10. 其他 The others

10.1 铝电解电容器的应用注意事项

Caution for proper use of aluminium electrolytic capacitors

12.1.1. 电解电容是有极性的 DC electrolytic capacitors are polarized

当施加反向直流电压时，电容器将损坏，电路中使用没有极化电容会被损坏，因为可施加到正电压的阴极端子的电路中流过异常电流。 When reverse voltage is applied on DC electrolytic capacitors, the capacitors will become short-circuited。 Please use no polarized capacitors in the circuit be damage due to abnormal current flows through the capacitors since the circuit where the positive voltage may be applied to the cathode terminal.

10.1.2.施加电容器的额定电压 Use capacitors within rated voltage

当电容器用比额定电压更高的电压时，漏电流增加，特性显著恶化，并在很短的时间内发生损坏的结果。请特别小心的峰值电压不应超过额定电压。 When capacitor is used at higher voltage than the rated voltage, leakage current increases, characteristics drastically deteriorate and damage in a short period may occur as a result. Please take extra caution that the peak voltage should not exceed the rated voltage.

10.1.3. 充电和放电 Charge and discharge application.

当铝电解电容器用于快速充电和放电的应用，其寿命可缩短减少，热量上升，等等。

When aluminum electrolytic capacitors for general purpose are employed in rapid charge and discharge application, its life expectancy may be shortened by capacitance decrease, heat rise, etc.

10.1.4. 存储 Store the capacitors.

在已经存储了长时间的铝电容器其漏电流上升是常见的。存储温度越高，漏电流增大，因此，请采取预防措施，如存储环境。有电压被施加到电容器上时其漏电流逐渐减小。漏电流增加，会造成问题，因此，使用前在电路中施加电压（老化）。 Increased leakage current is common in aluminum capacitors which have been stored for long period of time. The Higher the storage temperature, the higher the leakage current increase,

therefore please take precautions concerning the storage location. The leakage current decreases

gradually as voltage are applied to the capacitor. In cases where increased leakage current causes problems in the circuit, apply voltage (aging) before using.

10.1.5 适用于电容器的纹波电流不应超过额定的值

Ripple current applied to capacitors should not exceed the rated value.

如果纹波电流超过指定值，过多的热量会减少容量和缩短电容寿命。因此纹波电压的峰值应不超过额定值。

Excessive heat will reduce capacitance and result in shortened life of capacitor if ripple currents exceeding the specified rated value are applied. The peak value of the ripple voltage should be less than the rated voltage.

10.1.6. 环境温度 Ambient temperature.

铝电解电容器的寿命受环境温度的影响。人们普遍表示, 温度每下降 10℃ 寿命加倍。Life of the aluminum electrolytic capacitor is affected by the ambient temperature. It is generally stated, that life doubles for each 10°C decrease in temperature.

10.1.7. 引线的强度 Intensity of lead

加到引线或端子, 应力的内部连接。这可能会导致短路, 开路或漏电流增加。在电容器已被焊接到 PC 板上后, 弯曲或后处理电容器是不可取的。

When a strong force is applied to the lead wires or terminals, stress is put on the internal connections. This may result in short circuit, open circuit or increased leakage current. It is not

10.1.8 在焊接过程中的耐热性 Heat resistance at the soldering process

在 PC 板上安装铝电解电容器的浸焊工艺中, 观察到 PET 外套二次收缩或开裂时, 焊料的温度太高或浸渍时间太长。Advisable to bend or handle a capacitor after it has been soldered to the PC board.

In the dip soldering process of PC board with aluminum electrolytic capacitors mounted, secondary shrinkage or crack of PET sleeve may be observed when solder temperature is too high or dipping time is too long.

10.1.9. PC 板的孔间距和位置 Hole pitch and position of PC board.

设计印刷电路板, 其孔距适合指定的目录或规格的电容的引线间距。当电容器强行插入一个孔间距时, 把应力加在引线。这可能会导致短路或漏电流增加。

capacitor specified by the catalog or specifications. When a capacitor is forcibly inserted into an unmatched hole A PC board must be designed so its hole pitch coincides with the lead pitch (lead spacing) of the pitch, a stress is put on the leads. This could result in a short circuit or increased leakage current.

10.2 该产品是无铅和环保 This product is lead free and environmental friendly. (SHMLP2025931105, SGS)
