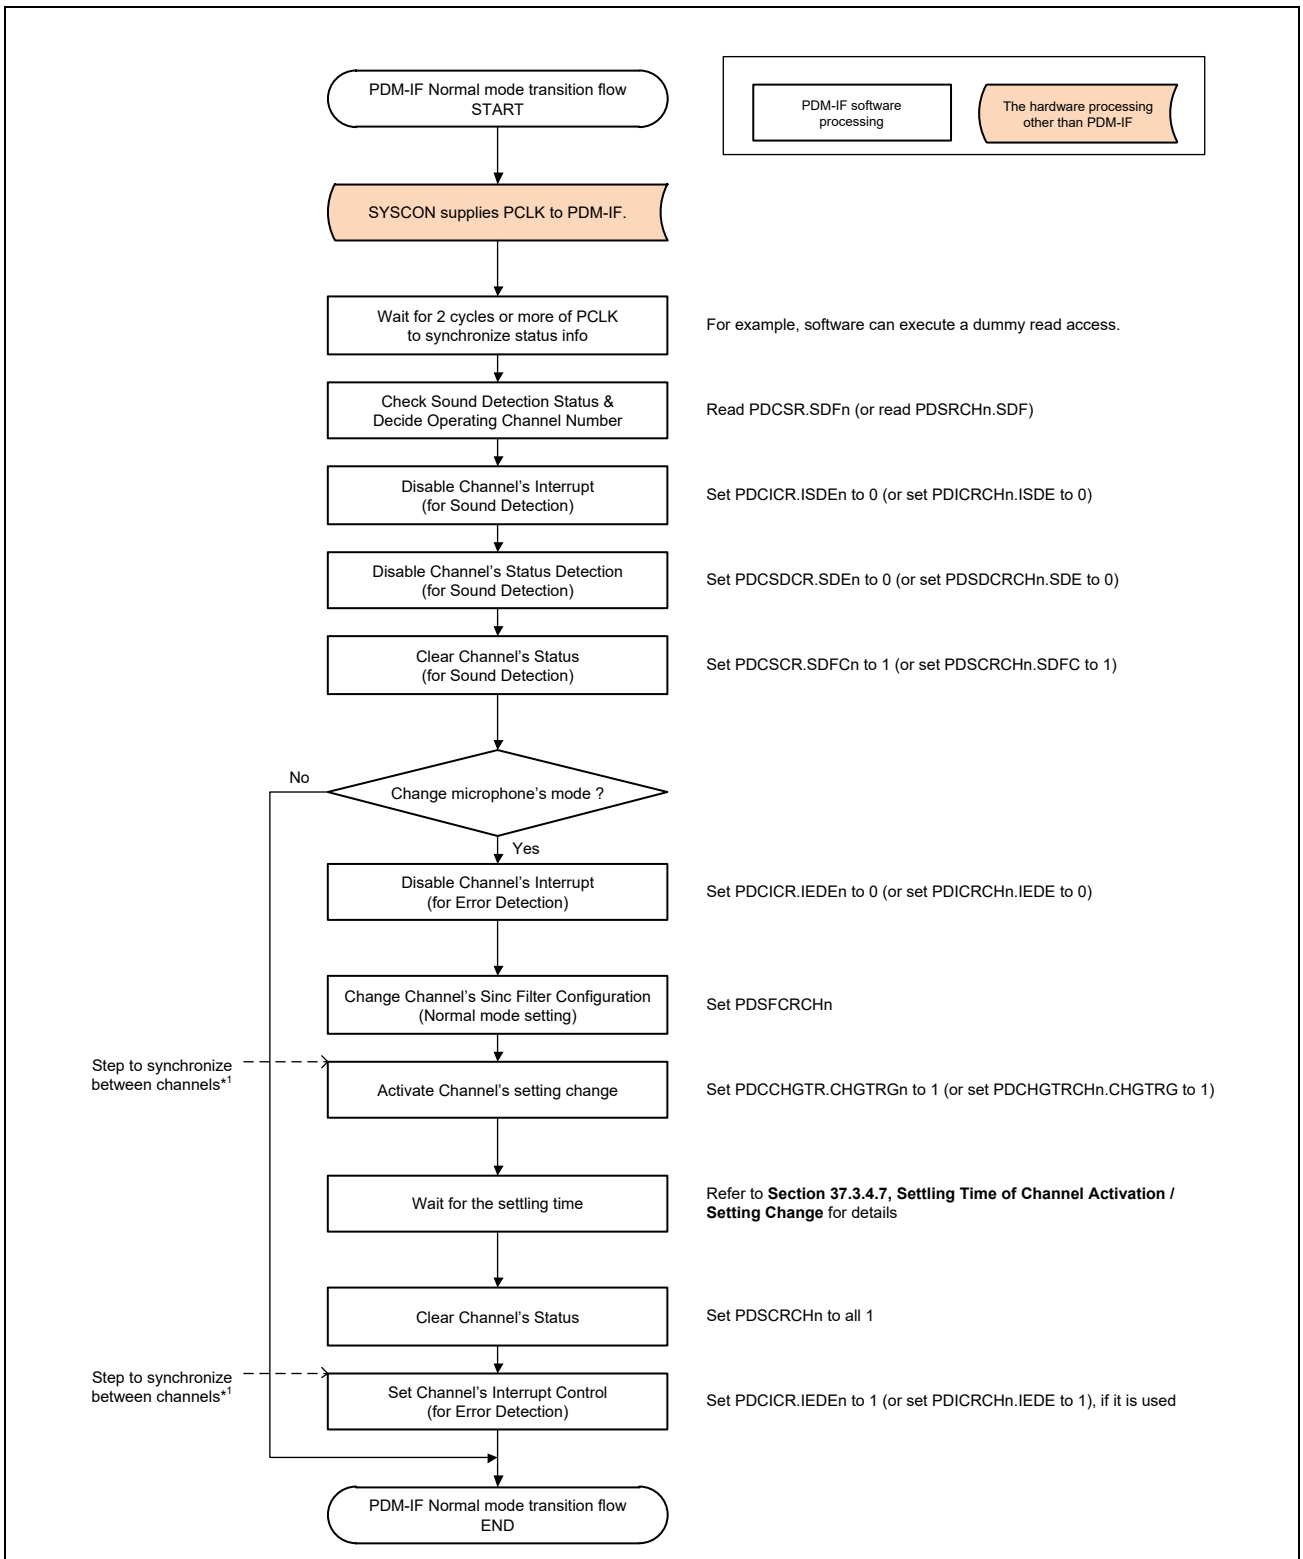
37.4.5 Normal Mode Transition Flow

Figure 37.21 shows the example of normal mode transition procedure of PDM-IF.



Note 1. If the channels are to be synchronized, complete the settings for respective channels before this step.

Figure 37.21 PDM-IF Normal Mode Transition Flow

37.4.6 Setting PDM_CLKn (n = 0, 1, 2) Frequency and Sampling Frequency Generated by the Unit

The frequency of PDM_CLKn (n = 0, 1, 2), which is the reference for receiving data from the external device, and the sampling frequency generated by the PDM unit for external input PDM data can be changed by setting the register. The PDM_CLKn (n = 0, 1, 2) frequency must match the clock input specifications of the external device. The sampling frequency generated by the unit should be set to the expected value.

In this LSI, the PDM reference clock CCLK is fixed at 8 MHz, so the PDM_CLK output frequency and the unit-generation sampling frequency follow the equation below when implementing the circuit.

- PDM_CLKn (n = 0, 1, 2) frequency

$$= \frac{\text{CCLK frequency}}{(\text{CKDIV} + 1) \times 2};$$

- Unit-generation sampling frequency

$$= \frac{\text{PDM\_CLK frequency}}{(\text{SINCDEC} + 1) \times 2^{*1}} = \frac{\text{CCLK frequency}}{(\text{CKDIV} + 1) \times 2} \div (\text{SINCDEC} + 1) \times 2^{*1};$$

Remark: CKDIV: PDSFCRCHn.CKDIV[3:0] register set value (Set the PDM_CLKn division ratio to CCLK)
SINCDEC: PDSFCRCHn.SINCDEC[7:0] register set value (Set the decimation ratio of the Sinc filter)

Note 1. Reason for ×2: Low-pass filter decimation ratio

- PDMIF sampling rate:

$$\frac{\text{CCLK frequency}}{\big((\text{CKDIV} + 1) \times 2\big) \times (\text{SINCDEC} + 1) \times 2}$$

The output range of the sinc filter is changed by changing the decimation ratio of the sinc filter (SINCDEC) with the change of the sampling frequency above. Since the maximum number of effective bits for processing of audio data within the PDM following sinc filtering is 20 bits, PDSFCRCHn.SINCRNG[4:0] must also be changed according to the output range of the sinc filter. This allows avoiding the occurrence of overflow and underflow and maximizing the effective audio amplitude.

Recommended setting: Set PDSFCRCHn.SINCRNG[4:0] such that the higher-order 20 bits of valid data of the sinc filter output are effective in calculation processing following sinc filtering.

For details on clipping or sifting of the sinc filter output, see **Section 37.3.4.1, Data Clipping and Shifting between Filters**.

- Output range of the sinc filter
  = ±decimation ratio (PDSFCRCHn.SINCDEC[7:0]) ^ order (PDMDSRCHn.SFMD[2:0]);

[Example]

When SINCDEC[7:0] = H'27 (decimation ratio: 40) and SFMD[2:0] = 0 (4-order), the output range of the sinc filter is ±2560000 (23 bits consisting of 22 bits of significant digits and a sign bit). The recommended setting of PDSFCRCHn.SINCRNG[4:0] in this case is 0_1011b (b22-b3).

37.4.7 DMA Transfer Method

This PDM unit can only receive voice data from external sources, and does not have a transmit function. The PDM unit does not have a dedicated REQ/ACK signal to the DMAC master, but only reads data from the PDM buffer read register via the APB I/F. Reading data via the CPU and reading data via the DMAC master are not different in terms of PDM functionality.

Figure 37.22 shows an overview of the PDM data read process.

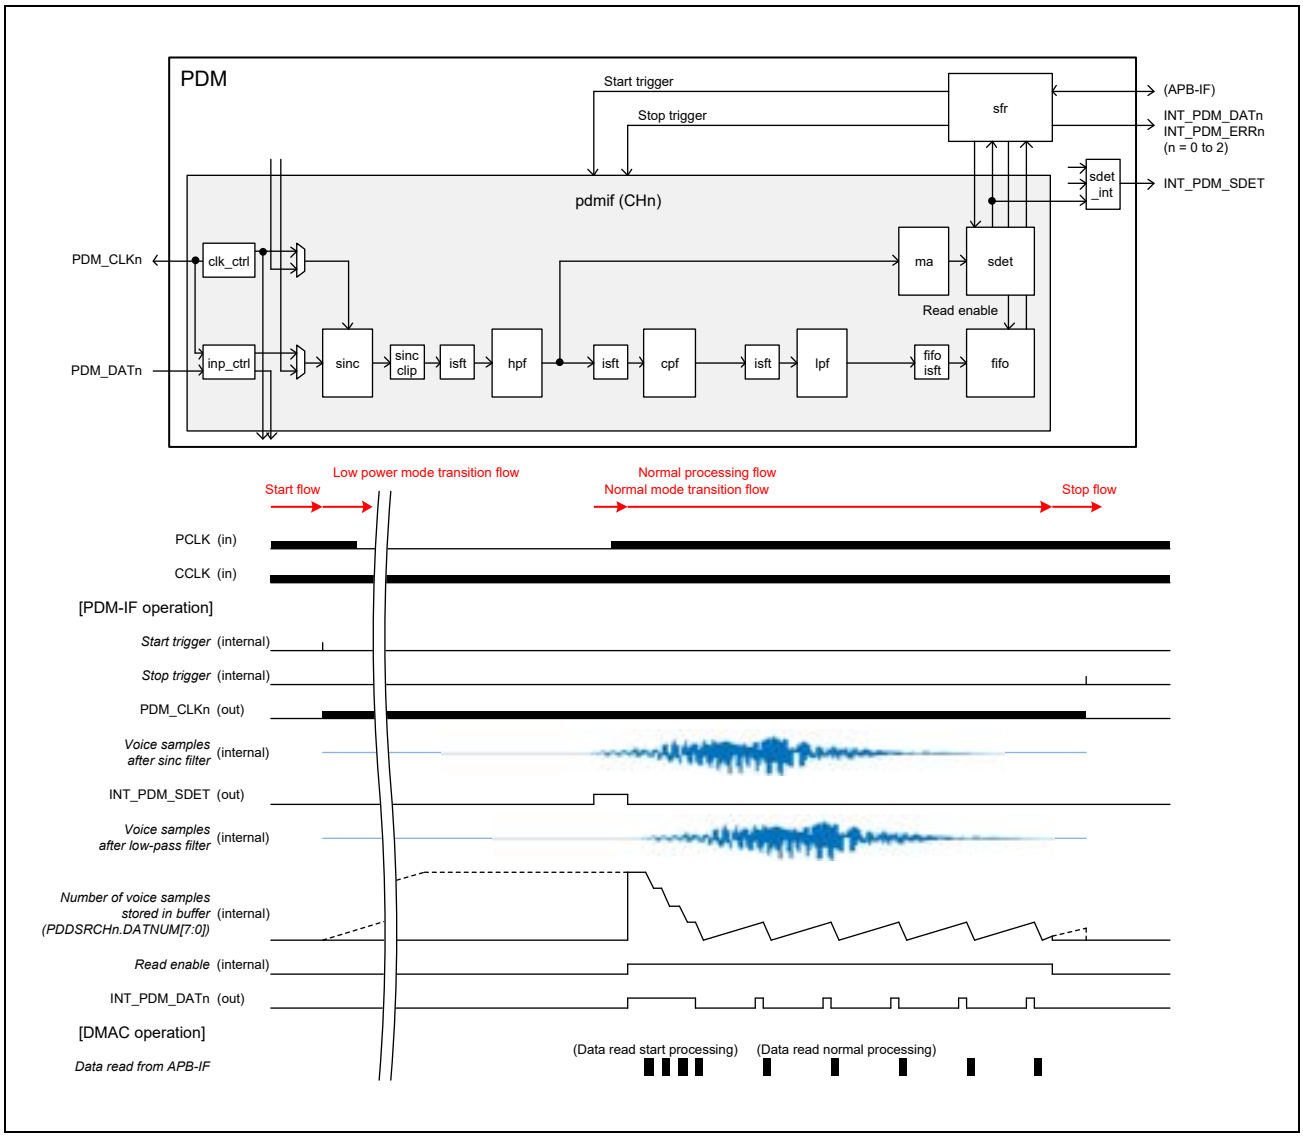


Figure 37.22 PDM-IF Operation Example

The DMA data transfer using the DMA master must follow the description in **Section 37.4.3, Normal Processing Flow**. The following explains the connection configuration with the DMA master, initialization settings on the DMA master, and recommended settings for the INT_PDM_DAT0/1/2 signal at PDM initialization.

The connection configuration with the DMA master in this LSI is as follows, issuing a DMA request to the DMA master based on the INT_PDM_DAT0/1/2 signal of the PDM. The INT_PDM_DAT0/1/2 interrupt signal is active (high) depending on the amount of data stored in the receive buffer in the PDM (the amount of interrupt generation buffer can be changed by setting the register / PDDBCRCHn (n = 0, 1, 2).DATRITHR[2:0]).

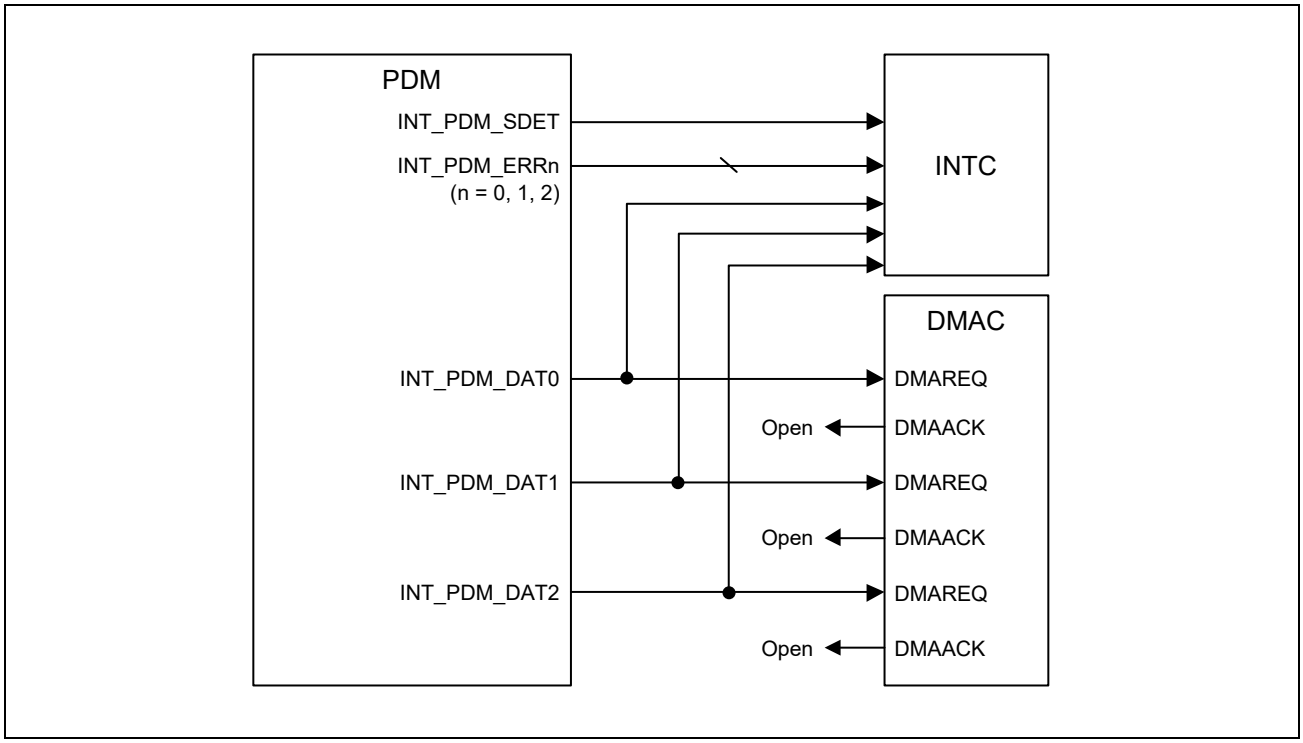

Figure 37.4-23 PDM Connection Configuration

This section describes the restrictions at DMA transfer and the active condition of the INT_PDM_DAT0/1/2 signal at PDM initialization.

1) Restrictions at DMA transfer:

The initialization setting on the DMA master is required in “Software configures DMAC/Software re-configures DMAC” in **Figure 37.19** of **Section 37.4.3, Normal Processing Flow**. The restrictions on PDM DMA transfers are described below.

- DMA transfer mode (1): Single

  (One DMA transfer process is performed for one DMA request.)
  Reference value for the DMA master setting: TM register = 0b

- DMA transfer mode (2): Bus cycle mode

  (DMAREQ is masked in the bus cycle period (while DMAACK is active.))
  Reference value for the DMA master setting: AM[2:0] = H’010

- One DMA transfer: 32 bits

  Reference value for the DMA master: DDS or SDS register = 32 bits

- DMA REQ signal attribute: Level/High

  (The active polarity of the INT_PDM_DAT0/1/2 signal is high, so the DMA request signal must also be high.)
  Reference value for the DMA master: LVL = 1b, HIEN = 1b, LOEN = 0b

- DMA REQ signal active release timing: After the completion of data read from the PDM unit

  (DMA REQ is masked while DMA ACK is enabled.)
  Reference value for the DMA master: REQD = 0b

- DMA transfer data read register: PDDRRCHn (n = 0, 1, 2).DAT[19:0] register

2) Interrupt setting of the INT_PDM_DAT0/1/2 signal in the PDM receive initialization setting:

The interrupt setting for the INT_PDM_DAT0/1/2 signal is required in “Set Channel’s Data Buffer Control” in **Figure 37.17** of **Section 37.4.1, Start Flow**.
As the receive buffer amount of PDM in this LSI is fixed at 64 stages, it is recommended to set PDDBCRCHn (n = 0, 1, 2).DATRITHR[2:0] = 4 (16 stages). Since a time difference may occur between the active timing of the INT_PDM_DAT0/1/2 signal and the request decision on the DMA master, the active timing of the INT_PDM_DAT0/1/2 signal must always be selected to be at least 2 stages.

37.4.8 Reset Clock Control

For the reset clock control, the following reset clock pins must be controlled.

Table 37.22 List of Reset Clocks

	Reset Signal	Clock Signal	Clock Source	Description
System 1	PRESETn	PCLK, PCLK_SFR	CPG unit (Divider clock for CPG PLL output)	For internal bus control circuit
System 2	CRESETn	CCLK	CPG unit (External system clock: 8 MHz fixed)	For external IF control circuit

The above reset clock pins are controlled by the CPG unit, and each reset clock can be controlled ON/OFF with the CPG register. When each reset is released, a feature is implemented on the CPG to stop the target clock before and after the reset is released.

For each system, reset and clock control should be performed according to the following procedure.

However, the reset and clock control between the two systems below are independent, and there are no restrictions on the order of settings between the systems.

Furthermore, when controlling the reset clock, the PDM unit should be stopped and accesses from related units should also be stopped.

1. Reset (PRESETn) and clock (PCLK, PCLK_SFR) for the internal bus control circuit:
   — PDM operation start condition (reset/clock supply): clock supply → reset release
   — PDM stop condition (reset/clock stop): reset enabled → clock stop
   — PDM reset (reset ON/OFF, clock supply continued): Reset can be enabled or disabled at any timing

2. Reset (CRESETn) and clock (CCLK) for the external IF control circuit:
   — PDM operation start condition (reset/clock supply): clock supply → reset release
   — PDM stop condition (reset/clock stop): reset enabled → clock stop
   — PDM reset (reset ON/OFF, clock supply continued): Reset can be enabled or disabled at any timing

As for PCLK/PCLK_SFR, the CPG unit can change the clock frequency variable (100 MHz, 50 MHz, 25 MHz, 12.5 MHz, 3.125 MHz). When lowering the PCLK/PCLK_SFR frequency, the performance of reading voice data from the PDM unit will be degraded. Use caution when lowering the frequency.

37.5 Interrupt

37.5.1 Interrupt List

Table 37.23 is a list of interrupt signals for this unit. For details on interrupts, refer to **Section 8, Interrupt Controller**.

Table 37.23 PDM-IF Interrupt List

No.	Signal Name	Interrupt Name	Number of Signals	Pulse or Level	Related Register Bit Name		Function (Related Section)
					Common Register	Channel Register	
1	INT_PDM_DATn (n = 0, 1, 2)	Data reception interrupt CHn (n = 0, 1, 2)	3	Level	PDCSR.DRFn	PDSRCHn (n = 0, 1, 2).DRF	**Section 37.3.7, Data Buffer**
2	INT_PDM_SDET	Sound detection interrupt (3-channel status flags are ORed.)	1	Level	PDCSR.SDFn	PDSRCHn (n = 0, 1, 2).SDF	**Section 37.3.6, Sound Detection**
3	INT_PDM_ERRn (n = 0, 1, 2)	Error detection interrupt CHn (n = 0, 1, 2)	3	Level	PDCSR.EDFn	PDSRCHn (n = 0, 1, 2).SCDF	**Section 37.3.8, Short-Circuit Detection**
						PDSRCHn (n = 0, 1 ,2).OVLDF	**Section 37.3.9, Overvoltage Detection**
						PDSRCHn (n = 0, 1, 2).OVUDF	**Section 37.3.9, Overvoltage Detection**
						PDSRCHn (n = 0, 1, 2) BFOWDF	**Section 37.3.7, Data Buffer**

37.6 Usage Notes

37.6.1 Data Reception Interrupt Threshold Register Setting

A data reception interrupt INT_PDM_DATn is issued as a level output. Therefore, if the number of samples in buffer still exceeds the data reception interrupt threshold set in PDDBCRCHn.DATRITHR[2:0] when data reading of DMA finishes, the interrupt controller might not detect the edge of INT_PDM_DATn. The situation happens if data reading time exceeds sampling rate*1 x threshold. Set the appropriate threshold so that the interrupt controller can detect the interrupt.

In case the threshold cannot avoid the situation, read PDDBCRCHn.DATRITHR[2:0] and re-start DMA by software after reading the data.

Note 1. Sampling rate: Time to spend to store a sample in buffer.

37.6.2 Frequency Characteristics of Filters with Default Settings

The following figure and table show the frequency characteristics of the filters with the default settings for reference information.

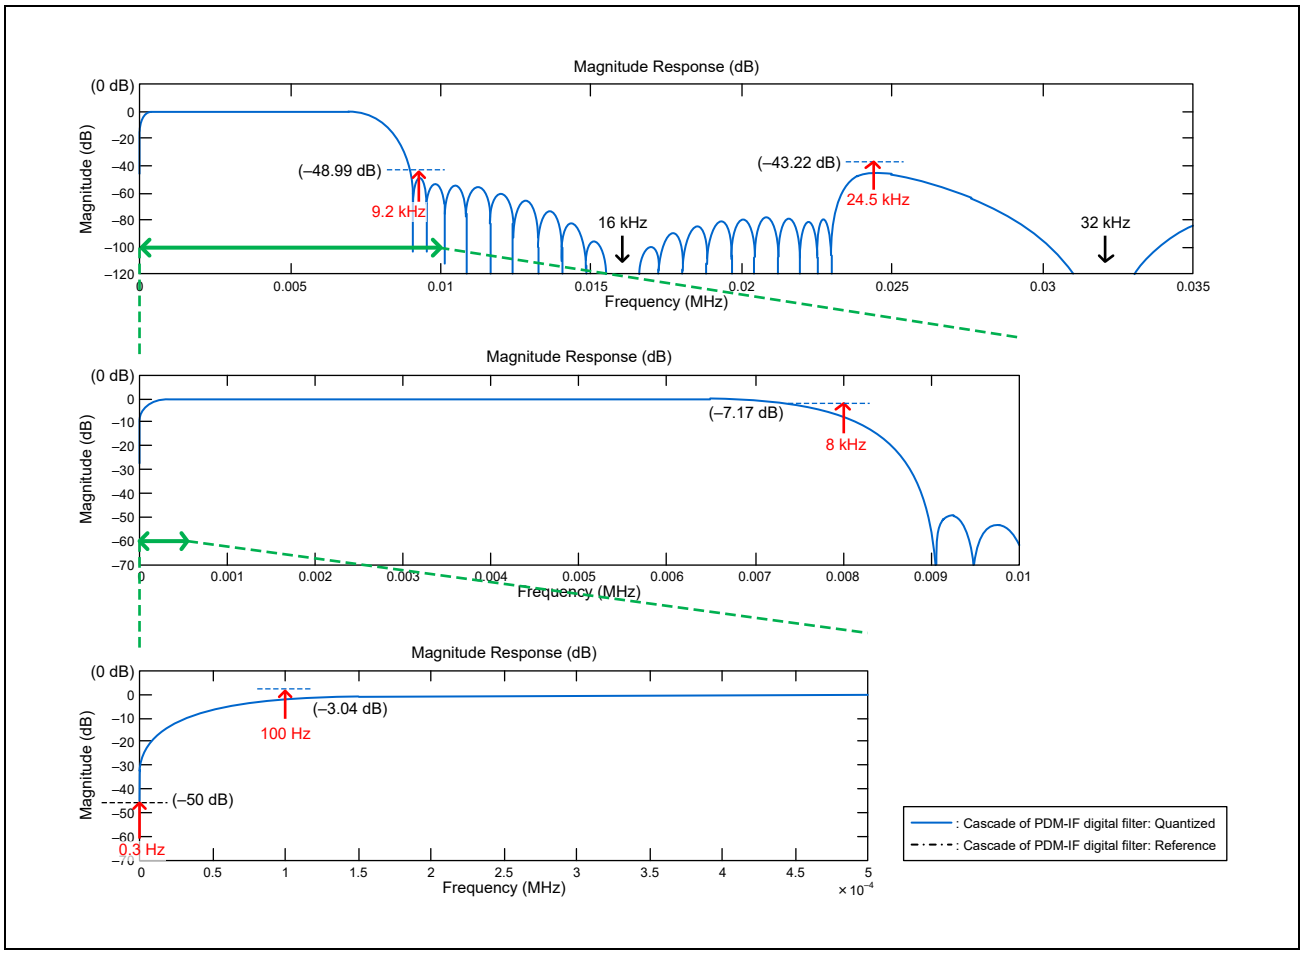

Figure 37.24 Frequency Characteristics of Filters with Default Settings

Table 37.24 Frequency Characteristics of Filters with Default Settings

Frequency (Hz)		Magnitude (dB)
Cut-off frequency of LPF	24.5 kHz	−43.22
	…	…
	9.2 kHz	−48.99
	8 kHz	−7.17
Passband	7 kHz	−0.39
	6 kHz	−0.07
	…	…
	150 Hz	−1.63
	100 Hz	−3.04
Cut-off frequency of HPF	50 Hz	−7.02
	0.3 Hz	−50.00

38. Renesas SPDIF Interface

38.1 Overview

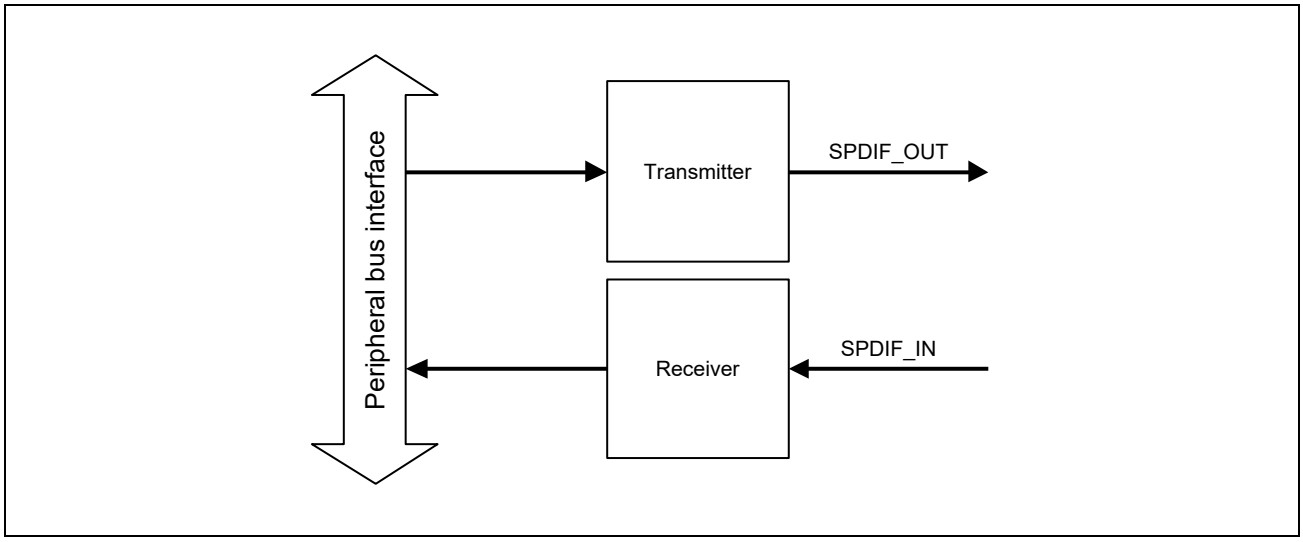

Figure 38.1 Overview Block Diagram

38.2 Features

- Supports the IEC 60958 standard (stereo and consumer use modes only).
- Supports sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz.
- Supports audio word sizes of 16 to 24 bits per sample.
- Biphase mark encoding.
- Double buffered data.
- Parity encoded serial data.
- Simultaneous transmit and receive
- Receiver autodetects IEC 61937 compressed mode data

38.3 Functional Block Diagram

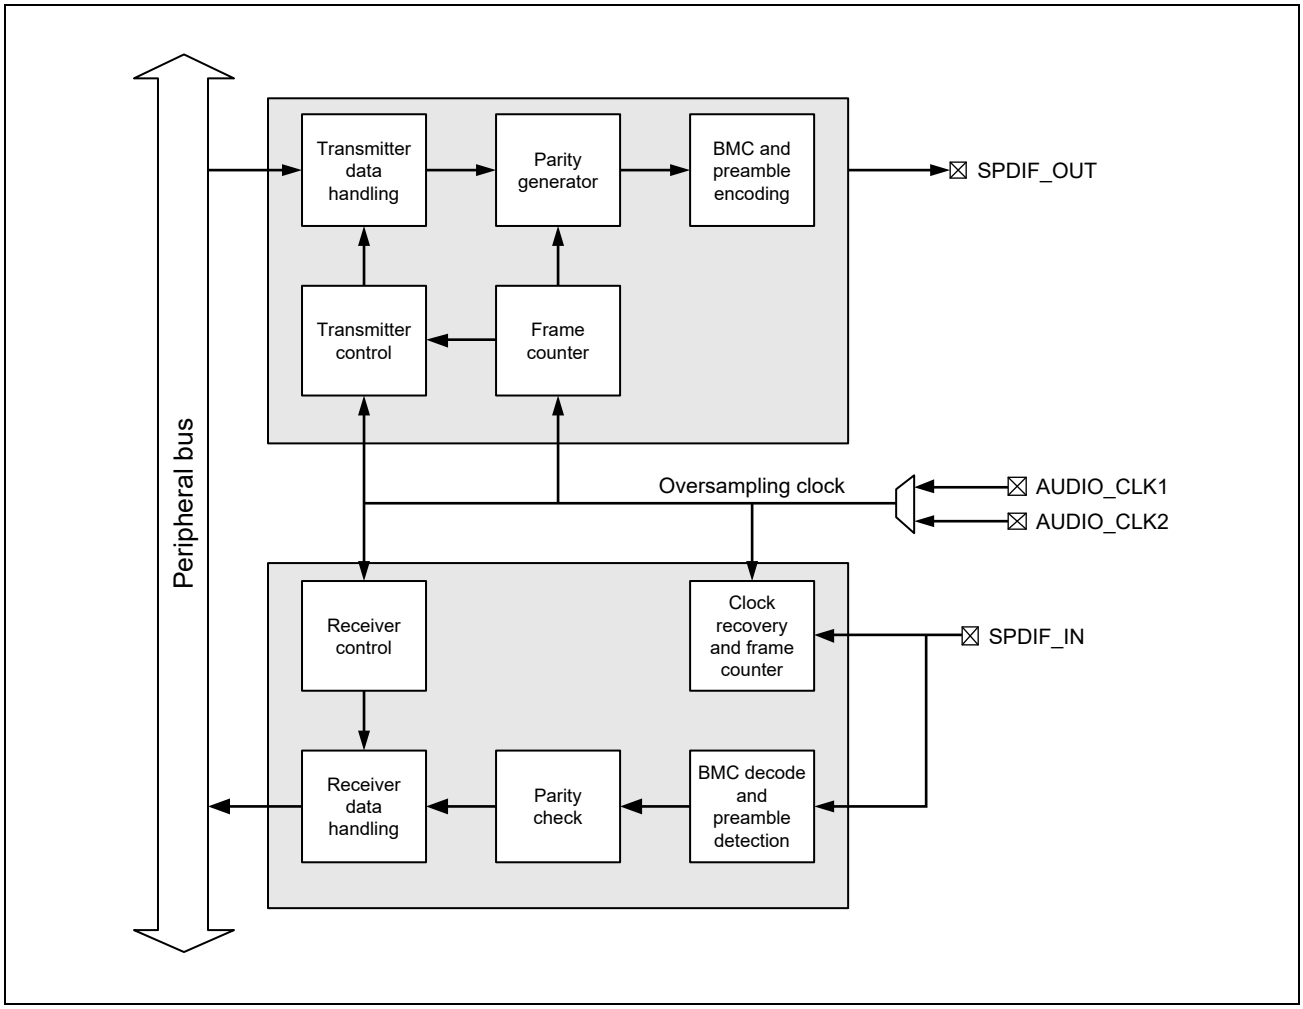

Figure 38.2 Functional Block Diagram

38.4 Input/Output Pins

Table 38.1 shows the pin configuration.

Table 38.1 Pin Configuration

Channel	Pin Name	I/O	Description
0	SPDIF_OUT	Output	Transmitter biphase-mark encoded SPDIF bitstream
1	SPDIF_IN	Input	Receiver biphase-mark encoded SPDIF bitstream
0, 1 (Common)	AUDIO_CLK1	Input	External clock for audio 1
	AUDIO_CLK2	Input	External clock for audio 2

38.5 Renesas SPDIF (IEC60958) Frame Format

The Renesas SPDIF frame consists of two subframes (for channels 1 and 2), each of which contains a 4-bit preamble, audio data of up to 24 bits, a V flag, a user bit, a channel status bit, and an even parity bit. **Figure 38.3** shows the subframe format. According to this format, the Renesas SPDIF performs biphase-mark modulation (channel coding) that will make the transmission line's DC component a minimum value.

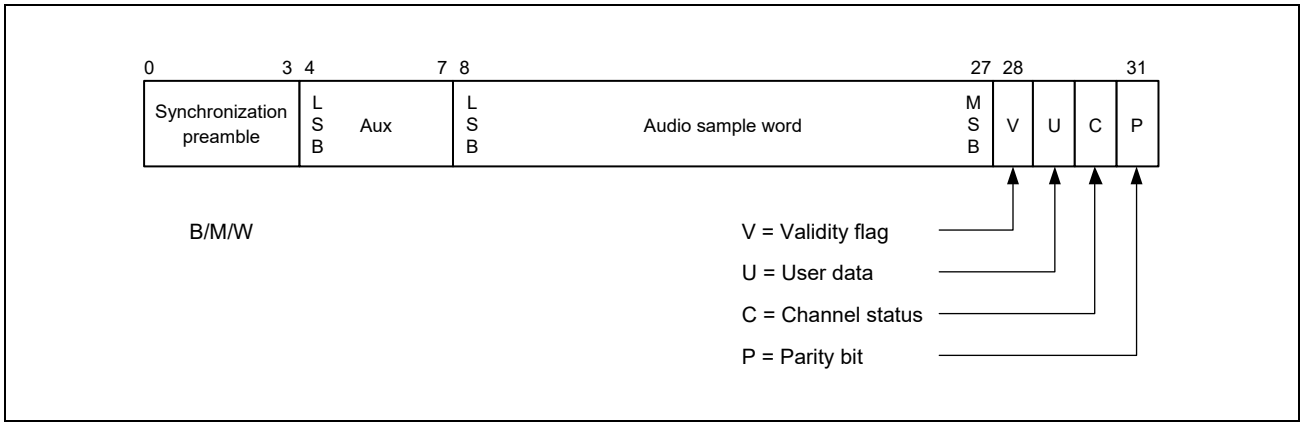

Figure 38.3 Subframe Format

Figure 38.4 shows the block format, which consists of 192 continuous frames. One block begins at the starting frame (preamble B) and ends at the 192nd frame (frame 191), and the preamble is used to identify all subframes. Each block has a total of 384 subframes, which are classified into three categories: subframe 0 indicating the beginning of a new block, subframe 1 (usually the channel 1), and subframe 2 (usually the channel 2). Usually, the music data sent and received by the SPDIF is continuous so that continuous blocks appear.

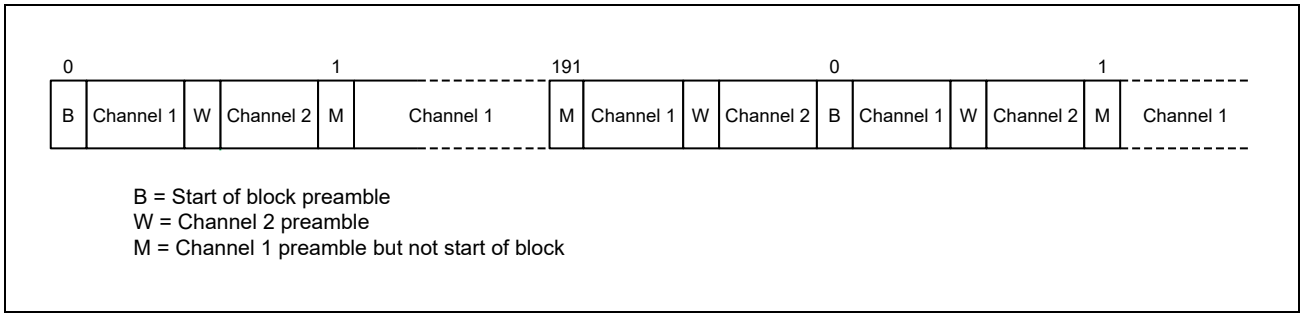

Figure 38.4 Block Format

Table 38.2 shows the binary values of the Renesas SPDIF preambles. The polarity of these preambles differs depending on the status of the preceding symbol (parity bit).

Table 38.2 Binary Preamble Values

Preamble	Preceding Symbol's Status = 0	Preceding Symbol's Status = 1
B	H'1110_1000	H'0001_0111
M	H'1110_0010	H'0001_1101
W	H'1110_0100	H'0001_1011

Note: As shown in **Figure 38.3**, the even parity bit at time slot 31 of a subframe determines the type of a preamble for one cycle of transmission. Usually, therefore, any one is selected from the set states that are sent through the Renesas SPDIF. However, IEC60958 requires decoding both types in view of connection with the preamble polarity reversed; the Renesas SPDIF has preambles decoded according to **Table 38.2**.

Channel status information is encoded at the rate of one bit per subframe, making the channel status information per block have a total of 192 bits for each of subframes 1 and 2. For the format of the channel status, refer to the IEC 60958 standard.

38.6 Register

Table 38.3 shows the register configuration. The SPDIF address space is offset from the base address. The base address of SPDIF is as follows.

SPDIF base address: H'0_100A_9000 (Overall Address Space)
SPDIF base address: H'400A_9000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
SPDIF base address: H'500A_9000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 38.3 Register Configuration

Channel	Register Name	Abbreviation	Offset Address	Access size
0 (Transmit)	Transmitter channel 1 audio register	TLCA	H'0000	32
	Transmitter channel 2 audio register	TRCA	H'0004	32
	Transmitter channel 1 status register	TLCS	H'0008	32
	Transmitter channel 2 status register	TRCS	H'000C	32
	Transmitter user data register	TUI	H'0010	32
1 (Receive)	Receiver channel 1 audio register	RLCA	H'0014	32
	Receiver channel 2 audio register	RRCA	H'0018	32
	Receiver channel 1 status register	RLCS	H'001C	32
	Receiver channel 2 status register	RRCS	H'0020	32
	Receiver user data register	RUI	H'0024	32
0, 1 (Common)	Control register	CTRL	H'0028	32
	Status register	STAT	H'002C	32
0, 1 (Common)	Transmitter DMA audio data register	TDAD	H'0030	32
	Receiver DMA audio data register	RDAD	H'0034	32

Note: All registers are longword registers and must be accessed as such.
A register diagram containing a 0 indicates that the write value should always be 0 (if the register is writable) and that the read value should always be 0 (if readable).

38.7 Register Descriptions

[Legend]

Initial Value: Register value after reset

—: Undefined value

R/W: Readable/writable register. The write value can be read.

R: Read only register. The write value should always be 0.

R/WC0: Readable/writable register. Writing 0 initializes the bit, but writing 1 is ignored.

R/WC1: Readable/writable register. Writing 1 initializes the bit, but writing 0 is ignored.

W: Write only register. Reading is prohibited. If this bit is reserved, the write value should always be 0.

—/W: Write only, Read value undefined

38.7.1 Control Register (CTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	CKS	0	R/W	Oversampling clock select Selects oversampling clock supply source. 0: AUDIO_CLK1 1: AUDIO_CLK2
27	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	PB	0	R/W	Pass Back Passes transmitter SPDIF output into SPDIF receiver in SPDIF module. 0: Pass Back disabled 1: Pass Back enabled
25, 24	RASS	All 0	R/W	Receiver Audio Sample Bit Size These bits Indicate the receiver audio sample bit size (16, 20, or 24 bits), for data alignment purposes. 00: 16-bit sample 01: 20-bit sample 10: 24-bit sample 11: Reserved
23, 22	TASS	All 0	R/W	Transmitter Audio Sample Bit Size These bits Indicate the transmitter audio sample bit size (16, 20, or 24 bits), for data alignment purposes. 00: 16-bit sample 01: 20-bit sample 10: 24-bit sample 11: Reserved
21	RDE	0	R/W	Receiver DMA Enable Enables DMA requests for the receiver. 0: Receiver DMA disabled 1: Receiver DMA enabled
20	TDE	0	R/W	Transmitter DMA Enable Enables the DMA requests for the transmitter. 0: Transmitter DMA disabled 1: Transmitter DMA enabled
19	NCSI	0	R/W	New Channel Status Information Set this bit to 1 when new channel status information to be corrected is in the transmitter. 0: New channel status information has not been in transmitter 1: New channel status information has been in transmitter

Bit	Bit Name	Initial Value	R/W	Description
18	AOS	0	R/W	Audio Only Samples Clear this bit to 0 when audio channel 1 and channel 2 registers contain user information. When this bit is set to 1, all user bits are cleared to 0. 0: User information present 1: User information not present
17	RME	0	R/W	Receiver Module Enable Enables the receiver module. 0: Receiver module disabled 1: Receiver module enabled
16	TME	0	R/W	Transmitter Module Enable Enables the transmitter module. 0: Transmitter module disabled 1: Transmitter module enabled
15	REIE	0	R/W	Receiver Error Interrupt Enable Enables the receiver error interrupts. 0: Receiver error interrupt disabled 1: Receiver error interrupt enabled
14	TEIE	0	R/W	Transmitter Error Interrupt Enable Enables the transmitter error interrupts. 0: Transmitter error interrupt disabled 1: Transmitter error interrupt enabled
13	UBOI	0	R/W	User Buffer Overrun Interrupt Enable Enables the user buffer overrun interrupts. 0: User buffer overrun interrupt disabled 1: User buffer overrun interrupt enabled
12	UBUI	0	R/W	User Buffer Underrun Interrupt Enable Enables the user buffer underrun interrupts. 0: User buffer underrun interrupt disabled 1: User buffer underrun interrupt enabled
11	CREI	0	R/W	Clock Recovery Error Interrupt Enable Enables the clock recovery error interrupts. 0: Clock recovery error interrupt disabled 1: Clock recovery error interrupt enabled
10	PAEI	0	R/W	Parity Error Interrupt Enable Enables the parity check error interrupts. 0: Parity check error interrupt disabled 1: Parity check error interrupt enabled
9	PREI	0	R/W	Preamble Error Interrupt Enable Enables the preamble check error interrupts. 0: Preamble error interrupt disabled 1: Preamble error interrupt enabled
8	CSEI	0	R/W	Channel Status Error Interrupt Enable Enables the channel status error interrupts. 0: Channel status error interrupt disabled 1: Channel status error interrupt enabled
7	ABOI	0	R/W	Audio Buffer Overrun Interrupt Enable Enables the receiver audio buffer overrun interrupts. 0: Audio buffer overrun interrupt disabled 1: Audio buffer overrun interrupt enabled
6	ABUI	0	R/W	Audio Buffer Underrun Interrupt Enable Enables the transmitter audio buffer underrun interrupts. 0: Audio buffer underrun interrupt disabled 1: Audio buffer underrun interrupt enabled

Bit	Bit Name	Initial Value	R/W	Description
5	RUII	0	R/W	Receiver User Information Interrupt Enable Enables the receiver user information register full interrupts. 0: Receiver user information interrupt disabled 1: Receiver user information interrupt enabled
4	TUII	0	R/W	Transmitter User Information Interrupt Enable Enables the transmitter user information register empty interrupts. 0: Transmitter user information interrupt disabled 1: Transmitter user information interrupt enabled
3	RCSI	0	R/W	Receiver Channel Status Interrupt Enable Enables the receiver channel status register full interrupts. 0: Receiver channel status interrupt disabled 1: Receiver channel status interrupt enabled
2	RCBI	0	R/W	Receiver Channel Buffer Interrupt Enable Enables the receiver audio channel buffer full interrupts. 0: Receiver audio channel interrupt disabled 1: Receiver audio channel interrupt enabled
1	TCSI	0	R/W	Transmitter Channel Status Interrupt Enable Enables the transmitter channel status register empty interrupts. 0: Transmitter channel status interrupt disabled 1: Transmitter channel status interrupt enabled
0	TCBI	0	R/W	Transmitter Channel Buffer Interrupt Enable Enables the transmitter audio channel buffer empty interrupts. 0: Transmitter audio channel interrupt disabled 1: Transmitter audio channel interrupt enabled

38.7.2 Status Register (STAT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RIS	TIS	UBO	UBU	CE	PARE	PREE	CSE	ABO	ABU	RUIR	TUIR	CSRX	CBRX	CSTX	CBTX
Initial Value	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R	R	R	R	R	R

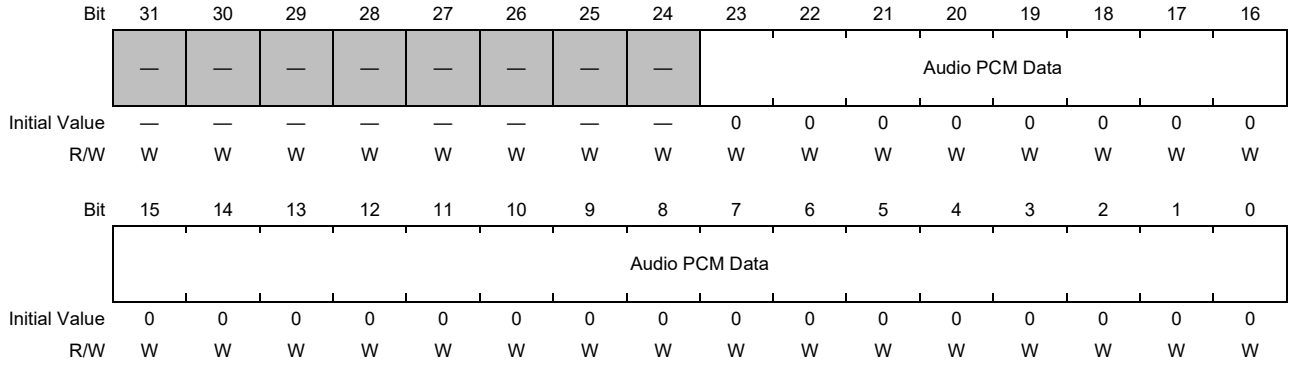
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CMD	0	R	Compressed Mode Data Sets if the data being received is compressed mode data (When bit 1 = 1 in the V flag and channel status). 0: Data is not in compressed mode 1: Data is in compressed mode
15	RIS	1	R	Receiver Idle State Sets if the receiver is in the idle state. 0: Receiver is not in idle state 1: Receiver in idle state
14	TIS	1	R	Transmitter Idle State Sets if the transmitter is in the idle state. 0: Transmitter is not in idle state 1: Transmitter is in idle state
13	UBO	0	R/WC0	User Buffer Overrun*1 Sets if the receiver user buffer overruns. This bit is cleared by writing 0 to the register. If bit REIE and bit UBOI in the control register are set this causes an interrupt. 0: User buffer has not overrun 1: User buffer has overrun
12	UBU	0	R/WC0	User Buffer Underrun*1 Sets if the transmitter user buffer underrun. This bit is cleared by writing 0. If bits TEIE and UBUI in the control register are set this causes an interrupt. 0: User buffer has not underrun 1: User buffer has underrun
11	CE	0	R/WC0	Clock Error*1 Sets when the clock recovery falls out of synchronization. This bit is cleared by writing 0. If bits REIE and CREI in the control register are set this causes an interrupt. 0: Clock recovery stable 1: Clock recovery error
10	PARE	0	R/WC0	Parity Error*1 Sets when the parity checker produces a fail result. This bit is cleared by writing 0. If bits REIE and PAEI in the control register are set this causes an interrupt. 0: Parity check correct 1: Parity error

Bit	Bit Name	Initial Value	R/W	Description
9	PREE	0	R/WC0	Preamble Error*1 Sets when the start of word preamble fails to appear in the correct place. This bit is cleared by writing 0. If bits REIE and PREI in the control register are set this causes an interrupt. 0: Preamble is in the correct place 1: Preamble error *Note*: Only set after a start of block preamble has occurred.
8	CSE	0	R/WC0	Channel Status Error*1 Sets when the channel status information is written before the 32nd frame of the current block. This bit is cleared by writing 0. If bits TEIE and CSEI in the control register are set this causes an interrupt. 0: Channel status correct 1: Channel status error
7	ABO	0	R/WC0	Audio Buffer Overrun*1 Indicates that the receiver audio buffer is full in both the first and second stages and that data has been overwritten. This bit is cleared by writing 0. If bits REIE and ABOI in the control register are set then this causes an interrupt. 0: Receiver audio buffer has not overrun 1: Receiver audio buffer has overrun
6	ABU	0	R/WC0	Audio Buffer Underrun*1 Indicates that the transmitter audio buffer is empty in both the first and second stages and that the last data transmission has been repeated. This bit is cleared by writing 0. If bits TEIE and ABUI in the control register are set then this causes an interrupt. 0: Transmitter audio buffer has not underrun 1: Transmitter audio buffer has underrun
5	RUIR	0	R	Receiver User Information Register Status Indicates the status of the receiver user information register. This bit is cleared by reading from the receiver user register. If bit RUII in the control register is set then this causes an interrupt. 0: Receiver user information register is empty 1: Receiver user information register is full
4	TUIR	0	R	Transmitter User Information Register Status Indicates the status of the transmitter user information register. This bit is cleared by writing to the transmitter user register. If bit TUII in the control register is set then this causes an interrupt. 0: Transmitter user information register is full 1: Transmitter user information register is empty
3	CSRX	0	R	Channel 1 and Channel 2 Status for Receiver Indicates the status of the receiver channel status registers. This bit is cleared by reading from the receiver channel status registers. If bit RCSI in the control register is set this causes an interrupt. 0: Receiver channel status registers are empty 1: Receiver channel status registers are full
2	CBRX	0	R	Channel 1 and Channel 2 Buffers for Receiver Indicates the status of the receiver audio channel registers. This bit is cleared by reading from the receiver audio channel registers. If bit RCBI in the control register is set this causes an interrupt. 0: Receiver audio channel registers are empty 1: Receiver audio channel registers are full

Bit	Bit Name	Initial Value	R/W	Description
1	CSTX	0	R	Channel 1 and Channel 2 Status for Transmitter Indicates the status of the transmitter channel status registers. This bit is cleared by writing to the transmitter channel status registers. If bit TCSI in the control register is set this causes an interrupt. 0: Transmitter channel status register is full 1: Transmitter channel status register is empty
0	CBTX	0	R	Channel 1 and Channel 2 Buffers for Transmitter Indicates the status of the transmitter audio channel registers. This bit is cleared by writing to the transmitter audio channel registers. If bit TCBI in the control register is set this causes an interrupt. 0: Transmitter audio channel registers are full 1: Transmitter audio channel registers are empty

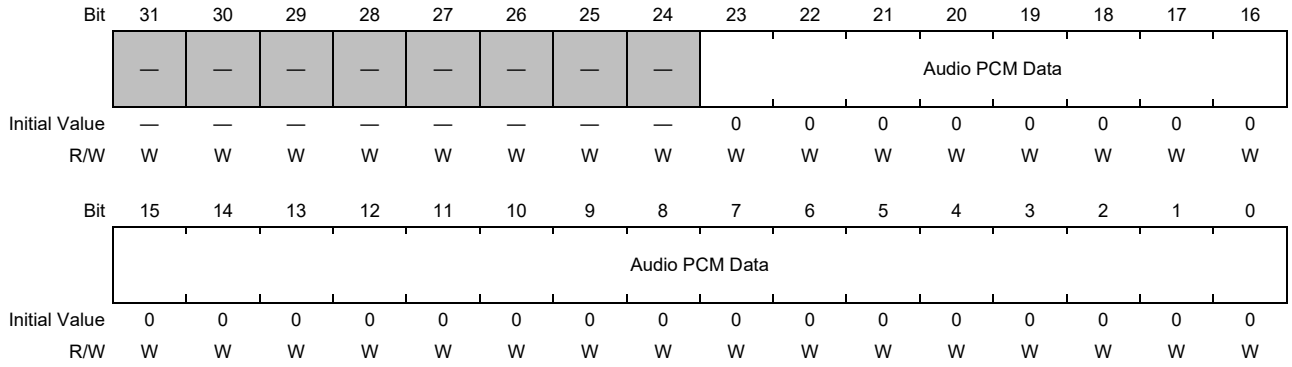
Note 1. When an error bit is detected during DMA transfer, DMA transfer settings must be made again. In this case, the Renesas SPDIF's module enable bit (either the RME or TME bit) and the DMA enable bit (either the RDE or TDE bit) must be disabled and the error status must be cleared before making DMA transfer settings again. Then the module enable bit should be set and DMA transfer can be started again.

38.7.3 Transmitter Channel 1 Audio Register (TLCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

38.7.4 Transmitter Channel 2 Audio Register (TRCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

38.7.5 Transmitter DMA Audio Data Register (TDAD)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	Audio PCM Data							
Initial Value	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Audio PCM Data															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

38.7.6 Transmitter User Data Register (TUI)

U-bit data in subframes is written into this register. Because U-bit data is transmitted in a sequence of subframes 1 and 2, you need to update the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use. The user bits to be transmitted are set in sequence starting at the LSB.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	User Byte 4								User Byte 3							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	User Byte 2								User Byte 1							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	User Byte 4	All 0	W	U-bit information is stored here.
23 to 16	User Byte 3	All 0	W	
15 to 8	User Byte 2	All 0	W	
7 to 0	User Byte 1	All 0	W	

38.7.7 Transmitter Channel 1 Status Register (TLCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CLAC[1:0]		FS[3:0]				CHNO[3:0]				SRCNO[3:0]			
Initial Value	—	—	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATCD[7:0]								—	—	CTL[4:0]					—

27 to 24	FS[3:0]	All 0	W	Sample Frequency (FS) 0000: 44.1 kHz 0010: 48 kHz 0011: 32 kHz
23 to 20	CHNO[3:0]	All 0	W	Channel Number 0000: Don’t care 0001: A (left channel) 0010: B (right channel) 0011: C
19 to 16	SRCNO[3:0]	All 0	W	Source Number 0000: Don’t care 0001: 1 0010: 2 0011: 3
15 to 8	CATCD[7:0]	All 0	W	Category Code (Example) 00000000: 2-channel general format 00000001: 2-channel compact disc (IEC 908) 00000010: 2-channel PCM encoder/decoder 00000011: 2-channel digital audio tape recorder
7, 6	—	All 0	W	Reserved The write value should always be 0.
5 to 1	CTL[4:0]	All 0	W	Control The control bits are copied from the source (see IEC60958 standard).
0	—	0	W	Reserved The write value should always be 0.

38.7.8 Transmitter Channel 2 Status Register (TRCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CLAC[1:0]		FS[3:0]				CHNO[3:0]				SRCNO[3:0]			
Initial Value	—	—	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

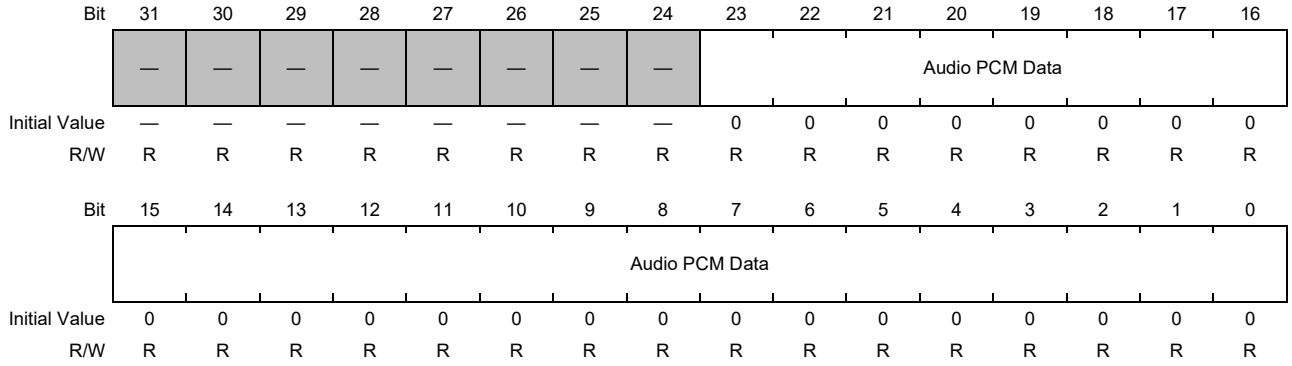
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

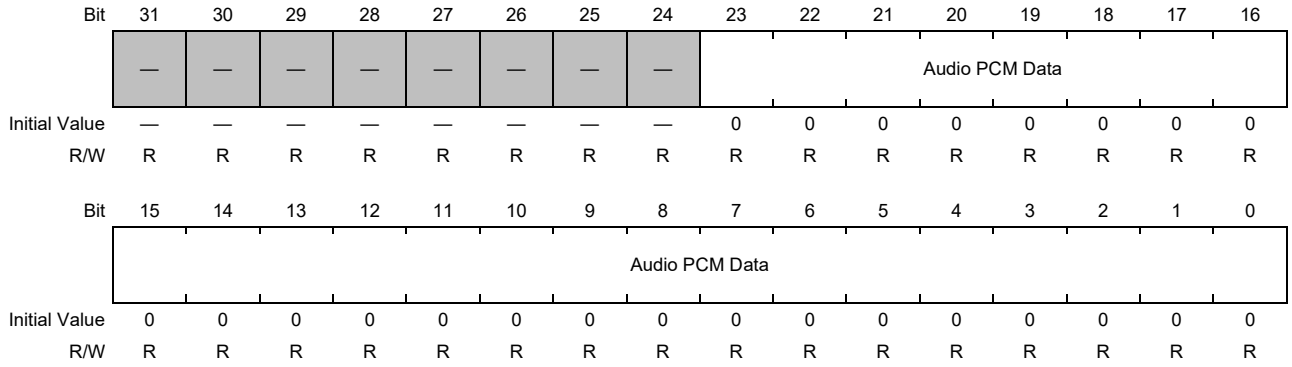
Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	—	W	Reserved
29, 28	CLAC[1:0]	All 0	W	Clock Accuracy 00: Level 2 01: Level 1 10: Level 3 11: Reserved
27 to 24	FS[3:0]	All 0	W	Sample Frequency (FS) 0000: 44.1 kHz 0010: 48 kHz 0011: 32 kHz
23 to 20	CHNO[3:0]	All 0	W	Channel Number 0000: Don’t care 0001: A (left channel) 0010: B (right channel) 0011: C
19 to 16	SRCNO[3:0]	All 0	W	Source Number 0000: Don’t care 0001: 1 0010: 2 0011: 3
15 to 8	CATCD[7:0]	All 0	W	Category Code (Example) 00000000: 2-channel general format 00000001: 2-channel compact disc (IEC 908) 00000010: 2-channel PCM encoder/decoder 00000011: 2-channel digital audio tape recorder
7, 6	—	All 0	W	Reserved The write value should always be 0.
5 to 1	CTL[4:0]	All 0	W	Control The control bits are copied from the source (see IEC60958 standard).
0	—	0	W	Reserved The write value should always be 0.

38.7.9 Receiver Channel 1 Audio Register (RLCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

38.7.10 Receiver Channel 2 Audio Register (RRCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

38.7.11 Receiver DMA Audio Data (RDAD)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	Audio PCM Data

	Audio PCM Data															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

38.7.12 Receiver User Data Register (RUI)

The register stores the U-bit data received through the Renesas SPDIF. Because U-bit data is stored in a sequence of subframes 1 and 2 starting at the LSB, you need to read the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use.

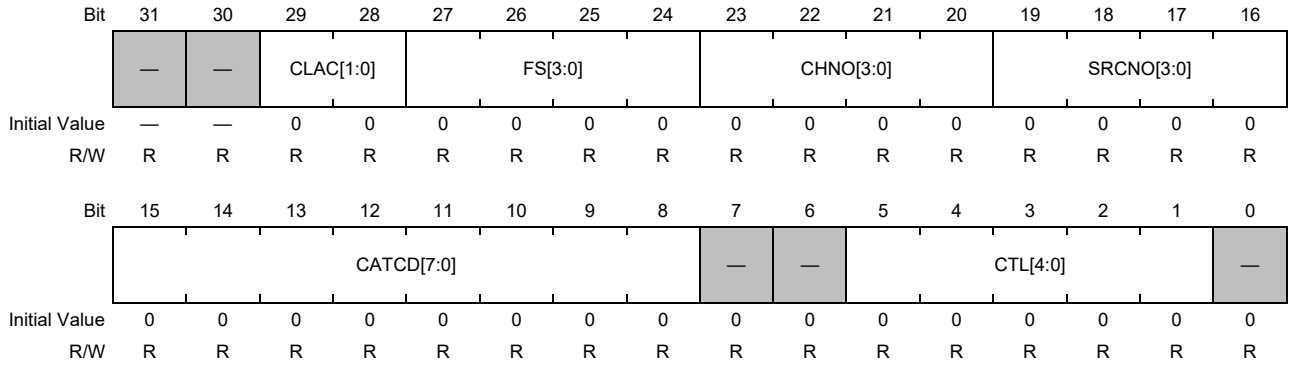
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	User Byte 4								User Byte 3							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	User Byte 2								User Byte 1							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	User Byte 4	All 0	R	U-bit information is stored here.
23 to 16	User Byte 3	All 0	R	
15 to 8	User Byte 2	All 0	R	
7 to 0	User Byte 1	All 0	R	

38.7.13 Receiver Channel 1 Status Register (RLCS)

The channel status is stored starting at the register's LSB in a way that subframe 1 received from the beginning of the block is stored. For the contents of the channel status register, refer to the IEC-60958 standard.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	—	R	Reserved
29, 28	CLAC[1:0]	All 0	R	Clock Accuracy 00: Level 2 01: Level 1 10: Level 3 11: Reserved

0	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

38.8 Functional Description — Transmitter

38.8.1 Transmitter Module

The transmitter module transmits PCM data and auxiliary information after encoding it according to the method of biphase-mark modulation that complies with the IEC60958 standard (SPDIF).

The clock for the transmitter module is an oversampling clock supplied from the outside. This clock usually selects a value that serves as an oversample at a frequency eight times larger than the clock frequency required for biphase-mark encoding. In this case, the clock frequency required to transmit 32 time slots in a subframe is 512 times as large as the sample frequency for audio data.

Audio data and channel status information are first written into the module's channel 1 and then into channel 2. Generally, the channel status need to be written only when the information changes. The SPDIF module requests that the channel status be written in 30 frames -- when all the current channel status data have been transmitted. You need to write somewhere between frame 31 and the beginning of the next block of 192 frames.

The audio data is stored in a double buffer arrangement. To make sure that the first stage buffer is empty, you can send an interrupt request or poll the status register. DMA transfers send channel 1 audio data on the first request and channel 2 data on the second.

The channel status information is stored in the 30-bit registers of channels 1 and 2. For each channel, the channel status information per frame consists of 192 bits. Because necessary data covers only 30 bits, zeros continue to be sent after the transmission of the first 30 bits until the block is completed.

User data forms a 32-bit double buffer arrangement. You can make sure that the first stage buffer is empty by either sending an interrupt request or polling the status register. Usually, information about the user data will become insufficient with the length of data between blocks. Transmission takes place in a sequence of channels 1 and 2. For the user data within a block, 384 bits are transmitted before the next block is continuously transmitted.

The audio data handled by the Renesas SPDIF module is a linear PCM, making it possible to set up to 24 bits. For this reason, the V flag indicating that audio data is a linear PCM remains to be 0. The V flag involves no register-based setting. An even parity is created for each 32 bits of serial output data (excluding the preamble).

NOTE

When transmitter user buffer underrun occurs, the current data in the buffer data of SPDIF is transmitted until the next data is filled.

38.8.2 Transmitter Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state when 0 is written to the TME bit in the CTRL register. When the transmitter module is idle, it has the following settings:

- The transmitter idle status bit (TIS) is set to 1, all other status bits are cleared to 0.
- Preamble generation is invalid.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both word_count and frame_count are set to 0.
- The output from the biphase-mark encoder is set to 0.

Channel status, user and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the TME bit in the CTRL register.

38.8.3 Initial Settings for Transmitter Module

When the TME bit is set to 1, the TUIR and CSTX bits are set to 1. After that, if data is written in the order of 1) TUI and 2) TLCS and TRCS, a channel status error will occur. To avoid this, be sure to write data in the order of 1) TLCS and TRCS and 2) TUI.

Before writing the first audio data (write access to TLCA or TRCA by the CPU or write access to TDAD by the DMA transfer) after setting the TME bit to 1, be sure to check that the CSTX and TUIR bits are cleared by writing to TLCS, TRCS, and TUI.

38.8.4 Transmitter Module Data Transfer

Once the transmitter module has left the idle state, it is ready for data transfer. Data transfer timing can be achieved in three ways. Either the transfer is done by interrupts, DMA requests or by polling the status register. There is a shared interrupt line (for both transmit and receive) and a single transmitter DMA request line.

Figure 38.5 shows a data transfer with an interrupt for the transmitter.

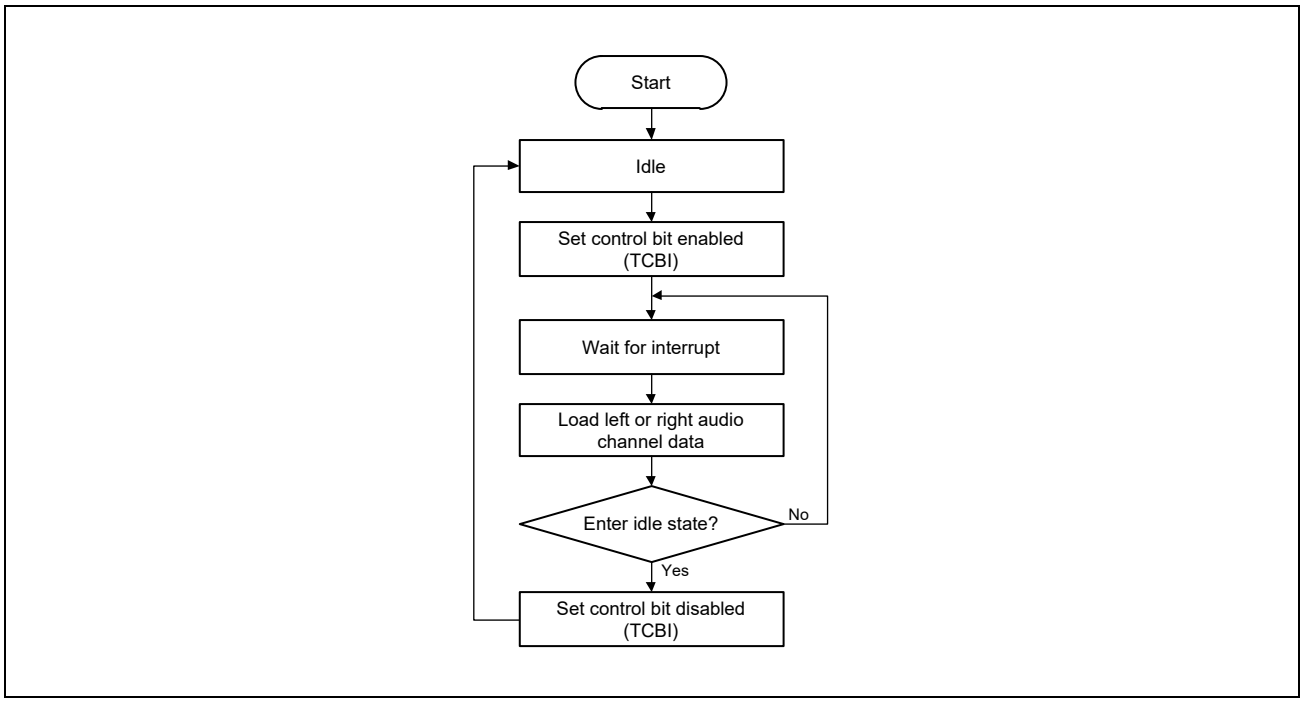

Figure 38.5 Transmitter Data Transfer Flow Diagram - Interrupt Driven

Figure 38.6 shows a data transfer with a DMA transfer for the transmitter.

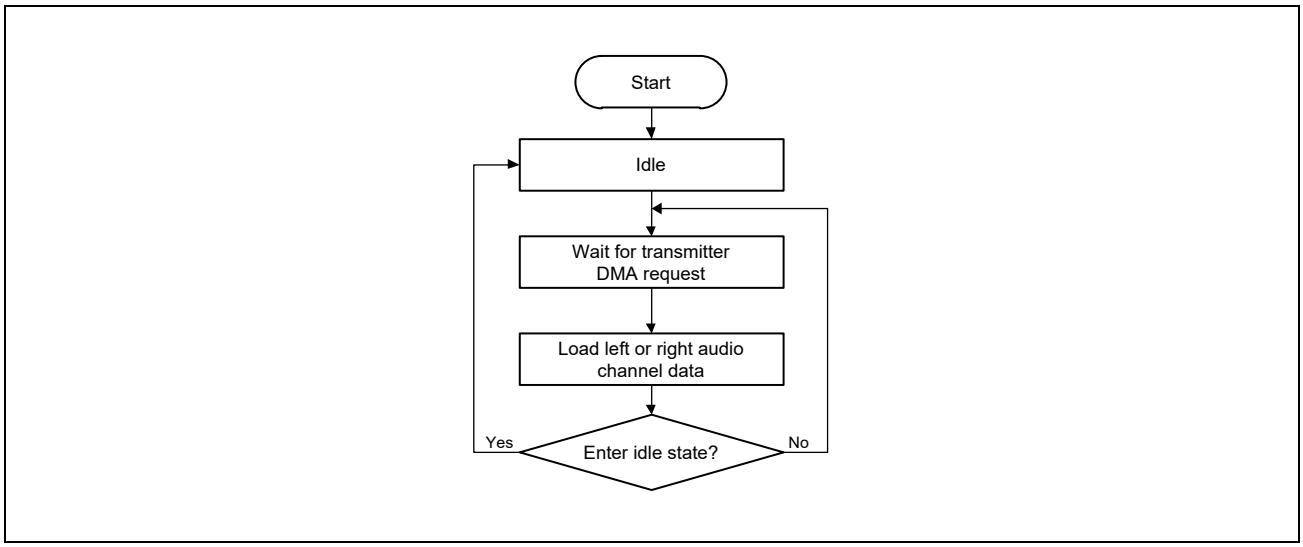

Figure 38.6 Transmitter Data Transfer Flow Diagram - DMA Request Driven

Channel status information is required to be updated when the information has changed. Because the updating needs to be done before the transmission of the next block, the channel status to be updated should be written after 30 frames have been sent; this is indicated either by an interrupt or by polling the status bit. If channel status is written before 30 frames have been sent (while current information is being sent) then an interrupt indicates that the channel status error bit (CSE) in the status register has been set.

NOTE

30 frames contains all the valid information in a single channel status block.

38.9 Functional Description — Receiver

38.9.1 Receiver Module

The receiver module demodulates data and clock signals from the input encoded according to the IEC60958 standard. The encoded data, shown in linear PCM format, is stored into the audio data register. The register also stores the channel status and user information being received simultaneously as auxiliary information.

The main clock for the receiver module is an oversampling clock supplied from the outside. The module operates at a frequency four times as large as the oversampling clock.

NOTE

The oversampling clock is the same for the transmitter and receiver.

Clock recovery is performed using a pulse width counter and averaging filters to produce a sampling pulse in the middle of each bit in the datastream. A clock error status bit indicates clock synchronization loss. Synchronization is achieved when a preamble occurs on the data stream for the first time. Continuous adjustment prevents jitter and/or clock drift from affecting clock recovery, provided that they fall within the clock recovery specifications.

Once the clock recovery is successful the biphase-mark decoder initiates its preamble detection. The decoder searches for the start of block preamble (see **Table 38.2**). A preamble error status bit indicates that following preambles have not appeared at the correct time, such failures are most likely caused by transmission loss or interference.

Even parity checking is performed on the decoded data. A discrepancy will result in the parity error status bit being set.

The SPDIF module acquires user data and channel status information in addition to audio data. The audio is stored in a double buffer arrangement. Either an interrupt request because of a full buffer or polling of the status bit will indicate when the data is ready to be read. DMA transfers receive channel 1 audio data on the first request and channel 2 data on the second.

Channel status is stored in a 30-bit register. Channel status information is received at 1-bit per subframe. Therefore, the registers will not be full until a total of 30 frames for each channel have been received. New channel status is compared with the current data to see if it has changed and is only read by the processor if it has. User data, which is also received at the same time, is stored into the register on a subframe basis, so that the reception is completed when 16 frames are reached.

NOTES

1. Channel status data requests do not support DMA.
2. When receiver user buffer overrun occurs, the current data in the buffer data of SPDIF is overwritten by the next incoming data from SPDIF interface.

38.9.2 Receiver Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state by writing 0 to bit RME in the CTRL register. Whilst idle the module has the following settings:

- The receiver idle status bit is set to 1, all other status bits are cleared to 0.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both Word_count and frame_count are set to 0.

Channel status registers, user data registers and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the bit RME in the CTRL register.

38.9.3 Receiver Module Data Transfer

Once the module has left the idle state it is ready for data transfer. Data transfer timing can be achieved in three ways. The transfer can be done by interrupts, or by polling the status register, or by DMA. There is a shared interrupt line (transmit and receive) and a single receiver DMA request line. Data transfer for the receiver can be interrupted by error signals caused by:

1. Clock recovery failure.
2. Transmission loss or interference – indicated by a preamble error.
3. Parity check failure.

Transmission loss or interference can cause the start of subframe or start of block preamble to be misplaced or not present.

Parity check failure occurs when the parity bit is incorrect, this can be caused by any of the above.

[Clock Recovery Deviation]

The receive margin for clock recovery is based on the following equation:

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\%$$

where M = receive margin
N = oversampling rate
L = frame length = 33
D = duty cycle = 0.6
F = oversampling clock deviation = Level II accuracy = 1000 in $10e^{-6}$

Figure 38.7 indicates what the receive margin M represents

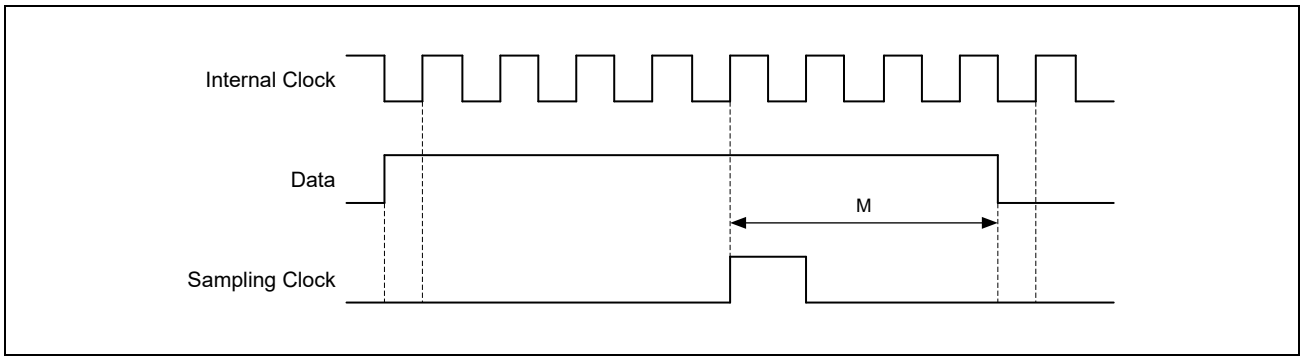

Figure 38.7 Receive Margin

Introducing jitter into the equation gives the following inequality.

$$J \leq \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\%$$

J = clock jitter

Eight times oversampling produces a receive margin = 39.25%
Four times oversampling produces a receive margin = 31.75%
Two times oversampling produces a receive margin = 16.75%

The fastest sample frequency is 48 kHz. This requires a clock speed of 128 × 48 kHz = 6.144 MHz. The worst case jitter in one cycle is specified at 40 ns = 24.5% of the period. This means that an oversampling rate of 4 or more will satisfy the inequality and therefore be sufficient for clock recovery.

Figure 38.8 illustrates the receiver data transfer using interrupts.

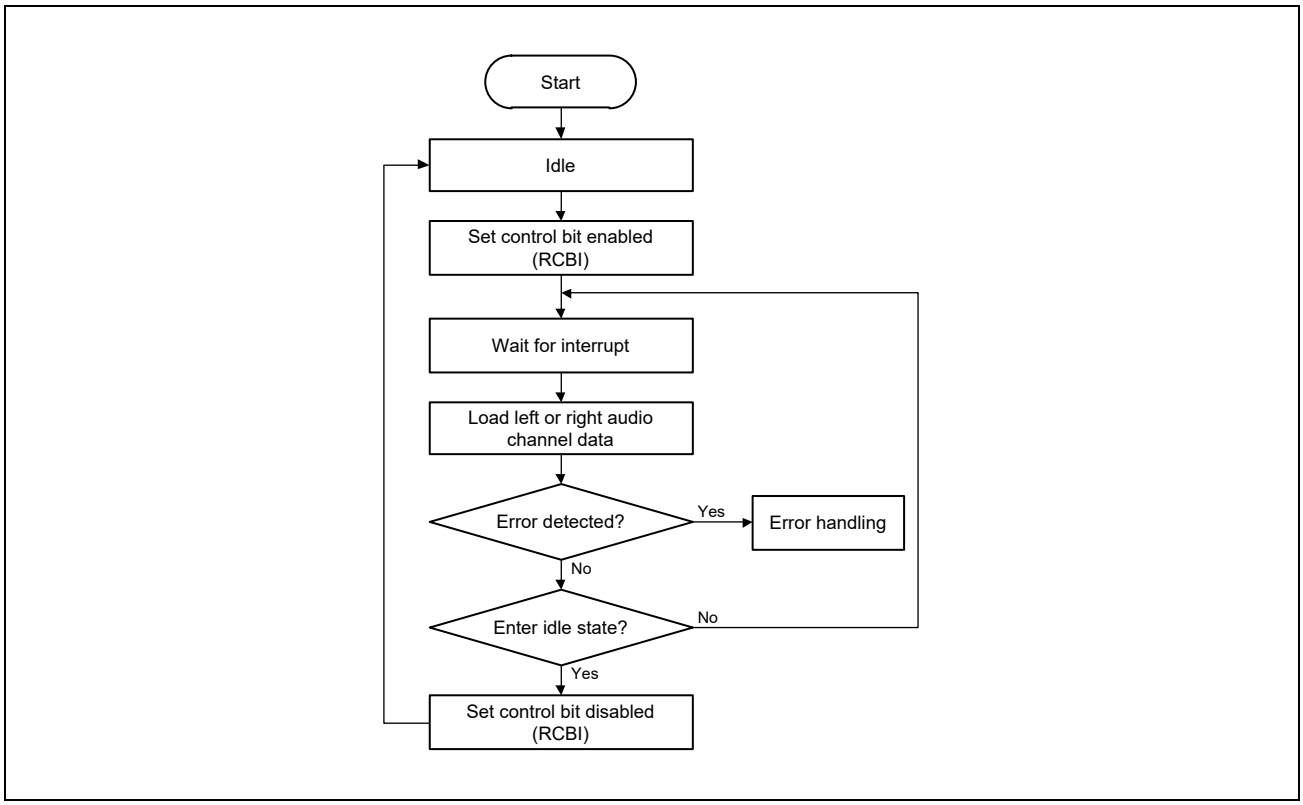

Figure 38.8 Receiver Data Transfer Flow Diagram - Interrupt Driven

Interrupts to indicate that the channel status information register is full occur after frame 30 has been received and only if the information has changed. When the first four bytes have been stored an interrupt occurs.

38.10 Disabling the Module

38.10.1 Transmitter and Receiver Idle

The transmitter or receiver modules can be disabled by writing 0 to the idle bit in the control register (TME for the transmitter and RME for the receiver). The idle state can be detected by polling the idle bit in the status register (TIS and RIS).

38.11 Compressed Mode Data

Compressed mode data is defined in the IEC 61937 specification. This module only detects compressed mode data. This is done by checking the parity flag (V flag) and bit 1 in the channel status data. If both are one then the data is in compressed mode. This is indicated by the setting of the CMD bit in the status register.

NOTE

Only the receiver detects compressed mode data since the information is not relevant to the transmitter.

- IEC61937 Compressed Mode Digital Audio Interface

38.13 Usage Notes

38.13.1 Clearing TUIR

After TUI is written to, the TUIR bit is cleared only after transmission of a maximum of one frame is completed. When using a transmitter user information interrupt to write data to TUI, check that the TUIR bit is cleared before terminating the interrupt handling routine so that the interrupt is expectedly accepted again.

38.13.2 Frequency of Clock Input for Audio

The frequency of the clock input to the AUDIO_CLK1 or AUDIO_CLK2 must be lower than the P0Φ frequency.

39. A/D Converter

39.1 Features

This LSI has a successive approximation A/D converter with a 12-bit accuracy. Up to eight analog input channels and one dedicated channel to TSU can be selected.

■ Resolution

12 bits

■ Eight input channels and one dedicated input channel to TSU

■ Input voltage range

0 V to 1.8 V

■ Minimum conversion time

1.0 µs per channel (when A/D conversion clock ADC_ADCLK is 100 MHz)

■ Twelve data registers

The A/D conversion result is stored in a 32-bit data register corresponding to each channel.

■ Sample-and-hold function

■ Trigger mode

- Software trigger mode and hardware trigger mode are available.
- Software trigger mode to start A/D conversion by software
- Hardware trigger mode to start A/D conversion by an asynchronous trigger or synchronous trigger
  - Asynchronous trigger using an external pin (ADC_TRG) as the activation source
  - Synchronous trigger using the multi-function timer pulse unit 3 (MTU3a) or general-purpose
  - PWM timer (GPT) as the activation source

■ Operating mode

- Select mode and scan mode are available.
- Select mode to convert the specified single analog input channel
  - 1-buffer mode or 4-buffer mode can be specified for storing the A/D conversion result.
  - In 4-buffer mode, A/D conversion proceeds four times for the selected analog input and the A/D conversion results are stored in four registers.
- Scan mode to convert the analog inputs of arbitrarily selected channels in ascending order of channel number
  - 1-buffer mode can be specified for storing the A/D conversion result.

■ Conversion mode

- Single mode and repeat mode are available.
- Single mode to proceed A/D conversion only once
- Repeat mode to repeatedly proceed A/D conversion

■ A single interrupt source

- An A/D conversion end interrupt (INTAD) can be generated on completion of A/D conversion.
  - In the select mode with 1-buffer mode selected, an A/D conversion end interrupt is generated on completion of a single conversion.
  - In the select mode with 4-buffer mode selected, an A/D conversion end interrupt is generated on completion of four rounds of conversion.
  - In scan mode, an A/D conversion end interrupt is generated on completion of scanning of all the selected channels.

Table 39.1 shows the outline of the functions of the A/D converter.

Table 39.1 Functions of A/D Converter (1/2)

39.2 List of Registers

Table 39.3 shows the register list of this module.

The base address is as follows.

Base address: H'0_1005_8000 (Cortex-A55 Address Space)
Base address: H'4005_8000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)
Base address: H'5005_8000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 39.3 List of Registers of A/D Converter

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D converter mode register 0	ADM0	R/W	H'0000	H'0	32

Reserved	—	R	H'0000	H'60 – 6C	32
Renesas reserved area*1	—	R/W	Undefined	H'70 – 7F	32

Note: When writing successively to the same register, the notes in **Section 39.5.2, Timing Restrictions**, need to be observed.

Note 1. Writing to a Renesas reserved area is prohibited.

39.3 Register Descriptions

39.3.1 A/D Converter Mode Register 0 (ADM0)

The ADM0 is a 32-bit register that controls A/D conversion and the power-saving mode of the A/D converter, and also executes a software reset. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRESB	—	—	—	—	—	—	—	—	—	—	—	—	PWDWNB	ADBSY	ADCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
15	SRESB	0	R/W	Issues a software reset to the A/D converter. Circuits (e.g. registers) other than those of the A/D converter will not be reset. To release the A/D converter from the reset state, write 1 to this bit. 0: A/D converter is reset. 1: A/D converter is released from the reset state. The A/D converter enters the power-saving mode when this bit is used to execute a reset.
14 to 3	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
2	PWDWNB	0	R/W	Specifies the A/D converter to enter or exit the power-saving mode. 0: Power-saving mode 1: Normal mode
1	ADBSY	0	R	Indicates the status of the A/D converter. This bit is read-only. Writing to this bit is ignored. 0: A/D converter is stopped. 1: A/D converter is busy. For operation of the ADBSY bit, see **Figure 39.1**.
0	ADCE	0	R/W	Stops or enables the A/D converter. 0: A/D converter is stopped. 1: A/D converter is enabled. When 0 is written to the ADCE bit, the A/D converter stops operating. For operation of the ADCE bit at reading, see **Figure 39.1**.

Note: Notes regarding the ADM0 register are given on the next page.

NOTES

1. To enable A/D conversion operation using the ADCE bit, first switch from PWDWNB = 0 (power-saving mode) to PWDWNB = 1 (normal mode) and then wait for a period equal to or longer than the stabilization wait time before setting the ADCE bit to 1. The stabilization wait time is 1 µs.
2. To make a transition to the power-saving mode using the PWDWNB bit, first stop operation of the A/D converter (ADCE = 0) and then confirm that A/D conversion is completed (ADBSY = 0) before setting the PWDWNB bit to 0.

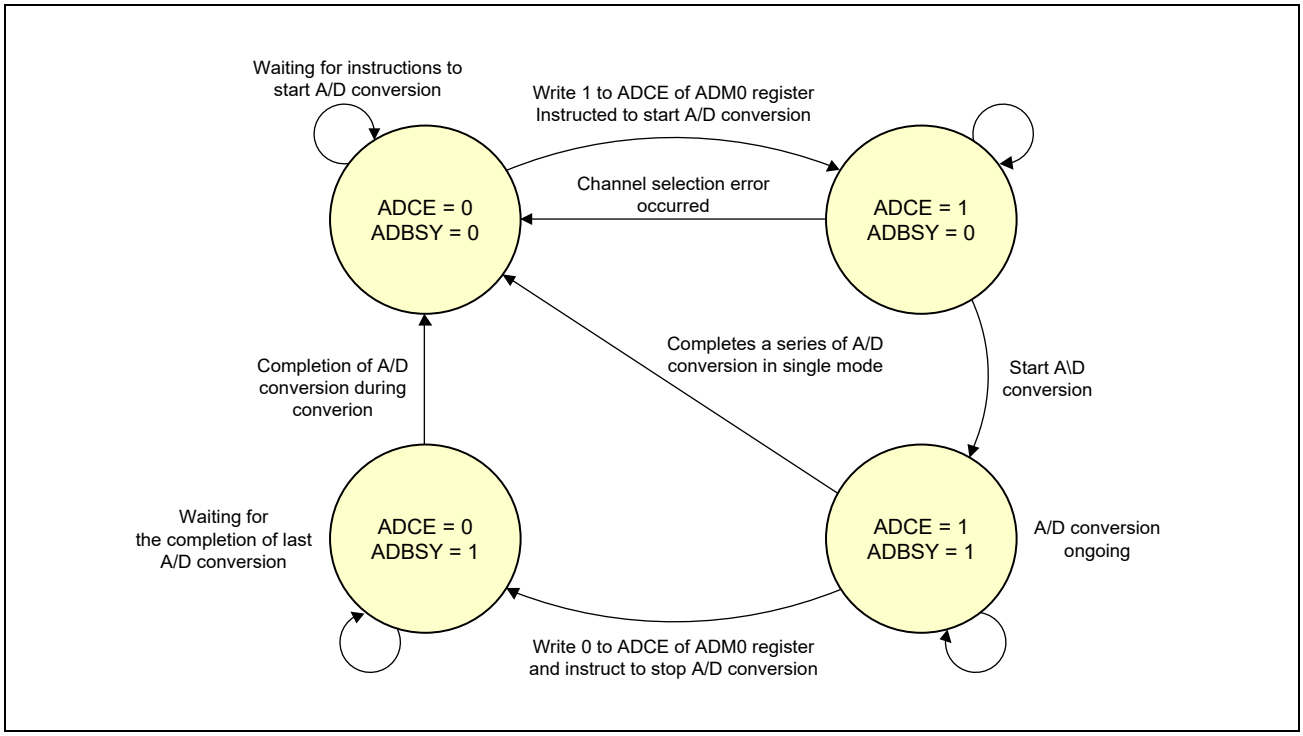

Figure 39.1 State Transitions of ADCE Bit and ADBSY Bit

39.3.2 A/D Converter Mode Register 1 (ADM1)

The ADM1 is a 32-bit register that controls A/D conversion and sets the mode for a hardware trigger. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TRGEN5	TRGEN4	TRGEN3	TRGEN2	TRGEN1	TRGEN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	EGA1	EGA0	—	—	—	—	—	—	—	BS	RPS	MS	TRGIN	TRG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
21 to 16	TRGEN[5:0]	All 0	R/W	These bits select the hardware trigger pin. For details, see **Table 39.4**.
15, 14	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
13, 12	EGA[1:0]	00	R/W	These bits select the valid edge of the trigger pin.

EGA1	EGA0	Valid Edge
0	0	Hardware trigger is invalid
0	1	Falling edge
1	0	Rising edge
1	1	Both edges

Note: When the EGA[1:0] bits are set to 00 in hardware trigger mode, a trigger from the trigger pin will be ignored. When a trigger pin of the MTU3a or GPT is used, the falling edge is always valid and the setting of the EGA[1:0] bits (01b, 10b, or 11b) will be ignored. When the external trigger pin (ADC_TRG) is used, the valid edge is set by the EGA[1:0] bits.

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
4	BS	0	R/W	Selects the buffer mode (valid in select mode). 0: 1-buffer mode 1: 4-buffer mode 4-buffer mode is prohibited in scan mode.
3	RPS	0	R/W	Selects the repeat number. 0: Single 1: Repeat
2	MS	0	R/W	Selects the operating mode. 0: Scan mode 1: Select mode
1	TRGIN	0	R/W	Selects the trigger input mode. 0: Auto mode 1: Step mode

Bit	Bit Name	Initial Value	R/W	Description
0	TRG	0	R/W	Sets the trigger mode. 0: Software trigger mode*1 1: Hardware trigger mode

Note 1. Set the EGA[1:0] bits to 00 when using software trigger mode.

Table 39.4 TRGEN[5:0] Bits and Trigger Source

Module	Source	Description	TRGEN[5:0] Bits					
			5	4	3	2	1	0
External pin	ADC_TRG	External trigger input	0	0	0	0	0	0
MTU	TRGA0N	Compare match with or input capture to MTU0.TGRA	0	0	0	0	0	1

	TRGA2N	Compare match with or input capture to MTU2.TGRA	0	0	0	0	1	1
	TRGA3N	Compare match with or input capture to MTU3.TGRA	0	0	0	1	0	0
	TRGA4N	Compare match with or input capture to MTU4.TGRA or underflow (trough) of MTU4.TCNT in complementary PWM mode	0	0	0	1	0	1
	TRGA6N	Compare match with or input capture to MTU6.TGRA	0	0	0	1	1	0
	TRGA7N	Compare match with or input capture to MTU7.TGRA or underflow (trough) of MTU7.TCNT in complementary PWM mode	0	0	0	1	1	1
	TRG0N	Compare match with MTU0.TGRE	0	0	1	0	0	0
	TRG4AN	Compare match between MTU4.TADCORA and MTU4.TCNT	0	0	1	0	0	1
	TRG4BN	Compare match between MTU4.TADCORB and MTU4.TCNT	0	0	1	0	1	0
	TRG4AN or TRG4BN	Compare match between MTU4.TADCORA and MTU4.TCNT or compare match between MTU4.TADCORB and MTU4.TCNT	0	0	1	0	1	1
	TRG4ABN	Compare match between MTU4.TADCORA and MTU4.TCNT and compare match between MTU4.TADCORB and MTU4.TCNT (when interrupt skipping function 2 is used)	0	0	1	1	0	0
	TRG7AN	Compare match between MTU7.TADCORA and MTU7.TCNT	0	0	1	1	0	1
	TRG7BN	Compare match between MTU7.TADCORB and MTU7.TCNT	0	0	1	1	1	0
	TRG7AN or TRG7BN	Compare match between MTU7.TADCORA and MTU7.TCNT or compare match between MTU7.TADCORB and MTU7.TCNT	0	0	1	1	1	1
	TRG7ABN	Compare match between MTU7.TADCORA and MTU7.TCNT and compare match between MTU7.TADCORB and MTU7.TCNT (when interrupt skipping function 2 is used)	0	1	0	0	0	0
GPT	ADTRGA0	Compare match with GPT0.GTADTRA	0	1	0	0	0	1
	ADTRGB0	Compare match with GPT0.GTADTRB	0	1	0	0	1	0
	ADTRGA1	Compare match with GPT1.GTADTRA	0	1	0	0	1	1
	ADTRGB1	Compare match with GPT1.GTADTRB	0	1	0	1	0	0
	ADTRGA2	Compare match with GPT2.GTADTRA	0	1	0	1	0	1
	ADTRGB2	Compare match with GPT2.GTADTRB	0	1	0	1	1	0
	ADTRGA3	Compare match with GPT3.GTADTRA	0	1	0	1	1	1
	ADTRGB3	Compare match with GPT3.GTADTRB	0	1	1	0	0	0
	ADTRGA0 or ADTRGB0	Compare match with GPT0.GTADTRA or GPT0.GTADTRB	0	1	1	0	0	1
	ADTRGA1 or ADTRGB1	Compare match with GPT1.GTADTRA or GPT1.GTADTRB	0	1	1	0	1	0
	ADTRGA2 or ADTRGB2	Compare match with GPT2.GTADTRA or GPT2.GTADTRB	0	1	1	0	1	1
	ADTRGA3 or ADTRGB3	Compare match with GPT3.GTADTRA or GPT3.GTADTRB	0	1	1	1	0	0

39.3.3 A/D Converter Mode Register 2 (ADM2)

The ADM2 is a 32-bit register that specifies the analog input channels to be used in A/D conversion. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CHSEL 8	CHSEL 7	CHSEL 6	CHSEL 5	CHSEL 4	CHSEL 3	CHSEL 2	CHSEL 1	CHSEL 0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
8 to 0	CHSEL[8:0]	All 0	R/W	These bits select the A/D analog input channel n (n = 0 to 8). CHSEL8 is a dedicated channel for TSU. 0: Analog input channel n is not subjected to conversion. 1: Analog input channel n is subjected to conversion.

Note 1. Select only one channel in select mode.

Note 2. If more than one channel is selected in select mode, a channel select error occurs.

39.3.4 A/D Converter Mode Register 3 (ADM3)

The ADM3 is a 32-bit register that sets the sampling period of the A/D converter. Be sure to set this register before starting the A/D converter. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADIL7	ADIL6	ADIL5	ADIL4	ADIL3	ADIL2	ADIL1	ADIL0	ADCMP7	ADCMP6	ADCMP5	ADCMP4	ADCMP3	ADCMP2	ADCMP1	ADCMP0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ADSMP7	ADSMP6	ADSMP5	ADSMP4	ADSMP3	ADSMP2	ADSMP1	ADSMP0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADIL[7:0]	All 0	R/W	These bits should be set to H'00.
23 to 16	ADCMP[7:0]	All 0	R/W	These bits should be set to H'1D.
15 to 8	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
7 to 0	ADSMP[7:0]	All 0	R/W	These bits set the sampling period (unit: ADIVCLK cycle). Set above H'4F if select ch.0-7. Set H'FF if measure TSU. T stands for the cycle of ADIVCLK (100 MHz).

Note: The ADIL[7:0] bits should be set to H'00 and the ADCMP[7:0] bits should be set to H'1D. If they are set to other values, normal operation cannot be guaranteed.

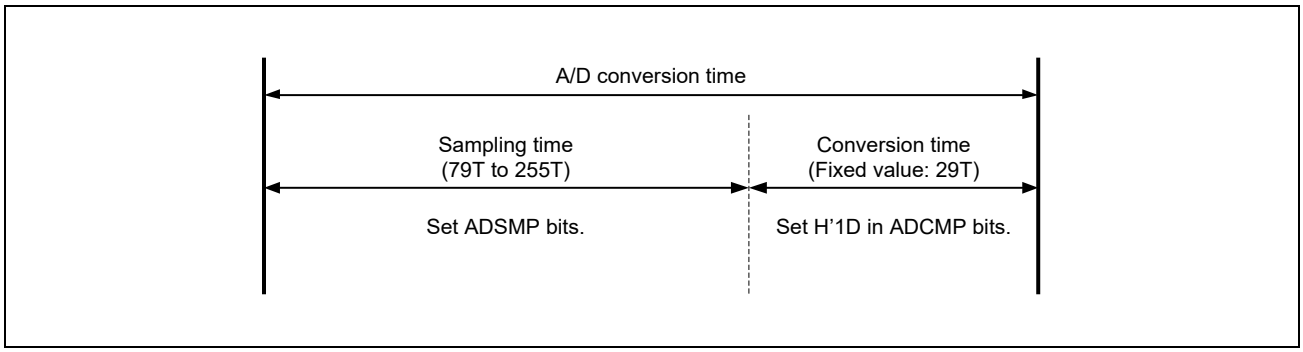

Figure 39.2 Correspondence between ADM3 Register and A/D Conversion Time

39.3.5 TSU Conversion Mode Register (TSUMODE)

The TSUMODE is a 32-bit register that control TSU conversion. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSUEN	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
1	TSUEN	All 0	R/W	This bit set the TSU conversion mode. 0: TSU conversion mode is disabled.. 1: TSU conversion mode is enabled.
0	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.

39.3.6 A/D Converter Interrupt Control Register (ADINT)

The ADINT is a 32-bit register that controls interrupts. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSEEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	INTEN 11	INTEN 10	INTEN 9	INTEN 8	INTEN 7	INTEN 6	INTEN 5	INTEN 4	INTEN 3	INTEN 2	INTEN 1	INTEN 0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	INTS	0	R/W	Selects the attribute of the interrupt (INTAD) signal. 0: Pulse signal 1: Reserved This bit should be set to 0.
30 to 17	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
16	CSEEN	0	R/W	Enables or disables the A/D conversion channel select error interrupt. 0: Interrupt output is disabled. 1: Interrupt output is enabled.
15 to 12	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
11 to 0	INTEN[11:0]	All 0	R/W	These bits enable or disable the conversion end interrupt of channel n (n = 0 to 11). 0: Interrupt output is disabled. 1: Interrupt output is enabled.

The interrupt signal is specified as a pulse and that pulse is output at any of the following timing:

1. An A/D conversion request is detected while the ADM2 register has caused an A/D conversion channel select error
2. Completion of conversion on the channel for which interrupt output has been enabled in the ADINT register
3. An A/D conversion request is detected while 4-buffer mode has been specified in scan mode

39.3.7 A/D Converter Status Register (ADSTS)

The ADSTS is a 32-bit register that controls the state of the A/D converter. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TRGS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSEST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	INST8	INTST7	INTST6	INTST5	INTST4	INTST3	INTST2	INTST1	INTST0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TRGS	0	R/W	• When reading 0: Nothing detected 1: A trigger was detected during the A/D conversion time in **Figure 39.2**. • When writing 0: No effect 1: The state is cleared.
30 to 17	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
16	CSEST	0	R/W	Indicates the status of the A/D conversion channel select error interrupt. It is the status of the interrupt for an error that occurs when A/D conversion is started with no channel being specified in the CHSEL[8:0] bits in the ADM2 register as a channel on which A/D conversion proceeds. • When reading 0: No A/D conversion channel select error occurred. 1: An A/D conversion channel select error occurred. • When writing 0: No effect 1: The status is cleared.
15 to 9	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
8 to 0	INTST[8:0]	All 0	R/W	Indicates the state of the conversion end interrupt of channel n (n = 0 to 8). • When reading 0: Conversion has not finished. 1: Conversion has finished. • When writing 0: No effect 1: The state is cleared.*1

Note 1. When an interrupt source is generated simultaneously with clearing of the interrupt source, clearing is ignored and the respective bit remains set to 1.

39.3.8 A/D Converter External Trigger Pin Filter Control Register (ADFIL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	FILNUM		—	—	—	FILONOFF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
5, 4	FILNUM[1:0]	00	R/W	These bits select the number of stages of the AD external trigger pin filter. The signal to be filtered is ADC_ADCLK(TSUϕ) (100 MHz). 00: 10.0 ns (100 MHz) × 4 stages 01: 10.0 ns (100 MHz) × 8 stages 10: 10.0 ns (100 MHz) × 12 stages 11: 10.0 ns (100 MHz) × 16 stages
3 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	FILONOFF	0	R/W	Enables or disables the AD external trigger pin filter 0: Filter is disabled. 1: Filter is enabled.

39.3.9 A/D Conversion Result Registers11 to 0 (ADCR11 to ADCR0)

The ADCR11 to ADCR0 are 32-bit registers that hold the A/D conversion results. The A/D converter has twelve 32-bit registers. These registers are read from in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	AD11	AD10	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
11 to 0	AD[11:0]	All 0	R	These bits hold the A/D conversion results.

Analog Input Channel	ADCR7 to ADCR0 Registers	
	Select Mode with 1-Buffer Mode Selected or Scan Mode	Select Mode with 4-Buffer Mode Selected
0	ADCR0	ADCR3 to ADCR0
1	ADCR1	
2	ADCR2	
3	ADCR3	
4	ADCR4	ADCR7 to ADCR4
5	ADCR5	
6	ADCR6	
7	ADCR7	
8	ADCR8	ADC11 to ADCR8
9	—	
10	—	
11	—	

The following formula indicates the relationship between the analog input voltage that is input to analog input pins (ADC_CH8 to ADC_CH0) and the A/D conversion results (A/D conversion result registers (ADCR11 to ADCR0)).

$$\mathrm{ADCR} = \mathrm{INT}\left[\frac{\mathrm{Vin}}{\mathrm{ADC\_AVREF}} \times 2^{\mathrm{d}} \times 0.5\right]$$

or

$$(\mathrm{ADCR} - 0.5) \times \frac{\mathrm{ADC\_AVREF}}{2^{\mathrm{d}}} \leq \mathrm{Vin} < (\mathrm{ADCR} + 0.5) \times \frac{\mathrm{ADC\_AVREF}}{2^{\mathrm{d}}}$$

INT[ ]:	Function that returns the integer portion of the value enclosed in [ ]
Vin:	Analog input voltage
ADC_AVREF:	Voltage of power supply pin(ADC_AVDD18) for the analog unit
ADCR:	Value of A/D conversion result registers (ADCR11 to ADCR0)
d:	Resolution of A/D converter (d = 12 in this LSI)

The relationship between the analog input voltage and A/D conversion result is shown in the figure below.

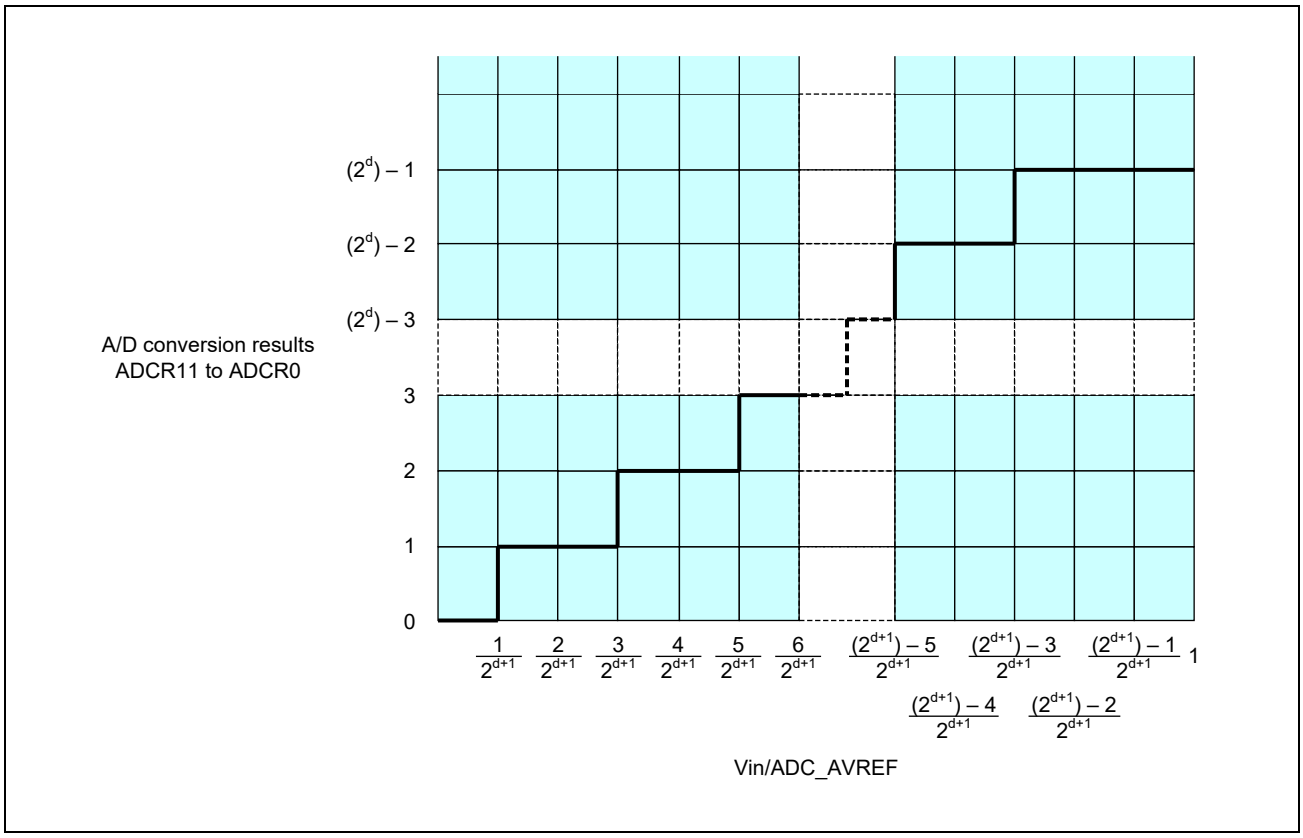

Figure 39.3 Relationship between Analog Input Voltage and A/D Conversion Result

39.4 Operation

39.4.1 Types of A/D Conversion Modes

The following A/D conversion modes can be specified. A/D conversion modes can be set in the ADM1 register.

Table 39.5 A/D Conversion Modes

Trigger Mode	Trigger Input Mode	Operating Mode	Conversion Count	Buffer Count	Operation	Example of A/D Conversion for Reference
Software trigger	—	Select	Single	1 buffer	Selected 1 channel × 1-time conversion	**Section 39.4.4.1, Example of A/D Conversion in Select Mode with Single Mode Selected**
				4 buffers	Selected 1 channel × 4-time conversion	—
			Repeat	1 buffer	(Selected 1 channel × 1-time conversion) × repeated	**Section 39.4.4.2, Example of A/D Conversion in Select Mode with Repeat Mode Selected**
				4 buffers	(Selected 1 channel × 4-time conversion) × repeated	**Section 39.4.4.3, Example of A/D Conversion in 4-Buffer Mode**
		Scan	Single	1 buffer	All selected channels × 1-time conversion	**Section 39.4.4.4, Example of A/D Conversion in Scan Mode with Single Mode Selected**
				4 buffers	(Setting prohibited)	
			Repeat	1 buffer	(All selected channels × 1-time conversion) × repeated	**Section 39.4.4.5, Example of A/D Conversion in Scan Mode with Repeat Mode Selected**
				4 buffers	(Setting prohibited)	
Hardware trigger	Auto (started with a single trigger input)	Select	Single	1 buffer	Selected 1 channel × 1-time conversion	—
				4 buffers	Selected 1 channel × 4-time conversion	—
			Repeat	1 buffer	(Selected 1 channel × 1-time conversion) × repeated	—
				4 buffers	(Selected 1 channel × 4-time conversion) × repeated	—
		Scan	Single	1 buffer	All selected channels × 1-time conversion	**Section 39.4.4.6, Example of A/D Conversion in Auto Mode**
				4 buffers	(Setting prohibited)	
			Repeat	1 buffer	(All selected channels × 1-time conversion) × repeated	—
				4 buffers	(Setting prohibited)	
	Step (conversion proceeds at every trigger input)	Select	Single	1 buffer	Selected 1 channel × 1-time conversion	—
				4 buffers	Selected 1 channel × 4-time conversion	—
			Repeat	1 buffer	(Selected 1 channel × 1-time conversion) × repeated	—
				4 buffers	(Selected 1 channel × 4-time conversion) × repeated	—
		Scan	Single	1 buffer	All selected channels × 1-time conversion	**Section 39.4.4.7, Example of A/D Conversion in Step Mode**
				4 buffers	(Setting prohibited)	
			Repeat	1 buffer	(All selected channels × 1-time conversion) × repeated	—
				4 buffers	(Setting prohibited)	

Note: When 4-buffer mode is set in scan mode, a channel select error occurs.

39.4.1.1 Trigger Modes

Software trigger mode and hardware trigger mode are the two types of trigger modes in which the trigger is the timing for starting the A/D conversion processing. These trigger modes can be set by the TRG bit in the ADM1 register.

(1) Software Trigger Mode

In software trigger mode, A/D conversion is started for the input of the ADC_CH8 to ADC_CH0 pins by setting the ADCE bit in the ADM0 register to 1. The ADBSY bit in the ADM0 register is 1 while the converter is operating.

The hardware trigger is invalid when software trigger mode is set. Set the EGA[1:0] bits in the ADM1 register to 00 when using software trigger mode. When a hardware trigger is input, A/D conversion is not started and the TRGS bit in the ADSTS register retains 0.

(2) Hardware Trigger Mode

There are two triggers in hardware trigger mode: asynchronous trigger using the ADC_TRG pin as the activation source and synchronous trigger using the multi-function timer pulse unit 3 (MTU3a) or general purpose PWM timer (GPT) as the activation source.

The valid edge of the selected hardware trigger can be set by the EGA[1:0] bits in the ADM1 register.

When the ADCE bit in the ADM0 register is set to 1, the A/D converter enters a standby state for a hardware trigger after 250 ns as passed and will start conversion operation upon detection of a valid edge. The ADBSY bit in the ADM0 register remains to be 1 during conversion operation.

The status of the TRGS bit in the ADSTS register can be cleared by writing 1 to the TRGS bit.

In hardware trigger mode, the available trigger input modes are auto mode and step mode. The trigger input mode can be set in the TRGIN bit in the ADM1 register.

(a) Auto mode

When a hardware trigger is input once, A/D conversion is repeated automatically for the conversion count in accordance with the specified conversion settings.

(b) Step mode

A/D conversion proceeds every time a hardware trigger is input. For example, if select mode, single mode, and 4-buffer mode are selected, conversion finishes when a hardware trigger has been input four times.

39.4.1.2 Operating mode

There are two operating modes: select mode and scan mode. The select mode has 1-buffer mode and 4-buffer mode as sub-modes. These modes can be set in the BS and MS bits in the ADM1 register.

(1) Select Mode

A/D conversion proceeds for the analog input specified in the CHSEL[8:0] bits in the ADM2 register. The A/D conversion results are stored in the ADCR11 to ADCR0 registers corresponding to the ADC_CH8 to ADC_CH0 pins. In select mode, 1-buffer mode or 4-buffer mode can be used as the method for storing the A/D conversion results.

Only one channel is selectable for A/D conversion in select mode.

If more than one analog input channel is selected in select mode, a channel select error occurs.

(a) 1-buffer mode

A/D conversion proceeds only once for the analog input specified in the ADM2 register and the conversion result is stored in the ADCR8 to ADCR0 registers corresponding to the ADC_CH8 to ADC_CH0 pins.

The ADC_CH8 to ADC_CH0 pins correspond with the ADCR8 to ADCR0 registers on a one-on-one basis. If interrupt output is enabled in the INTEN[8:0] bits in the ADINT register for the channels on which A/D conversion proceeds, an A/D conversion end interrupt (INTAD) occurs on completion of a single conversion.

This mode is usable for reading the result of a single conversion.

(b) 4-buffer mode

A/D conversion proceeds four times for the analog input specified in the ADM2 register and the conversion results are stored in the ADCR11 to ADCR8 or ADCR7 to ADCR4 or ADCR3 to ADCR0 registers. See **Table 39.7** for the correspondence between the analog inputs and A/D conversion result registers.

If interrupt output is enabled in the INTEN[11:0] bits in the ADINT register for the channels corresponding to the ADC11 to ADCR0 registers where the A/D conversion result is to be stored in 1-buffer mode, an A/D conversion end interrupt (INTAD) occurs when the A/D conversion result is stored in the ADCR11 to ADCR0 registers. For example, to generate an interrupt on the fourth A/D conversion when ADC_CH0 is selected, set the INTEN3 bit in the ADINT register to 1.

See **Table 39.6** for the relationship between the setting of the ADINT register and the output of an A/D conversion end interrupt in 4-buffer mode.

This mode is usable for obtaining the average of the A/D conversion results.

Table 39.6 ADINT Setting and Generation of A/D Conversion End Interrupt in 4-Buffer Mode

Channel for A/D Conversion	ADINT Register Setting		A/D Conversion End Interrupt
1 channel is selected from ADC_CH3 to ADC_CH0	INTEN[0]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 0.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 0.
	INTEN[1]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 1.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 1.
	INTEN[2]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 2.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 2.
	INTEN[3]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 3.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 3.
1 channel is selected from ADC_CH7 to ADC_CH4	INTEN[4]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 4.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 4.
	INTEN[5]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 5.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 5.
	INTEN[6]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 6.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 6.
	INTEN[7]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 7.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 7.
1 channel is selected from ADC_CH8	INTEN[8]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 8.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 8.
	INTEN[9]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 9.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 9.
	INTEN[10]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 10.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 10.
	INTEN[11]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 11.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 11.

Table 39.7 Correspondence between Analog Inputs and A/D Conversion Result Registers in 4-Buffer Mode

Analog Input	A/D Conversion Result Register
1 channel is selected from ADC_CH3 to ADC_CH0	ADCR0 (first time)
	ADCR1 (second time)
	ADCR2 (third time)
	ADCR3 (fourth time)
1 channel is selected from ADC_CH7 to ADC_CH4	ADCR4 (first time)
	ADCR5 (second time)
	ADCR6 (third time)
	ADCR7 (fourth time)
1 channel is selected ADC_CH8	ADCR8 (first time)
	ADCR9 (second time)
	ADCR10 (third time)
	ADCR11 (fourth time)

(2) Scan Mode

A/D conversion proceeds for the analog inputs of channels selected in the ADM2 register, in ascending order of channel number. The A/D conversion results are stored in the ADCR8 to ADCR0 registers corresponding to the analog inputs. If interrupt output is enabled in the INTEN[8:0] bits in the ADINT register for the channels on which A/D conversion proceeds, an A/D conversion end interrupt (INTAD) occurs when A/D conversion on the relevant channel finishes.

This mode is usable for constantly monitoring multiple analog signals.

In scan mode, only 1-buffer mode can be specified. If 4-buffer mode is specified in scan mode, a channel select error occurs.

39.4.1.3 Conversion Mode

Single mode and repeat mode are available. Use the RPS bit in the ADM1 register to set the conversion mode.

(1) Single Mode

When A/D conversion for the number of times of the conversion count finishes, the ADCE bit in the ADM0 register is automatically cleared to 0. For the number of times of conversion, see the description of operation in **Table 39.5**.

(2) Repeat Mode

When 1 is written to the ADCE bit in the ADM0 register, A/D conversion repeatedly proceeds in the A/D conversion mode specified in the ADM1 register. Immediately after 0 is written to the ADCE bit in the ADM0 register, A/D conversion is finished.

For the number of times of conversion, see the description of operation in **Table 39.5**.

39.4.2 Interrupt Functions

Table 39.8 lists the interrupt sources of the A/D converter and the conditions for generating them and the methods for confirming and clearing the interrupt sources.

The INTS bit in the ADINT register is used to set the operation for outputting an interrupt request of the INTAD.

Table 39.8 List of Interrupt Functions

Interrupt Source	Condition for Generation	Enabling Interrupt ADINT Register	Confirming Interrupt Source ADSTS Register*1	Method for Clearing Interrupt Source ADSTS Register
A/D conversion end	When A/D conversion on the specified channel is completed	INTEN[11:0]*2	INTST[11:0]	Write 1 to the bits that were 1 when the register was read.
A/D conversion channel select error	• When all of the CHSEL[7:0] bits in the ADM2 register were 0 at the start of A/D conversion*3 • When multiple analog input channels are selected in select mode*3 • When 4-buffer mode is specified in scan mode*3	CSEEN	CSEST	Write 1 to the CSEST bit.

Note 1. If an interrupt source is generated regardless of the settings of the INTEN[11:0] and CSEEN bits in the ADINT register, the bit corresponding to the interrupt source is set to 1 in the ADSTS register.

Note 2. The A/D conversion end interrupt can be enabled or disabled individually for each channel.

Note 3. When an A/D conversion channel select error occurs, the ADCE bit in the ADM0 register becomes 0 and A/D conversion operation is stopped.

39.4.3 Procedures of A/D Conversion

Follow the procedures given below for A/D conversion.

(1) Procedure for starting A/D conversion

After the A/D converter is released from the software reset state, use the ADM3 to ADM0 registers*1 to select the analog input channels on which A/D conversion proceeds and specify the trigger mode (software trigger or hardware trigger), operating mode (select or scan), etc.

Setting the ADCE bit in the ADM0 register to 1 will start A/D conversion in software trigger mode, whereas the A/D converter will enter a standby state for a trigger*2 in hardware trigger mode.

Note 1. Set the ADM3 to ADM0 registers when conversion by the A/D converter is stopped (ADBSY bit in the ADM0 register is 0).

Note 2. If the ADCE bit in the ADM0 register is set to 1 in hardware trigger mode, a transition is made to a trigger standby state. A/D conversion is started (ADBSY bit in ADM0 register is 1) by a hardware trigger signal and the A/D converter returns to the trigger standby state (ADBSY bit in ADM0 register is 0) on completion of A/D conversion.

A/D conversion operation is enabled.

After the A/D converter makes a transition from power-saving mode to normal mode, a period as long as the stabilization wait time is required. The stabilization wait time is 1 μs.

After the stabilization wait time has passed, set the ADCE bit in the ADM0 register to 1.

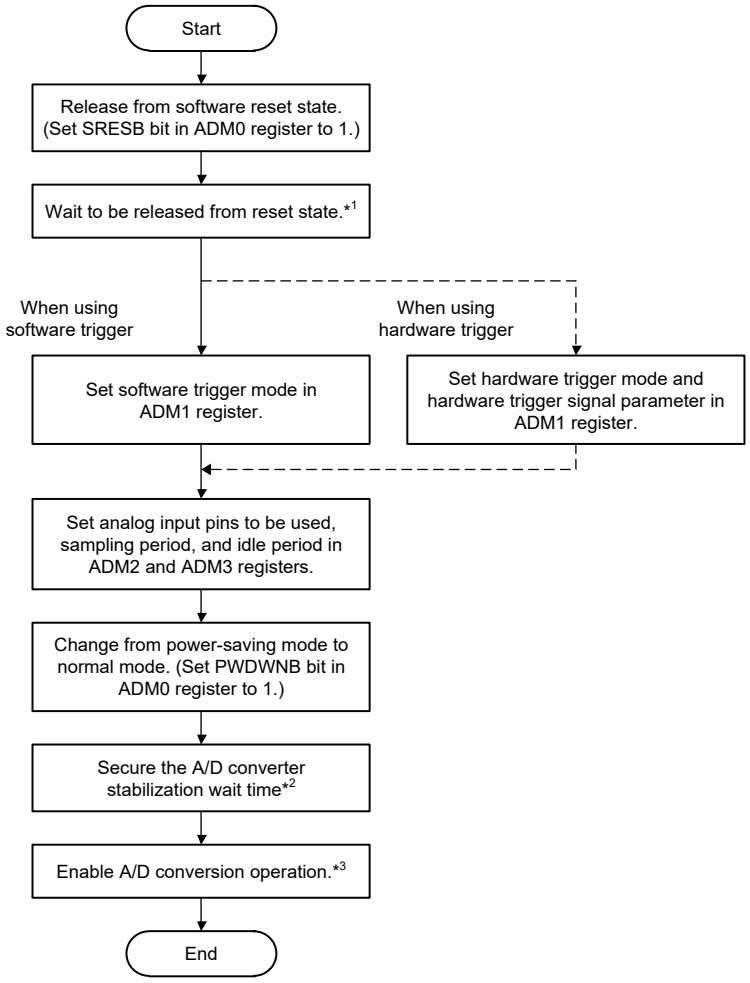
In software trigger mode, setting the ADCE bit to 1 starts A/D conversion.

In hardware trigger mode, setting the ADCE bit to 1 makes the A/D converter enter a standby state for a hardware trigger after 250 ns has passed, and conversion operation is started upon detection of a valid edge.

(2) When A/D conversion is finished, the A/D conversion results are stored in the ADCR11 to ADCR0 registers. Also, an A/D conversion end interrupt (INTAD) occurs on completion of A/D conversion on the channels specified in the INTEN[8:0] bits in the ADINT register.

39.4.3.1 Procedure for Starting A/D Conversion

Use the following flowchart to start A/D conversion.



Note 1. The time waiting for the A/D converter to be released from the reset state is 2 × ADC_ADCLK(TSUϕ).

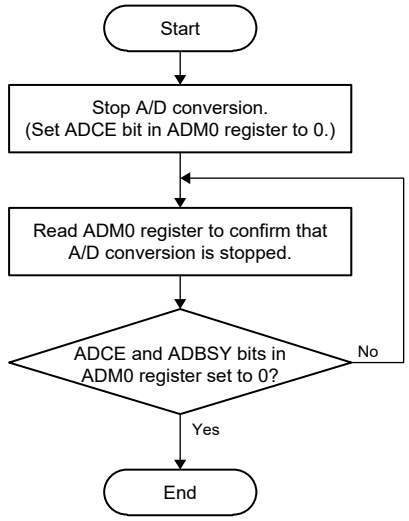
Note 2. The stabilization wait time is 1 µs.

Note 3. In software trigger mode, A/D conversion is started by setting the ADCE bit to 1.
In hardware trigger mode, after the ADCE bit is set to 1, A/D conversion is started upon detection of a valid edge.

Figure 39.4 Procedure for Starting A/D Conversion

39.4.3.2 Procedure for Stopping A/D Conversion

Use the following flowchart to stop A/D conversion.

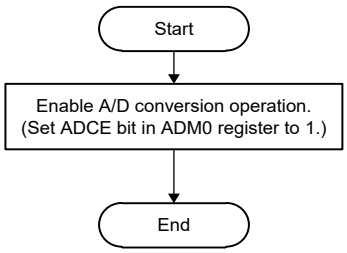


Note: For details on the operation for stopping conversion by writing 0 to the ADCE bit, see **Table 39.10**.

Figure 39.5 Procedure for Stopping A/D Conversion

39.4.3.3 Procedure for Stopping and Restarting A/D Conversion

Use the following flowchart to restart A/D conversion after it has been stopped with the procedure for stopping A/D conversion.



Note: For details on the operation for restarting conversion, see **Table 39.10**.

Figure 39.6 Procedure for Stopping and Restarting A/D Conversion

39.4.3.4 Procedure for Entering Power-saving Mode

Use the following flowchart to make a transition to the power-saving mode.

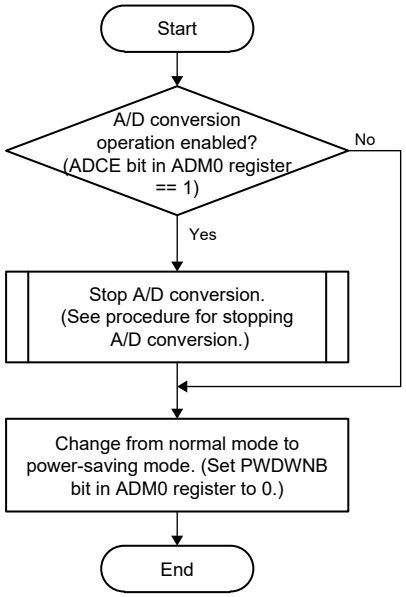


Figure 39.7 Procedure for Entering Power-Saving Mode

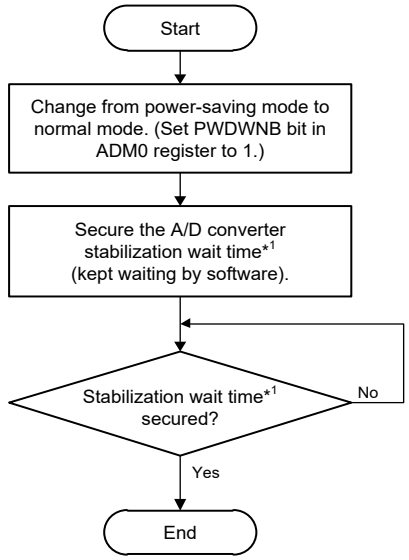
39.4.3.5 Procedure for Releasing from Power-saving Mode

Use the following flowchart to release the A/D converter from the power-saving mode.



Note 1. The stabilization wait time is 1 µs.

Figure 39.8 Procedure for Releasing from Power-Saving Mode

39.4.3.6 Procedure for a Software Reset

Use the following flowchart to execute a software reset.

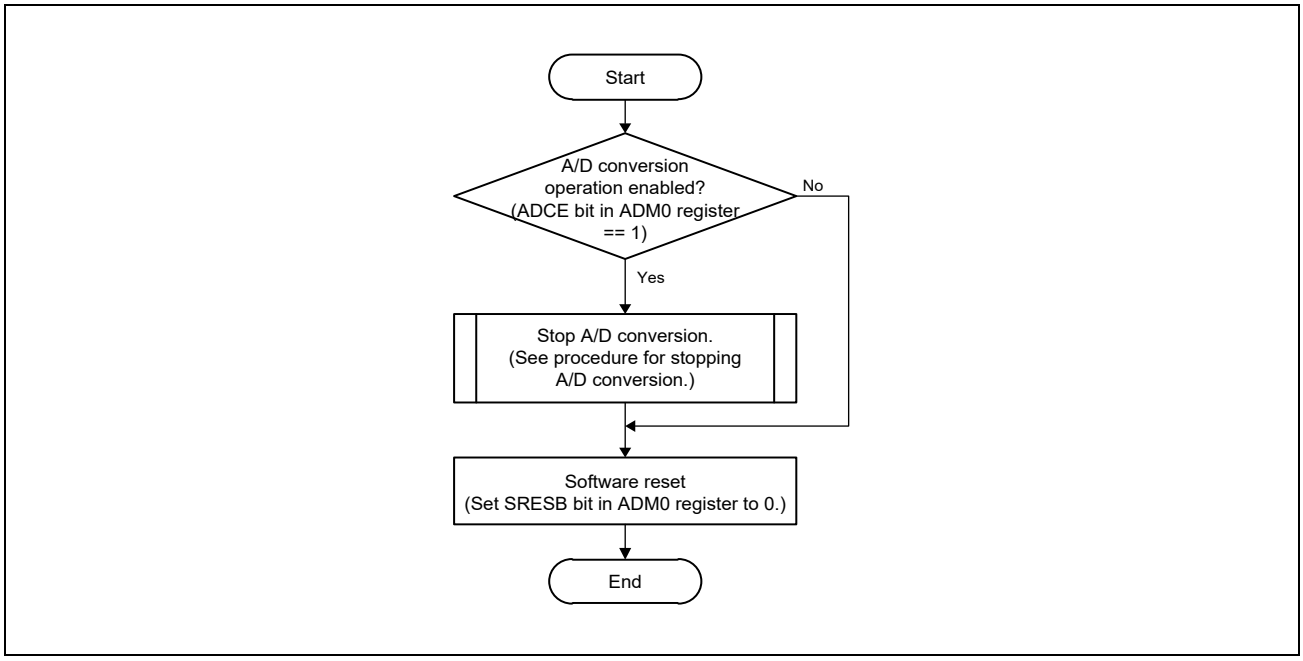


Figure 39.9 Procedure for a Software Reset

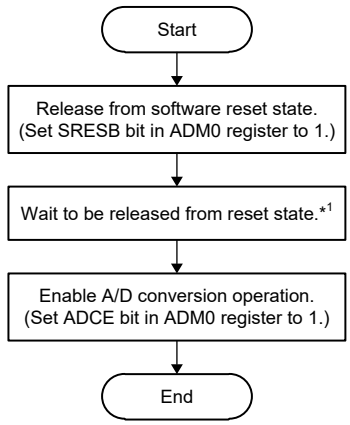
39.4.3.7 Procedure for Restarting A/D Conversion after a Software Reset

Use the following flowchart to start A/D conversion, then execute a software reset with the procedure for a software reset, and finally restart A/D conversion.



Note 1. The time waiting for the A/D converter to be released from the reset state is 2 × ADC_ADCLK(TSUϕ).

Figure 39.10 Procedure for Restarting A/D Conversion after a Software Reset

39.4.3.8 Procedure for Interrupt Processing

Use the flowchart in **Figure 39.11** to process an interrupt request that was output by the A/D converter.

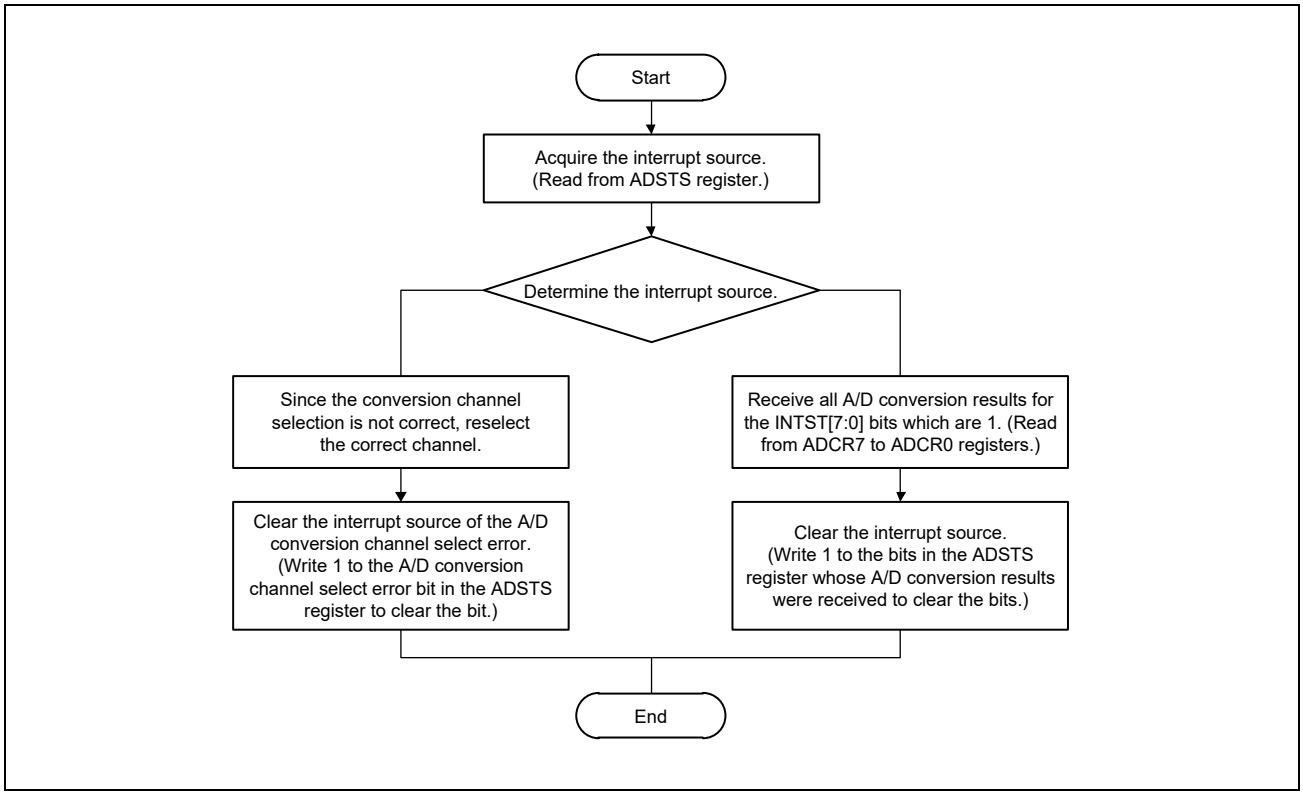


Figure 39.11 Procedure for Interrupt Processing

39.4.4 Examples of A/D Conversion

This section gives examples of A/D conversion.

1) Example of A/D conversion in select mode with single mode selected
2) Example of A/D conversion in select mode with repeat mode selected
3) Example of A/D conversion in 4-buffer mode
4) Example of A/D conversion in scan mode with single mode selected
5) Example of A/D conversion in scan mode with repeat mode selected
6) Example of A/D conversion in auto mode
7) Example of A/D conversion in step mode

Note to confirm the differences between modes shown below because not all possible combinations are included in this manual.

- For the differences between 1-buffer mode and 4-buffer mode, refer to 1) and 3).
- For the differences between single mode and repeat mode, refer to 1) and 2).
- For the differences between select mode and scan mode, refer to 1) and 4) or 2) and 5)
- For the differences between auto mode and step mode, refer to 6) and 7)
- For the differences between software trigger mode and hardware trigger mode, refer to 4) and 6).

39.4.4.1 Example of A/D Conversion in Select Mode with Single Mode Selected

Figure 39.12 shows an example of A/D conversion with software trigger mode, select mode, single mode and 1-buffer mode are selected. In the example in **Figure 39.12**, conversion proceeds with the analog input changed from ADC_CH1 to ADC_CH2.

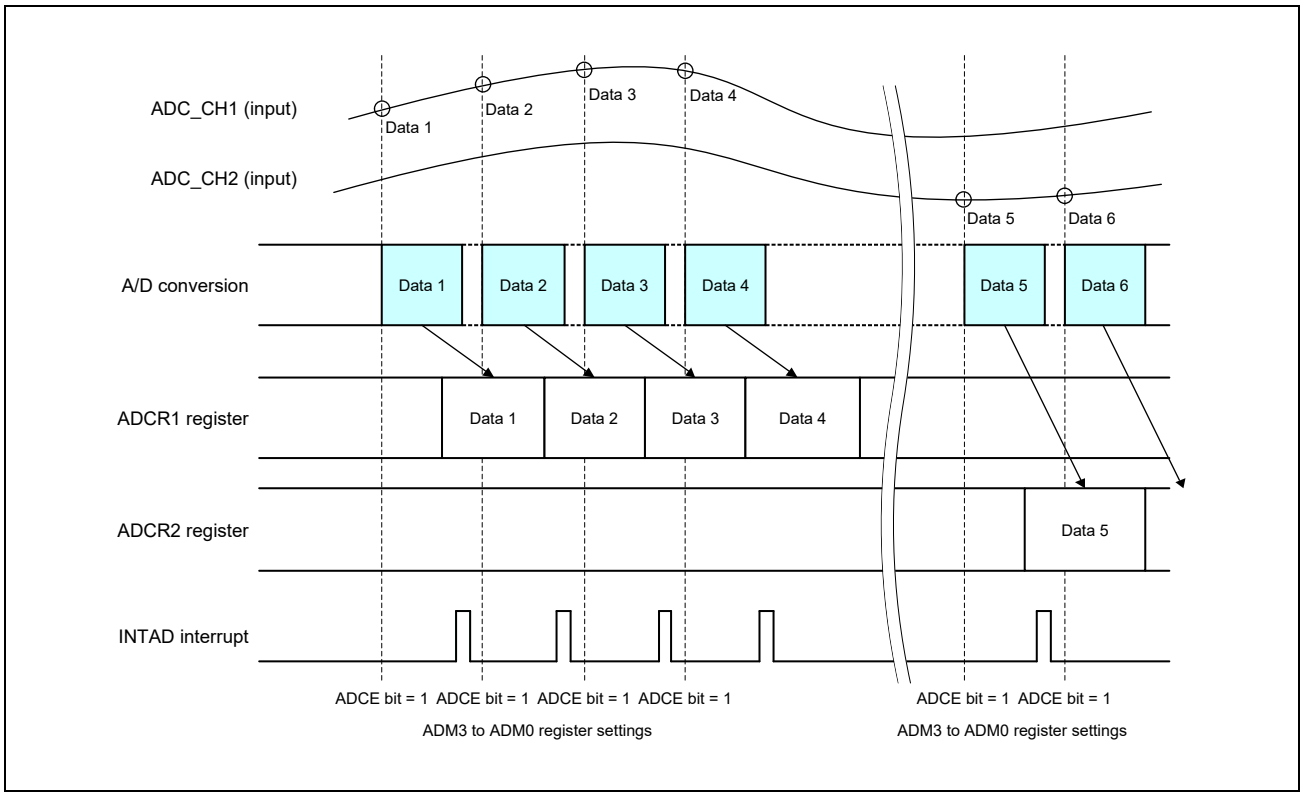

Figure 39.12 Example of A/D Conversion in Select Mode with Single Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, single mode, and 1-buffer mode are selected, and analog input pin ADC_CH1 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH1 (A/D conversion result is stored in the ADCR1 register).
9. An INTAD interrupt occurs.
10. Steps 7 to 9 above are repeated.
11. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.
12. In the ADM3 to ADM0 registers, software trigger mode, select mode, single mode, and 1-buffer mode are selected, and analog input pin ADC_CH2 is set.

13. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
14. A/D conversion proceeds on ADC_CH2 (A/D conversion result is stored in the ADCR2 register).
15. An INTAD interrupt occurs.
16. Steps 13 to 15 above are repeated.

Note 1. The stabilization wait time is 1 μs.

39.4.4.2 Example of A/D Conversion in Select Mode with Repeat Mode Selected

Figure 39.13 shows an example of A/D conversion with software trigger mode, select mode, repeat mode, and 1-buffer mode are selected. In the example in **Figure 39.13**, conversion proceeds with the analog input changed from ADC_CH1 to ADC_CH2.

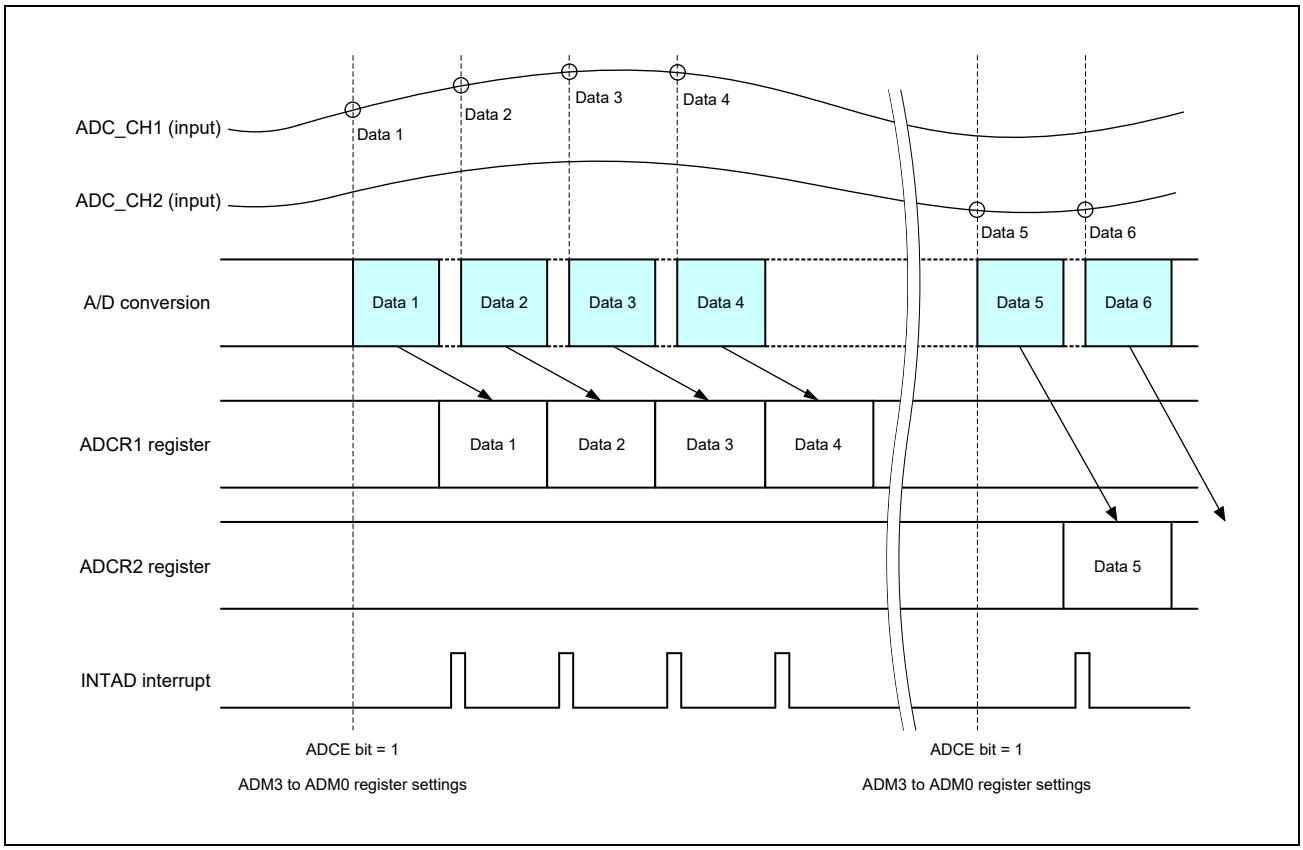

Figure 39.13 Example of A/D Conversion in Select Mode with Repeat Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 1-buffer mode are selected, and analog input pin ADC_CH1 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH1 (A/D conversion result is stored in the ADCR1 register).
9. An INTAD interrupt occurs.
10. Steps 8 and 9 above are repeated automatically.
11. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.

12. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, 1-buffer mode are selected, and analog input pin ADC_CH2 is set.
13. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
14. A/D conversion proceeds on ADC_CH2 (A/D conversion result is stored in the ADCR2 register).
15. An INTAD interrupt occurs.
16. Steps 14 and 15 above are repeated.

Note 1. The stabilization wait time is 1 μs.

39.4.4.3 Example of A/D Conversion in 4-Buffer Mode

Figure 39.14 shows an example of A/D conversion with software trigger mode, select mode, repeat mode, and 4-buffer mode are selected. In the example in **Figure 39.14**, conversion proceeds with the analog input changed from ADC_CH2 to ADC_CH4.

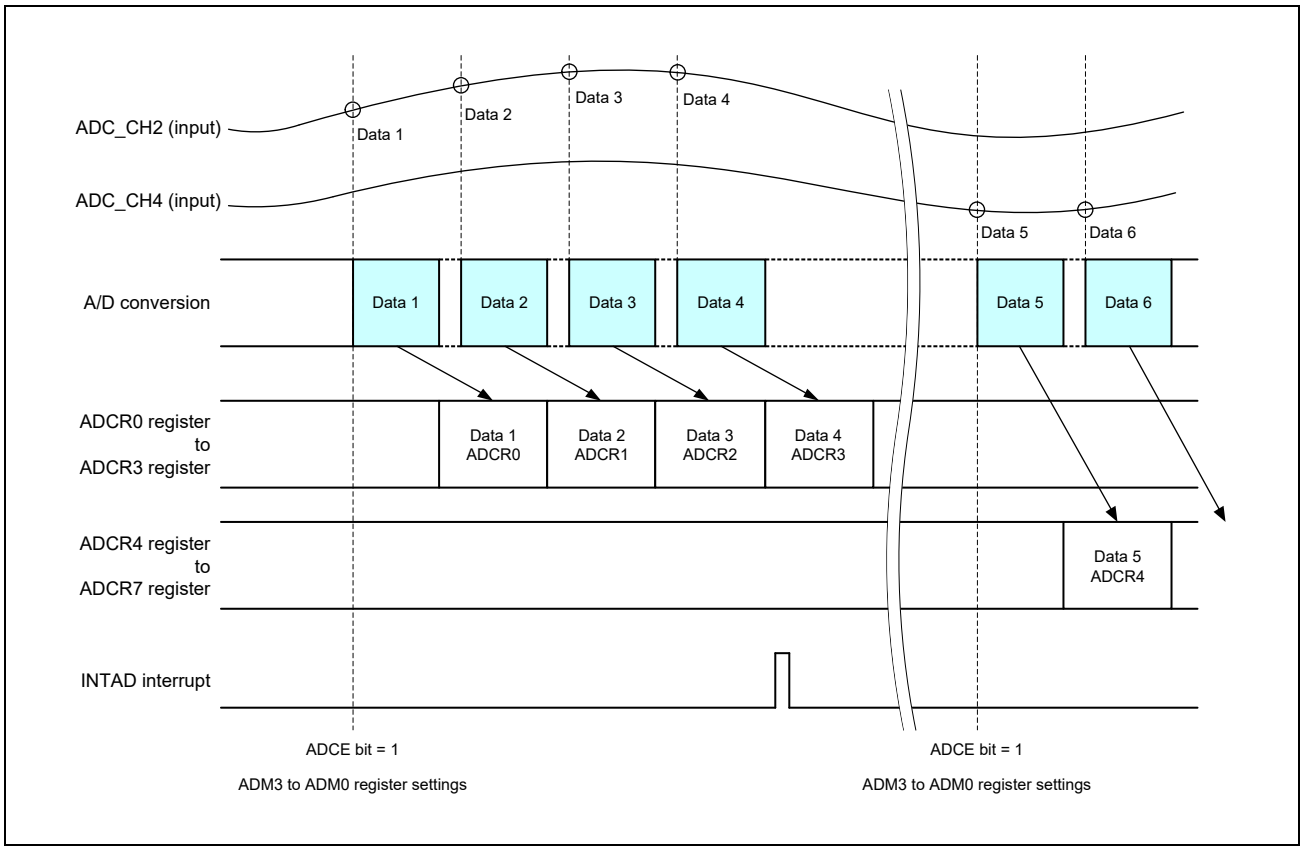

Figure 39.14 Example of A/D Conversion in 4-Buffer Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 4-buffer mode are selected, and analog input pin ADC_CH2 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 3) is stored in the ADCR2 register).
11. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 4) is stored in the ADCR3 register).

12. An INTAD interrupt occurs.
13. Steps 8 to 12 above are repeated automatically.
14. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.
15. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 4-buffer mode are selected, and analog input pin ADC_CH4 is set.
16. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
17. A/D conversion proceeds on ADC_CH4 (A/D conversion result (data 5) is stored in the ADCR4 register).
18. A/D conversion proceeds on ADC_CH4 (A/D conversion result (data 6) is stored in the ADCR5 register).

...

Note 1. The stabilization wait time is 1 μs.

39.4.4.4 Example of A/D Conversion in Scan Mode with Single Mode Selected

Figure 39.15 shows an example of A/D conversion with software trigger mode, scan mode, and single mode are selected. In the example in **Figure 39.15**, conversion proceeds with ADC_CH3 to ADC_CH0 selected.

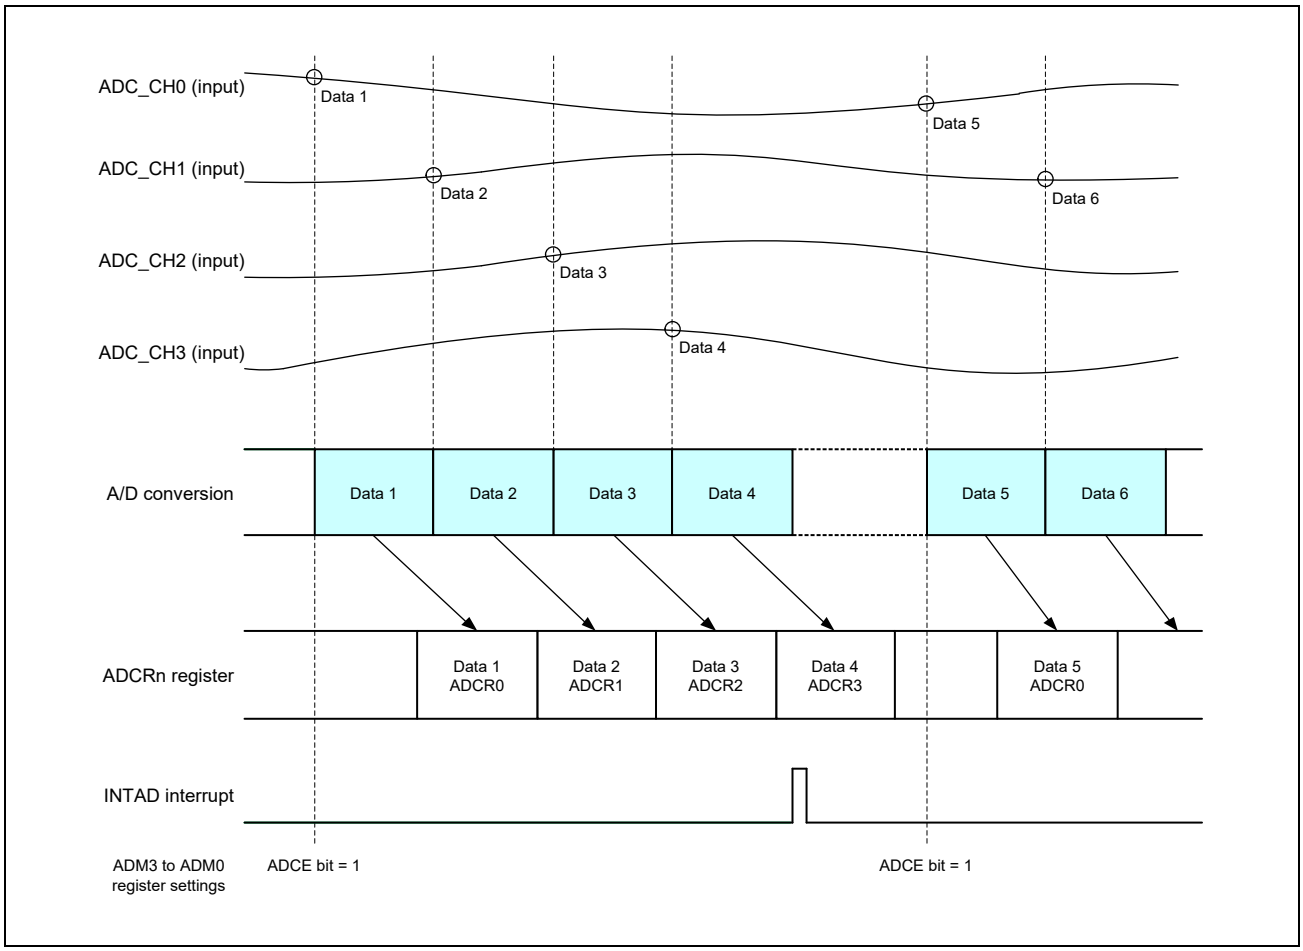

Figure 39.15 Example of A/D Conversion in Scan Mode with Single Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, scan mode, and single mode are selected, and analog input pins ADC_CH3 to ADC_CH0 are set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 3) is stored in the ADCR2 register).

11. A/D conversion proceeds on ADC_CH3 (A/D conversion result (data 4) is stored in the ADCR3 register).
12. An INTAD interrupt occurs.
13. Steps 7 to 12 above are repeated.

Note 1. The stabilization wait time is 1 µs.

39.4.4.5 Example of A/D Conversion in Scan Mode with Repeat Mode Selected

Figure 39.16 shows an example of A/D conversion with software trigger mode, scan mode, and repeat mode are selected. In the example in **Figure 39.16**, conversion proceeds with ADC_CH3 to ADC_CH0 selected.

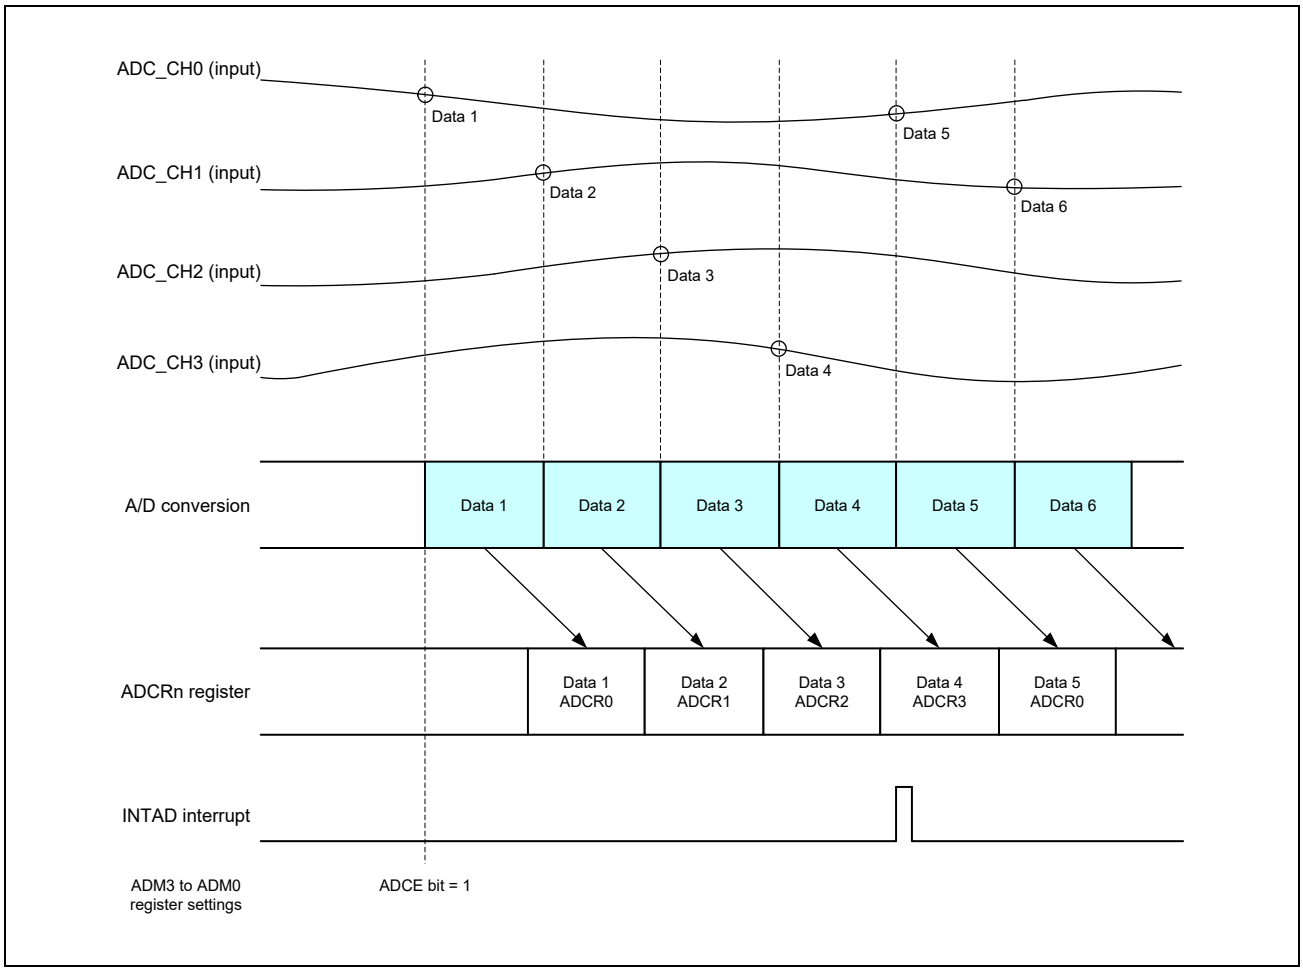

Figure 39.16 Example of A/D Conversion in Scan Mode with Repeat Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, scan mode, and repeat mode are selected and analog input pins ADC_CH3 to ADC_CH0 are set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 3) is stored in the ADCR2 register).

11. A/D conversion proceeds on ADC_CH3 (A/D conversion result (data 4) is stored in the ADCR3 register).
12. An INTAD interrupt occurs.
13. Steps 8 to 12 above are repeated automatically.

Note 1. The stabilization wait time is 1 µs.

39.4.4.6 Example of A/D Conversion in Auto Mode

Figure 39.17 shows an example of A/D conversion with hardware trigger mode, auto mode, scan mode, and single mode are selected. In the example in **Figure 39.17**, conversion proceeds with ADC_CH3 to ADC_CH0 selected.

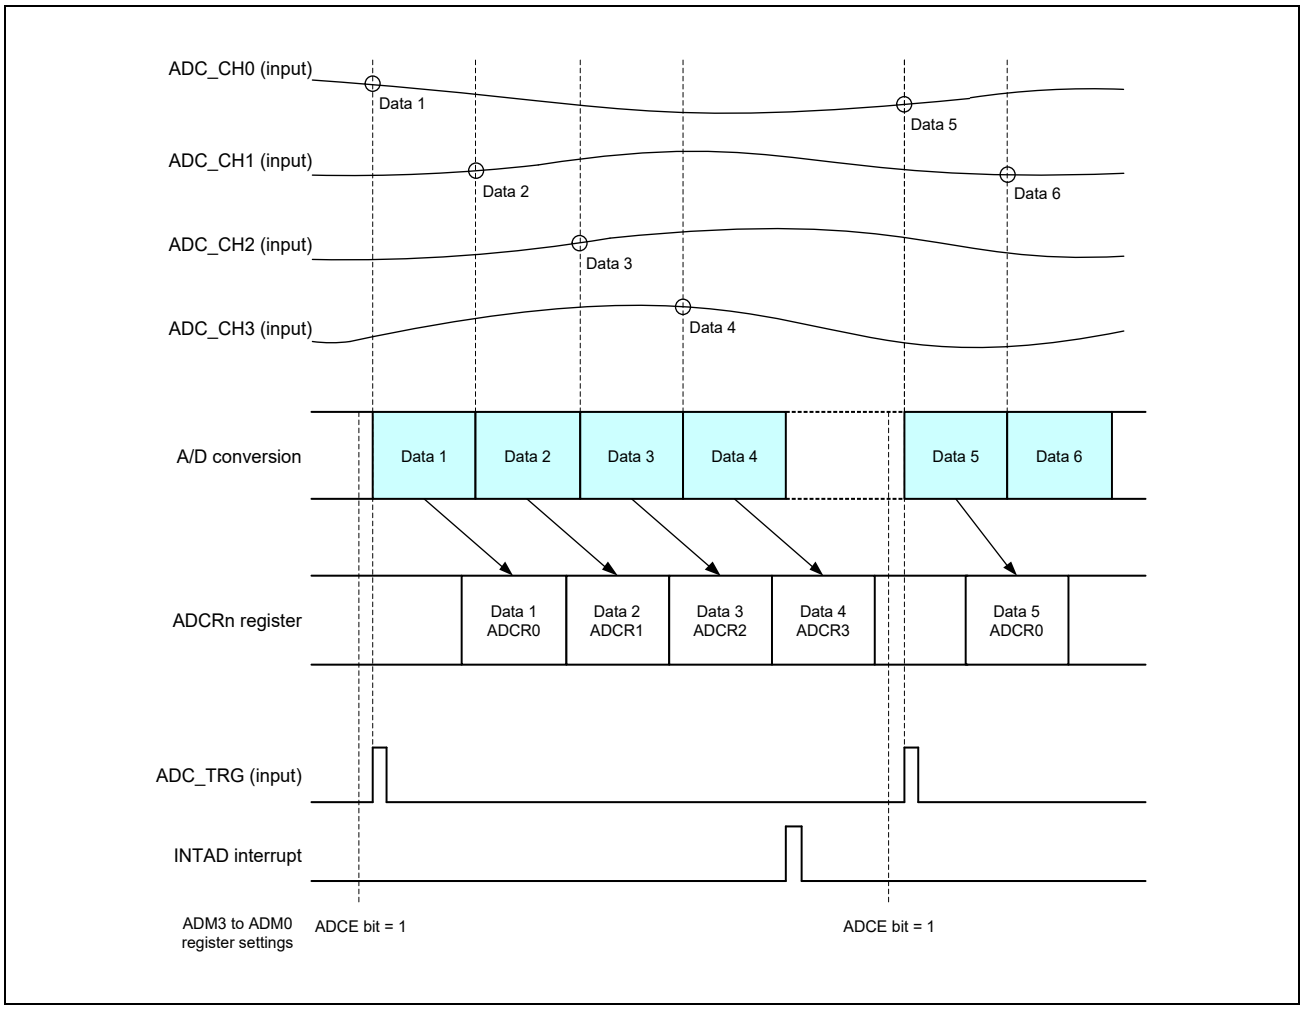

Figure 39.17 Example of A/D Conversion in Auto Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, hardware trigger mode, auto mode, scan mode, and single mode are selected, and analog input pins ADC_CH3 to ADC_CH0 are set, the trigger of the ADC_TRG pin is enabled, and rising-edge detection of the hardware trigger is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*[1] by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).

8. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
10. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
11. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 3) is stored in the ADCR2 register).
12. A/D conversion proceeds on ADC_CH3 (A/D conversion result (data 4) is stored in the ADCR3 register).
13. An INTAD interrupt occurs.
14. Steps 7 to 13 above are repeated.

Note 1. The stabilization wait time is 1 µs.

39.4.4.7 Example of A/D Conversion in Step Mode

Figure 39.18 shows an example of A/D conversion with hardware trigger mode, step mode, scan mode, and single mode are selected. In the example in **Figure 39.18**, conversion proceeds with ADC_CH3 to ADC_CH0 selected.

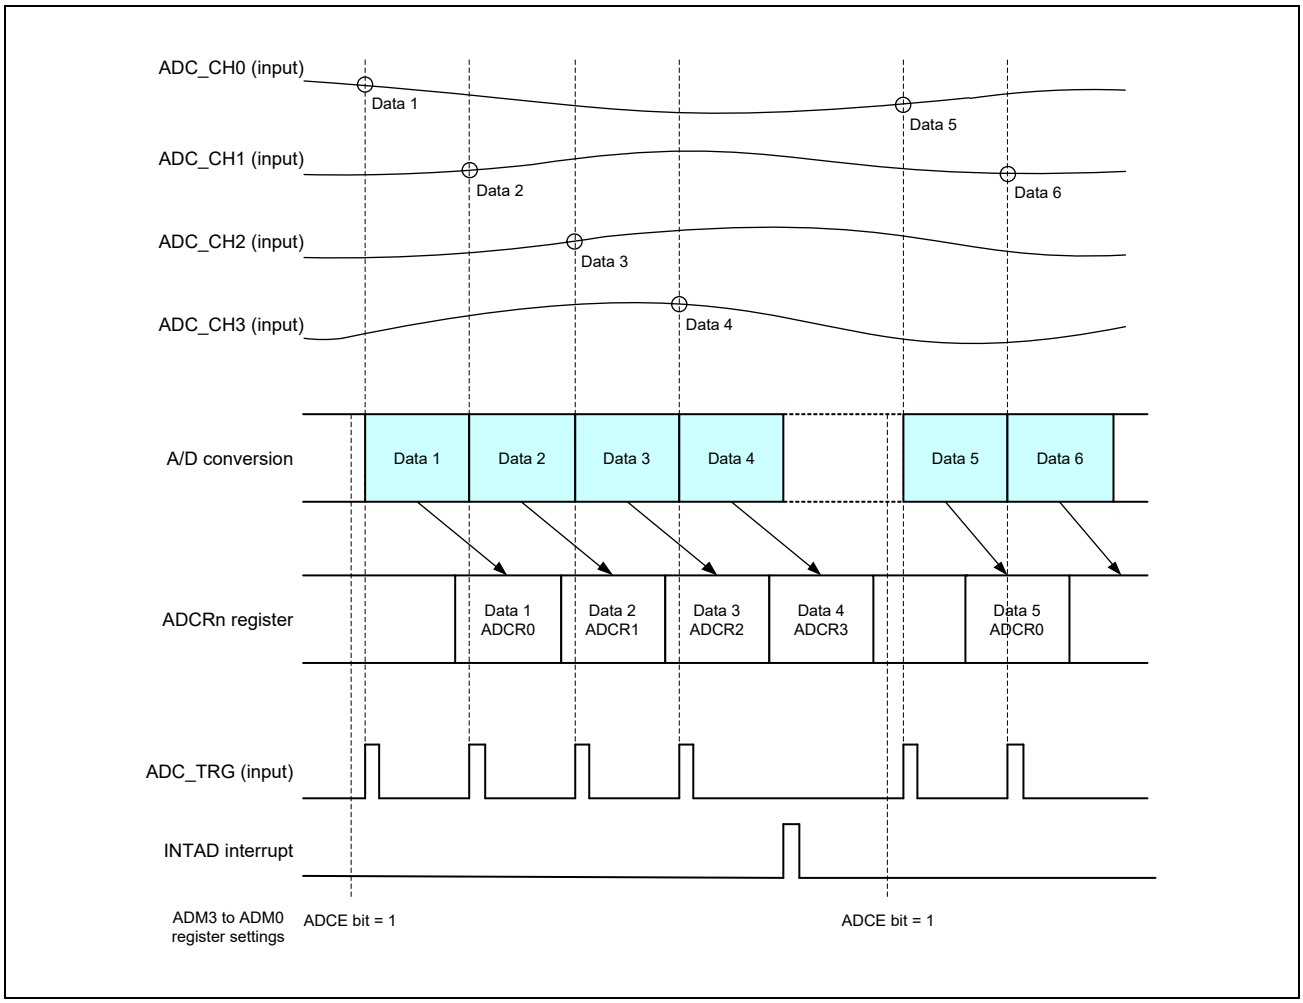

Figure 39.18 Example of A/D Conversion in Step Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, hardware trigger mode, step mode, scan mode, and single mode are selected, analog input pins ADC_CH3 to ADC_CH0 are set, the trigger of the ADC_TRG pin is enabled, and rising-edge detection of the hardware trigger is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1.
8. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).

9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
10. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
11. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
12. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
13. A/D conversion proceeds on ADC_CH2 (A/D conversion result (data 3) is stored in the ADCR2 register).
14. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
15. A/D conversion proceeds on ADC_CH3 (A/D conversion result (data 4) is stored in the ADCR3 register).
16. An INTAD interrupt occurs.
17. Steps 7 to 16 above are repeated.

Note 1. The stabilization wait time is 1 μs.

39.4.5 TSU Conversion

ADC convert the temperature that TSU IP output to 12bit data. There are two conversion methods: one is to set the TSUMODE register and the other is to convert with normal ADC operation. Start/stop the TSU every time you measure temperature or always keep the TSU on. (See chapter TSU for TSU control)

39.4.5.1 TSUMODE register

1. Stop an operation of ADC. (See **Section 39.4.3.2, Procedure for Stopping A/D Conversion**)
   If the temperature sensor is not operating, start control from the temperature sensor register.
2. Set TSUMODE.TSUEN to 1b.
3. Set ADM3.ADSMP[7:0] to H'FF.
4. Set ADM0.ADCE to 1b to start ADC operation.
   The temperature data is converted every 3 µs, and 12-bit conversion data is stored in ADCR8 register.
5. Read data from ADCR8 register. Calculate the temperature with Tj correction. (See the section "Procedure for Measuring the Temperature" in chapter TSU)
6. After temperature calculation, set ADM0.ADCE to 0b to stop ADC operation.
7. Set TSUMODE.TSUEN to 0b.
   In the case of stopping the temperature sensor, stop it with temperature sensor register.
8. Restore ADM3.ADSMP[7:0] to the value before TSU conversion.
9. When ADM0.ADCE is set to 1b, operation resumes with the settings before TSU conversion.

39.4.5.2 ADM2.CHSEL8 selection

If ADM2.CHSEL8 is selected, the dedicated channel for TSU is A/D converted like other channels. Start the temperature sensor before measurement. If ADM2.CHSEL8 is selected, set ADM3.ADSMP[7:0] to H'FF to extend the sampling time.

When converting in scan mode, not only TSU but also the conversion time of other channels are extended together. When setting to 1buffer mode, the conversion result is stored in the ADCR8 register.

When setting to 4buffer mode, the conversion result is stored in ADCR8, ADCR9, ADCR10 and ADCR11 registers.

Read the data from the register, perform Tj correction and calculate the temperature. (See the section "Procedure for Measuring the Temperature" in chapter TSU)

39.5 Notes

39.5.1 Interval of Hardware Trigger

The interval (interval of input time) of a trigger in hardware trigger mode must be longer than the A/D conversion time. For the A/D conversion time, see **Section 39.3.4, A/D Converter Mode Register 3 (ADM3)**.

39.5.2 Timing Restrictions

This A/D converter has restrictions on the timing interval, which are caused by the asynchronism countermeasure circuit. The restrictions shown in **Table 39.9** need to be met. If an access is made in a period shorter than this interval, the register values on the ADC_PCLK (P0ϕ) side are not reflected in the registers on the ADC_ADCLK (TSUϕ) side because the notification of register update does not reach the ADC_ADCLK (TSUϕ) side.

Table 39.9 Restrictions on Timing Interval

Condition	Restriction
Writing to the same register successively	(Interval of write access) ≥ (6 × ADC_PCLK(P0ϕ) + 6 × ADC_ADCLK(TSUϕ))
Interval of A/D conversion	(A/D conversion time) ≥ (6 × ADC_PCLK(P0ϕ) + 6 × ADC_ADCLK(TSUϕ))

Note: For the A/D conversion time, see **Figure 39.2**.

39.5.3 Restrictions on ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) Cycles

The ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) cycles need to satisfy the relation in the following formula.

$$\frac{\text{ADC\_ADCLK(TSU}\phi\text{)} \leq \text{(A/D conversion time)}}{6 - \text{ADC\_PCLK(P0}\phi\text{)}}$$

Note: For the A/D conversion time, see **Figure 39.2**.

39.5.4 Operation when Stopping or Restarting A/D Conversion

When 0 is written to the ADCE bit in the ADM0 register, the A/D converter stops A/D conversion. A/D conversion is restarted by writing 0 to the ADCE bit in the ADM0 register once and then writing 1 to the same bit. Even though there was an instruction to stop A/D conversion, A/D conversion may not stop immediately. **Table 39.10** shows the operation for stopping conversion and also the operation for restarting conversion after it has been stopped.

Table 39.10 Operation when Stopping or Restarting A/D Conversion with the ADCE Bit

A/D Conversion Modes					Timing for Stopping Conversion when Stop is Instructed with ADCE = 0	Operation for Restarting Conversion
Trigger		Operating Mode	Conversion Count	Buffer Count		
Mode	Input					
Software	—	Select	Single	1	Stopped on completion of 1-time conversion.	Conversion proceeds on the channel selected in the ADM2 register.
				4	Stopped on completion of conversion in which there was an instruction to stop in the middle of 4-time conversion.	Same as above
			Repeat	1	Stopped on completion of 1-time conversion.	Same as above
				4	Stopped on completion of conversion in which there was an instruction to stop in the middle of 4-time conversion.	Same as above
		Scan	Single	1	Stopped on completion of conversion in which there was an instruction to stop in the middle of scanning.	Conversion proceeds from the smallest channel number selected in the ADM2 register.
				4	(Setting prohibited)	(Setting prohibited)
			Repeat	1	Stopped on completion of conversion in which there was an instruction to stop in the middle of scanning.	Conversion proceeds from the smallest channel number selected in the ADM2 register.

40. Thermal Sensor Unit (TSU)

This LSI chip incorporates a thermal sensor unit (TSU) that measures the temperature inside the LSI.

40.1 Overview

40.1.1 Features

- This LSI has a single TSU.
- The thermal sensor in this unit measures temperatures in the range from −40°C to 125°C with an accuracy of ±7°C.
- The analog output of TSU is connected to channel 8 of ADC. By controlling ADC, it converts the analog output with 12bit digital data and outputs the result. (See **Section 39, A/D Converter**.)

40.1.2 Block Diagram

Figure 40.1 is a block diagram of the TSU.

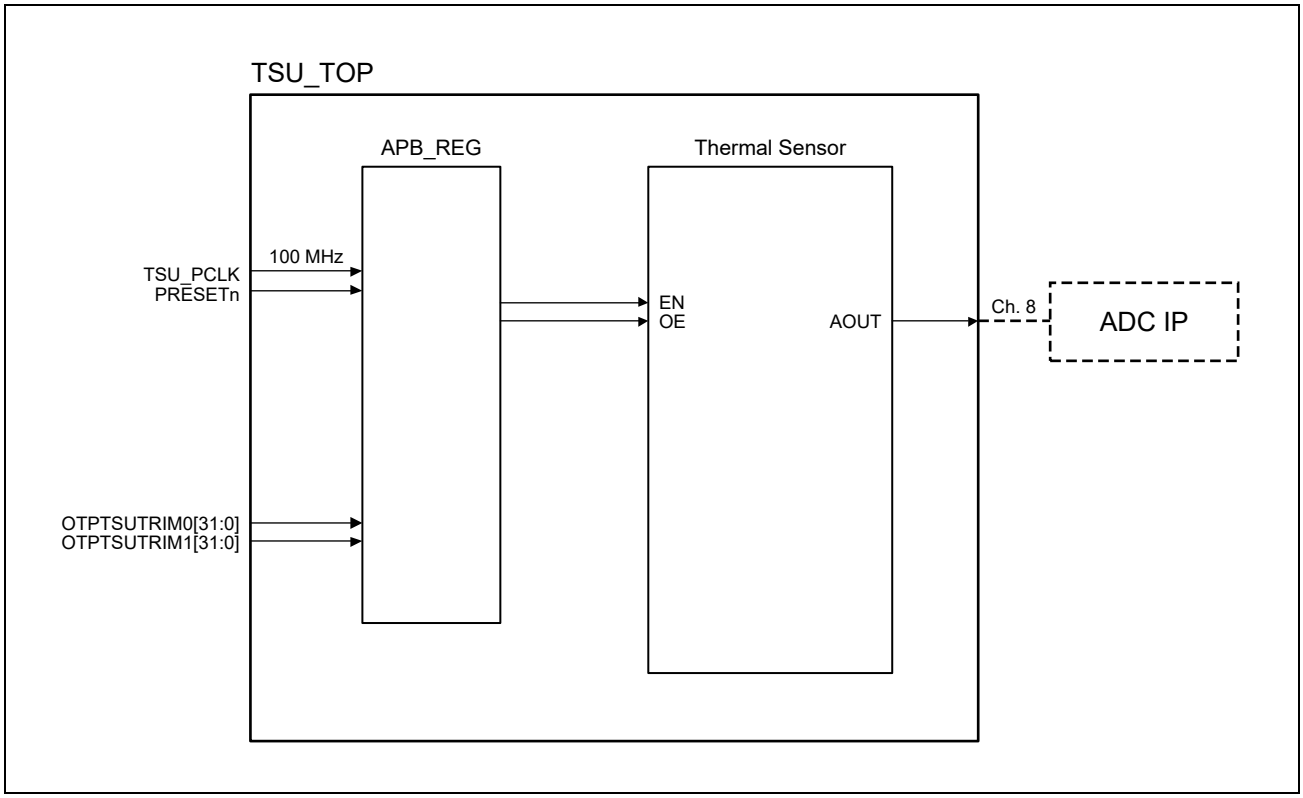

Figure 40.1 Block Diagram of the TSU

The TSU consists of the following blocks.

- APB_REG
- Thermal Sensor

40.1.2.1 APB_REG

- The APB_REG block provides an external interface for the TSU.
- This block contains control and status registers for the thermal sensor.

40.1.2.2 Thermal Sensor

- The thermal sensor block includes the internal probe, A/D converter and other items.
- The analog output of TSU is connected to channel 8 of ADC. By controlling ADC, it converts the analog output with 12bit digital data.

40.1.3 External Pins

The TSU has no external pins.

40.1.4 Interrupts

The TSU has no interrupts.

40.2 Register Configuration

This section describes the registers for use in controlling the TSU.

Base Address: H'0_1005_9000 (Cortex-A55 Address Space)
Base Address: H'5005_9000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'4005_9000 (Cortex-M33 Address Space Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

40.2.1 List of Register

Table 40.1 lists the TSU registers. All registers are accessible in 32-bit units.

Table 40.1 List of the TSU Registers

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Sensor Mode Register	TSU_SM	R/W	H'0000_0000	H'00	32
TSU OTP Calibration Register 0	OTPTSUTRIM0_REG	R	—	H'18	32
TSU OTP Calibration Register 1	OTPTSUTRIM1_REG	R	—	H'1C	32

40.3 Register Descriptions

40.3.1 Sensor Mode Register (TSU_SM)

This register is used to specify the operating mode of the thermal sensor.

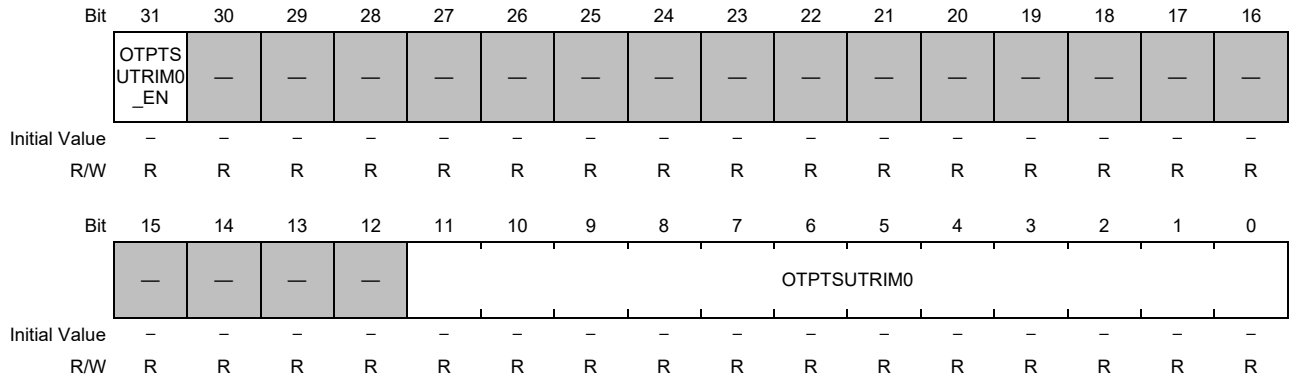
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OE	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	OE	0b	R/W	TS IP Output Enable 1b: output enable 0b: output disable
0	EN	0b	R/W	TS IP Enable 1b: Thermal sensor enable 0b: Thermal sensor disable

40.3.2 TSU OTP Calibration Register 0 (OTPTSUTRIM0_REG)

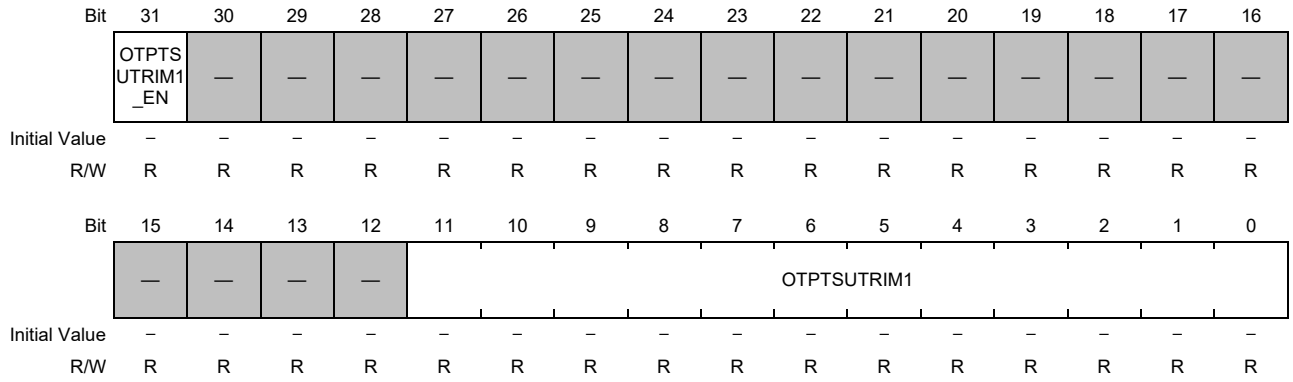
This register holds the correction value for calibration to be used in calculating the temperature.



Bit	Bit Name	Initial Value	R/W	Description
31	OTPTSUTRIM0_EN	—	R	This bit indicates whether [11:0] OTPTSUTRIM0 is valid or invalid. 0b: [11:0] OTPTSUTRIM0 is invalid. 1b: [11:0] OTPTSUTRIM0 is valid.
30 to 12	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
11 to 0	OTPTSUTRIM0	—	R	These bits hold the correction value for calibration to be used in calculating the temperature.

40.3.3 TSU OTP Calibration Register 1 (OTPTSUTRIM1_REG)

This register holds the correction value for calibration to be used in calculating the temperature.



Bit	Bit Name	Initial Value	R/W	Description
31	OTPTSUTRIM1_EN	—	R	This bit indicates whether [11:0] OTPTSUTRIM1 is valid or invalid. 0b: [11:0] OTPTSUTRIM1 is invalid. 1b: [11:0] OTPTSUTRIM1 is valid.
30 to 12	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
11 to 0	OTPTSUTRIM1	—	R	These bits hold the correction value for calibration to be used in calculating the temperature.

40.4 Operation

40.4.1 Procedure for Starting the TSU

This section describes the procedure for starting the TSU.

1. Set the EN bit in the TSU_SM register to 1b to place the thermal sensor in the normal operating mode.
2. Wait for 30 µs or more, set the OE bit in the TSU_SM register to 1b to enable the output.
3. Wait for 50 µs or more to stable the output level.
4. ADC to convert 12bit digital data.
5. Read converted data from ADC register.

40.4.2 Procedure for Stopping the TSU

This section describes the procedure for stopping the TSU.

1. Set the EN and OE bits in the TSU_SM register to 0 at the same time to place the thermal sensor in the standby mode.

40.4.3 Setting A/D Converter

See **Section 39, A/D Converter** for more information.

40.4.4 Procedure for Measuring the Temperature

To calculate the temperature Tj, read registers ADCR of ADC, OTPTSUTRIM0_REG, and OTPTSUTRIM1_REG of TSU, and follow the procedure below.

1. Read the value of the ADCR of ADC register eight times every at least 3 µs. The read values are defined as TSCode[0] to TSCode[7].

2. Calculate the average of the values read, TSCodeAVE, by using the following formula.

$$\mathrm{TSCodeAVE} = \frac{(\mathrm{TSCode}[0] + \cdots + \mathrm{TSCode}[7])}{8}$$

3. Read the correction values for use in calibration from registers OTPTSUTRIM0_REG and OTPTSUTRIM1_REG and use the following formula to calculate Tj.

$$\mathrm{Tj} = (\mathrm{TSCodeAVE} - \mathrm{OTPTSUTRIM1}) \times \left(\frac{165}{(\mathrm{OTPTSUTRIM0} - \mathrm{OTPTSUTRIM1})}\right) - 40$$

Note: If the ADC_AVDD18 is not 1.80 V on board, use the following formula to calculate the corrected TSCode.
Corrected TSCode = (ADC_AVDD18 voltage / 1.80) × TSCodeAve

$$\mathrm{Tj} = (\mathrm{Corrected\ TSCode} - \mathrm{OTPTSUTRIM1}) \times \left(\frac{165}{(\mathrm{OTPTSUTRIM0} - \mathrm{OTPTSUTRIM1})}\right) - 40$$

40.5 Usage Note

- Do not set OE to 1 during EN = 0.

41. Low Power Consumption

This LSI has several functions to achieve low power consumption. By combining with power supply isolation, further power consumption can be reduced.

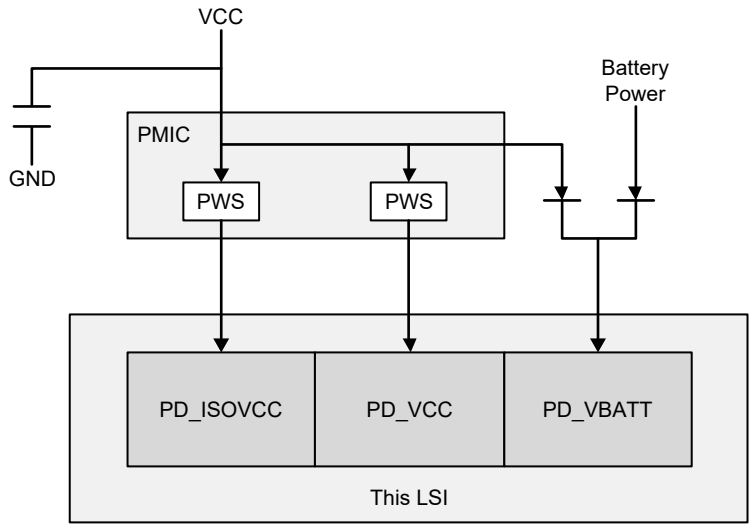
41.1 Overview

41.1.1 Power Domain

A power domain of this LSI is divided into PD_VCC domain, PD_ISOVCC domain and PD_VBATT domain.

- PD_VCC domain always powered on area.
- PD_ISOVCC domain is the area where the power can be turned off.
- PD_VBATT domain is the area where the RTC/backup register is located, works on battery power when the power of PD_VCC and PD_ISOVCC domain are turned off.

The following figure shows one example relationship of the power domain and power supply.



Note: PMIC: Power Management IC
PWS: Power Switch

Figure 41.1 Power Domain and Power Supply

The **Table 41.1** shows the relationship of the power domain and power supply pins.

The power-on/power-off sequence should be followed to **Section 47.3, Power-On/Power-Off Sequence**.

Table 41.1 Power Domain to which Power Supply Pins Belong

Group	Pin Name	Power Domain
G1	VBATT_VDD	PD_VBATT
G2	VDD	PD_VCC
	PLL16_AVDD	
	PLL23_AVDD	
	PLL4_AVDD	
G3	PVDD18	
	ADC_AVDD18	
	OTP_AVDD18	
G4	PVDD33	
	JTAG_PVDD	
	XSPI_PVDD	
	I3C_PVDD	
G5	VDD_ISO	PD_ISOVCC
	PCIE_VDD09	
G6	SDn_PVDD (n = 0, 1)	
	PVDD182533_n (n = 0, 1)	
G7	USB_AVDD18	
	USB_VDD18	
	PCIE_VDD18	
G8	USB_VDD33	
G9	DDR_VAA	
G10	DDR_VDDQ	

The following figure shows the power domain to which each module belongs.

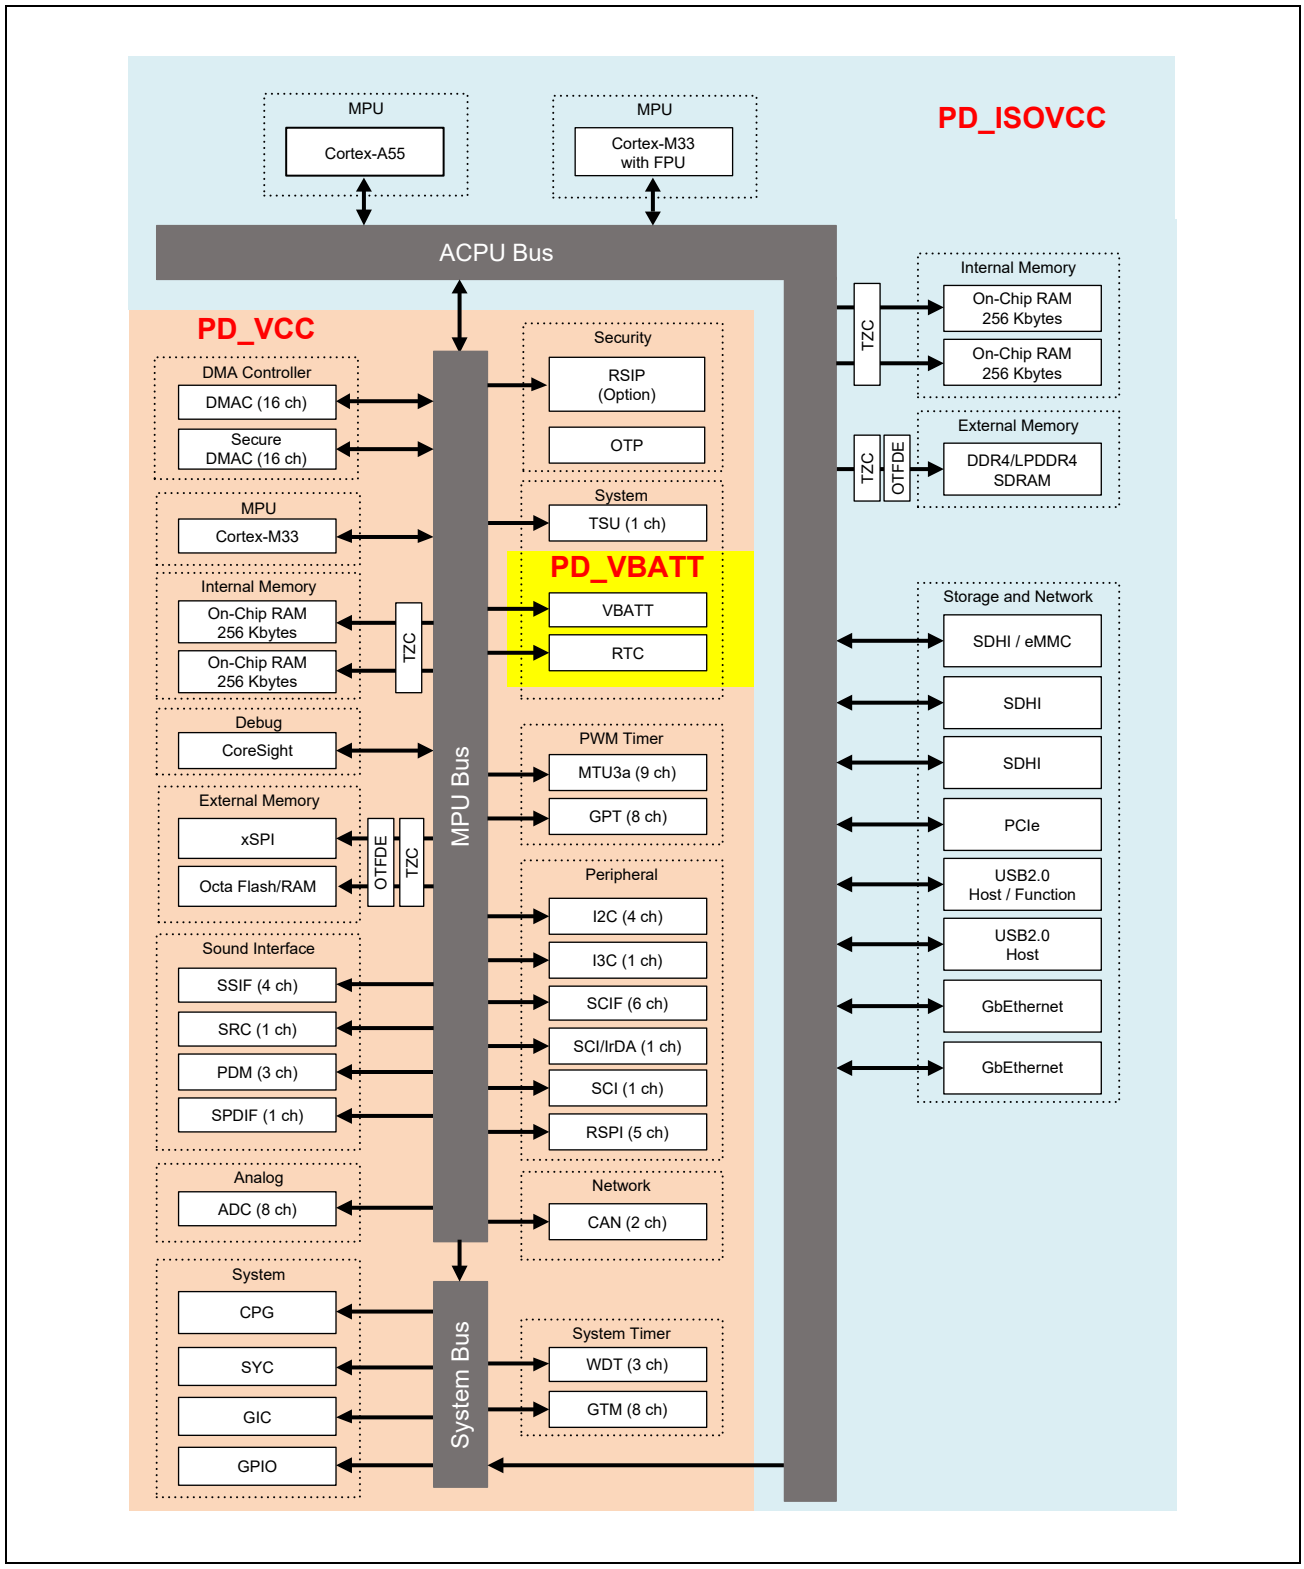


Figure 41.2 Modules in Power Domain

41.1.2 Power mode

This LSI has the following four power modes depending on the power on/off combination of the power domain.

Table 41.2 Power Mode

Power Mode	Power Domain		
	PD_ISOVCC	PD_VCC	PD_VBATT
ALL_ON	ON	ON	ON
AWO	OFF	ON	ON
VBATT	OFF	OFF	ON
ALL_OFF	OFF	OFF	OFF

Note: • ALL_OFF mode: All CPUs and peripheral modules can not be worked.
• ALL_ON mode: All CPUs and peripheral modules can be worked.
• AWO mode: Cortex-M33 and peripheral modules in PD_VCC and PD_VBATT domain can be worked.
• VBATT mode: Only RTC, tamper detection and backup registers can be worked.

The following figure shows the transition of the power mode. Regarding to the operation for the power mode transition, refer to **Section 41.6, Power Mode Transition**.

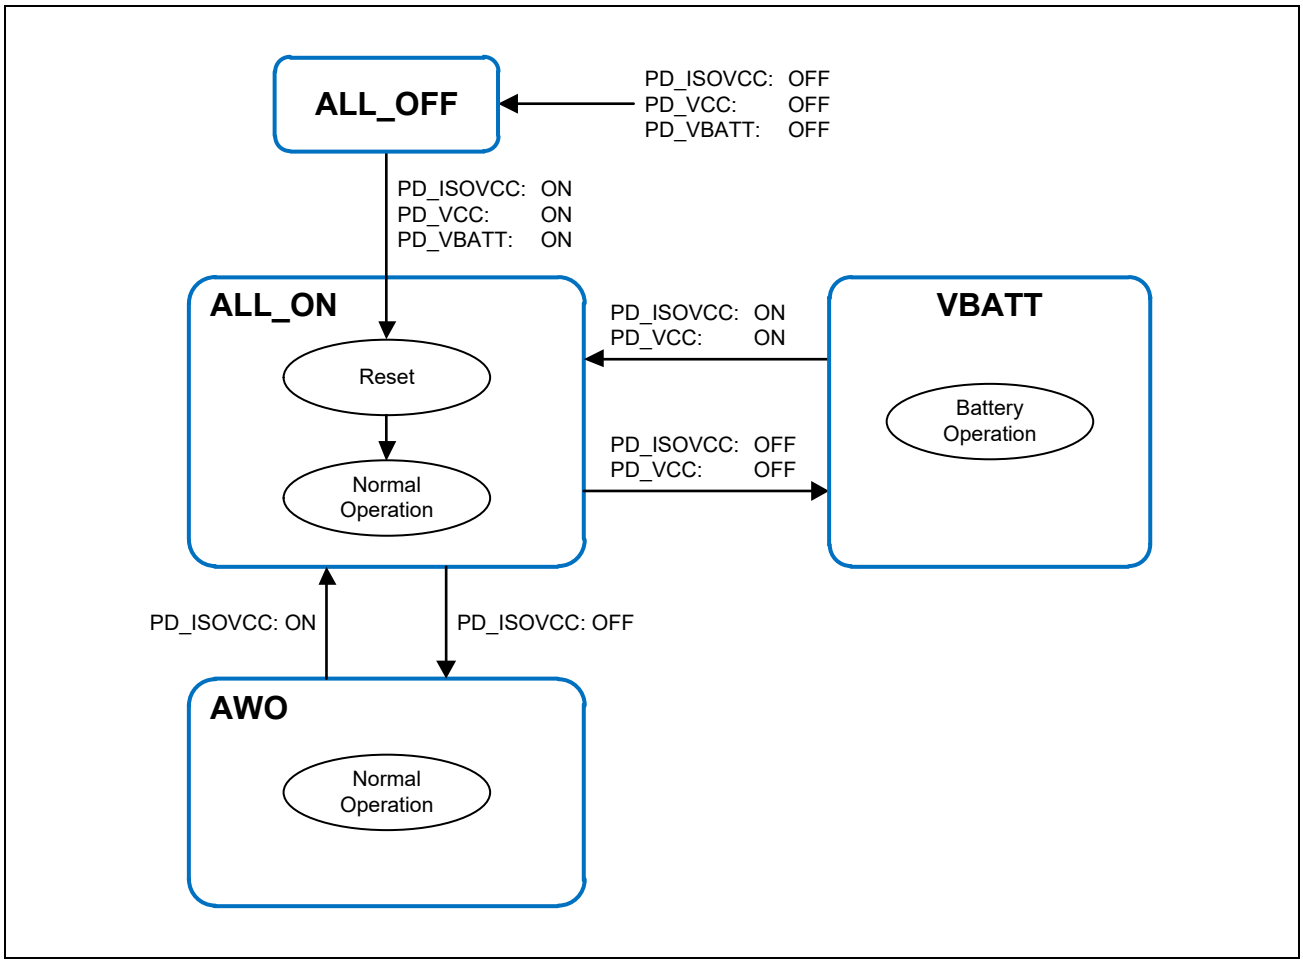

Figure 41.3 Power Mode Transition

41.1.3 Low Power Function

This LSI has the following low power function.

■ Module Standby Mode

This mode stops the clock of specific peripheral modules except CPU to reduce the power consumption.

Stop the clock by setting the CPG register.

Refer to **Section 41.2, Module Standby Mode**.

■ Low Frequency Mode

This mode slows down the clock of the peripheral modules which synchronized to the system bus clock, and CPU to reduce the power consumption.

Change the clock frequency by setting the CPG register.

Refer to **Section 41.3, Low Frequency Mode**.

■ Cortex-A55 Sleep Mode

This mode puts Cortex-A55 into a low power state to reduce the power consumption.

Put into a low power state by issuing a WFI instruction.

The return factor is interrupt.

Refer to **Section 41.4, Cortex-A55 Sleep Mode**.

■ Cortex-M33/Cortex-M33_FPU Sleep Mode

This mode puts Cortex-M33/Cortex-M33_FPU into a low power state to reduce the power consumption.

Put into a low power state (Deep Sleep) by issuing a WFI instruction.

The return factor is interrupt and SysTick Timer.

Refer to **Section 41.5, Cortex-M33/Cortex-M33_FPU Sleep Mode**.

41.2 Module Standby Mode

41.2.1 Overview

The Module Standby Mode is a mode that requests the clock stop of the module specified by the master.

The purpose of this mode is to reduce power consumption by stopping unnecessary functions.

The master which can request the clock stop is Cortex-A55 and Cortex-M33/Cortex-M33_FPU. So, Cortex-A55 and Cortex-M33/Cortex-M33_FPU cannot be placed in the Module Standby Mode. To reduce the power consumption in the CPUs, use the CPU sleep modes to be described later.

This mode is implemented by stopping the clock supply by the CPG register and switching the MSTOP signal of the bus through CPG register settings.

If the master accesses a module that has the clock stopped and the MSTOP bit set, a bus error will occur.

The following registers are used in the Module Standby Mode.

Table 41.3 Module Standby Mode Related Registers

Register Name	Abbreviation	Description
Clock Control Register	CPG_CLKON_***	The detail information of each register is described in **Section 6, System Controller (SYSC)** and **Section 7, Clock Pulse Generator (CPG)**. The usage of these registers is described in **Section 41.2.2, Operation**.
MSTOP Register	CPG_BUS_***_MSTOP CPG_MHU_STOP	

The following figure shows the block connection overview related Module Standby Mode.

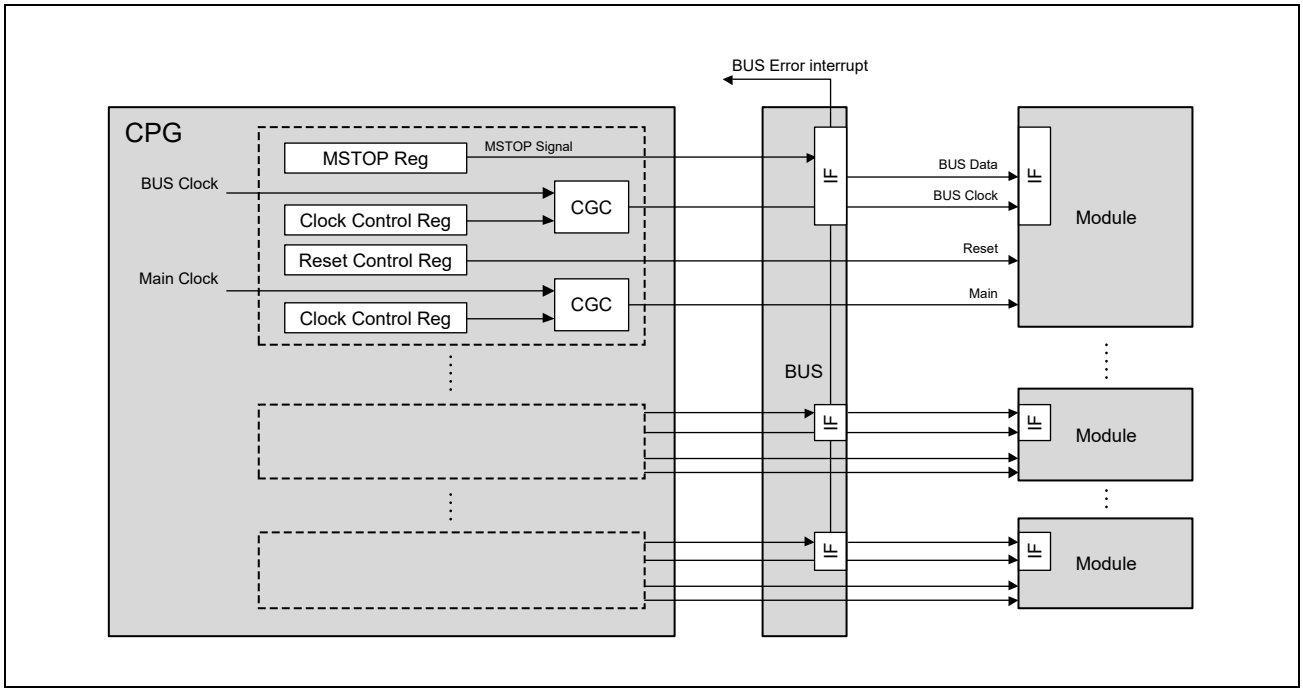

Figure 41.4 Block Connection Overview for Module Standby Mode

41.2.2 Operation

The following chart shows the procedure to enter and return from the Module Standby Mode.

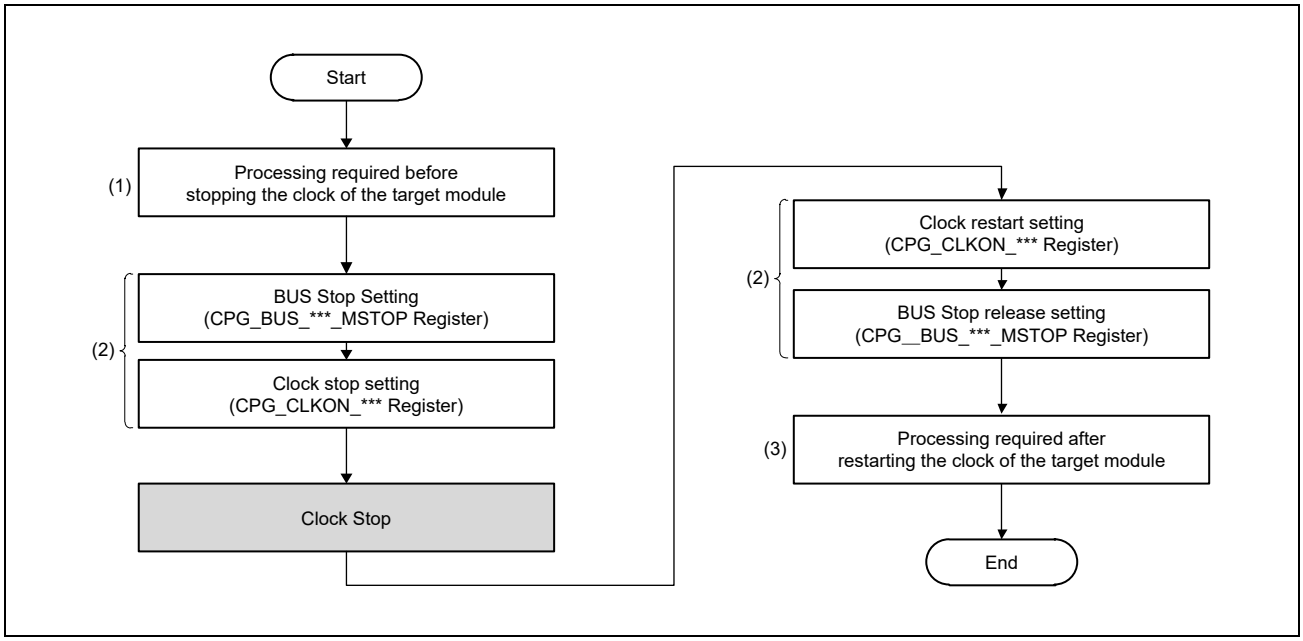

Figure 41.5 Module Standby Mode Procedure

(1) Depend on the module, there may be a request to stop during communication and various processing. In this case, if the managed CPU can be stopped unilaterally for each module, a stop request is immediately issued to the CPG. For those that cannot be stopped until a certain process is completed, after confirming that the managed CPU has stopped for each module, a stop request is made to the CPG.

(2) Refer to **Section 41.2.2.1, Setting of Clock Control and MSTOP Register** regarding to the setting of Clock Control Register and MSTOP Register.

(3) Whether the reset control is required depends on the module; check the specifications of the target module. Set the reset control register to 0 to enter the reset state. Set 1 for the release from the reset state.

41.2.2.1 Setting of Clock Control and MSTOP Register

The following table shows the combination of the Clock Control register and the MSTOP register to stop the clock of the target module.

The Module Standby Mode can be applied only to the modules shown in the table below.

- When entering the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 1.
  Set the Clock Control Register bit of the target module to 0.

- When exiting the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 0.
  Set the Clock Control Register bit of the target module to 1.

Table 41.4 Registers for Module Standby Mode (1/2)

Note 1. CPG_MHU_STOP itself is the register name.

Note 2. The clock for USB2.0 PHY can only be stopped when the clock for USB2.0 ch0 and ch1 are stopped.

41.3 Low Frequency Mode

41.3.1 Overview

This mode reduces the power consumption by reducing the frequency of the clock signal supplied to the CPU and the specified peripheral module which synchronized to the system bus. Refer to **Table 41.5**.

Table 41.5 Clocks and Registers Related to Low Frequency Mode

Clock Symbol	CPG Register	Division Ratio	Related Clock*1
Iϕ	CPG_PL1_DDIV[1:0]	1/1, 1/2, 1/4, 1/8	Cortex-A55 main clock
I2ϕ	CPG_PL6_DDIV[2:0]	1/1, 1/2, 1/4, 1/8, 1/32	Coetex-M33 main clock
I3ϕ	CPG_PL6_DDIV[6:4]	1/1, 1/2, 1/4, 1/8, 1/32	Coetex-M33_FPU main clock
P0ϕ	CPG_PL2_DDIV[6:4]	1/1, 1/2, 1/4, 1/8, 1/32	Peripheral modules and related system bus clock
P1ϕ	CPG_PL3_DDIV[2:0]	1/1, 1/2, 1/4, 1/8, 1/32	Peripheral modules and related system bus clock
P2ϕ	CPG_PL3_DDIV[6:4]	1/1, 1/2, 1/4, 1/8, 1/32	Peripheral modules and related system bus clock
P3ϕ	CPG_PL3_DDIV[10:8]	1/1, 1/2, 1/4, 1/8, 1/32	Peripheral modules and related system bus clock

Note 1. For more detailed information, refer to another file for the clock list.

41.3.2 Operation

It is achieved by having software control registers of the CPG to switch the frequency divisors for the various domains. Regarding to the operation of the register, refer to **Section 7.4.5, Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers**.

41.4 Cortex-A55 Sleep Mode

41.4.1 Overview

Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** for detail.

The following table shows the registers related to the Cortex-A55 Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 41.6 Cortex-A55 Sleep Mode Related Registers

Register Name	Abbreviation	Bit Name
Lowpower Sequence Control Register1	SYS_LP_CTL1	bit[24]: CA55SLEEP_ACK bit[8]: CA55SLEEP_REQ
Lowpower Sequence Control Register2	SYS_LP_CTL2	bit[0]: CA55_STBYCTL
Lowpower Sequence Control Register5	SYS_LP_CTL5	bit[8]: CA55SLEEP0_F
Lowpower Sequence Control Register6	SYS_LP_CTL6	bit[8]: CA55SLEEP0_E

41.4.2 Operation

This section shows an example procedure.

The following figure is one example how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-A55 with Cortex-M33. Referring to these registers, Cortex-M33 can perform processing if need when Cortex-A55 enters and exits the Cortex-A55 Sleep Mode.

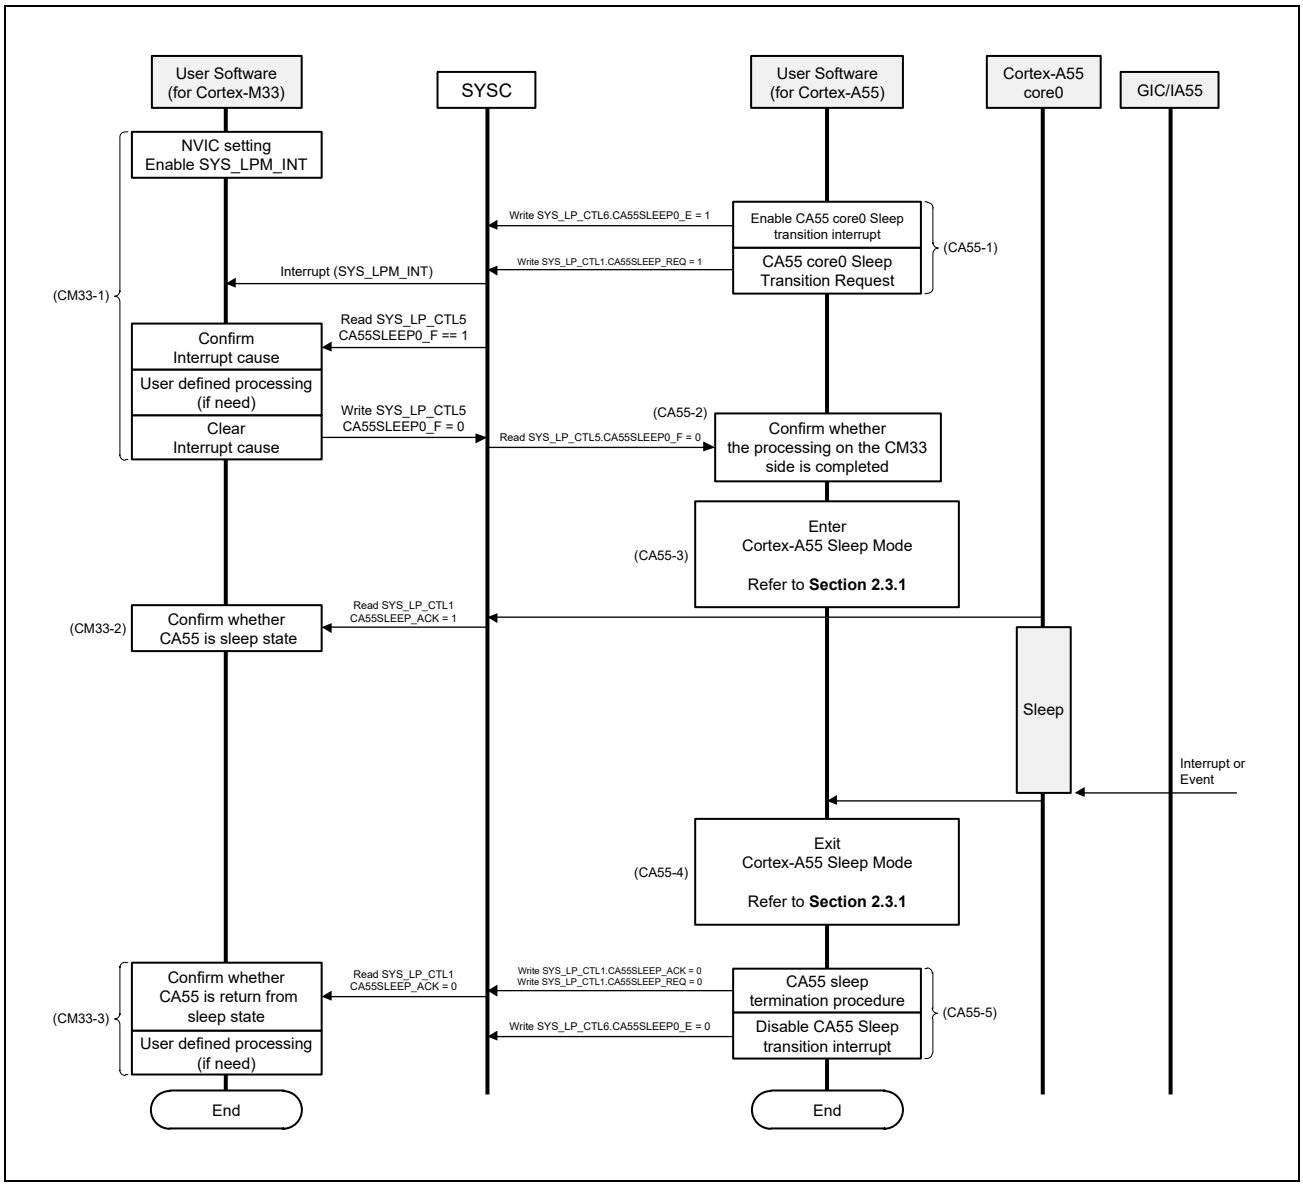

Figure 41.6 The Example Procedure How to Use the SYSC Registers (Cortex-A55 Sleep Mode)

(CA55-1) Set the CA55SLEEP0_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-A55 Sleep Mode (core0).
Setting the CA55SLEEP_REQ bit of the SYS_LP_CTL1 register to 1 causes a SYS_LPM_INT interrupt.
The CA55SLEEP0_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CM33-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the NVIC in advance.)

By confirming that the CA55SLEEP0_F bit is 1, the software on Cortex-M33 can know that Cortex-A55 core0 is about to transition to Sleep Mode.
Perform the process required when Cortex-A55 is the sleep mode. (if need)
And then clear the CA55SLEEP0_F bit of the SYS_LP_CTL5 register.

(CA55-2) Read the SYS_LP_CTL5 register.
By confirming that the CA55SLEEP0_F is cleared, the software on Cortex-A55 can confirm that the processing on the Cortex-M33 side is completed.

(CA55-3) Enter the Cortex-A55 Sleep Mode.
Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** procedure (1) to (3).

(CM33-2) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK bit is 1, the software on Cortex-M33 can confirm that Cortex-A55 core0 completed transiting to the sleep mode.

(CA55-4) Exit the Cortex-A55 Sleep Mode.
Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** procedure (4) to (6).

(CA55-5) Clear the CA55SLEEP_ACK bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CA55SLEEP_REQ bit of the SYS_LP_CTL1 register to release the Cortex-A55 sleep mode transition request.
Set the CA55SLEEP_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-CA55 Sleep Mode.

(CM33-3) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK bit is cleared, the software on Cortex-M33 can confirm that Cortex-A55 completed returning from the sleep mode.
Perform the process required when Cortex-A55 returned from the sleep mode. (if need)

41.5 Cortex-M33/Cortex-M33_FPU Sleep Mode

41.5.1 Overview

Refer to **Section 3.4.4, Cortex-M33/Cortex-M33_FPU Sleep Mode** for detail.

The following table shows the registers related to the Cortex-M33/Cortex-M33_FPU Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 41.7 Cortex-M33/Cortex-M33_FPU Sleep Mode Related Registers

Register Name	Abbreviation	Bit Name
Lowpower Sequence Control Register1	SYS_LP_CTL1	bit[12]: CM33SLEEP_REQ bit[13]: CM33FPUSLEEP_REQ bit[28]: CM33SLEEP_ACK bit[29]: CM33FPUSLEEP_ACK
Lowpower Sequence Control Register2	SYS_LP_CTL5	bit[10]: CM33SLEEP_F bit[11]: CM33USLEEP_F
Lowpower Sequence Control Register5	SYS_LP_CTL6	bit[10]: CM33SLEEP_E bit[11]: CM33FPUSLEEP_E
Lowpower Sequence Control Register6	SYS_LP_CTL7	bit[0]: IM33_MASK bit[1]: IM33_MASK

41.5.2 Operation

This section shows an example procedure.

The following figure is one example how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-M33 with Cortex-A55. Referring to these registers, Cortex-A55 can perform processing if need when Cortex-M33 enters and exits the Cortex-M33 Sleep Mode.

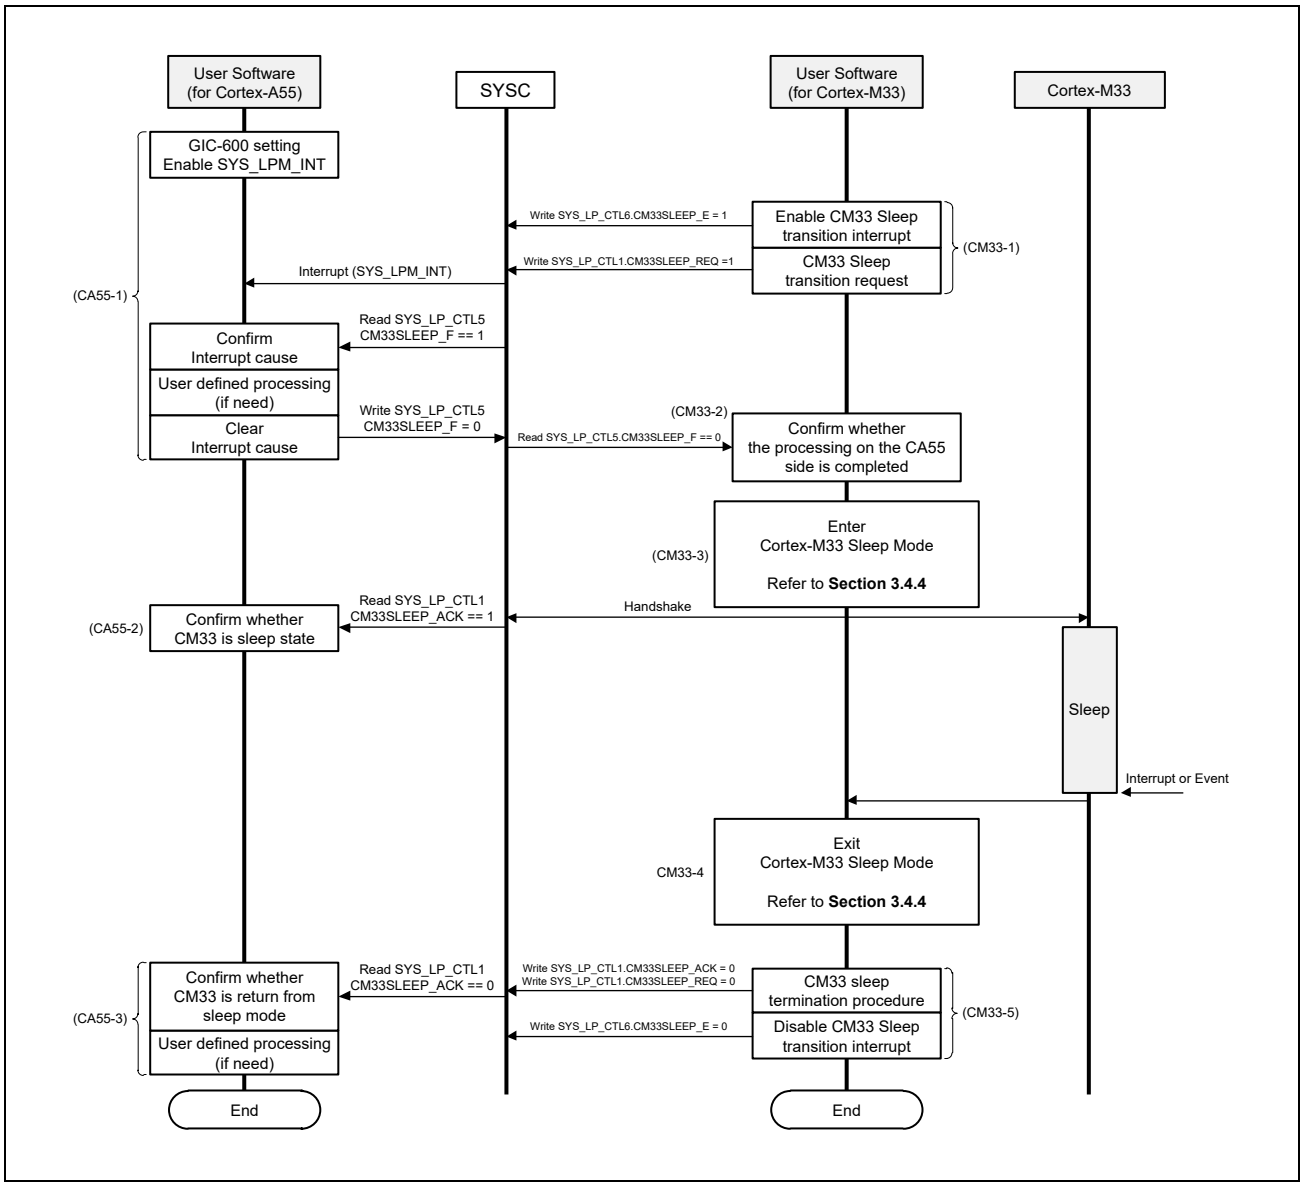

Figure 41.7 The Example Procedure How to Use the SYSC Registers (Cortex-M33 Sleep Mode)

(CM33-1) Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-M33 Sleep Mode.
Setting the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to 1 causes a SYS_LPM_INT interrupt.
The CM33SLEEP_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CA55-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the GIC in advance.)

By confirming that the CM33SLEEP_F bit is 1, the software on Cortex-A55 can know that Cortex-M33 is about to transition to Sleep Mode.
Perform the process required when Cortex-M33 is the sleep mode. (if need)
And then clear the CM33SLEEP_F bit of the SYS_LP_CTL5 register.

(CM33-2) Read the SYS_LP_CTL5 register.
By confirming that the CM33SLEEP_F is cleared, the software on Cortex-M33 can confirm that the processing on Cortex-A55 side is completed.

(CM33-3) Enter the Cortex-M33 Sleep Mode.
Refer to **Section 3.4.4, Cortex-M33/Cortex-M33_FPU Sleep Mode** procedure (1) to (7).

(CA55-2) Read SYS_LP_CTL1 register.
By confirming that the CM33SLEEP_ACK bit is 1, the software on Cortex-A55 can confirm that Cortex-M33 completed transiting to the sleep mode.

(CM33-4) Exit the Cortex-M33 Sleep Mode.
Refer to **Section 3.4.4, Cortex-M33/Cortex-M33_FPU Sleep Mode** procedure (8) to (12).

(CM33-5) Clear the CM33SLEEP_ACK bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to release the Cortex-M33 sleep mode transition request.
Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-M33 Sleep Mode.

(CA55-3) Read SYS_LP_CTL1 register.
By confirming that the CM33SLEEP_ACK bit is cleared, the software on Cortex-A55 can confirm that Cortex-M33 completed returning from the sleep mode.
Perform the process required when Cortex-M33 returned from the sleep mode. (if need)

41.6 Power Mode Transition

The power mode transitions are accomplished by combining the following control:

1. Internal control by register control inside this LSI.
2. Power supply control for each power domain.
3. Control flow branches considering the state before state transition and the state after transition.

As for 2 and 3, it depends on the system configuration including this LSI and power control system, so it is necessary to implement it according to the user's system.

41.6.1 ALL_ON to VBATT

The following table shows an example transition flow outline from ALL_ON mode to VBATT mode.

Table 41.8 Example Transition Flow Outline from ALL_ON Mode to VBATT Mode

Step	Controlled by	Operation	Description
1	Cortex-A55	Stop DMA transfer of all IPs.	Depend on IPs.
2	Cortex-A55	Enter DDR IO retention Mode. (if needed)	IO Retention mode setting.
3	Cortex-M33	Transition to Cortex-M33 Sleep Mode. (if booting)	Refer to step (1) to (7) in **Section 3.4.4, Cortex-M33/Cortex-M33_FPU Sleep Mode**.
4	Cortex-M33_FPU	Transition to Cortex-M33_FPU Sleep Mode. (if booting)	Refer to step (1) to (7) in **Section 3.4.4, Cortex-M33/Cortex-M33_FPU Sleep Mode**.
5	Cortex-A55	Activate VBATT module. (if inactive)	CPG_CLKON_VBAT, CPG_RST_VBA, CPG_BUS_MCPU3_MSTOP
6	Cortex-A55	USB PHY PWRRDY signal control (if using USB)	SYS_USB_PWRRDY
7	Cortex-A55	PCIe RST_RSM_B signal control (if using PCIe)	SYS_PCIE_RST_RSM_B
8	Cortex-A55	Enable the isolation cell for PD_VBATT.	ISOENPROT, ISOEN
9	Cortex-A55	Set the VBATT flag*1 to the external device (ex. register in PMIC) via I2C.	VBATT flag is used when returning to ALL_ON mode.
10	Cortex-A55	Shut down the power supply for PD_VCC and PD_ISOVCC from PMIC via I2C.	Regarding to the power off sequence, refer to **Figure 47.4**.

Note 1. The implementation method of VBATT flag depends on the user's system.

41.6.2 VBATT to ALL_ON

The following table shows an example transition flow outline from VBATT mode to ALL_ON mode.

Table 41.9 Example Transition Flow Outline from VBATT Mode to ALL_ON Mode

Step	Controlled by	Operation	Description
1	External	Start the power supply for PD_VCC and PD_ISOVCC from PMIC.	Regarding to the power on sequence, refer to **Figure 47.4**. The isolation cell for PD_VBATT is automatically disabled after power on.
2	External	Release system reset and boot Cortex-A55.	De-assert PRST#.
3	Cortex-A55	Confirm the VBATT flag*1 via I2C to check if normal boot or return from VBATT mode.	The VBATT flag is set when transition to VBATT mode.
4	Cortex-A55	Exit from DDR IO retention mode. (if using the DDR retention mode)	The setting exiting from DDR IO retention mode.
5	Cortex-A55	Activate the other CPUs and the peripheral modules.	Depend on the user system.

Note 1. The implementation method of VBATT flag depends on the user's system.

41.6.3 ALL_ON to AWO

The following table shows an example transition flow outline from ALL_ON mode to AWO mode.

Table 41.10 Example Transition Flow Outline from ALL_ON Mode to AWO Mode

Step	Controlled by	Operation	Description
1	Cortex-A55	Stop DMA transfer of all IPs.	Depend on IPs.
2	Cortex-A55	Enter DDR retention Mode. (if needed)	Retention mode setting.
4	Cortex-M33_FPU	Transition to Cortex-M33_FPU Sleep Mode. (if booting)	Refer to step (1) to (7) in **Section 3.4.4, Cortex-M33/Cortex-M33_FPU Sleep Mode**.
5	Cortex-A55	Module stop setting for peripheral modules and system bus in PD_ISOVCC.	CPG_BUS_***_MSTOP (***: ACPU, PERI_COM, PERI_DDR, TZCDDR), CPG_MHU_MSTOP.
6	Cortex-A55	Clock stop setting for peripheral modules and system bus in PD_ISOVCC.	CPG_CLKON_*** (***: GIC600, MHU, SDHI, USB, ETH, DDR, PCI, AXI_COM_BUS, PERI_COM, AXI_TZCDDR, OTFDE_DDR)
7	Cortex-A55	Reset assert setting for peripheral modules and system bus in PD_ISOVCC.	CPG_RST_*** (***: GIC600, MHU, SDHI, USB, ETH, DDR, PCI, AXI_COM_BUS, PERI_COM, AXI_TZCDDR, OTFDE_DDR)
	Cotex-A55	Clock stop setting and reset assert setting for Cortex-M33_FPU	CPG_CLKON_CM33, CPG_RST_CM33
8	Cortex-A55	USB PHY PWRRDY signal control (if using USB)	SYS_USB_PWRRDY
9	Cortex-A55	PCIe RST_RSM_B signal control (if using PCIe)	SYS_PCIE_RST_RSM_B
11	Cortex-A55	Transition to Cortex-A55 Sleep Mode.	Refer to step (1) to (3) in **Section 2.3.1, Cortex-A55 Sleep Mode**.
12	Cortex-M33	Cortex-A55 Core P-Channel Control Cortex-A55 Cluster P-Channel Control	CPG_CORE0_PCHCTL CPG_CLUSTER_PCHCTL
13	Cortex-M33	Cortex-A55 Q-Channel Control	SYS_LP_CA55CK_CTLn (n=1,2,3)
14	Cortex-M33	Clock stop setting for Cortex-A55	CPG_CLKON_CA55.
15	Cortex-M33	Reset assert setting for Cortex-A55	CPG_RST_CA55.
16	Cortex-M33	Enable the isolation cell for PD_ISOVCC.	SYS_PD_ISO_CTRL
17	Cortex-M33	Shut down the power supply for PD_ISOVCC from PMIC via I2C.	Regarding to the power off sequence, refer to **Figure 47.2** and **Figure 47.3**.

41.6.4 AWO to ALL_ON

The following table shows an example transition flow outline from AWO mode to ALL_ON mode.

Table 41.11 Example Transition Flow Outline from AWO Mode to ALL_ON Mode

Step	Controlled by	Operation	Description
1	Cortex-M33	Supply the power for PD_ISOVCC from PMIC via I2C	Regarding to the power on sequence, refer to **Figure 47.2** and **Figure 47.3**.
2	Cortex-M33	Disable the isolation cell for PD_ISOVCC	SYS_PD_ISO_CTRL
3	Cortex-M33	Initial setting for return to ALL_ON mode	CPG_RETn_REG (n = 0, 1, 2)
4	Cortex-M33	Clock start setting for Coretex-A55	CPG_CLKON_CA55.
5	Cortex-M33	Reset release setting for Cortex-A55	CPG_RST_CA55.
6	Cortex-M33	Cortex-A55 Q-Channel Control	SYS_LP_CA55CK_CTLn (n = 1, 2, 3)
7	Cortex-M33	Cortex-A55 Cluster P-Channel Control Cortex-A55 Core P-Channel Control	CPG_CLUSTER_PCHCTL CPG_CORE0_PCHCTL
8	Cortex-A55	Exit from DDR retention mode (when using)	Setting for exiting form DDR retention mode
9	Cortex-A55	USB PHY PWRRDY signal control (if use USB)	SYS_USB_PWRRDY
10	Cortex-A55	PCIe RST_RSM_B signal control (if use PCIe)	SYS_PCIE_RST_RSM_B
11	Cortex-A55	Clock start setting for system bus and desired peripheral modules in PD_ISOVCC	CPG_CLKON_*** (***: GIC600, MHU, SDHI, USB, ETH, DDR, PCI, AXI_COM_BUS, PERI_COM, AXI_TZCDDR, OTFDE_DDR)
12	Cortex-A55	Release reset setting for system bus and desired peripheral modules in PD_ISOVCC	CPG_RST_*** (***: GIC600, MHU, SDHI, USB, ETH, DDR, PCI, AXI_COM_BUS, PERI_COM, AXI_TZCDDR, OTFDE_DDR)
13	Cortex-A55	Release MSTOP bit for system bus and desired peripheral modules in PD_ISOVCC	CPG_BUS_***_MSTOP (***: ACPU, PERI_COM, PERI_DDR, TZCDDR), CPG_MHU_MSTOP.
14	Cortex-A55	Clock start setting and reset release setting for Cortex-M33_FPU (if use Cortex-M33_FPU)	CPG_CLKON_CM33, CPG_RST_CM33

42. Battery Backup Function (VBATTB)

Backup power supplied by a battery can keep the realtime clock (RTC) operating and retain the important data while the VCC power is turned off. The tamper detection function can be used to erase the backed-up data in cases where an intrusion to the system has been detected.

Regarding the Real time clock, refer to **Section 22, Realtime Clock (RTCA-3)** for details.

42.1 Overview

Table 42.1 shows the specifications of the VBATTB.

Table 42.1 VBATTB Specifications

Item	Description
Scope of backup	All modules in the backup domain (PD_VBATT) • Backup registers • 32kHz-clock oscillator • Tamper detector • Realtime clock (RTC)
Backup registers	128 bytes • The backup registers can immediately be erased in response to the detection of physical tampering.
Tamper event detection	When the tamper detector has detected an intrusion to the system, it indicates this by setting a flag and, if this is selected, generating an interrupt. • Tamper event can acquire a timestamp on tamper detection. • Tamper input pin (TAMPIN) • Noise filter (sampling rate: 32.768 kHz; passes signal transitions in response to three consecutive samples with the same level)

Figure 42.1 shows a block diagram of the VBATTB, and **Table 42.2** shows the external pins of the VBATTB.

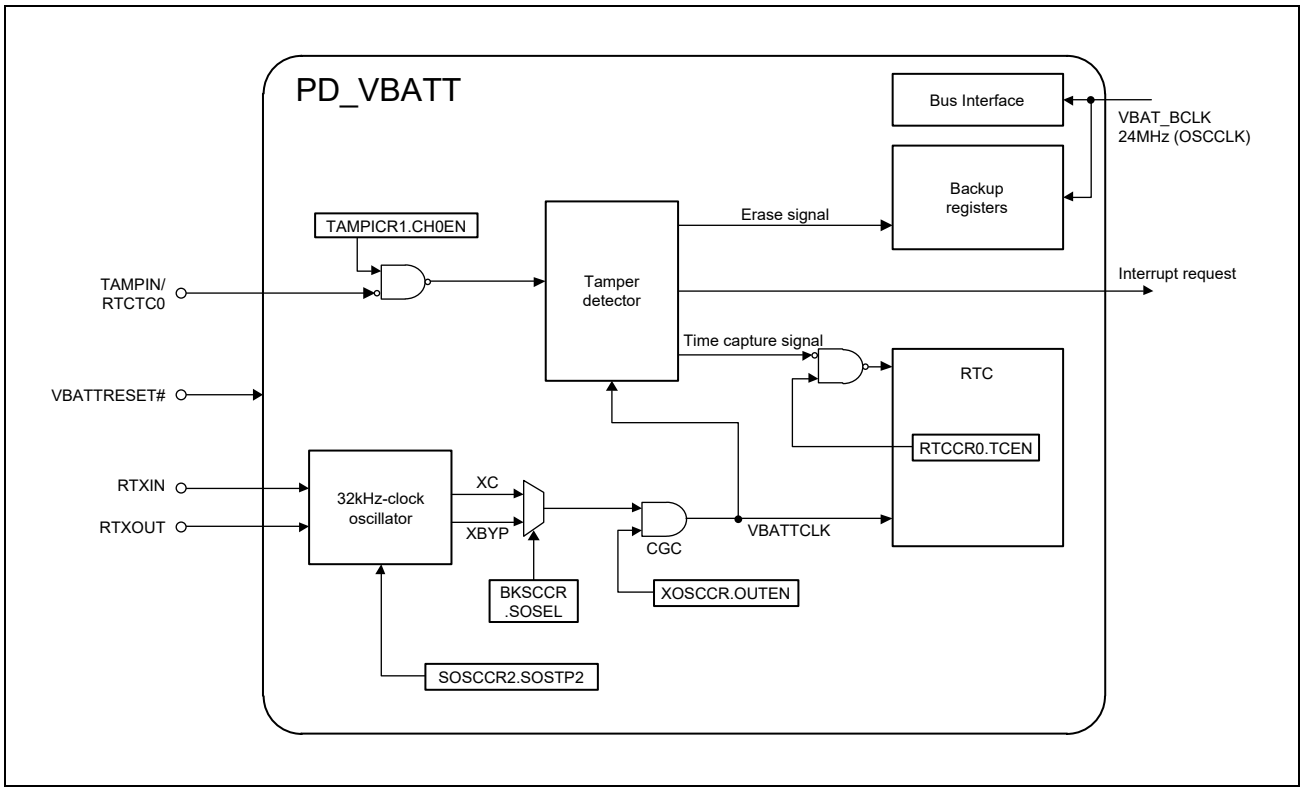

Figure 42.1 Block Diagram of VBATTB

Table 42.2 External Pins

Pin Name	I/O	Function
VBATTRESET#	Input	Backup domain reset
RTXIN	Input	Pins for the 32kHz-clock • Oscillation mode : Connect 32.768-kHz crystal to RTXIN and RTXOUT pins. • Bypass mode (RTXOUT to XBYP): Connect external clock to RTXOUT pin.
RTXOUT	Input /Output	
TAMPIN	Input	Tamper input pin (TAMPIN) / Time capture event input pin for RTC (RTCTC0)

42.2 Register Configuration

NOTE

- Registers in the battery backup function (VBATTB) can only be initialized by the backup domain reset (VBATTRESET#).
- Resets generated by other sources such as the PRST# pin or software will not affect these registers.

The Base Address is as follows.

Base Address: H'0_1005_C000 (Cortex-A55 Address Space)
Base Address: H'4005_C000 (Cortex-M33/Cortex-M33_FPU Address Space Secure)
Base Address: H'5005_C000 (Cortex-M33/Cortex-M33_FPU Address Space Non-Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

Table 42.3 shows the register list of the VBATTB. Prohibit to access the undefined area.

Table 42.3 Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Backup Domain Power Status Register	BKPSR	R/W	H'0000_00x1	H'00	32
Tamper Status Register	TAMPSR	R/W	H'0000_0000	H'04	32
Tamper Control Register	TAMPCR	R/W	H'0000_0000	H'08	32
Time Capture Event Control Register	TCECR	R/W	H'0000_0000	H'0C	32
Tamper/RTCTC Input Control Register 1	TAMPICR1	R/W	H'0000_0000	H'10	32
Tamper/RTCTC Input Control Register 2	TAMPICR2	R/W	H'0000_0070	H'14	32
Tamper/RTCTC Input Monitoring Register	TAMPIMR	R	H'0000_000x	H'18	32
Backup Domain 32kHz-Clock Control Register	BKSCCR	R/W	H'0000_0000	H'1C	32
32kHz-Clock Oscillator Control Register 2	SOSCCR2	R/W	H'0000_0000	H'24	32
Isolation Enable Control Register	ISOEN	R/W	H'0000_0000	H'28	32
Isolation Enable Write Protect Control Register	ISOENPROT	R/W	H'0000_0000	H'2C	32
Oscillator Control Register	XOSCCR	R/W	H'0000_0000	H'30	32
Backup Register n (n = 0 to 31)	BKRn	R/W	H'0000_0000	H'80 to H'FC	32

42.3 Register Descriptions

42.3.1 Backup Domain Power Status Register (BKPSR)

The BKPSR register indicates the VBATRESET# status monitor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DDRIO CTL	—	—	—	—	—	—	VBT RSTF
Initial Value	0	0	0	0	0	0	0	0	0	0	x	1	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	DDRIOCTL	0	R/W	This bit is used when DDR IO retention control. Set to 0 when exit from DDR IO retention mode. Set to 1 when enter DDR IO retention mode. *Note*: DDR cannot be accessed when DDRIOCTL is 1.
6	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	—	x	R	Reserved When read, the initial value is undefined. The written value will be ignored.
4	—	1	R	Reserved When read, the initial value is read. The written value will be ignored.
3 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VBTRSTF	1	R/W	VBATTRESET# status flag. This bit indicates VBATTRESET# status. When an assert of VBATTRESET# is detected, VBTRSTF is set to 1. This status flag can be cleared writing 0. [Read Operation] 0: VBATTRESET# is de-asserted. 1: VBATTRESET# is asserted. [Write operation] 0: VBTRSTF status flag is cleared (VBTRSTF is set to 0). 1: VBTRSTF is set to 1.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.2 Tamper Status Register (TAMPSR)

The TAMPSR register indicates the status of the tamper detection events.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TAMP0F
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	TAMP0F	0	R/W	Tamper 0 Detection Flag 0: Tamper 0 event has not been detected. 1: Tamper 0 event has been detected. Only 0 can be written to this bit, to clear the flag. To clear this flag, confirm that its value is 1 and then write 0 to it. TAMP0F flag indicates that a trigger (an effective edge) was input to the TAMPIN pin. The trigger is selected by the TAMPICR2.CH0TRG bit. [Setting condition] • The trigger set by the TAMPICR2.CH0TRG bit being detected on the TAMPIN pin. [Clearing conditions] • 0 being written to the TAMP0F flag after having confirmed that its value is 1.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.3 Tamper Control Register (TAMPCR)

The TAMPCR register controls operations in response to the detection of tampering.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TAMP0EE	—	—	—	TAMP0IE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 5	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	TAMP0EE	0	R/W	Tamper 0 Erase Enable 0: Backup registers are not erased in response to a tamper 0 event. 1: Backup registers are erased in response to a tamper 0 event. The TAMP0EE bit selects whether the backup registers should be or should not be erased in response to a tamper 0 event.
3 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	TAMP0IE	0	R/W	Tamper 0 Detection Interrupt Enable. 0: Tamper 0 detection interrupt is disabled. 1: Tamper 0 detection interrupt is enabled. The TAMP0IE bit enables or disables the tamper n detection interrupt.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.4 Time Capture Event Control Register (TCECR)

The TCECR register selects the sources for time capture events of the RTC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCE0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	TCE0	0	R/W	Time Capture Event 0 Source Select 0: Input signal from the RTCTC0 pin 1: Tamper 0 event The TCE0S bit selects the source of time capture event 0 for the RTC. When this bit is set to 0, a signal input to the RTCTC0 pin is input to the RTC. Selection of this setting is recommended when tamper detection is not to be used. When this bit is set to 1, the tamper 0 event detection signal is input to the RTC. Selection of this setting is recommended when a tamper event is to cause a timestamp to be recorded.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.5 Tamper/RTCTC Input Control Register 1 (TAMPICR1)

The TAMPICR1 register enables or disables input from the TAMPIN/RTCTC0 pins.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CH0EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CH0EN	0	R/W	Channel 0 Input Enable 0: The TAMPIN/RTCTC0 signal input is disabled. 1: The TAMPIN/RTCTC0 signal input is enabled. The CH0EN bit enables or disables the input from the TAMPIN/RTCTC0 pin. Set each bit to 1 not only if tamper events are to be detected but also if the RTC time capture function is to be used.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.6 Tamper/RTCTC Input Control Register 2 (TAMPICR2)

The TAMPICR2 register is used to enable or disable the noise filters for the TAMPIN/RTCTC0 pin and select the triggers for tamper event detection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CH0 TRG	—	—	—	CH0 NFE
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6 to 5	—	11b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	CH0TRG	1	R/W	Channel 0 Trigger Select Select the trigger for tamper 0 event detection. 0: A falling edge of the input on the TAMPIN pin 1: A rising edge of the input on the TAMPIN pin The CH0TRG bit is used to select the effective edge for the input signal from the TAMPIN pin for use as a trigger of tamper event detection.
3 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CH0NFE	0	R/W	Channel 0 Noise Filter Enable 0: Noise filter for the TAMPIN/RTCTC0 pin is disabled. 1: Noise filter for the TAMPIN/RTCTC0 pin is enabled. The CH0NFE bit enables or disables the noise filter for the TAMPIN/RTCTC0 pin. When tamper 0 event detection is not to be used, set the bit to 0. Five cycles of the 32kHz-clock are necessary for the output of the noise filter to become stable after this bit has been set to 1.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.7 Tamper/RTCTC Input Monitoring Register (TAMPIMR)

The TAMPIMR register is used to monitor the input levels on the TAMPIN pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CH0LV
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 3	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2 to 1	—	x	R	Reserved When read, the initial value is undefined. The written value will be ignored.
0	CH0LV	x	R	Channel 0 Level Monitoring Flag 0: The low level is being input on the TAMPIN pin. 1: The high level is being input on the TAMPIN pin. CH0LVL flag indicates the input level on an TAMPIN pin.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.8 Backup Domain 32kHz-Clock Control Register (BKSCCR)

The BKSCCR register is used to select the output of the 32kHz-clock oscillator provided to each module in the backup domain.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SOSEL	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	SOSEL	0	R/W	32kHz-Clock Oscillator output Select 0: The 32kHz-clock oscillator XC output is selected. 1: The 32kHz-clock oscillator XBYP output is selected. The SOSEL bit is used to select the output of the 32kHz-clock oscillator provided to each module in the backup domain. When using external clock, select the XBYP output.
5 to 0	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.9 32kHz-Clock Oscillator Control Register 2 (SOSCCR2)

The SOSCCR2 register controls the 32kHz-clock oscillation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSTP2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SOSTP2	0	R/W	32kHz-Clock Oscillator Stop 0: 32kHz-clock oscillator is operating. 1: 32kHz-clock oscillator is stopped.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.10 Isolation Enable Control Register (ISOEN)

The ISOEN register controls the isolation enable signal before entering the battery backup mode.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ISOEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ISOEN	0	R/W	Isolation Enable 0: Isolation OFF 1: Isolation ON The ISOEN bit should be set to 1 before entering the battery backup mode. This register can be written when released the write protection by the ISOENPROT register.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.11 Isolation Enable Write Protect Control Register (ISOENPROT)

The IOSENPROT register is used to remove write-protection from the ISOEN register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WPROT[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WPROT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	WPROT	0	R/W	ISOEN register write protect control After writing H'15AF_FA51 to this register, ISOEN register can be written. When ISOEN register is written, this register is cleared to zero.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.12 Oscillator Control Register (XOSCCR)

The Oscillator Control register controls the 32-kHz oscillator.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

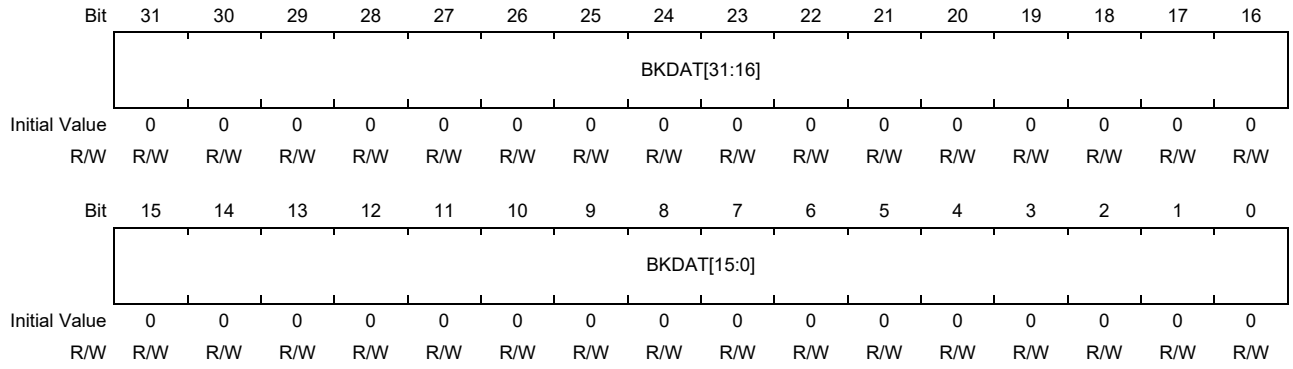
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	XSEL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	OUTEN	0	R/W	32kHz-clock output control 0: Disable 32kHz-clock output 1: Enable 32kHz-clock output
15 to 2	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1 to 0	XSEL	0	R/W	Oscillation mode control 00: CL = 4 pF 01: CL = 7 pF 10: CL = 9 pF 11: CL = 12.5 pF

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.3.13 Backup Register n (BKRn) (n = 0 to 31)

The BKRn (0 to 31) registers are backup registers.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BKDAT	0	R/W	Backup Data The contents of the BKRn registers are retained even in the battery backup mode. The BKRn registers can be erased when a tamper event is detected.

Note: This register can only be initialized by the backup domain reset (VBATTRESET# pin).

42.4 Operation

42.4.1 Battery Backup Function

This function is used to retain the operations of the modules in the backup domain by supplying power from the VBATTB pin while the main power supply is turned off.

The following modules are in the backup domain.

- Backup registers
- 32kHz-clock oscillator
- Tamper detector
- RTC

42.4.2 Tamper Detctor

This LSI has TAMPIN pin which remains functional in the battery backup mode and can detect physical intrusions.

The tamper inputs can be configured for rising or falling edge detection and with or without noise filtering.

The following operations can be selected in response to the detection of tampering.

- Generating an interrupt request
- Erasing the backup registers
- Generating RTC timestamp events

Figure 42.2 is a block diagram of the tamper detector.

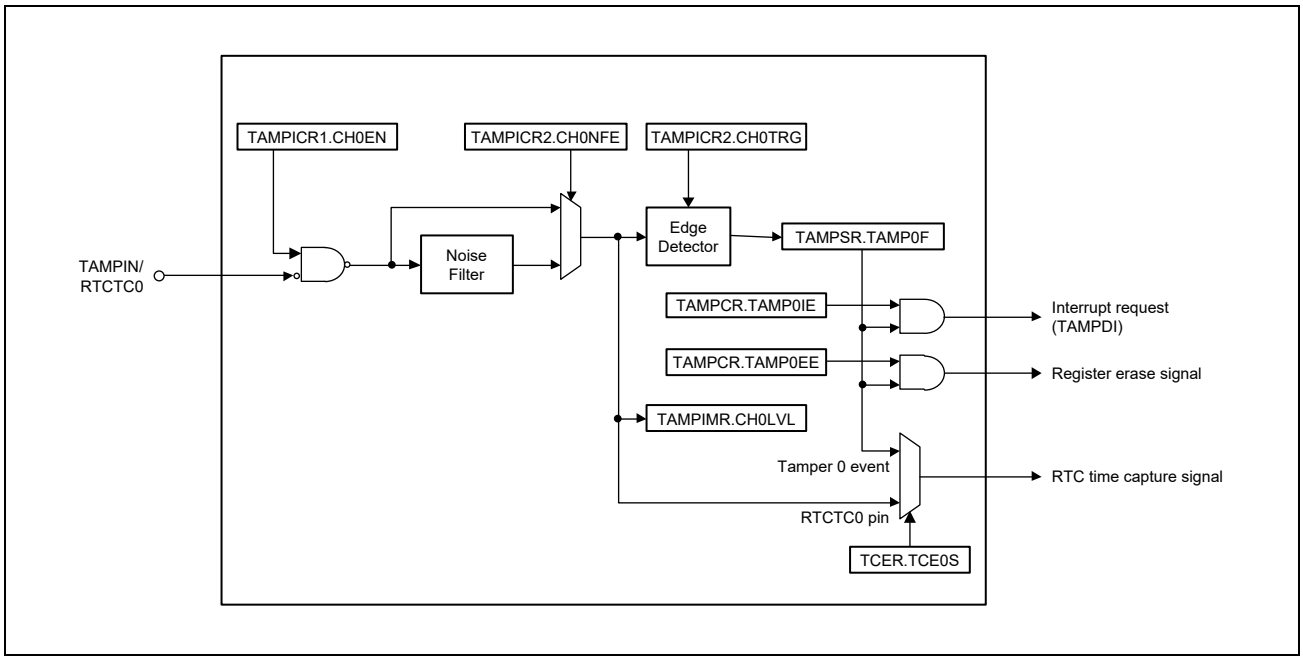


Figure 42.2 Tamper Detector

If the value of the TAMPICR1.CH0EN bit or the CH0NFE or CH0TRG bit in the TAMPICR2 register is changed, a TAMPSR.TAMP0F flag may become 1. Set the TAMP0IE and TAMP0EE bits in the TAMPCR register to 0 before setting these bits. Clear the TAMP0F flags after setting these bits.

The TAMPIMR.CH0LVL flags are for monitoring the levels being input on the TAMPIN pin.

When an effective edge is detected, the TAMP0F flag becomes 1. If the TAMP0IE bit is 1 at this point, the TAMPDI interrupt is generated. If the TAMP0EE bit is 1, the backup registers are erased to H'00.

Setting the TCECR.TCE0S bit to 1 enables a timestamp on tamper detection by using the time capture function of the RTC. For details on the time capture function, refer to **Section 22, Realtime Clock (RTCA-3)**.

Figure 42.3 shows the setting flow when using the tamper detector.

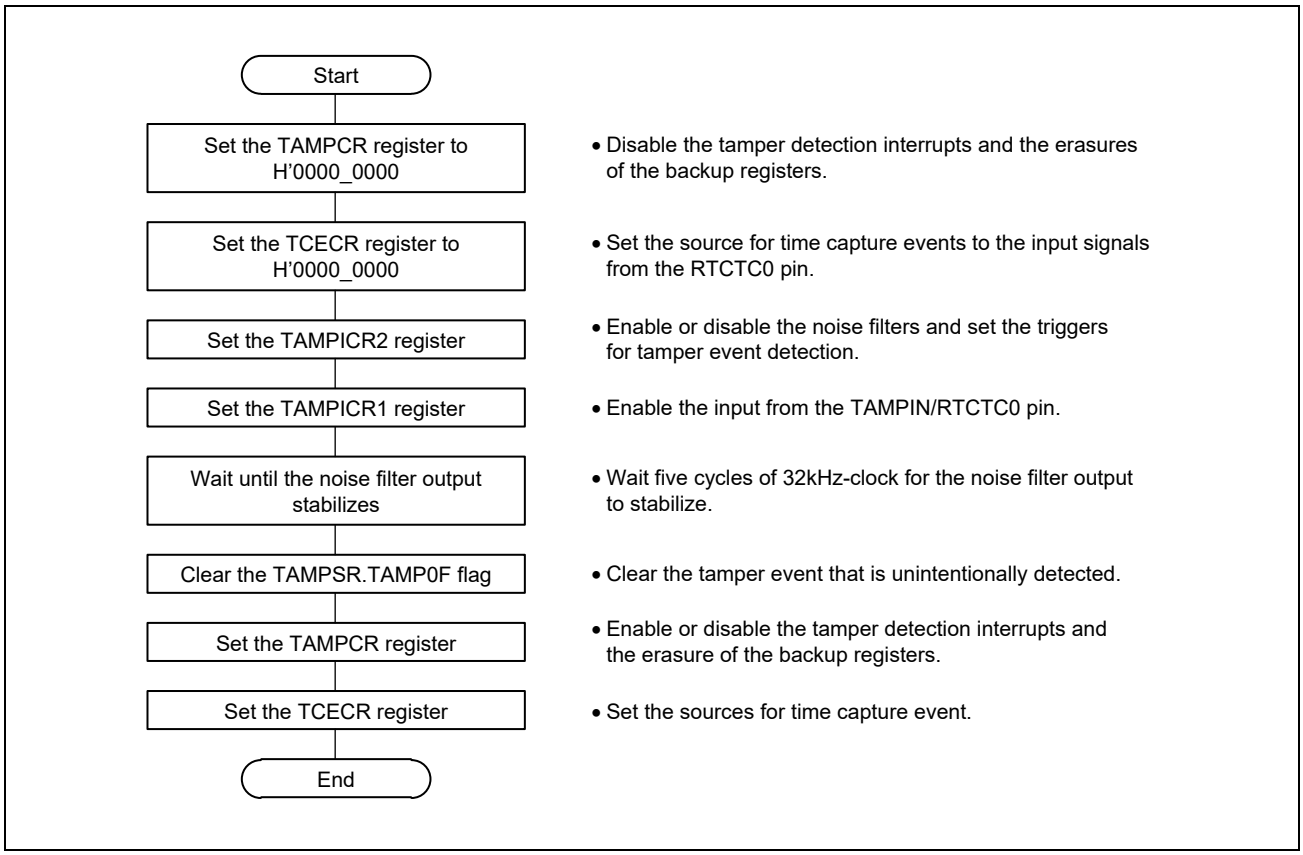

Figure 42.3 Setting for Tamper Detector

42.4.3 Isolation Control

Before entering the battery backup mode (VBATT mode), the following procedure should be performed.

1. Write “H’15AF_FA51” to ISOENPROT register to release the write protection of ISOEN register.
2. Set the ISOEN bit of ISOEN register to 1.

Refer to the **Section 41, Low Power Consumption** regarding to the battery backup mode.

42.4.4 Interrupt

The VBATTB has interrupt source listed in **Table 42.4.**

Table 42.4 VBATTB Interrupt Source

Name	Symbol	Interrupt Source	Interrupt Flag	Interrupt Enable Bit
Tamper detection interrupt	TAMPDI	Tamper 0 detection	TAMP0F	TAMP0IE

43. Renesas Secure IP (RSIP-E05A)

The Renesas Security IP (RSIP-E05A) consists of the access management circuit, encryption engine, and random number generation circuit. In combination with the RSIP-E05A library, the RSIP-E05A can prevent eavesdropping (to maintain confidentiality), falsification of information (to ensure integrity), and impersonation (to verify authenticity).

Because key information required for encryption and decryption is stored only in the RSIP-E05A and all accesses from the outside can be blocked, RSIP-E05A enables building a more robust security system.

43.1 Overview

Table 43.1 summarizes the specifications of the RSIP-E05A. **Figure 43.1** shows a block diagram of the RSIP-E05A.

Table 43.1 Specifications of RSIP-E05A (1/2)

Item	Description
Access control	Access management circuit • In case of irregular access to the RSIP-E05A due to a tampered program or CPU runaway, this circuit blocks all subsequent accesses and stops data output from the RSIP-E05A
Encryption engine	AES: Compliant with NIST FIPS PUB 197 • Key length: 128, 192, or 256 bits • Data block size: 128 bits • AES supports following block cipher mode – ECB, CBC, CTR: Compliant with NIST SP 800-38A – CCM: Compliant with NIST SP 800-38C – GCM: Compliant with NIST SP 800-38D – XTS: Compliant with IEEE 1619-2007 • AES supports following authentication algorithm – CMAC: Compliant with NIST SP 800-38B – GMAC: Compliant with NIST SP 800-38D • AES does not support the KEY size of 192-bit in XTS, CMAC, GMAC, CCM, GCM and CMAC.
Random number generation	128-bit true random number generation circuit
Signature generation and verification	RSA • Maximum number of operable bits: 4224 bits • Signature generation, signature verification, public-key encryption, private-key decryption (Add RSA compliance specification(s)) ECC • Maximum number of operable bits: 576 bits • Signature generation, signature verification, key generation
Message digest computation	HASH • Block size: – 512-bit (SHA-1, SHA-224, SHA-256) – 1024-bit (SHA-512/224, SHA-512/256, SHA-384, SHA-512) • Key size: 512-bit or less • HASH supports following secure hash algorithms – SHA-1, SHA-224, SHA-256, SHA-512/224, SHA-512/256, SHA-384 and SHA-512: Compliant with FIPS PUB 180-4 • HASH supports following message authentication algorithm – HMAC: Compliant with FIPS PUB 198

Table 43.1 Specifications of RSIP-E05A (2/2)

Item	Description
Hardware Unique Key	• Key derivation functions combine the Hardware Unique Key with the key generation information. The derived keys implement the key wrapping for user key secure storage. • The HUK uniqueness prevents the illicit cloning and copying of keys to another LSI of the LSI group. • The HUK itself is stored in wrapped (encrypted, non-plain) format in an isolated memory area. Therefore it is protected from illicit access and copy.
Application Key Management	• Wrapped keys are only valid within the RSIP-E05A.
Unique ID	• An LSI (Unique ID) is accessible from the access management circuit. • Key derivation functions combine the Unique ID with the key generation information. Such derived keys are used to unwrap the HUK within the RSIP-E05A boundary.
On-the-fly Decryption / Encryption (OTFDE)	• The RSIP-E05A outputs the key data of the On-the-fly Decryption / Encryption IP (OTFDE) through a dedicated bus
SPA/DPA Protections	• SPA/DPA protections can optionally be enabled for crypto engine processing.
Low power consumption	• Setting of the module stop state is possible.

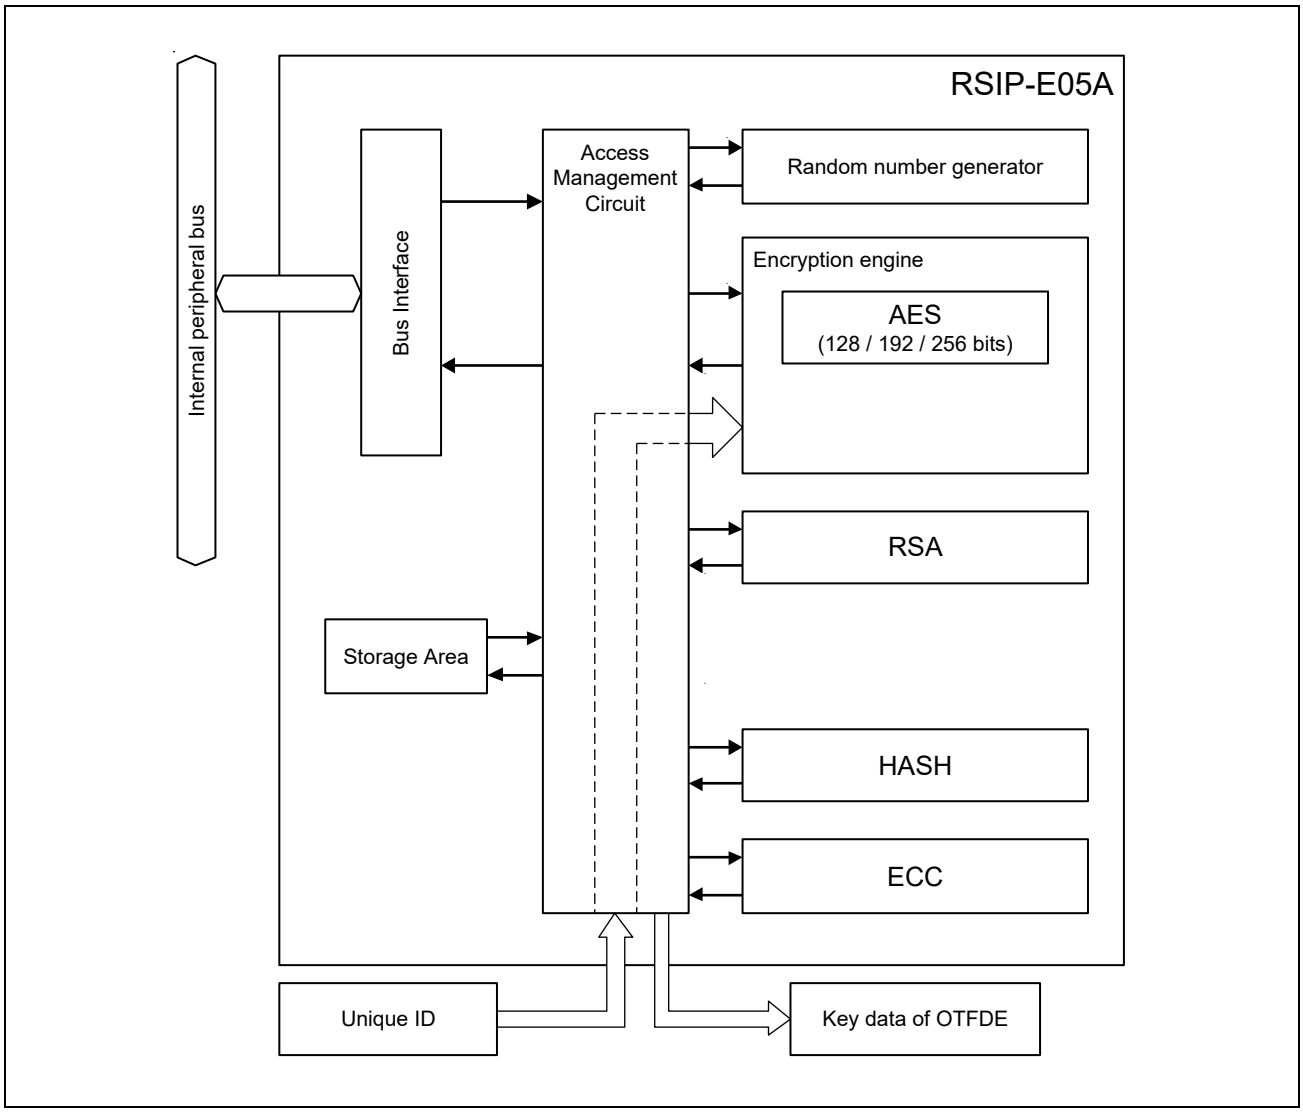

Figure 43.1 RSIP-E05A Block Diagram

43.2 Operation

43.2.1 Encryption Engine

Figure 43.2 shows conceptual block diagram of the encryption engine installed in the RSIP-E05A.

The encryption engine uses the input key information, and converts the plaintext data to ciphertext or ciphertext data to plaintext through the hardware.

The encryption/decryption process can be completed without exposing the key data and the process's intermediate data outside of the RSIP-E05A. This process is performed by the secure engine and storage area of the RSIP-E05A internally.

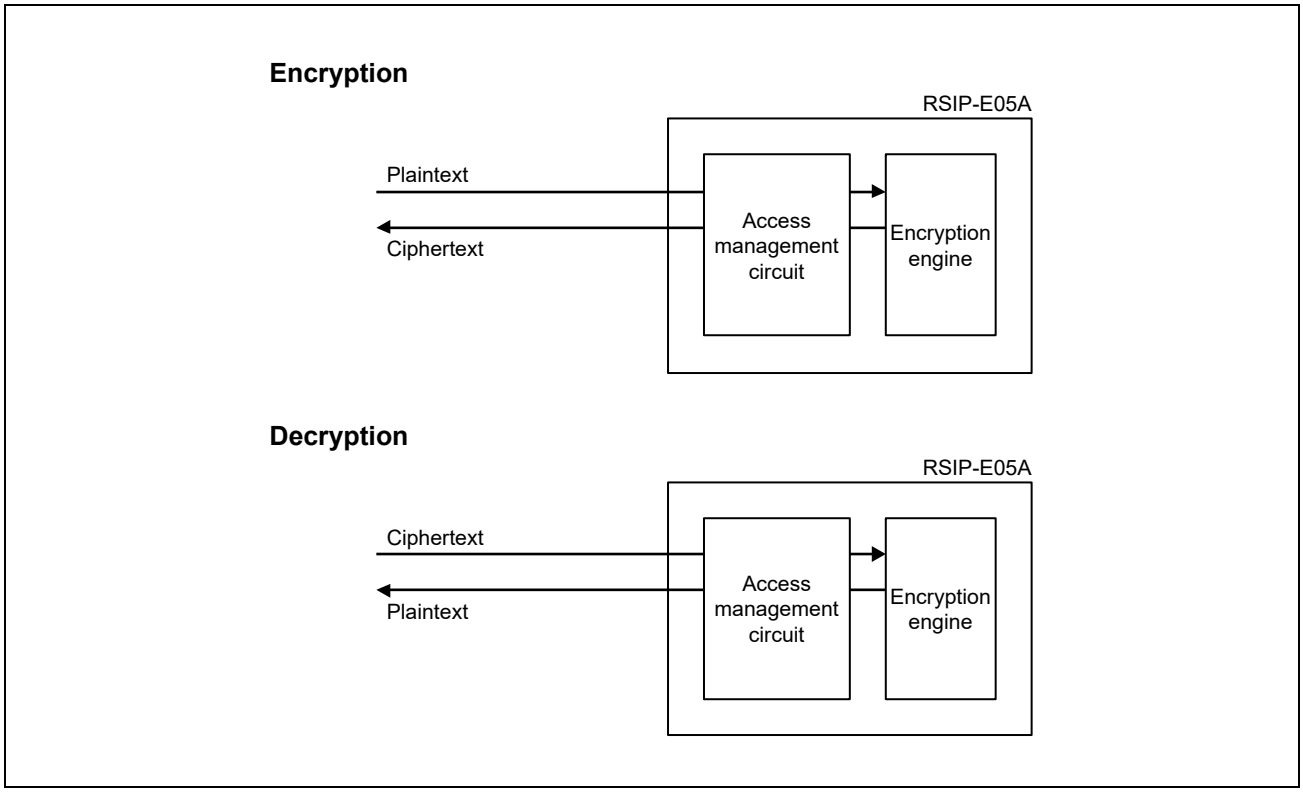

Figure 43.2 Encryption and Decryption Processes by Encryption Engine

43.2.2 Encryption and Decryption

Follow the procedure below to encrypt and decrypt the data:

(1) Input the key information to the RSIP-E05A.

(2) Input the target data to the RSIP-E05A. Plaintext data is converted to ciphertext and ciphertext data to plaintext.

(3) Read the converted data.

The encryption engine has input and output buffers, and can perform encryption/decryption in parallel with data input/output. **Figure 43.3** shows the encryption engine timing.

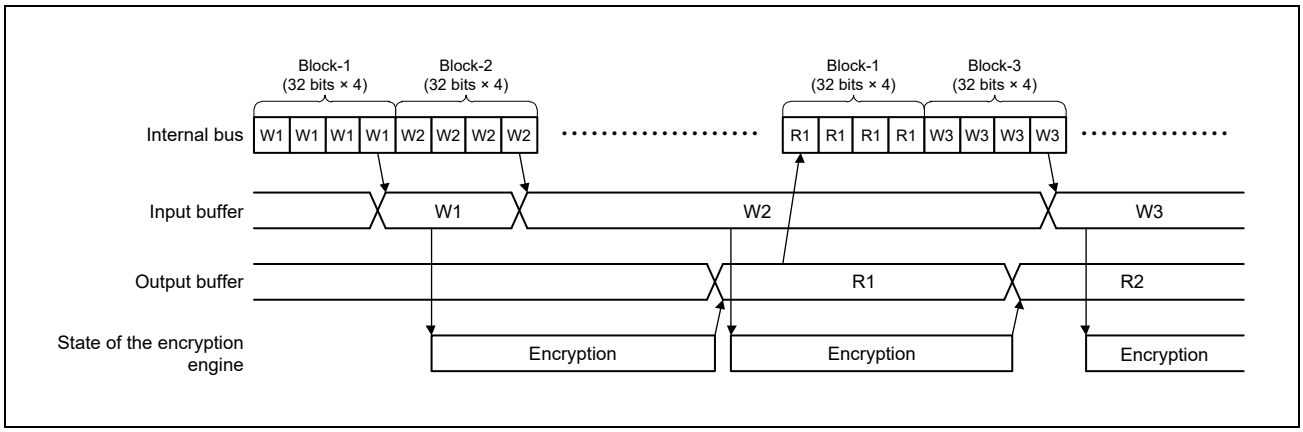

Figure 43.3 Encryption and Decryption Timing Diagram

43.3 Usage Notes

43.3.1 SPA/DPA Protections

SPA/DPA protections can optionally be enabled for crypto engine processing.

43.3.2 Renesas Secure IP(RSIP-E05A) Driver

Use of the RSIP-E05A requires the RSIP-E05A driver provided by Renesas Electronics. Please contact our sales office for information regarding the RSIP-E05A driver.

44. On-The-Fly Decryption/Encryption (OTFDE)

44.1 Overview

On-The-Fly Decryption/Encryption (OTFDE) module encrypts and decrypts data stored in specific address areas of external memory connected to this LSI to ensure data security.

The supported encryption algorithm is AES. The AES key is managed by RSIP.

This LSI has the OTFDE modules for DDR controller and xSPI or Octa controller as shown in **Figure 44.1**.

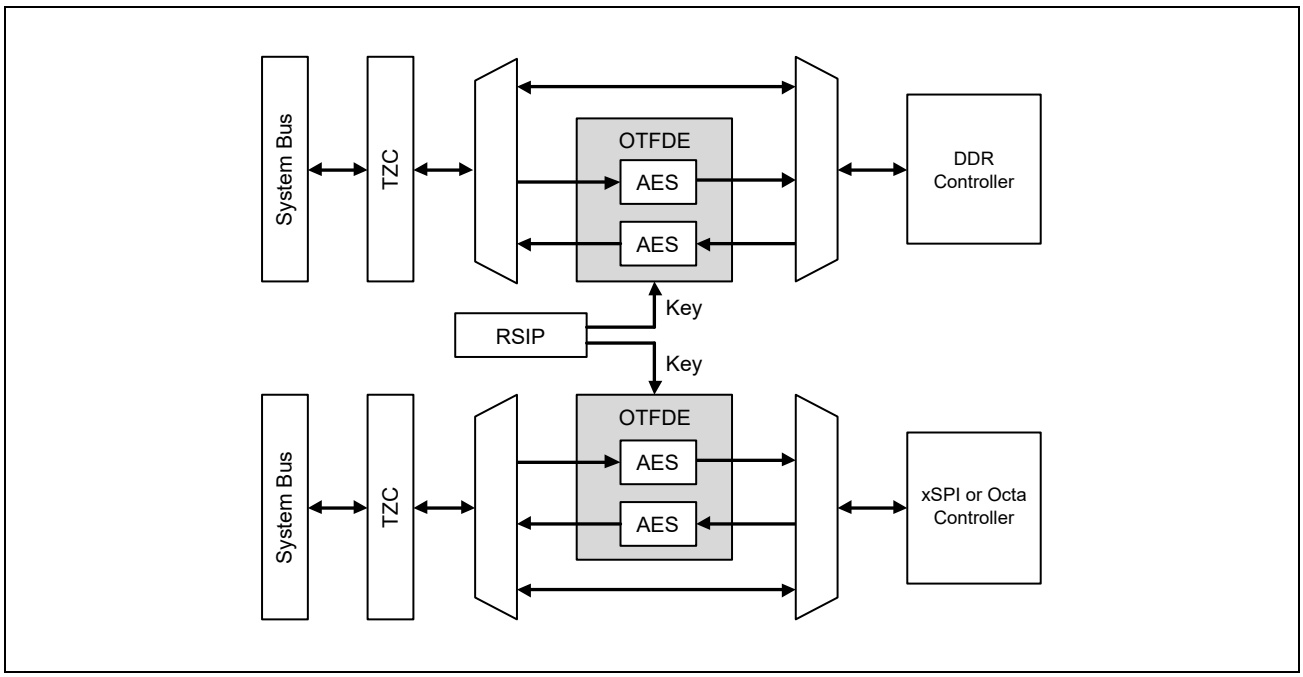

Figure 44.1 On-The-Fly Decryption/Encryption Block Diagram

44.2 Renesas Secure IP(RSIP) Driver

Use of the OTFDE requires the RSIP driver provided by Renesas Electronics. Please contact our sales office for information regarding the RSIP driver.

45. General Purpose Input Output Port (GPIO)

This LSI can use up to 82 general-purpose I/O ports.

Each port of the general-purpose I/O port is multiplexed with the terminal of the peripheral function, and either the general-purpose I/O port function or the peripheral function can be selected by setting the register.

45.1 Features

45.1.1 General Purpose Input Output Port (GPIO)

General-purpose input/output ports (GPIOs) provide general-purpose ports that can be configured as inputs or outputs.

When set as an output, it can be written to an internal register to control the state driven by the output pin. When set as an input, you can read the state of the input by reading the state of the internal registers. You can also generate interrupts using the GPIO input pin.

- GPIO Output Control (Port Register [P_m])
- GPIO Input, Output Enable (Port Mode Register [PM_m])
- GPIO Input Monitor (Port Input Register [PIN_m])
- Interrupt used the GPIO input (Interrupt Enable Control Register[ISEL_m])

Also, it able to control the following on some ports

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Pull-up/Pull-down Switching for each port
- Digital noise filter control for each port

45.1.2 Port Function Control

Switching of each port function can be controlled by the following register settings.

- GPIO function and peripheral function selection (Port Mode Control Register[PMC_m])
- Selection of each peripheral function (Port Function Control Register[PFC_m]) [Function1 to 8]

NOTE

Please refer to another excel file for the pin function for the peripheral functions that can be selected.
Please refer to above excel file for the “Pin function list” described in each chapter.
Do not select the same peripheral function for multiple different external terminals.

45.1.3 Special Purpose Port Function Control

The settings of the following specific ports can be controlled by registers.

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Digital noise filter control for each port
- Ether MII/RGMII mode control

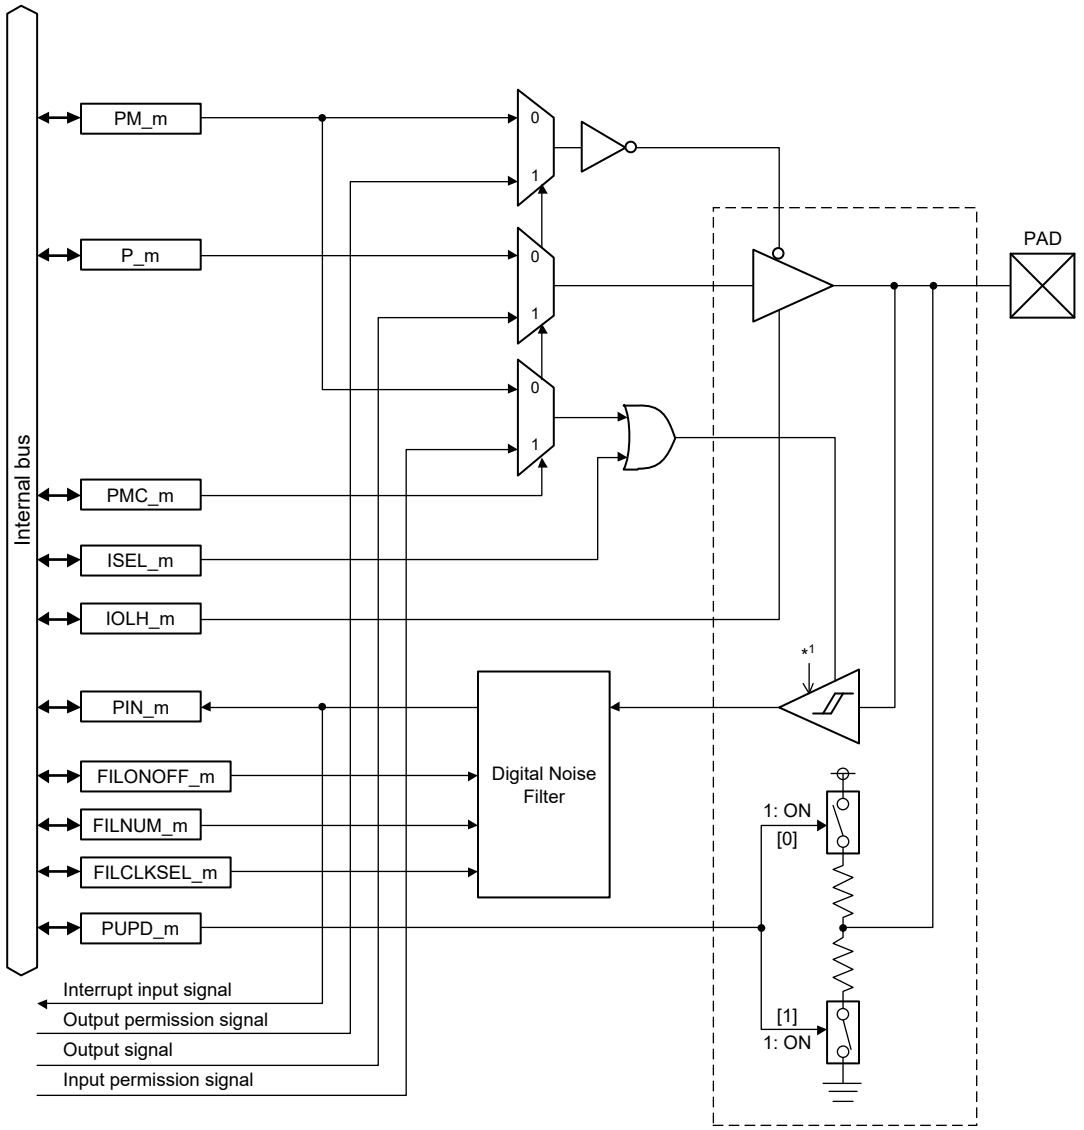
The specific ports shown below are targeted.

- Target Functions: Ether ch0/ch1, SDHI ch0/ch1, XSPI, RIIC, I3C
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2

45.1.4 General Purpose Input Output Port Configuration

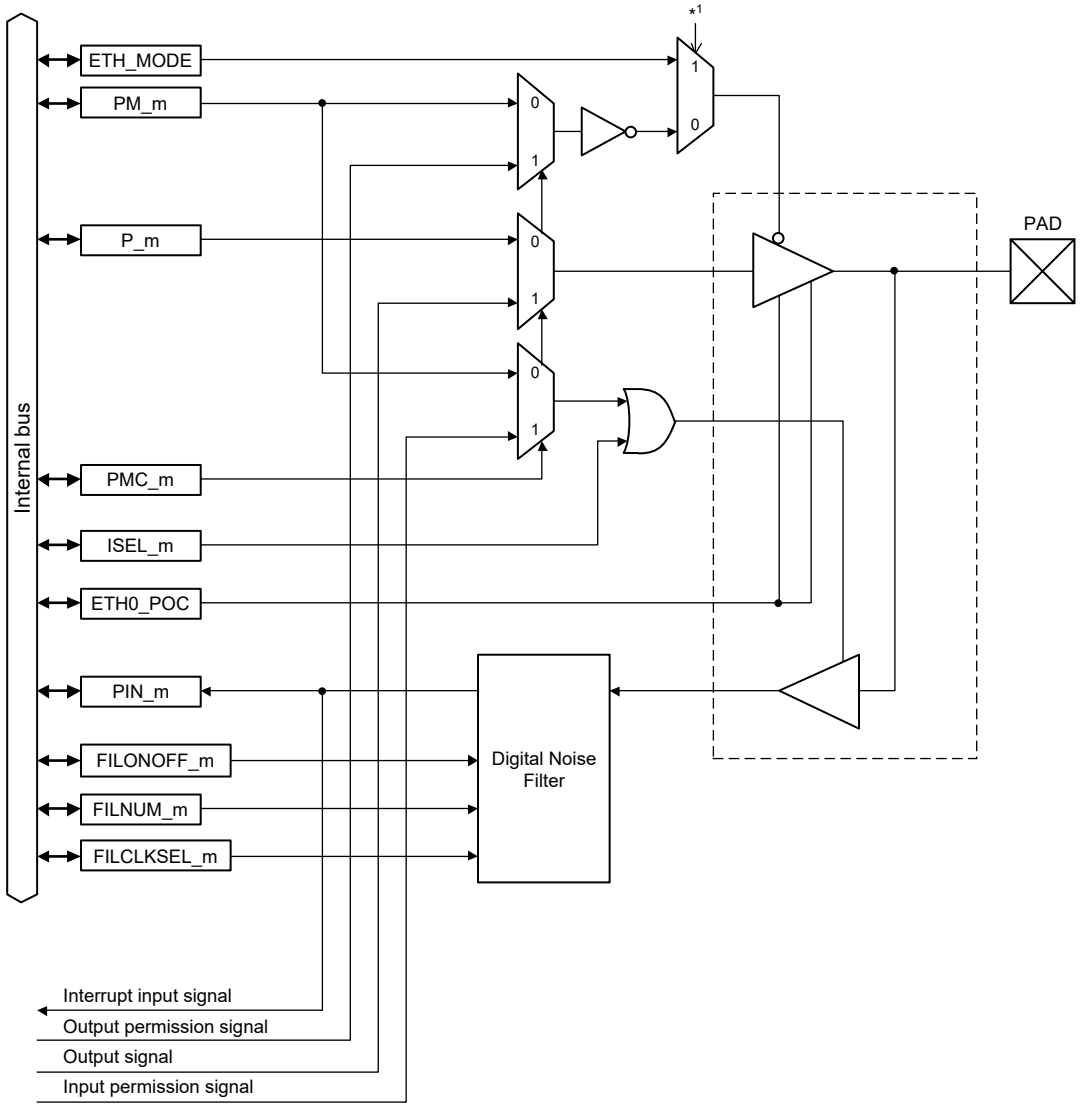
The configuration of the general-purpose I/O port is shown in **Figure 45.1** to **Figure 45.5**.

In addition, the configuration of the multiplexed Ether ch0/ch1 is also included in the configuration diagram of the general-purpose I/O port.



Note 1. When RIIC * is selected as the peripheral module, SMT = 1 and the Schmitt trigger circuit is enabled.

Figure 45.1 P0_0 to P0_3, P5_0 to P6_4, P11_0 to P18_5 (Multiplexed Peripheral Functions)



Note 1. When ETH0 is selected as the peripheral module, the ETH_MODE register output is selected.

Figure 45.2 P1_0 (Multiplexed Ether Ch0)

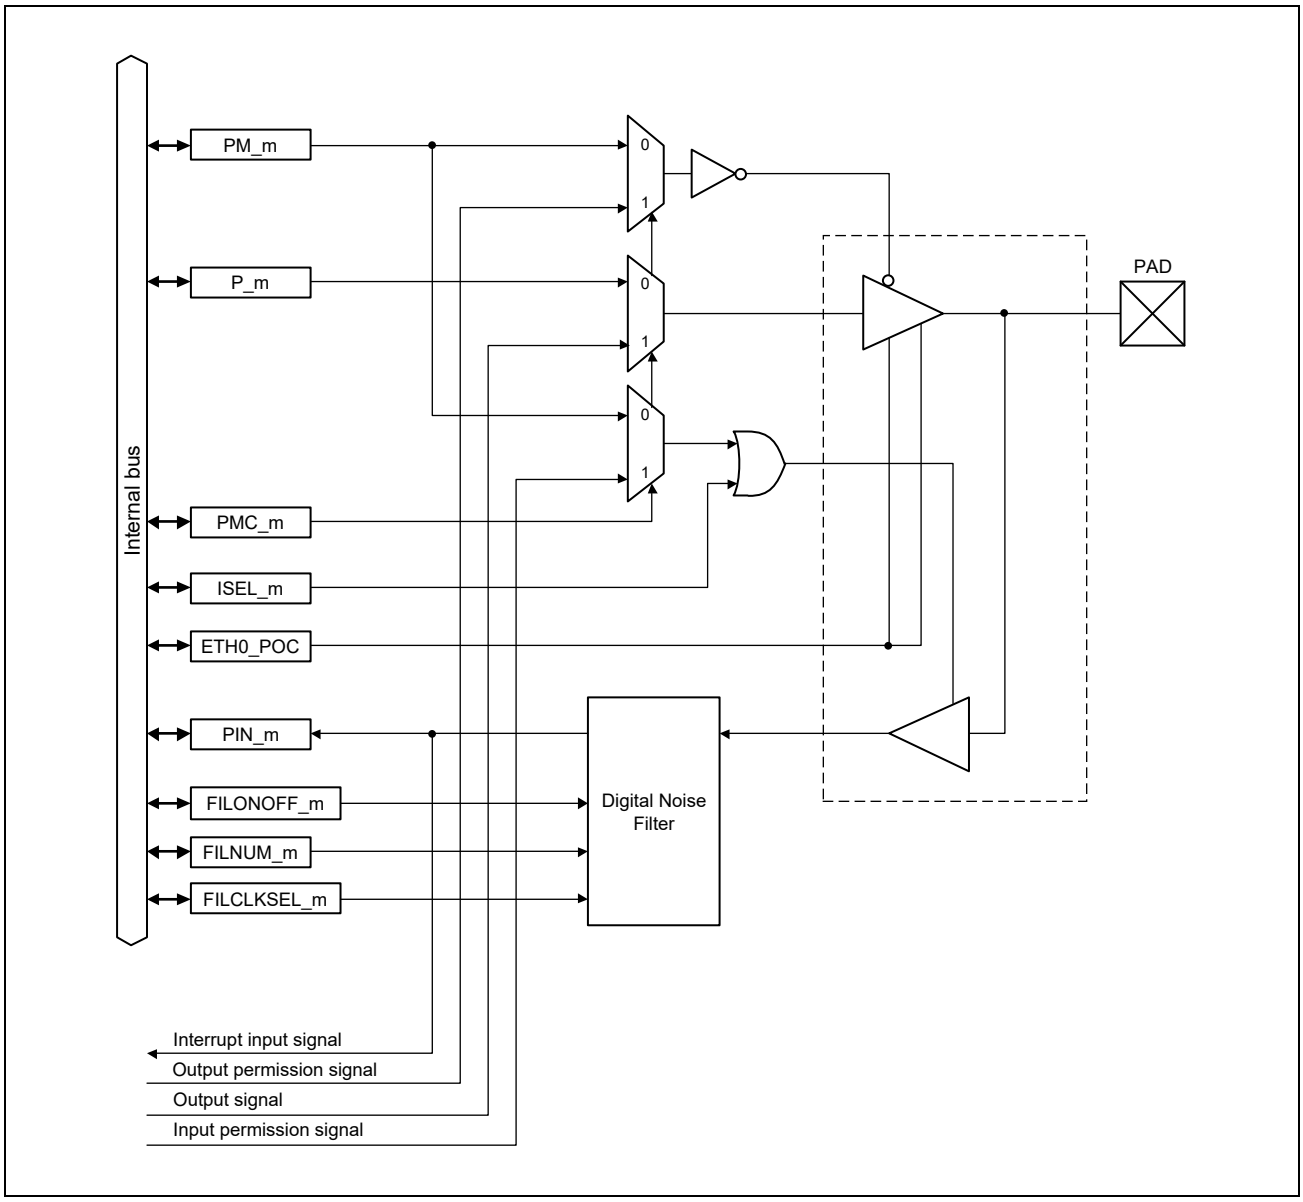


Figure 45.3 P1_1 to P4_5 (Multiplexed Ether Ch0)

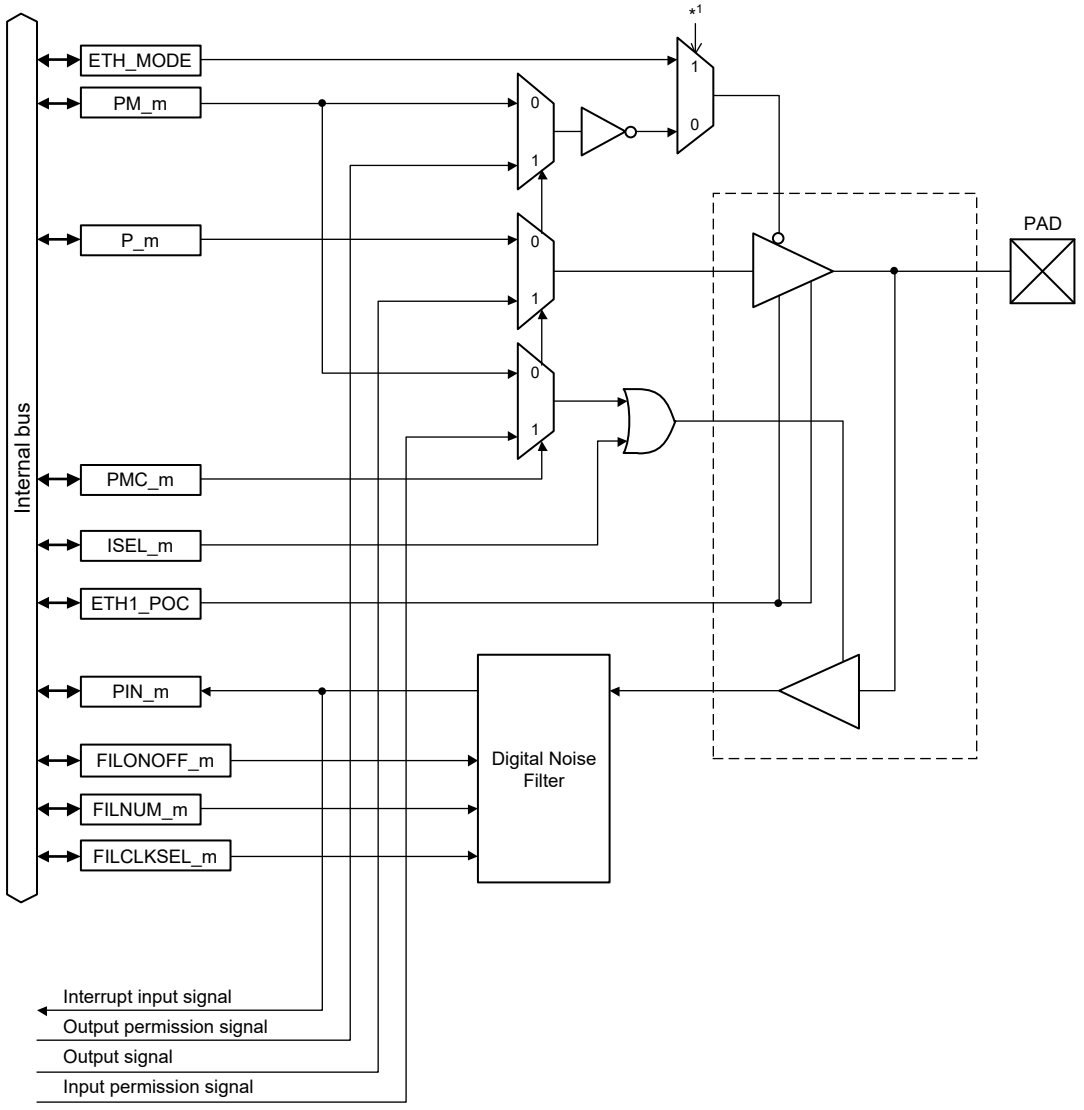

Note 1. When ETH1 is selected as the peripheral module, the ETH_MODE register output is selected.

Figure 45.4 P7_0 (Multiplexed Ether Ch1)

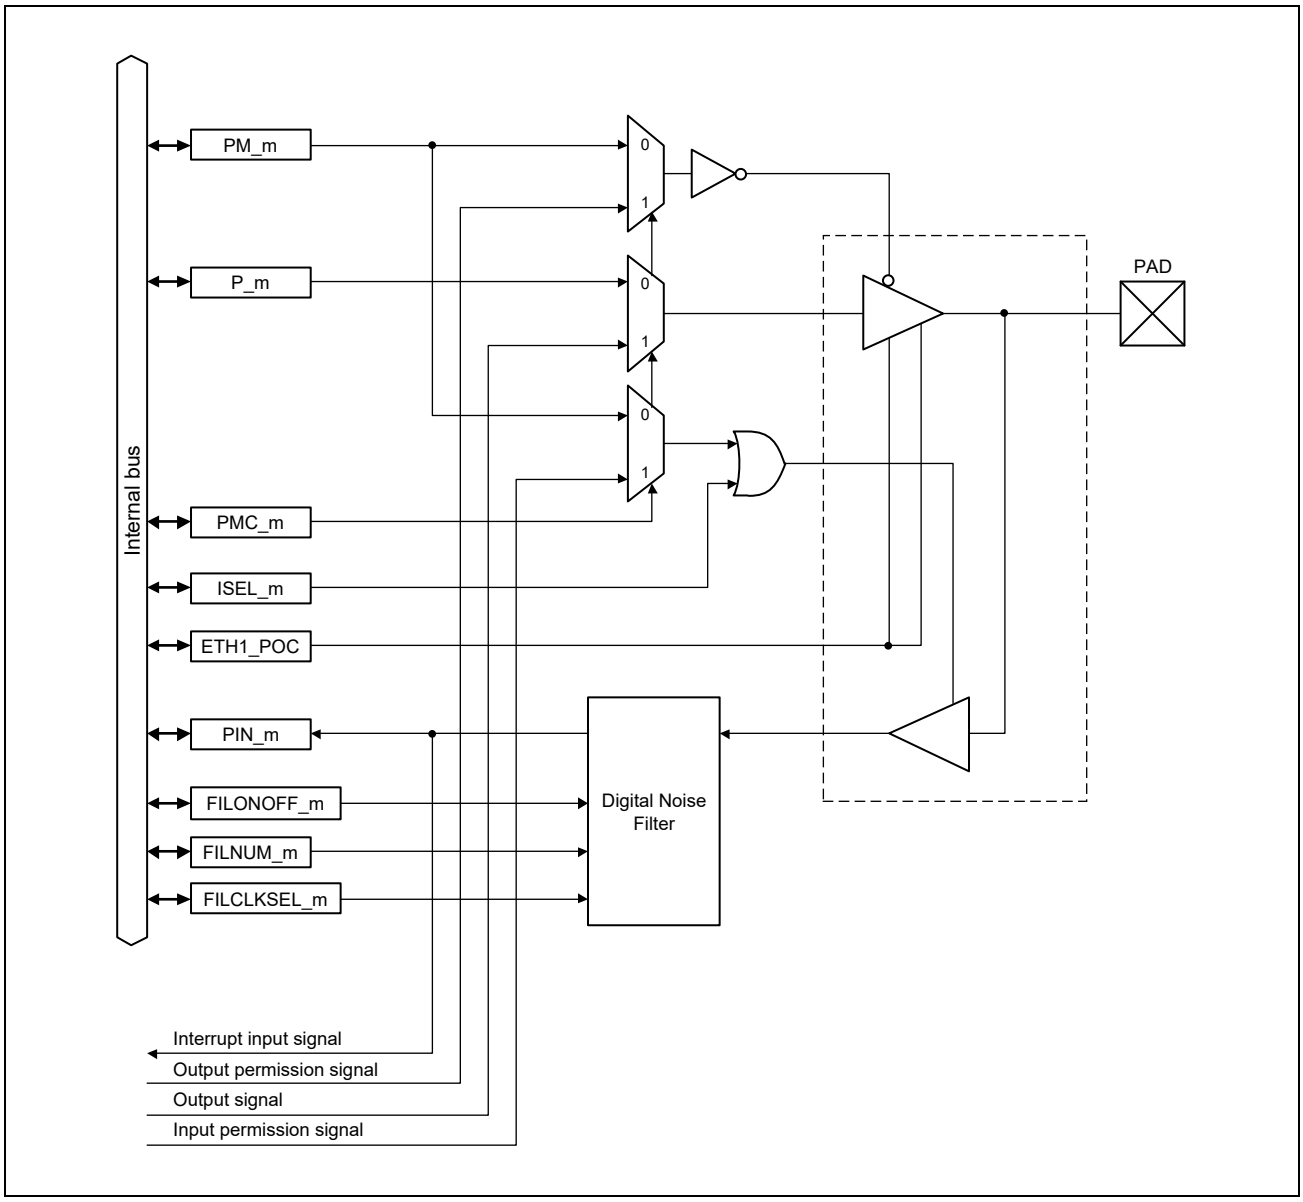

Figure 45.5 P7_1 to P10_4 (Multiplexed Ether Ch1)

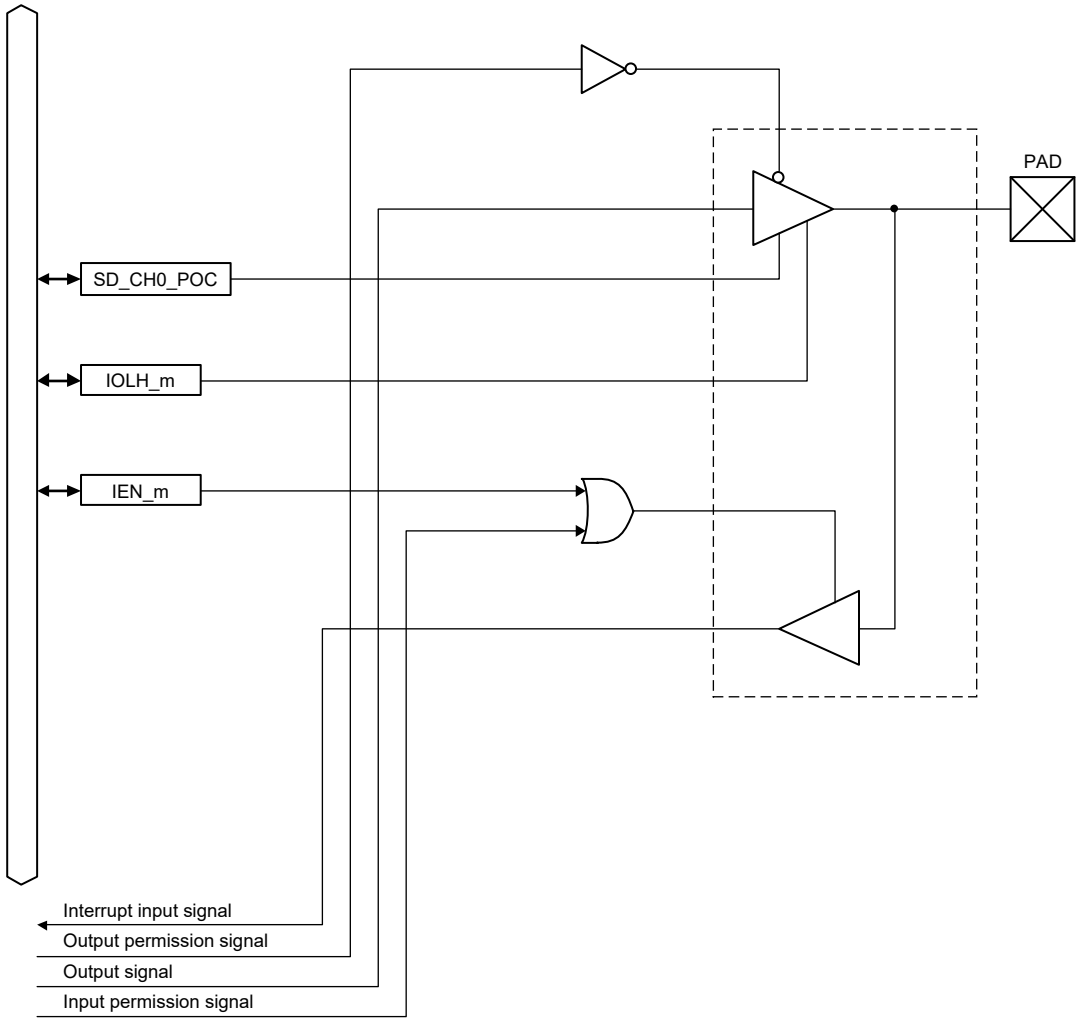
45.1.5 Special Purpose Port Configuration

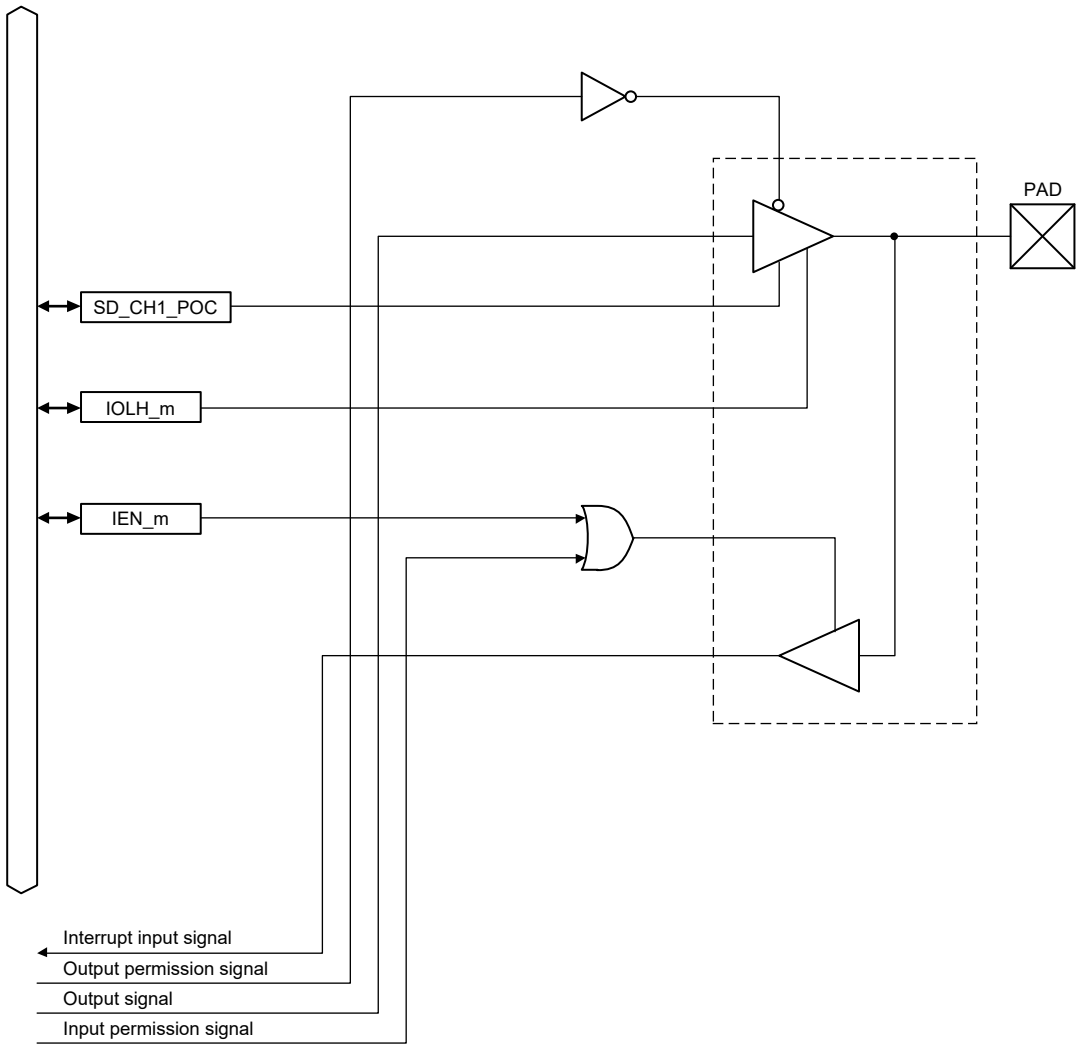
The functions and the signal of configurations shown below are shown in **Figure 45.6** to **Figure 45.12**.

- Target Functions: SDHI ch0, SDHI ch1, QSPI, RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2



Note: The IEN_m registers do not exist at the SD0_CLK and SD0_RST# pins.

Figure 45.6 SDHI Ch0 (SD0_CLK, SD0_CMD, SD0_RST#, SD0_DATA[7:0])



Note: The IEN_m registers do not exist at the SD1_CLK pin.

Figure 45.7 SDHI Ch1 (SD1_CLK, SD1_CMD, SD1_DATA[3:0])

45.2 Register Configuration

The base address is shown below.

Base address: H'0_1103_0000 (Cortex-A55 Address Space)
Base address: H'4103_0000 (Cortex-M33 Address Space Non-Secure)
Base address: H'5103_0000 (Cortex-M33 Address Space Secure)

Remark Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space, and SYS_IPCONT_IDAUZERONS_FPU register for Cortex-M33_FPU Address Space. The base address above are in case of the default Cortex-M33/Cortex-M33_FPU Address Space definition.

The register addresses shown in the following chapters will be offset addresses from the above base address.

NOTE

Access to areas for which Offset address is not defined in the register map is prohibited.

Please align the addresses according to the access size.

45.2.1 Port Register (P_m)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
PORT REGISTER 20	P_20	R/W	H'00	H'20	8
PORT REGISTER 21	P_21	R/W	H'00	H'21	8
PORT REGISTER 22	P_22	R/W	H'00	H'22	8
PORT REGISTER 23	P_23	R/W	H'00	H'23	8
PORT REGISTER 24	P_24	R/W	H'00	H'24	8
PORT REGISTER 25	P_25	R/W	H'00	H'25	8
PORT REGISTER 26	P_26	R/W	H'00	H'26	8
PORT REGISTER 27	P_27	R/W	H'00	H'27	8
PORT REGISTER 28	P_28	R/W	H'00	H'28	8

45.2.13 Ether Ch0 IO Voltage Mode Control Register (ETH0_POC)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
ETHER CH0 IO VOLTAGE MODE CONTROL REGISTER	ETH0_POC	R/W	H'0000_0000	H'3010	8/16/32

45.2.14 Ether Ch1 IO Voltage Mode Control Register (ETH1_POC)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
ETHER CH1 IO VOLTAGE MODE CONTROL REGISTER	ETH1_POC	R/W	H'0000_0000	H'3014	8/16/32

45.2.15 Ether MII/RGMII Mode Control Register (ETH_MODE)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
ETHER MII/RGMII MODE CONTROL REGISTER	ETH_MODE	R/W	H'0000_000F	H'3018	8/16/32

45.2.16 SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
SD CH0 IO VOLTAGE MODE CONTROL REGISTER	SD_CH0_POC	R/W	*1	H'3004	8/16/32

Note 1. For the initial value, refer to **Section 45.3.16, SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC)**.

45.2.17 SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
SD CH1 IO VOLTAGE MODE CONTROL REGISTER	SD_CH1_POC	R/W	H'0000_0000	H'3008	8/16/32

45.2.18 XSPI IO Voltage Mode Control Register (XSPI_POC)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
XSPI IO VOLTAGE MODE CONTROL REGISTER	XSPI_POC	R/W	*1	H'300C	8/16/32

Note 1. For the initial value, refer to **Section 45.3.18, XSPI IO Voltage Mode Control Register (XSPI_POC)**.

45.2.19 Input Enable Control Register (IEN_m)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
INPUT ENABLE CONTROL REGISTER 01	IEN_01	R/W	H'0000_0000	H'1808	8/16/32
INPUT ENABLE CONTROL REGISTER 02	IEN_02	R/W	H'0000_0000	H'1810	8/16/32

INPUT ENABLE CONTROL REGISTER 34	IEN_34	R/W	H'0000_0000	H'19A0	8/16/32

45.2.20 I3C Control Register (I3C_SET)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
I3C Control Register	I3C_SET	R/W	H'0000_0001	H'301C	8/16/32

45.2.21 XSPI/OCTA Output Enable Control Register (XSPI/OCTA Hi-Z)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
XSPI / OCTA Output Enable Control Register	XSPI/OCTA Hi-Z	R/W	H'0000_0000	H'3020	8/16/32

45.3 Register Descriptions

45.3.1 Port Register (P_m)

The Pn register sets the GPIO output value.

For the offset address, refer to **Section 45.2.1, Port Register (P_m)**.

45.3.6 Interrupt Enable Control Register (ISEL_m)

The ISEL register controls whether to enable or disable interrupts.

The pin set as the GPIO input port can be used as an external interrupt input. Controls whether this feature is enabled or disabled. When enabled, this pin can be used as an interrupt by setting the interrupt controller.

For the offset address, refer to **Section 45.2.6, Interrupt Enable Control Register (ISEL_m)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ISEL_m3	—	—	—	—	—	—	—	ISEL_m2

Note: WDTOVF_PERROUT# bit (H'1030 bit 1-0) in IOLH_m register is reset by the assertion of RST_WDTOVFN signal from CPG.

45.3.8 Pull-Up/Pull-Down Switching Register (PUPD_m)

The PUPD register sets pull-up and pull-down of the GPIO pins and the special purpose pins.

For the offset address, refer to **Section 45.2.8, Pull-Up/Pull-Down Switching Register (PUPD_m)**.

FILCLKSEL_37_H	—	—	—	P10_4

The operation of the digital noise filter will be explained using a timing chart using the external terminal P0_0 as an example.

(1) When the digital noise filter is disabled (FILONOFF = 0)

The timing chart of FILONOFF = 0 (OFF), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

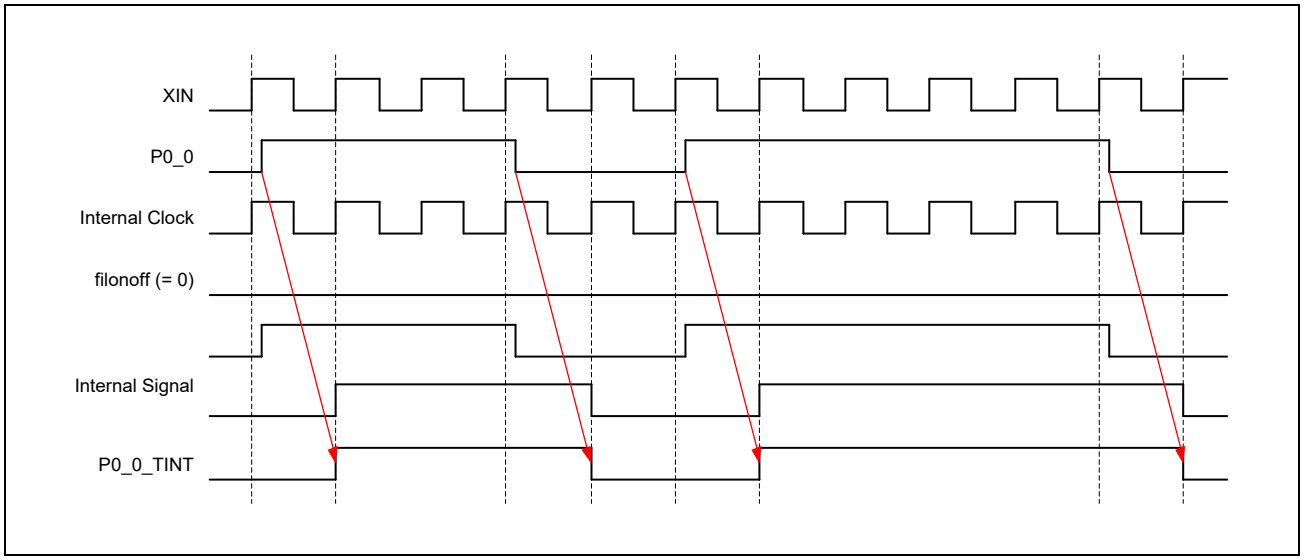

Figure 45.14 Digital Noise Filter (FILONOFF = 0) Timing Chart

The signal at the external terminal (P0_0) is not filtered regardless of the number of stages set in the FILNUM register.

The digital noise filter circuit inserts one stage of FF in the output of a digital noise filter.

Therefore, the external terminal (P0_0) signal is propagated internally with a delay of one cycle. (XIN).

(2) When the digital noise filter is enabled (FILONOFF = 1)

The timing chart of FILONOFF = 1 (ON), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

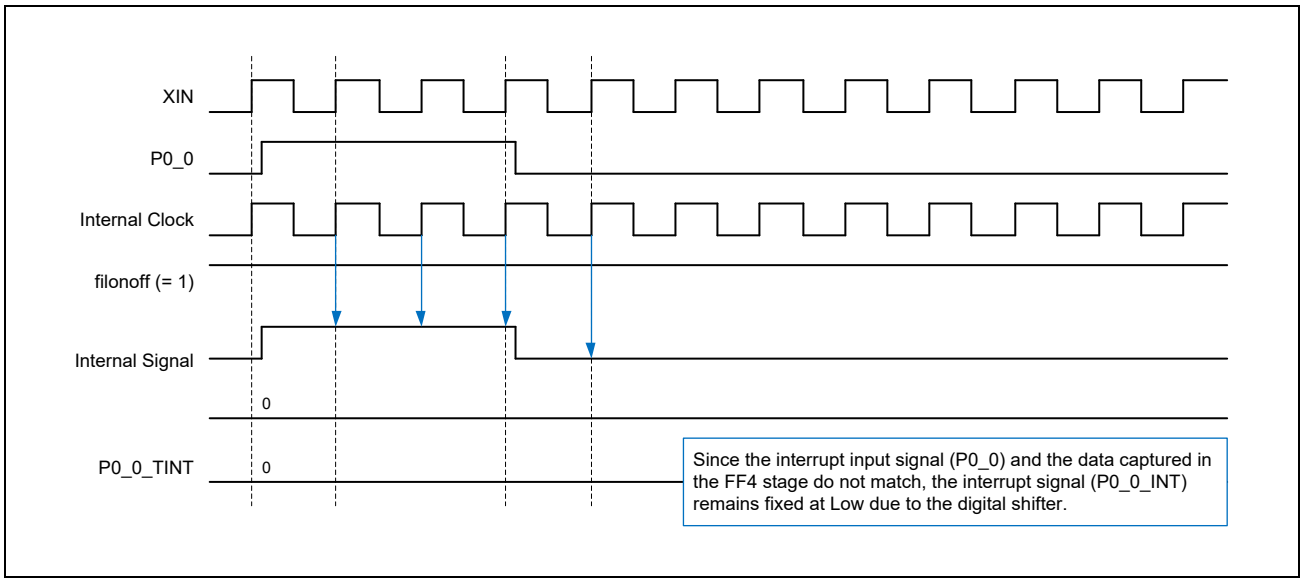

Figure 45.15 Digital Noise Filter (FILONOFF = 1) Timing Chart (1)

The signal of the external terminal (P0_0) is filtered, if even one signal captured by each FF for the number of FF stages set in the FILNUM register does not match.

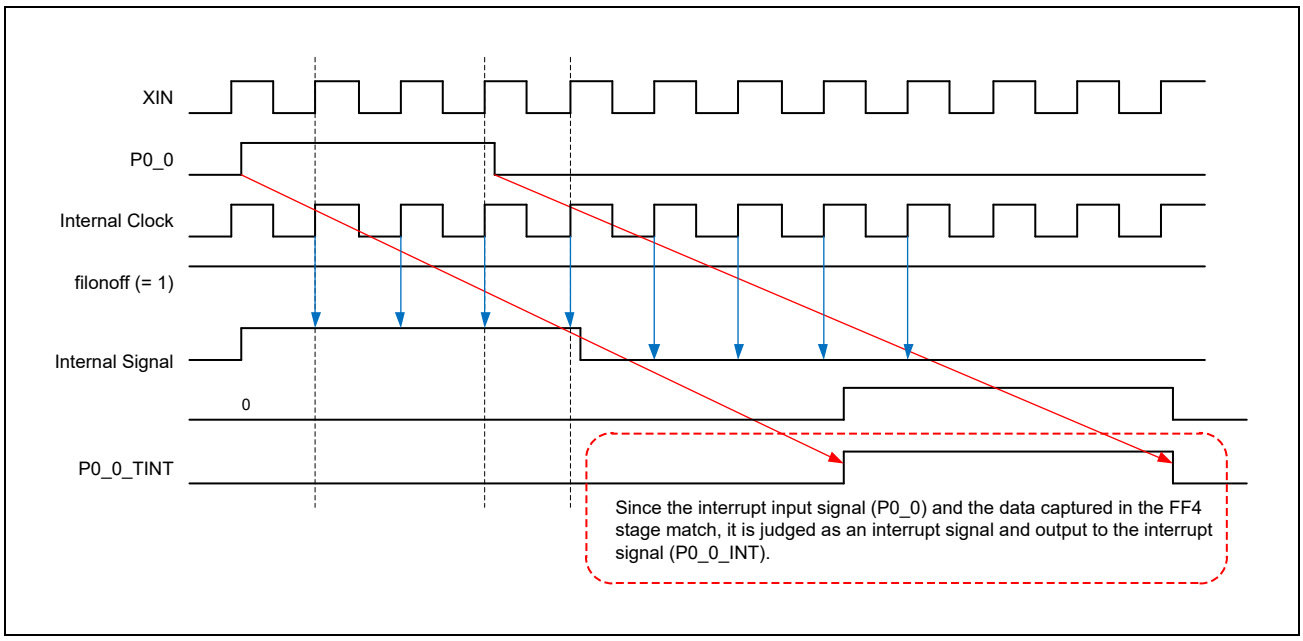

Figure 45.16 Digital Noise Filter (FILONOFF = 1) Timing Chart (2)

The external terminal (P0_0) signal is the signal captured by each FF for the number of FF stages set in the FILNUM register. If they all match, no filtering is done.

The digital noise filter circuit outputs to the interrupt signal with a delay of FILTER_CYCLE.

[FILTER_CYCLE Calculation]

FILTER_CYCLE = FILNUM_FF + $FILTER_FF

FILNUM_FF: Number of FF stages set in the FILNUM register @XIN
FILTER_FF: FF 2 stage in digital noise filter @XIN + Digital noise filter output FF 1 stage @XIN

Note: One stage of FF is inserted in the final stage of the digital noise filter circuit. Therefore, interrupt signals less than 1CLK @ XIN may be removed regardless of whether the digital noise filter is enabled or disabled.

45.3.13 Ether Ch0 Voltage Mode Control Register (ETH0_POC)

This register is sets the IO voltage mode control of Ether ch0.

For the offset address, refer to **Section 45.2.13, Ether Ch0 IO Voltage Mode Control Register (ETH0_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ETH0_POC[1]	ETH0_POC[0]
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	ETH0_POC[1]	0b	R/W	These bits set the IO voltage mode.
0	ETH0_POC[0]	0b	R/W	

Bit 1	Bit 0	IO Voltage
0	0	3.3 V (Initial value)
0	1	1.8 V
1	0	2.5 V
1	1	Setting prohibited

- For the IO voltage mode of P1_0 to P4_5, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch0 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_0) to be used.

  When Function2 to Function8, a function other than Ether ch0 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function1 to Function8 in the Pin function List.

  When using function0 (GPIO function is selected), this register can be set 3.3 V, 2.5 V or 1.8 V according to power supply voltage of VDD182533_0.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

45.3.14 Ether Ch1 Voltage Mode Control Register (ETH1_POC)

This register sets the IO voltage mode control for Etherch1.

For the offset address, refer to **Section 45.2.14, Ether Ch1 IO Voltage Mode Control Register (ETH1_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	ETH1_POC[1]	0b	R/W	These bits set the IO voltage mode.
0	ETH1_POC[0]	0b	R/W	

Bit 1	Bit 0	IO Voltage
0	0	3.3 V (Initial value)
0	1	1.8 V
1	0	2.5 V
1	1	Setting prohibited

- For the IO voltage mode of P7_0 to P10_4, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch1 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_1) to be used.

  When Function2 to Function8, a function other than Ether ch1 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function1 to Function8 in the Pin function List.

  When using function0 (GPIO function is selected), this register can be set 3.3 V, 2.5 V or 1.8 V according to power supply voltage of VDD182533_1.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

45.3.15 Ether MII/RGMII Mode Control Register (ETH_MODE)

This register controls the direction (input/output) of IO blocks related to Ether MII/RGMII mode.

This register is valid only for Function 1.

For the offset address, refer to **Section 45.2.15, Ether MII/RGMII Mode Control Register (ETH_MODE)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	OEN3	OEN2	OEN1	OEN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	OEN3	1b	R/W	0b = The Direction of the IO buffer is Output. 1b = The Direction of the IO buffer is Input. (Initial value)
2	OEN2	1b	R/W	<Bit> <Terminal name (Terminal name when using Function1)> OEN3: P7_1 (ET1_TX_CTL/TX_EN)*1 OEN2: P1_1 (ET0_TX_CTL/TX_EN)*1 OEN1: P7_0 (ET1_TXC/TX_CLK)*2 OEN0: P1_0 (ET0_TXC/TX_CLK)*2
1	OEN1	1b	R/W	
0	OEN0	1b	R/W	

Note 1. When using the terminal as output (in MII or RGMII mode), it is necessary to set OEN bit to 0 (direction is output).

Note 2. If not using the terminal (e.g. RGMII mode), it is necessary to set OEN bit to 0 (direction is output)

Note: By setting this register, the direction of some pins when using Ether's MII or RGMII can be selected.
Refer to **Section 31, Gigabit Ethernet Interface** for switching between MII and RGMII of Ether.

Note: In RGMII mode, set the external terminals shown below to port mode (PMCn = 0) and I/O disabled (PMn = 00b).

Ether Ch0		Ether Ch1	
Terminal Name Function 0	Terminal Name Function 1	Terminal Name Function 0	Terminal Name Function 1
P2_2	ET0_TX_COL	P8_2	ET1_TX_COL
P2_3	ET0_TX_CRS	P8_3	ET1_TX_CRS
P4_2	ET0_RX_ERR	P10_1	ET1_RX_ERR

45.3.16 SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC)

This register sets the IO voltage mode control of SD ch0.

For the offset address, refer to **Section 45.2.16, SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SD0_POC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Note 1. In Boot Mode 1 and Boot Mode 2, R/W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SD0_POC	0b*1	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8 V 0b: I/O domain voltage ≥ 3.3 V (Initial value)*1

Note 1. The initial value of this register

- The IO voltage mode of SD0_CLK, SD0_CMD, SD0_DATA[7-0], SD0_RST# is set by selecting each mode of this register and MD_BOOT[2: 0].
  - When Boot Modes 1 is not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 1 is selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection Function	Selection Device	Control Method
0	0	1	Boot Mode 1	SDHI0	eMMC (3.3 V)	By Hardware
1	0	1	Boot Mode 1	SDHI0	eMMC (1.8 V)	By Hardware
Other			SD_ch0 Control by Register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

45.3.17 SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC)

This register sets the IO voltage mode control of SD ch1.

For the offset address, refer to **Section 45.2.17, SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SD1_POC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SD1_POC	0b	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8 V 0b: I/O domain voltage ≥ 3.3 V (Initial value)

Note: The IO voltage mode of SD1_CLK, SD1_CMD, SD1_DATA [3-0] is set by this register.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

45.3.18 XSPI IO Voltage Mode Control Register (XSPI_POC)

This register sets the IO voltage mode control of XSPI.

For the offset address, refer to **Section 45.2.18, XSPI IO Voltage Mode Control Register (XSPI_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	XSPI_POC[1]	XSPI_POC[0]
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Note 1. In Boot Mode 2, R/W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1,0	XSPI_POC [1:0]	00b*1	R/W	This bit sets the IO voltage mode. 00b: I/O domain voltage 3.3 V (Initial value)*1 01b: I/O domain voltage 1.8 V 10b: I/O domain voltage 2.5 V 11b: Setting prohibitted

Note 1. The initial value of this register

- The IO voltage of QSPI0_SPCLK, QSPI0_IO[3-0], QSPI0_SSL, QSPI_RESET#, QSPI_WP# is set by each mode of this register and MD_BOOT[2: 0].
  - When Boot Mode 2 is not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Mode 2 is selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection Function	Selection Device	Control method
0	1	0	Boot Mode 2	XSPI I/O Bus Controller	Single/Quad (3.3 V)	By Hardware
1	1	0	Boot Mode 2		Single/Quad/Octal (1.8 V)	By Hardware
Other			XSPI Control by register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 1.8 V and the register is set to 3.3 V, the reliability of this LSI will be affected.

45.3.19 Input Enable Control Register (IEN_m)

This register is a register that controls the input of the special purpose port.

For the offset address, refer to **Section 45.2.19, Input Enable Control Register (IEN_m)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	IEN_m3	—	—	—	—	—	—	—	IEN_m2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IEN_34	—	—	—	P7_0 (ET1_TXC/TX_CLK)*1

Note 1. Regarding these terminals, this register is available when using a peripheral function described in parentheses.

45.3.20 I3C Control Register (I3C_SET)

This register is a register that controls I3C Interface.

For the offset address, refer to **Section 45.2.20, I3C Control Register (I3C_SET)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	POC	—	STBN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3, 1	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	POC	0	R/W	Set the voltage mode of I3C Interface. 0b: I/O domain voltage 1.8 V (Initial value) 1b: I/O domain voltage 1.2 V
0	STBN	1	R/W	Control the standby mode of I3C Interface. 0b: Standby mode*1 1b: Normal mode (Initial value)

Note 1. The output is fixed at Hi-Z and no data is transmitted to the inside even if data is input from outside. “Standby mode” is available when using I^2C mode only. (Not available when using I3C mode)

45.3.21 XSPI/OCTA Output Enable Control Register (XSPI/OCTA Hi-Z)

This register is a register that controls the output enable of XSPI /OctaRAM I/O buffer.

For the offset address, refer to **Section 45.2.21, XSPI/OCTA Output Enable Control Register (XSPI/OCTA Hi-Z)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SORST_N
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SORST_N	0	R/W	Control the output enable of XSPI /OctaRAM Interface (XSPI_xxx pins). 0b: Control to Hi-Z (output disable) 1b: Unlock Hi-Z*1

Note 1. In this case, status of output enable (Active Low) is Low or depends on status of XSPI/OCTA controller.

45.4 Operation

The operating procedure for the general-purpose I/O port function and the operating procedure for peripheral functions are shown below.

45.4.1 Operation for GPIO Function

(1) Set the PMC_m register to “0” (initial value = 0).

(2) Set the GPIO input/output with the PM_m register.

(3) Set the GPIO output value in the P_m register.

(4) The input value of the input terminal can be detected by the PIN_m register.

(5) When setting the interrupt input using the GPIO input pin, set the ISEL_m register to “1”.

- Set the FILONOFF_m, IOLH_m and PUPD_m registers between (1) and (2) as necessary.
- Set the FILONOFF_m register when using GPIO to set a digital noise filter for interrupt input and GPIO input.
- Set the FILNUM_m and FILCLKSEL_m registers according to the purpose of use.

45.4.2 Operation for Peripheral Function

(1) Set the PWPR register to allow writing to the PFC_m register.

After setting the PWPR.B0WI bit to “0” (initial value = 1), set the PWPR.PFCWE bit to “1” (initial value = 0).

Select the required function from Functions 1-8. (Hereafter, Function1 setting example)

(2) Set PFC_m = 000b and switch to Function1.

(3) Set the PMC_m register to “1” (initial value = 0).

(4) Set the PFC_m register to write-protected. After setting the PWPR.PFCWE bit to “0”, set the PWPR.B0WI bit to “1”.

- Set the FILONOFF_m, IOLH_m and PUPD_m registers according to the purpose of use.
- Set the FILONOFF_m register when using GPIO to set a digital noise filter for the IRQ[0-7].
- Set the FILNUM_m and FILCLKSEL_m registers according to the purpose of use. And also, the NMI input can set the noise filter by the same registers.

46. Debug Interface

46.1 Overview

This LSI has a debug interface for boundary scan function and debug support for Cortex-A55, Cortex-M33 and Cortex-M33_FPU.

46.1.1 Features

The functions of the debug interface of this LSI are shown below.

- Debug Interface
  - Support JTAG and SWD

- Debugger control function (DAP function)
  - Direct control of IP without going through CPU by switching Access Port (AP)

- Trace data support
  - Cortex-A55 trace output
  - Cortex-M33 / Cortex-M33_FPU trace output
  - Buffer function of trace data by ETF
  - Trace data output to system bus by using ETR

- Boundary Scan
  - Connection test between this LSI and other LSIs on the user board

- Other functions
  - Interlocking operation of (Cortex-A55, Cortex-M33 and Cortex-M33_FPU), system counter (SYC), watchdog timer, general timer (GTM), and debug component by cross trigger
  - Support WDT counter stop control function
  - Add time information to trace data by Time Stamp (24 MHz operation)

46.1.2 Block Diagram

Figure 46.1 shows the block diagram of the debug interface, and **Figure 46.2** shows the block diagram of the Core Sight System (CST).

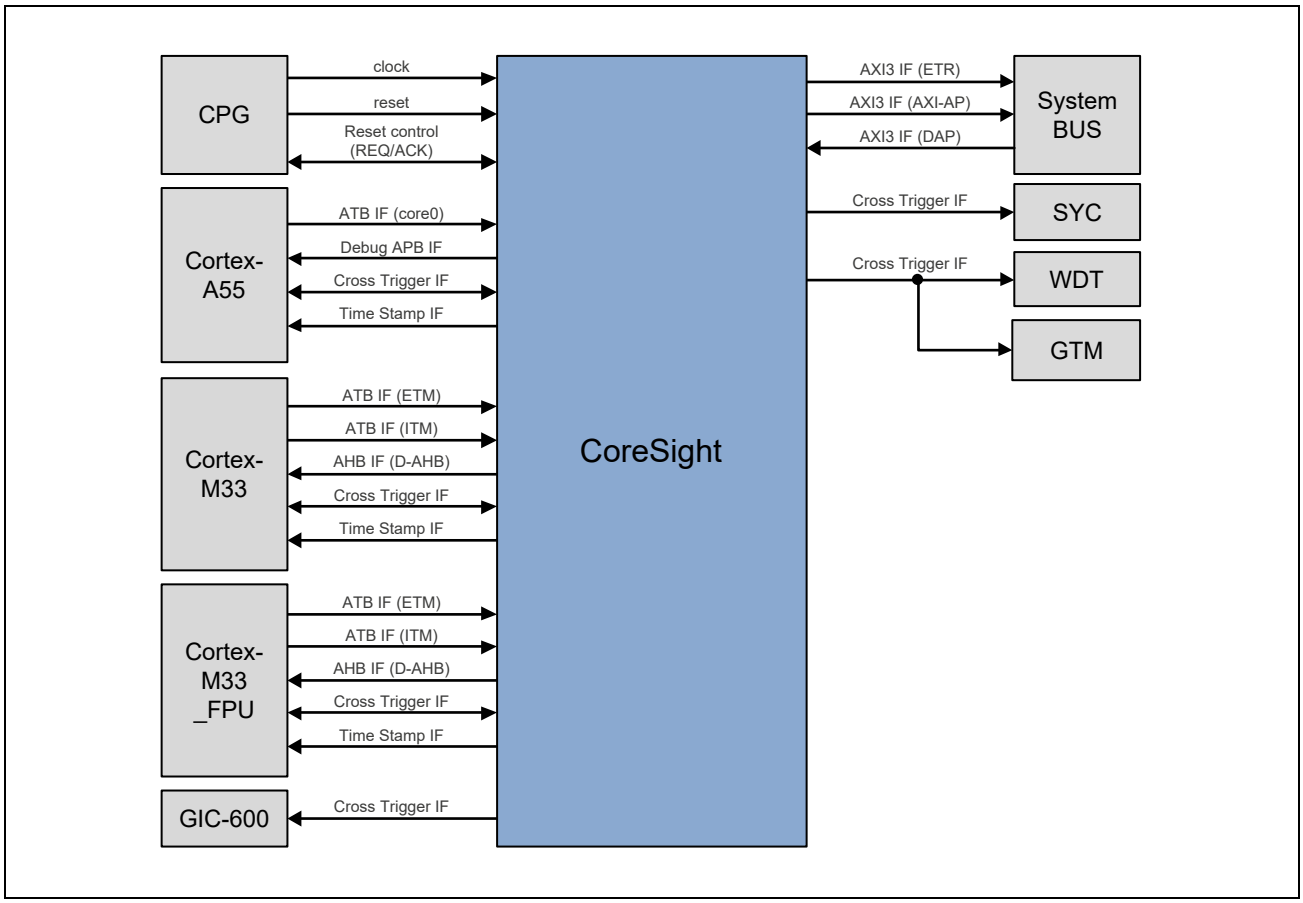

Figure 46.1 Debug System Block Diagram

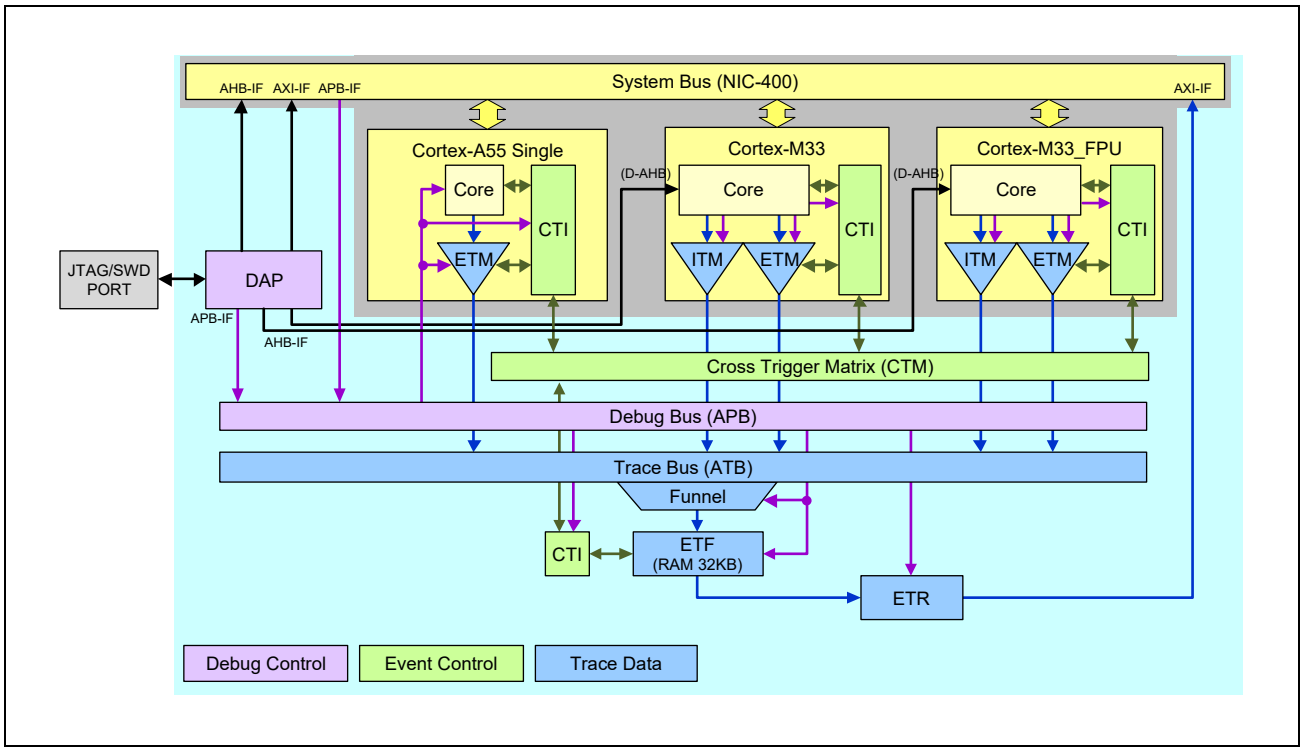

Figure 46.2 Core Sight System Block Diagram

- Debug Bus (APB)

  Bus used for controlling debug functions and acquiring debug data (register values and trace data in On-Chip Buffer)

  - DAP: Debug Access Port

- Cross Trigger Matrix (CTM)

  Functions required for co-debugging triggered by mutual events between CPU and Component

  - CTI: Cross Trigger Interface

- Trace Bus (ATB)

  A data bus which the trace data output by ETM flows

  - ETM: Embedder Trace Macrocell
  - ETR: Embedder Trace Router
  - ETF: Embedder Trace FIFO
  - Funnel: Trace data merge function

For details on ETM, ETR, and ETF, refer to “CoreSight Trace Memory Controller Technical Reference Manual”.

46.1.3 External Pins

- JTAG pins

The debug interface supports JTAG IF and SWD IF. **Table 46.1** shows the JTAG pins and their functions.

Table 46.1 JTAG Pins

Pin Name	I/O	Function		Name
		JTAG IF	SWD IF	
TCK/SWDCLK	Input	TCK	SWCLK	Test clock, Serial wire clock
TMS/SWDIO	Input, Input/Output	TMS	SWDIO	Test mode select, Serial wire data input/output
TDI	Input	TDI	—	Test data input
TDO	Output	TDO	—	Test data output
TRST#	Input	TRST	—	Test reset

- DEBUGEN pins

Table 46.2 shows the functions of the DEBUGEN pin.

Table 46.2 DEBUGEN Pins

Pin Name	I/O	Function
DEBUGEN	Input	Switches between normal operation and debug operation. 0: Normal operation 1: Debug operation

The DEBUGEN value must be fixed before releasing the power-on reset (PRST#). **Table 46.3** shows the difference in operation between normal operation and debug operation.

Table 46.3 Difference in Operation by DEBUGEN

	Normal Operation (DEBUGEN=0)	Debug Operation (DEBUGEN=1)	Related Module
Debug function module (CoreSight (other than DAP))	Boot impossible (Reset state)	Boot (Refer **Section 46.6.1, Debug Related Reset** for reset condition and range)	CPG (Reset control)

- BSCANP pins

Table 46.4 shows the functions of the BSCANP pin.

Table 46.4 BSCANP Pins

Pin Name	I/O	Function
BSCANP	Input	Switches between normal operation and boundary scan test mode. 0: Normal operation 1: Boundary scan test mode

Boundary scan test mode is a mode in which a connection test is performed between the terminals of this LSI and other ICs connected on the customer's board and is performed when BSCANP = 1.

The actual access is controlled by the 5 terminals of JTAG when BSCANP = 1.

Table 46.5 shows the operation modes of this LSI according to the values of the DEBUGEN pin and BSCANP pin.

Table 46.5 Operating Mode

Pin Name		
BSCANP	DEBUGEN	Operating Mode
0	0	Normal operation
0	1	Debug operation
1	*	Boundary scan test mode

46.1.4 Treatment of Unused Pins

When the external terminal of the debug interface is not used, handle it as shown in **Table 46.6**.

Table 46.6 Handling of Unused Pins

Pin Name	Handle*1
TCK/SWDCLK	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TMS/SWDIO	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TDO	Open-circuit
TRST#*2	Fix this pin at a low level (pull down or connect to the ground level)
DEBUGEN	Fix this pin at a low level (pull down or connect to the ground level)
BSCANP	Fix this pin at a low level (pull down or connect to the ground level)

Note 1. Mount the pull-up/pull-down resistors on the board side.

Note 2. TRST# should be fixed at low level in non-debug mode, and TRST# should be changed from low level to high level in debug mode.

46.2 Address Space

The CoreSight of this LSI has a 4 MB debug system address space. The address space of the debug system is shown in **Table 46.7**.

Table 46.7 Address Space of the Debug System

Address	Component*1
CoreSight Debug Components (Overall Address Space of this LSI)	
H'0_10C0_0000 ~ H'0_10C0_FFFF	CoreSight: ROM table
H'0_10C1_0000 ~ H'0_10C1_FFFF	CoreSight: Timestamp generator
H'0_10C2_0000 ~ H'0_10C2_FFFF	CoreSight: ETF
H'0_10C3_0000 ~ H'0_10C3_FFFF	CoreSight: ETR
H'0_10C4_0000 ~ H'0_10C4_FFFF	CoreSight: Trace Funnel
H'0_10C5_0000 ~ H'0_10C5_FFFF	CoreSight: CTI0
H'0_10C6_0000 ~ H'0_10C6_FFFF	CoreSight: CTI1
H'0_10C7_0000 ~ H'0_10CE_FFFF	Reserved
H'0_10CF_0000 ~ H'0_10CF_FFFF	Reserved
Reserved	
H'0_10D0_0000 ~ H'0_10DF_FFFF	Reserved
Cortex-A55 Debug Components (Overall Address Space of this LSI)	
H'0_10E0_0000 ~ H'0_10E0_FFFF	Cortex-A55: ROM table
H'0_10E1_0000 ~ H'0_10E1_FFFF	Cortex-A55: Core0 Debug
H'0_10E2_0000 ~ H'0_10E2_FFFF	Cortex-A55: Core0 CTI
H'0_10E3_0000 ~ H'0_10E3_FFFF	Cortex-A55: Core0 PMU
H'0_10E4_0000 ~ H'0_10E4_FFFF	Cortex-A55: Core0 ETM
H'0_10E5_0000 ~ H'0_10ED_FFFF	Reserved
H'0_10EE_0000 ~ H'0_10EE_FFFF	Cortex-A55: Core0 DSU CTI
H'0_10EF_0000 ~ H'0_10FF_FFFF	Reserved
Cortex-M33/Cortex-M33_FPU Debug Components	
H'E000_0000 ~ H'E000_0FFF	Cortex-M33/Cortex-M33_FPU: ITM
H'E000_1000 ~ H'E000_1FFF	Cortex-M33/Cortex-M33_FPU: DWT
H'E000_2000 ~ H'E000_2FFF	Cortex-M33/Cortex-M33_FPU: FPB
H'E000_3000 ~ H'E000_DFFF	Reserved
H'E000_E000 ~ H'E000_EFFF	Cortex-M33/Cortex-M33_FPU: Secure SCS
H'E000_F000 ~ H'E002_DFFF	Reserved
H'E002_E000 ~ H'E002_EFFF	Cortex-M33/Cortex-M33_FPU: Non-Secure SCS
H'E002_F000 ~ H'E004_0FFF	Reserved
H'E004_1000 ~ H'E004_1FFF	Cortex-M33/Cortex-M33_FPU: ETM
H'E004_2000 ~ H'E004_2FFF	Cortex-M33/Cortex-M33_FPU: CTI
H'E004_3000 ~ H'E00F_EFFF	Reserved
H'E00F_F000 ~ H'E00F_FFFF	Cortex-M33/Cortex-M33_FPU: ROM Table

Note 1. Access to the Reserved area is prohibited. Operation is not guaranteed when accessed.

NOTE

- The CoreSight Debug Components area and Cortex-A55 Debug Components area can be accessed via the system bus and APB-AP.
  APB-AP is connected to port-0 of DAP. For the port configuration of DAP, refer to **Section 46.6.2, DAP**.
- Each component is placed on a 64KB address boundary according to the ARMv8 Debug memory map. As an entity, the first 4 KB is valid.

46.3 Register Descriptions

46.3.1 ID Register (BSID)

The BSID register is a 32-bit register that cannot be accessed from the CPU. When the BSCANP pin is 1, it can be read from the TDO pin by setting the IDCODE command on the TAP controller. It cannot be written.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BSID[31:16]															
Initial Value	0	0	0	0	1	0	0	0	0	1	0	1	1	1	1	0
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSID[15:0]															
Initial Value	0	0	0	0	0	1	0	0	0	1	0	0	0	1	1	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BSID[31:0]	H'085E_0447	—	This is the ID register specified in JTAG. The upper 4 bits (bit31-28) may change depending on the chip version.

46.3.2 Other Registers

For details on each register other than the BSID register, refer to "ARM CoreSight SoC-400 Technical Reference Manual" and "CoreSight Trace Memory Controller Technical Reference Manual".

46.4 Debug Connection

46.4.1 Debug Connection Mode

There are the following four modes for the debug connection method of this LSI.

Authentication Mode	Method
No authentication	Allow access from the debugger without authentication (initial setting)
SEC authentication*1	Allow access from the debugger after authentication is OK. (authentication method is security authentication by security IP)
Authentication refusal*1	Block access from the debugger

Note 1. SEC authentication and Authentication refusal can only be authenticated with secure products.

For SEC authentication modes, enter the authentication code from the debugger is needed.

For information on the authentication function of secure products, please contact our sales.

46.5 Debug Access Range

The debug access range by CoreSight is for all slaves as well as Cortex-A55. For details, refer to **Section 5.3, Accessible Areas**.

46.6 Operation

46.6.1 Debug Related Reset

Please refer to **Section 7.3.2.1, Range of Reset Application** for debug-related reset and reset range.

46.6.2 DAP

DAP is equipped with SWJ-DP as Debug Port (DP) and APB-AP, AXI-AP, AHB-AP as Access Port (AP).

The DAP port numbers are shown in **Table 46.8**. Indicates the correspondence between the port number specified in the DP SELECT register and the AP, and its usage.

Table 46.8 DAP Port Number

Port number	AP	Usage
Port-0	APB-AP	Debug Component recognition and settings
Port-1	AXI-AP	System IP control (access to system bus)
Port-3	AHB-AP	Cortex-M33 settings
Port-4	AHB-AP	Cortex-M33_FPU settings

46.6.3 Trace

46.6.3.1 Data Flow

In CoreSight, all trace data is aggregated once by Trace Funnel, and stored in ETF, or output to the system bus via ETR in the subsequent stage. Setting this port number to the Trace Funnel according to the route of the trace data is needed. The Trace Funnel port numbers are shown in **Table 46.9**.

Table 46.9 Trace Funnel Port Number

Port Number	Source Components
Port-0	Cortex-A55: Core0 ETM
Port-1	Cortex-M33: ITM
Port-2	Cortex-M33: ETM
Port-3	Cortex-M33_FPU: ITM
Port-4	Cortex-M33_FPU: ETM

46.6.3.2 Timestamp

If time information want to be included in the trace data, the Timestamp Generator can be used. The timestamp replicator port numbers are shown in **Table 46.10**. The Timestamp Generator runs on a 24-MHz clock.

Table 46.10 Timestamp Replicator Port Number

Port Number	Target Components
Port-0	Cortex-A55: Core0 ETM
Port-1	Cortex-M33
Port-2	Cortex-M33_FPU

46.6.4 Cross Trigger

The CTI (Cross Trigger Interface) implemented in CoreSight, Cortex-A55, Cortex-M33 and Cotex-M33_FPU is used to communicate debug events.

46.6.4.1 CoreSight Cross Trigger Connection

CoreSight has two CTIs. The connection specifications are shown in **Table 46.11** to **Table 46.14**.

Table 46.11 CoreSight CTI0 Trigger Input

Trigger Input Bit	Source Components	Description
[7]	(Unused)	—
[6]	(Unused)	—
[5]	(Unused)	—
[4]	(Unused)	—
[3]	ETR	ETR Event Output 1 (FULL)
[2]	ETR	ETR Event Output 0 (ACQCOMP)
[1]	ETF	ETF Event Output 1 (FULL)
[0]	ETF	ETF Event Output 0 (ACQCOMP)

Table 46.12 CoreSight CTI0 Trigger Output

Trigger Output Bit	Destination Components	Description
[7]	SYC	SYC Event input1 (RESTART REQ/ACK)
[6]	SYC	SYC Event input0 (HALT REQ)
[5]	WDT/GTM	WDT/GTM Event input1 (RESTART REQ/ACK)
[4]	WDT/GTM	WDT/GTM Event input0 (HALT REQ)
[3]	ETR	ETR Event Input 1 (TRIGIN)
[2]	ETR	ETR Event Input 0 (FLUSHIN)
[1]	ETF	ETF Event Input 1 (TRIGIN)
[0]	ETF	ETF Event Input 0 (FLUSHIN)

[0]	GIC-600	GIC-600 Event Input (sample_req/sample_ack)

46.6.4.2 Cortex-A55 Cross Trigger Connection

The Cortex-A55 has one CTI (Cortex-A55 Core0 CTI). The connection specifications for each are shown in **Table 46.15** and **Table 46.16**.

Table 46.15 Cortex-A55 CTI0 trigger input

Trigger Input Bit	Source Components	Description
[7]	Cortex-A55: Core0 ETM	ETM Trace Output 3 trigger event
[6]	Cortex-A55: Core0 ETM	ETM Trace Output 2 trigger event
[5]	Cortex-A55: Core0 ETM	ETM Trace Output 1 trigger event
[4]	Cortex-A55: Core0 ETM	ETM Trace Output 0 trigger event
[3]	(Unused)	—
[2]	Cortex-A55: Core0 PE	Profiling sample trigger event
[1]	Cortex-A55: Core0 PE	Performance Monitors Overflow trigger event
[0]	Cortex-A55: Core0 PE	Cross-halt trigger event

Table 46.16 Cortex-A55 CTI0 Trigger Output

Trigger Output Bit	Destination Components	Description
[7]	Cortex-A55: Core0 ETM	Generic Trace External Input 3 trigger event
[6]	Cortex-A55: Core0 ETM	Generic Trace External Input 2 trigger event
[5]	Cortex-A55: Core0 ETM	Generic Trace External Input 1 trigger event
[4]	Cortex-A55: Core0 ETM	Generic Trace External Input 0 trigger event
[3]	(Unused)	—
[2]	External (GIC-600)	Generic CTI Interrupt trigger event
[1]	Cortex-A55: Core0 PE	Restart Request trigger event
[0]	Cortex-A55: Core0 PE	Debug Request trigger event

46.6.4.3 Cortex-M33 Cross Trigger Connection

The Cortex-M33 and Cortex-M33_FPU have one CTI. The connection specifications for each are shown in **Table 46.17** and **Table 46.18**.

Table 46.17 Cortex-M33 / Cortex-M33_FPU CTI0 trigger input

Trigger Input Bit	Source Components	Description
[7]	(Unused)	—
[6]	(Unused)	—
[5]	Cortex-M33:ETM	ETM Event Output 1
[4]	Cortex-M33:ETM/Processor	ETM Event Output 0 or Comparator Output 3
[3]	Cortex-M33:Processor	DWT Comparator Output 2
[2]	Cortex-M33:Processor	DWT Comparator Output 1
[1]	Cortex-M33:Processor	DWT Comparator Output 0
[0]	Cortex-M33:Processor	Processor Halted

Table 46.18 Cortex-M33 / Cortex-M33_FPU CTI0 Trigger Output

Trigger Output Bit	Destination Components	Description
[7]	Cortex-M33:ETM	ETM Event Input 3
[6]	Cortex-M33:ETM	ETM Event Input 2
[5]	Cortex-M33:ETM	ETM Event Input 1
[4]	Cortex-M33:ETM	ETM Event Input 0
[3]	Cortex-M33:system	Interrupt request 1
[2]	Cortex-M33:system	Interrupt request 0
[1]	Cortex-M33:Processor	Processor Restart
[0]	Cortex-M33:Processor	Processor debug request

46.6.5 WDT Counter Stop Control

This LSI has a WDT counter stop control function linked with a debug event to prevent an unintended reset by WDT during debug operation. When a debug event occurs, CoreSight asserts the WDT counter stop request signal, controls the WDT counter stop signal (CNTSTOP), and stops counting. The target WDT is all WDT. For details on the WDT count stop function, refer to **Section 6.4.2, WDT Stop Control Function**.

46.6.6 GTM Counter Stop Control

This LSI has a GTM counter stop control function linked with debug events to prevent unintended GTM counts during debug operation. When a debug event occurs, CoreSight asserts a GTM counter stop request signal to stop the GTM count.

46.6.7 SYC Counter Stop Control

This LSI has a SYC counter stop control function linked with debug events to prevent unintended SYC counts during debug operation. When a debug event occurs, CoreSight asserts a SYC counter stop request signal to stop the SYC count.

47. Electrical Characteristics

47.1 Absolute Maximum Ratings

Table 47.1 Absolute Maximum Ratings

Item		Symbol	Value	Unit
Power Supply voltage (0.94 V)		V_{DD}	−0.3 to +1.26	V
		PLL16_AV_{DD}		
		PLL23_AV_{DD}		
		PLL4_AV_{DD}		
		V_{DD_ISO}		
		PCIE_V_{DD09}		
Power Supply voltage (1.8 V)		VBATT_V_{DD}	−0.3 to +2.5	V
		ADC_AV_{DD18}		
		OTP_AV_{DD18}		
		USB_AV_{DD18}		
		USB_V_{DD18}		
		PCIE_V_{DD18}		
		DDR_V_{AA}		
Power Supply voltage (1.8 V)		PV_{DD18}	−0.3 to +2.45	V
		JTAG_PV_{DD}		
Power Supply voltage (3.3 V)		PV_{DD33}	−0.3 to +4.1	V
		USB_V_{DD33}		
Power Supply Voltage (1.8 V/3.3 V switchable)		XSPI_PV_{DD}	−0.3 to +2.45 (1.8 V mode)	V
		SDn_PV_{DD} (n = 0, 1)	−0.3 to +4.1 (3.3 V mode)	V
Power Supply Voltage (1.2 V/1.8 V switchable)		I3C_PV_{DD}	−0.3 to +2.45 (1.8 V mode)	V
			−0.3 to +1.8 (1.2 V mode)	V
Power Supply Voltage (1.8 V/2.5 V/3.3 V switchable)		$PV_{DD182533\_n}$ (n = 0, 1)	−0.3 to +2.45 (1.8 V mode)	V
			−0.3 to +3.2 (2.5 V mode)	V
			−0.3 to +4.1 (3.3 V mode)	V
Power Supply Voltage (DDR)		DDR_V_{DDQ}	−0.3 to +1.68	V
Input voltage	3.3 V I/O input signal	—	−0.5 to 3.3 V power supply + 0.5	V
	2.5 V I/O input signal	—	−0.5 to 2.5 V power supply + 0.5	V
	1.8 V I/O input signal	—	−0.5 to 1.8 V power supply + 0.5	V
Operating temperature	Ambient temperature	T_a	−40 to +85*1	°C
	Junction temperature	T_j	−40 to +125	°C
Storage temperature	Ambient temperature	T_{stg}	−40 to +150	°C

Note 1. If wider temp is required than this range, use case has to be investigated.

47.2 Power Supply

Table 47.2 Power Supply

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Power Supply Voltage (VBATT)	VBATT_V_{DD}	1.50	1.8	1.95	V	
Power Supply Voltage (Core)	V_{DD}	0.905	0.94	0.99	V	
Power Supply Voltage (PLL)	PLL16_AV_{DD}	0.905	0.94	0.99	V

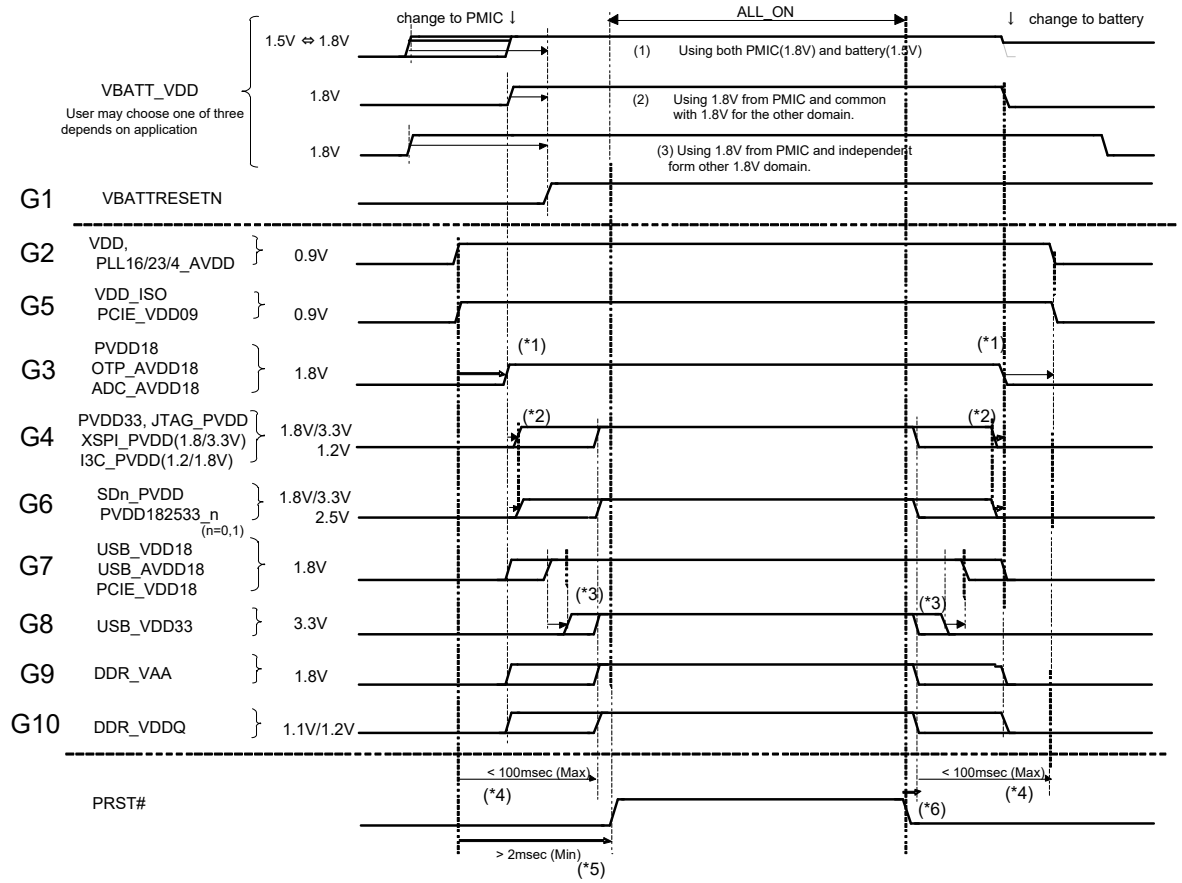
47.3 Power-On/Power-Off Sequence



Note 1. G3 must be powered on after G2, G5 and powered off before G2, G5. G3 and G7 may be powered on / off at the same time.

Note 2. G4, G6 must be powered on after G3 and powered off before G3.

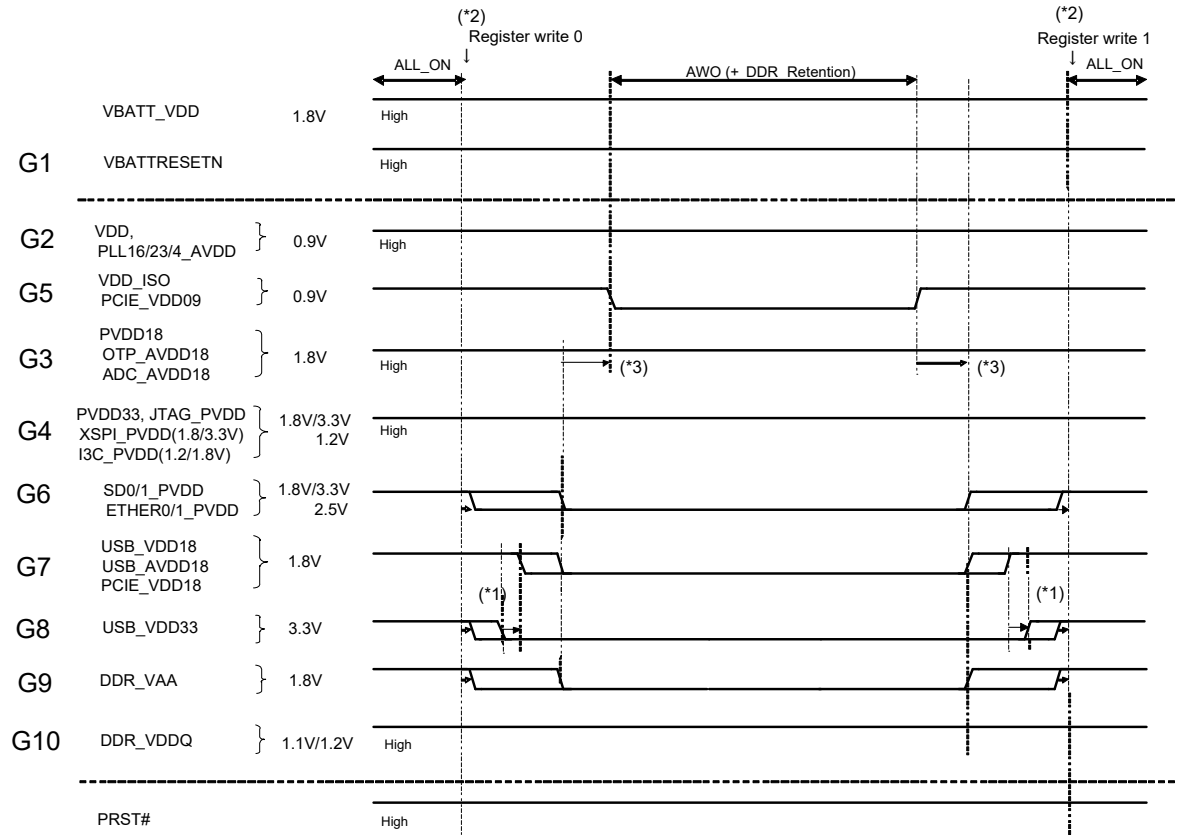
Note 3. G8 must be powered on after G7 and powered off before G7.

Note 4. It is recommended that all the power domains are powered on or off within approximately 100 msec.

Note 5. PRST# must be High after 2 msec from VDD (G2) power on.

Note 6. PRST# must be changed to Low before powered off.

Figure 47.1 Power-On/Power-Off Sequence 1 (All_OFF to ALL_ON, ALL_ON to ALL_OFF)

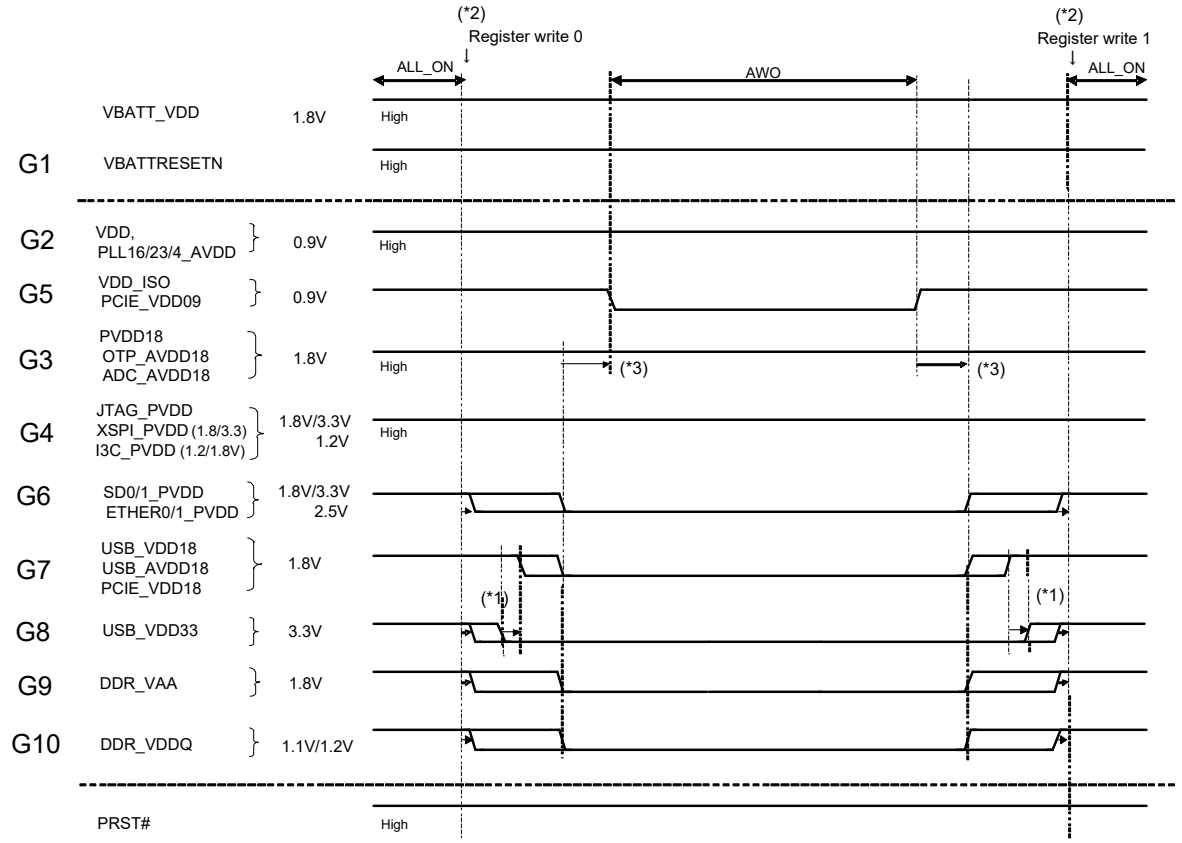


Note 1. G8 must be powered off before G7 and powered on after G7.

Note 2. The following registers must be written before G6, G7, G8, G9 are powered off or after G6, G7, G8, G9 are powered on.
- ISO_IOBUF_SE18_CTRL
- SYS_USB_PWRRDY
- CPG_RST_PCI (in CPG) or SYS_PCIE_RST_RSM_B (in SYSC)

Note 3. G5 must be powered off after G6 to G9 are powered off and powered on before G6 to G9 are powered on.

Figure 47.2 Power-On/Power-Off Sequence 2 (ALL_ON to AWO (+DDR Retention), AWO (+DDR Retention) to ALL_ON)

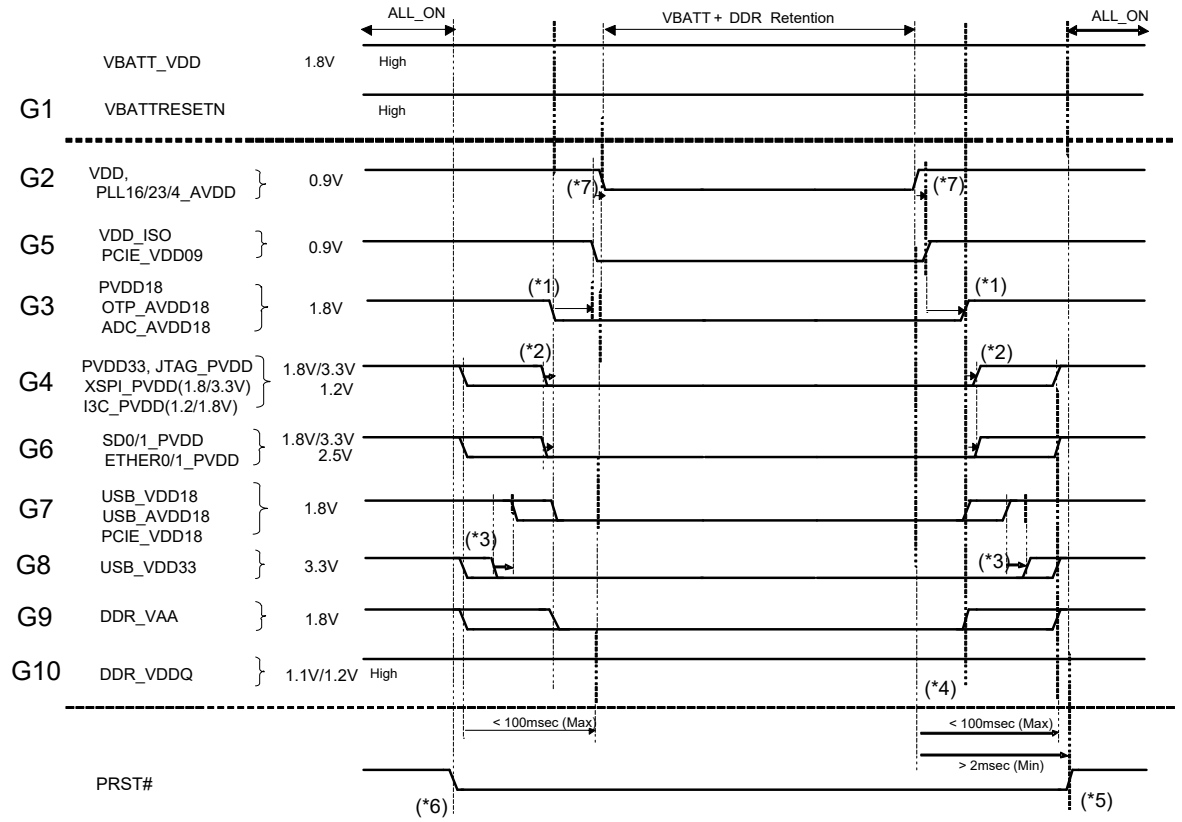


Note 1. G8 must be powered off before G7 and powered on after G7.

Note 2. The following registers must be written before G6, G7, G8, G9, G10 are powered off or after G6, G7, G8, G9, G10 are powered on.
- ISO_IOBUF_SE18_CTRL
- SYS_USB_PWRRDY
- CPG_RST_PCI (in CPG) or SYS_PCIE_RST_RSM_B (in SYSC)

Note 3. G5 must be powered off after G6 to G10 are powered off and powered on before G6 to G10 are powered on.

Figure 47.3 Power-On/Power-Off Sequence 3 (ALL_ON to AWO, AWO to ALL_ON)



Note 1. G3 must be powered off before G2, G5 and powered on after G2, G5. G3 and G7 can be powered on/off at the same time.

Note 2. G4, G6 must be powered off before G3 and powered on after G3.

Note 3. G8 must be powered off before G7 and powered on after G7.

Note 4. It is recommended that all the power domains are powered on or off within approximately 100 msec.

Note 5. PRST# must be High after 2 msec from VDD (G2) power on.

Note 6. PRST# must be changed to Low before powered off.

Note 7. G5 must be powered off before G2 and powered on after G2.

47.4 DC Characteristics

Table 47.3 DC Characteristics (1) [GP I/O (3.3 V)]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	2	—	—	V	
Low-level input voltage		V_{IL}	—	—	0.8	V	
Hysteresis threshold ↑		V_T+	2.1	—	—	V	
Hysteresis threshold ↓		V_T-	—	—	0.7	V	
Output logic high voltage	(I_{OH} = –1.9 mA)	V_{OH}	V_{CCQ} – 0.4	—	—	V	
	(I_{OH} = –4 mA)						
	(I_{OH} = –8 mA)						
	(I_{OH} = –9 mA)						
Output logic low voltage	(I_{OL} = 1.9 mA)	V_{OL}	—	—	0.4	V	
	(I_{OL} = 4 mA)						
	(I_{OL} = 8 mA)						
	(I_{OL} = 9 mA)						
Weak pull-up resistor (input mode)		R_{UP}	10 K	50 K	90 K	Ω	
Weak pull-down resistor (input mode)		R_{DN}	10 K	50 K	90 K	Ω	

Table 47.4 DC Characteristics (2) [SD I/O (1.8/3.3 V)]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	V_{DDQ} × 0.625	—	—	V	3.3 V mode
Low-level input voltage		V_{IL}	—	—	V_{DDQ} × 0.25	V	
Output logic high voltage	(I_{OH} = –4 mA)	V_{OH}	V_{CCQ} – 0.4	—	—	V	
	(I_{OH} = –6 mA)						
	(I_{OH} = –8 mA)						
	(I_{OH} = –9 mA)						
Output logic low voltage	(I_{OL} = 4 mA)	V_{OL}	—	—	0.4	V	
	(I_{OL} = 6 mA)						
	(I_{OL} = 8 mA)						
	(I_{OL} = 9 mA)						
High-level input voltage		V_{IH}	1.27	—	—	V	1.8 V mode
Low-level input voltage		V_{IL}	—	—	0.58	V	
Output logic high voltage	(I_{OH} = –7 mA)	V_{OH}	V_{CCQ} – 0.45	—	—	V	
	(I_{OH} = –8 mA)						
	(I_{OH} = –9 mA)						
	(I_{OH} = –10 mA)						
Output logic low voltage	(I_{OL} = 7 mA)	V_{OL}	—	—	0.45	V	
	(I_{OL} = 8 mA)						
	(I_{OL} = 9 mA)						
	(I_{OL} = 10 mA)						
Weak pull-up resistor (input mode)		R_{UP}	10 K	50 K	90 K	Ω	3.3 V/1.8 V mode
Weak pull-down resistor (input mode)		R_{DN}	10 K	50 K	90 K	Ω	

Table 47.5 DC Characteristics (3) [RGMII (1.8/2.5/3.3 V)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage	V_{IH}	V_{CCQ} × 0.65	—	—	V	3.3 V mode
Low-level input voltage	V_{IL}	—	—	V_{CCQ} × 0.35	V	
Output logic high voltage	V_{OH}	V_{CCQ} – 0.4	—	—	V	
Output logic low voltage	V_{OL}	—	—	0.4	V	
High-level input voltage	V_{IH}	1.7	—	—	V	2.5 V mode
Low-level input voltage	V_{IL}	—	—	0.7	V	
Output logic high voltage	V_{OH}	V_{CCQ} – 0.4	—	—	V	
Output logic low voltage	V_{OL}	—	—	0.4	V	
High-level input voltage	V_{IH}	V_{CCQ} × 0.65	—	—	V	1.8 V mode
Low-level input voltage	V_{IL}	—	—	V_{CCQ} × 0.35	V	
Output logic high voltage	V_{OH}	V_{CCQ} – 0.45	—	—	V	
Output logic low voltage	V_{OL}	—	—	0.45	V	

Table 47.6 DC Characteristics (4) [I3C (1.2/1.8 V)]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	V_{CCQ} × 0.7	—	—	V	1.8 V
Low-level input voltage		V_{IL}	—	—	V_{CCQ} × 0.3	V	I3C Open Drain mode
Output logic low voltage	IOL = 3 mA	V_{OL}	—	—	0.27	V	
High-level input voltage		V_{IH}	V_{CCQ} × 0.7	—	—	V	1.8 V
Low-level input voltage		V_{IL}	—	—	V_{CCQ} × 0.3	V	I2C Open Drain mode*1
Output logic low voltage	IOL = 20 mA	V_{OL}	—	—	0.4	V	
High-level input voltage		V_{IH}	V_{CCQ} × 0.7	—	—	V	1.8 V
Low-level input voltage		V_{IL}	—	—	V_{CCQ} × 0.3	V	I3C CMOS mode
Output logic high voltage	IOL= −3 mA	V_{OH}	V_{CCQ} − 0.27	—		V	
Output logic low voltage	IOL= 3 mA	V_{OL}	—	—	0.27	V	
High-level input voltage		V_{IH}	V_{CCQ} × 0.7	—	—	V	1.2 V
Low-level input voltage		V_{IL}	—	—	V_{CCQ} × 0.3	V	I3C CMOS mode
Output logic high voltage	IOL = −2 mA	V_{OH}	V_{CCQ} − 0.18	—		V	
Output logic low voltage	IOL = 2 mA	V_{OL}	—	—	0.18	V	

Note 1. fast-mode, fast-mode plus

Table 47.7 DC Characteristics (5) [I2C (1.8 V)]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	V_{CCQ} × 0.7	—	—	V	
Low-level input voltage		V_{IL}	—	—	V_{CCQ} × 0.3	V	
Output logic low voltage	IOL = 20 mA	V_{OL}	—	—	0.4	V	

Table 47.8 DC Characteristics (6) [Input (Schmitt/1.8 V)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage	V_{IH}	V_{CCQ} × 0.75	—	—	V	
Low-level input voltage	V_{IL}	—	—	V_{CCQ} × 0.25	V	

Table 47.9 DC Characteristics (7) [Input (3.3 V tolerant/Schmitt)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage	V_{IH}	V_{CCQ} × 0.75	—	—	V	
Low-level input voltage	V_{IL}	—	—	V_{CCQ} × 0.25	V	

Table 47.10 DC Characteristics (8) [USB 2.0]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Input levels for low/full speed						
High (driven)	V_{IH}	2.0	—	—	V	
Low	V_{IL}	—	—	0.8	V	
Differential input sensitivity	V_{DI}	0.2	—	—	V	
Differential common mode range	V_{CM}	0.8	—	2.5	V	
Input levels for high speed						
High-speed squelch detection threshold (differential signal amplitude)	V_{HSSQ}	100	—	150	mV	
High-speed data signaling common mode voltage range (guideline for receiver)	V_{HSCM}	−50	—	500	mV	
Output levels for low/full speed						
Low	V_{OL}	0.0	—	0.3	V	
High (driven)	V_{OH}	2.8	—	3.6	V	
Output signal crossover voltage	V_{CRS}	1.3	—	2.0	V	
Output levels for high-speed						
High-speed idle level	V_{HSOI}	−10.0	—	10.0	mV	
High-speed data signaling high	V_{HSOH}	360	—	440	mV	
High-speed data signaling low	V_{HSOL}	−10.0	—	10.0	mV	
Chirp J level (differential voltage)	V_{CHIRPJ}	700	—	1100	mV	
Chirp K level (differential voltage)	V_{CHIRPK}	−900	—	−500	mV	

Table 47.11 DC Characteristics (9) [ADC]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Resolution	—	—	12	—	Bit	
Analog input channel	—	—	—	8	Channel	
Analog input range	AIN	V_{SS}	—	ADC_AV_{DD18}	V	
Differential non-linearity	DNL	—	—	±3.0	LSB	
Integral non-linearity	INL	—	—	±6.0	LSB	

Table 47.12 DC Characteristics (10) [Current Consumption]

Item	Power Rail Symbol	Max Current	Unit	Remarks
Power Supply Voltage (VBATT)	VBATT_V_{DD}	10	mA	
Power Supply Voltage (Core)	V_{DD}	450	mA	
Power Supply Voltage (ISO)	V_{DD_ISO}	2350	mA	Condition: Cortex-A55, Dhrystone
Power Supply Voltage (PLL)	PLL16_AV_{DD}	10	mA	
	PLL23_AV_{DD}	10	mA	
	PLL4_AV_{DD}	10	mA	
Power Supply Voltage (I/O)	PV_{DD33}	1100	mA	
	PV_{DD18}	20	mA	
Power Supply Voltage (ADC/TSU)	ADC_AV_{DD18}	10	mA	
Power Supply Voltage (OTP)	OTP_AV_{DD18}	10	mA	
Power Supply Voltage (JTAG)	JTAG_PV_{DD}	10	mA	
Power Supply Voltage (XSPI) (1.8 V)	XSPI_PV_{DD}	400	mA	
Power Supply Voltage (XSPI) (3.3 V)	XSPI_PV_{DD}	600	mA	
Power Supply Voltage (I3C) (1.8 V)	I3C_PV_{DD}	10	mA	
Power Supply Voltage (I3C) (1.2 V)	I3C_PV_{DD}	10	mA	
Power Supply Voltage (SD) (1.8 V)	SD0_PV_{DD}	400	mA	
	SD1_PV_{DD}	300	mA	
Power Supply Voltage (SD) (3.3 V)	SD0_PV_{DD}	700	mA	
	SD1_PV_{DD}	500	mA	
Power Supply Voltage (Ether) (1.8 V)	$PV_{DD182533\_0}$	110	mA	
	$PV_{DD182533\_1}$	110	mA	
Power Supply Voltage (Ether) (2.5 V)	$PV_{DD182533\_0}$	200	mA	
	$PV_{DD182533\_1}$	200	mA	
Power Supply Voltage (Ether) (3.3 V)	$PV_{DD182533\_0}$	200	mA	
	$PV_{DD182533\_1}$	200	mA	
Power Supply Voltage (USB)	USB_V_{DD33}	100	mA	
	USB_AV_{DD18}	200	mA	
	USB_V_{DD18}	200	mA	
Power Supply Voltage (PCIe)	PCIE_V_{DD18}	100	mA	
	PCIE_V_{DD09}	100	mA	
Power Supply Voltage (DDR)	DDR_V_{AA}	10	mA	
Power Supply Voltage (DDR) (DDR4)	DDR_V_{DDQ}	300	mA	
Power Supply Voltage (DDR) (LPDDR4)	DDR_V_{DDQ}	400	mA	

Note: T_j = 125°C, Power supply voltage = Max.

47.5 AC Characteristics

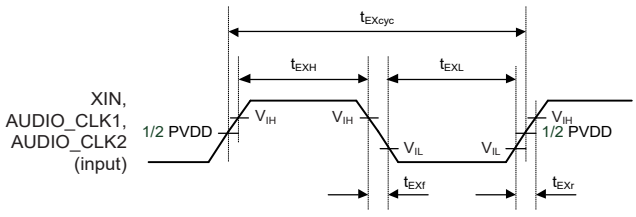
Conditions: VBATT_V_{DD} = 1.50 to 1.95 V, V_{DD} = PLL16/23/4_AV_{DD} = 0.905 to 0.99 V,
PV_{DD33} = 3.0 to 3.6 V, PV_{DD18} = ADC_AV_{DD18} = OTP_AV_{DD18} = 1.65 to 1.95 V,
JTAG_PV_{DD} = 1.65 to 1.95 V, XSPI_PV_{DD} = 1.65 to 1.95 V / 3.0 to 3.6 V,
I3C_PV_{DD} = 1.1 to 1.3 V / 1.65 to 1.95 V, V_{DD_ISO} = PCIE_V_{DD09} = 0.905 to 0.99 V,
SDn_PV_{DD} (n = 0, 1) = 1.65 to 1.95 V / 3.0 to 3.6 V,
$PV_{DD182533\_n}$ (n = 0, 1) = 1.65 to 1.95 V / 2.3 to 2.7 V / 3.0 to 3.6 V,
USB_V_{DD33} = 3.0 to 3.6 V, USB_AV_{DD18} = USB_V_{DD18} = PCIE_V_{DD18} = 1.65 to 1.95 V,
DDR_V_{AA} = 1.65 to 1.95 V, DDR_V_{DDQ} = 1.06 to 1.17 V (LPDDR4) / 1.14 to 1.26 V (DDR4),
USB_V_{SS} = 0 V, V_{SS} = 0 V, T_a = −40 to +85°C, T_j = −40 to +125°C

47.5.1 Clock Timing

Table 47.13 Clock Timing Table

Item	Symbol	Min.	Max.	Unit	Figures
XIN clock input frequency	f_{EX}	24 – 50ppm*1	24 + 50ppm*1	MHz	**Figure 47.5**
XIN clock input cycle time	t_{EXcyc}	41.67	41.67	ns	
AUDIO_CLK1, AUDIO_CLK2 clock input frequency (external clock is input)	f_{EX}	10	50	MHz	
AUDIO_CLK1, AUDIO_CLK2 clock input cycle time (external clock is input)	t_{EXcyc}	20	100	ns	
XIN, AUDIO_CLK1, AUDIO_CLK2 clock input low level pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
XIN, AUDIO_CLK1, AUDIO_CLK2 clock input high level pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	
XIN, AUDIO_CLK1, AUDIO_CLK2 clock input rise time	t_{EXr}	—	4	ns	
XIN, AUDIO_CLK1, AUDIO_CLK2 clock input fall time	t_{EXf}	—	4	ns	
Oscillator stabilization time	t_{OSC}	—	2	ms	**Figure 47.6**, **Figure 47.7**
Mode hold time	t_{MDH}	—	12	µs	
Mode setup time	t_{MDS}	—	0	µs	

Note 1. When using RGMII interface. If not using RGMII mode, this spec is ±100 ppm.



Note: When the clock is input on the EXCLK, AUDIO_CLK1 or AUDIO_CLK2

Figure 47.5 EXCLK, AUDIO_CLK1 and AUDIO_CLK2 Clock Input Timing

47.5.15 I²C Bus Interface Access Timing

Table 47.34 I²C Bus Interface Timing

Item	Symbol	I/O	Standard Mode (Sm)		Fast Mode (Fm)		Fast Mode Plus (Fm+)		Unit
			Min.	Max.	Min.	Max.	Min.	Max.	
SCL clock frequency	f_{CLK}	I/O	0	100	0	400	0	1000	kHz
Bus free time (between stop and start condition)	t_{BUF}	I/O	4.7	—	1.3	—	0.5	—	µs
Hold time*1	$t_{HD:STA}$	I/O	4.0	—	0.6	—	0.26	—	µs
Low period of SCL clock	t_{LOW}	I/O	4.7	—	1.3	—	0.5	—	µs
High period of SCL clock	t_{HIGH}	I/O	4.0	—	0.6	—	0.26	—	µs
Setup time for start / restart condition	$t_{SU:STA}$	I/O	4.7	—	0.6	—	0.26	—	µs
Data hold time (I²C bus device)	$t_{HD:DAT}$	I/O	0*2	—	0*2	—	0	—	µs
Data setup time	$t_{SU:DAT}$	I/O	250	—	100*3	—	50	—	ns
SDA and SCL signal rise time	t_R	Input	—	1000	20	300	—	120	ns
SDA and SCL signal fall time*3	t_F	Input	—	300	20 × (PV_{DD18}/ 5.5 V)	300	20 × (PV_{DD18}/ 5.5 V)	120	ns
		Output	—	300	20 × (PV_{DD18}/ 5.5 V)*6	300*6	20 × (PV_{DD18}/ 5.5 V)*7	120*7	ns
Setup time for STOP condition	$t_{SU:STO}$	I/O	4.0	—	0.6	—	0.26	—	µs
Capacitive load for each bus line	C_b	—	—	400*4	—	400*4	—	550*4	pF
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	Input	—	—	0	50*5	0	50*5	ns

Note: In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note: AC access timing condition: drive ability 4 mA, output load 400 pF

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

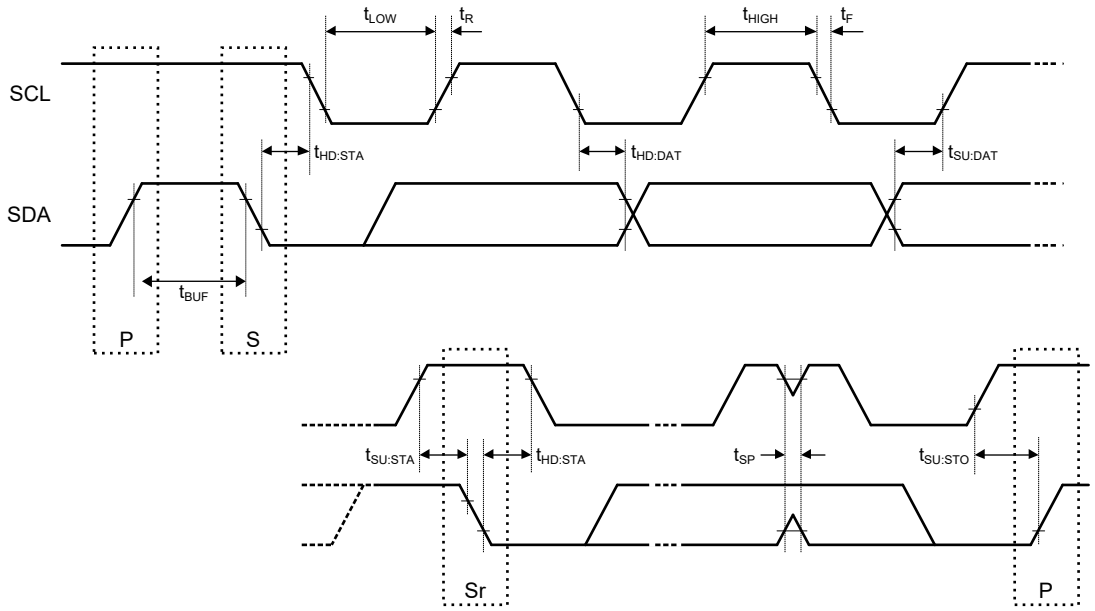
Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time ($t_{SU:DAT}$ (min.) 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released (t_R (max.) + $t_{SU:DAT}$ (min.) = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICϕ) and the NF[1:0] bits in RIICnMR3. For details, refer to **Section 25, I²C Bus Interface**.

Note 6. When using RIIC ch2 or RIIC ch3, the following limitations exists.
- Driving ability: IOLH_xx[1:0] = 01b
- Tfmin cannot meet the specification when the load of bus line is less than 200 pF.
- The range of pull-up resistance (Rp) (in the case of 200/300/400 pF)
  Cb is 200 pF: 1076.7 to 1770Ω, Cb is 300 pF: 966.7 to 1180Ω, Cb is 400 pF: 856.7 to 885Ω

Note 7. When using RIIC ch2 or RIIC ch3, the following limitations exists.
- Driving ability: IOLH_xx[1:0] = 11b
- The range of pull-up resistance (Rp) (in the case of 10/150/275/400/550 pF)
  Cb is 10 pF: 300 to 14163Ω, Cb is 150 pF: 300 to 944Ω, Cb is 275 pF: 300 to 515Ω, Cb is 400 pF: 300 to 354Ω, Cb is 550 pF: 300Ω (fixed)
- Tfmin cannot meet the specification in fast-mode plus.



Note: P: Stop condition
S: Start condition
Sr: Start condition for retransmission

Figure 47.42 Input/Output Timing

47.5.16 I3C Bus Interface Access Timing

Table 47.35 Characteristics of the SDA and SCL Bus Lines for Standard, Fast, and Fast-Mode Plus I²C-Bus Devices*1

Item	Symbol	Conditions	Standard-Mode		Fast-Mode		Fast-Mode Plus		Unit
			Min.	Max.	Min.	Max.	Min.	Max.	
SCL clock frequency	f_{SCL}		0	100	0	400	0	1000	kHz
Hold time (repeated) START condition	$t_{HD:STA}$	After this period,the first clock pulse is generated	4.0	—	0.6	—	0.26	—	µs
LOW period of the SCL clock	t_{LOW}		4.7	—	1.3	—	0.5	—	µs
HIGH period of the SCL clock	t_{HIGH}		4.0	—	0.6	—	0.26	—	µs
Setup time for a repeated START condition	$t_{SU:STA}$		4.7	—	0.6	—	0.26	—	µs
Data hold time*2	$t_{HD:DAT}$	I²C-bus device	0 *3	—*4	0*3	—*4	0	—	µs
Data setup time	$t_{SU:DAT}$		250	—	100	—	50	—	ns
Rise time of both SDA and SCL signals	t_r		—	1000	20	300	—	120	ns
Fall time of both SDA and SCL signals*3,*6,*7	t_f		—	300	20 × (I3C_PV_{DD}/ 5.5 V)	300	20 × (I3C_PV_{DD}/ 5.5 V)*8	120*7	ns
Setup time for STOP condition	$t_{SU:STO}$		4.0	—	0.6	—	0.26	—	µs
Bus free time between a STOP and START condition	t_{BUF}		4.7	—	1.3	—	0.5	—	µs

Note 1. All values referred to V_{IH}(min) (0.3 × I3C_PV_{DD}) and V_{IL}(max) (0.7 × I3C_PV_{DD}) levels, refer to **Table 47.6**

Note 2. $t_{HD:DAT}$ is the data hold time that is measured from the falling edge of SCL, applies to data in transmission and the acknowledge.

Note 3. A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the V_{IH}(min) of the SCL signal) to bridge the undefined region of the falling edge of SCL.

Note 4. The maximum $V_{HD:DAT}$ could be 3.45 µs and 0.9 µs for Standard mode and Fast mode, but must be less than the maximum of $t_{VD:DAT}$ or $t_{VD:ACK}$ by a transition time. This maximum must only be met if the device does not stretch the LOW period () of the SCL signal. If the clock stretches the SCL, the data must be valid by the setup time before it releases the clock.

Note 5. A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement $t_{SU:DAT}$ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_r(max) + $t_{SU:DAT}$ = 1000 + 250 = 1250 ns (according to the Standard-mode I²C-bus specification) before the SCL line is released. Also the acknowledge timing must meet this set-up time.

Note 6. The maximum t_f for the SDA and SCL bus lines is specified at 300 ns. The maximum fall time for the SDA output stage t_f is specified at 250 ns. This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified t_f.

Note 7. In Fast-mode Plus, fall time is specified the same for both output stage and bus timing. If series resistors are used, designers should allow for this when considering bus timing.

Note 8. Necessary to be backwards compatible to Fast-mode.

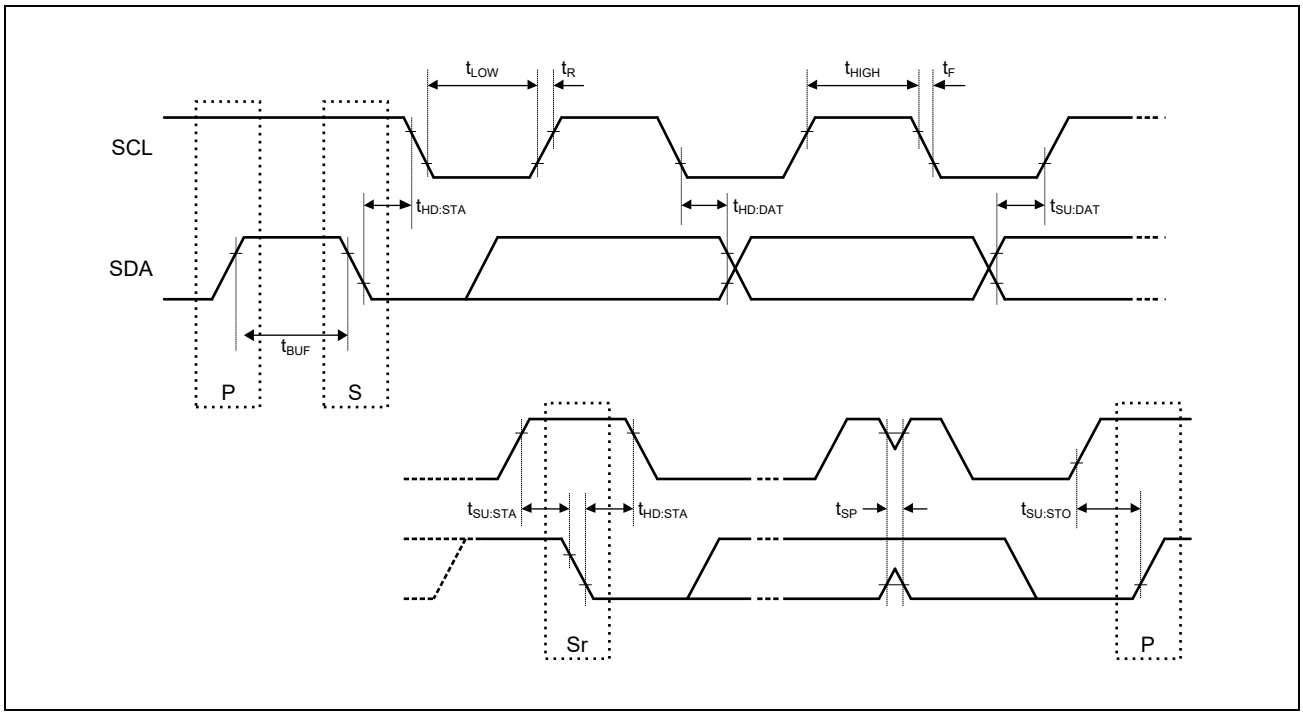


Figure 47.43 Input/Output Timing

Table 47.36 I3C Open Drain Timing Parameters

Item	Symbol	I3C Open Drain Mode			Figures	Notes
		Min.	Max.	Unit		
Low Period of SCL Clock	t_{LOW_OD}	200	—	ns	**Figure 47.47**	*1, *2
	$t_{DIG\_OD\_L}$	t_{LOW_ODmin} + t_{fDA_ODmin}	—	ns	**Figure 47.47**	
High Period of SCL Clock	t_{HIGH}	—	41	ns	**Figure 47.45**	*3, *4
	t_{DIG_H}	—	t_{HIGH} + t_{CF}	ns	**Figure 47.45**, **Figure 47.54**	
Fall Time of SDA Signal	t_{fDA_OD}	t_{CF}	12	ns	**Figure 47.47**	
SDA Data Setup Time During Open Drain Mode	t_{SU_OD}	3	—	ns	**Figure 47.46**, **Figure 47.47**	*1
Clock After START(S) Condition	t_{CAS}	38.4 nano	For ENTAS0: 1 µ For ENTAS1: 100 µ For ENTAS2: 2 milli For ENTAS3: 50 milli	seconds	**Figure 47.47**	*5, *6
Clock Before STOP(P) Condition	t_{CBP}	t_{CASmin}/2	—	seconds	**Figure 47.48**	
Current Master to secondary Master Overlap time during handoff	$t_{MMOverlap}$	$t_{DIG\_OD\_Lmin}$	—	ns	**Figure 47.53**	
Bus Available Condition	t_{AVAL}	1	—	µs	—	*7
Bus Idle Condition	t_{IDLE}	200	—	µs	—	
Time Internal Where New Master Not Driving SDA Low	t_{MMLock}	$t_{AVALmin}$	—	µs	**Figure 47.53**	

Note 1. This is approximately equal to t_{LOWmin} + t_{DS_ODmin} + t_{fDA_ODtyp} + t_{SU_ODmin}.

Note 2. The Master may use a shorter low period if it knows that this is safe, i.e., that SDA is already above V_{IH}.

Note 3. Based on t_{SPIKE}, rise and fall times, and interconnect.

Note 4. This maximum High period may be exceeded when the signals can be safely seen by Legacy I^2C Devices, and/or in consideration of the interconnect (e.g., a short bus).

Note 5. On a Legacy Bus where I^2C Devices need to see Start, the t_{CAS}(min) value is further constrained.

Note 6. Slaves that do not support the optional ENTASx CCCs shall use the t_{CAS}(max) value shown for ENTAS3.

Note 7. On a Mixed Bus with Fm Legacy I^2C Devices, t_{AVAL} is 300 ns shorter than the Fm Bus Free Condition time (t_{BUF}).

Table 47.37 I3C Push-Pull Timing Parameters for SDR Mode

Clock After Repeated START (Sr)		t_{CASr}	t_{CASmin}	—	N/A	ns	**Figure 47.52**	—
Clock Before Repeated START (Sr)		t_{CBSr}	t_{CASmin} / 2	—	N/A	ns	**Figure 47.52**	—
Capacitive Load per Bus Line (SDA/SDL)		C_b	—	—	50	pF	—	—

Note 1. FSCL = 1 / (t_{DIG_L} + t_{DIG_H})

Note 2. t_{DIG_L} and t_{DIG_H} are the clock low and high periods as seen at the receiver end of the I3C bus using V_{IL} and V_{IH} (see **Figure 47.44**).

Note 3. When communicating with an I3C Device on a mixed Bus, the $t_{DIG\_H\_MIXED}$ period must be constrained in order to make sure that I^2C Devices do not interpret I3C signaling as valid I^2C signaling.

Note 4. As both edges are used, the hold time needs to be satisfied for the respective edges; i.e., t_{CF} + 3 for falling edge clocks, and t_{CR} + 3 for rising edge clocks.

Note 5. The clock maximum rise/fall time is capped at 60 ns. For lower frequency rise and fall the maximum value is limited at 60 ns, and is not dependent upon the clock frequency.

Note 6. t_{HD_PP} is a Hold time parameter for Push-Pull Mode that has a different value for Master mode vs. Slave mode. In SDR Mode the Hold time parameter is referred to as t_{HD_SDR}.

Note 7. Devices with more than 12 ns of t_{SCO} delay shall set the limitation bit in the BCR, and shall support the GETMXDS CCC to allow the Master to read this value and adjust computations accordingly. For purposes of system design and test conformance, this parameter should be considered together with pad delay, bus capacitance, propagation delay, and clock triggering points.

Note 8. Pad delay based on 90Ω/4 mA driver and 50 pF load. Note that Master may be a Slave in a multi-Master system, and thus shall also adhere to this requirement.

47.5.17 Serial Communications Interface with FIFO (SCIFA) Access Timing

Table 47.38 SCIFA Timing

Item			Symbol	Min.	Max.	Unit	Figures
SCIFA	Input clock cycle	Asynchronous	t_{Scyc}	4	—	t_{p1cyc}*1	**Figure 47.55**
		Clocked synchronous		12	—		
	Input clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Input clock rise time		t_{SCKr}	—	5	ns	
	Input clock fall time		t_{SCKf}	—	5	ns	
	Output clock cycle	Asynchronous*2	t_{Scyc}	8	—	t_{p1cyc}*1	
		Clocked synchronous		4	—		
	Output clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Output clock rise time		t_{SCKr}	—	9	ns	
	Output clock fall time		t_{SCKf}	—	9	ns	
	Transmit data delay time	Internal clock	t_{TXD}	−10	10	ns	**Figure 47.56**
		External clock		3 × t_{p1cyc}*1	4 × t_{p1cyc}*1 + 20		
	Receive data setup time	Internal clock	t_{RXS}	3 × t_{p1cyc}*1 + 20	—	ns	
		External clock		t_{p1cyc}*1 + 10	—		
	Receive data hold time	Internal clock	t_{RXH}	−3 × t_{p1cyc}*1	—	ns	
		External clock		2 × t_{p1cyc}*1 + 10	—		

Note: AC access timing condition: drive ability 12 mA, output load 30 pF, slew

Note 1. t_{p1cyc} indicates peripheral clock means SCIFn_CLK_PCK (P0ϕ) (n = 0 to 5).

Note 2. When the SEMR.ABCS0 and SEMR.BGDM bits are set to 1.
