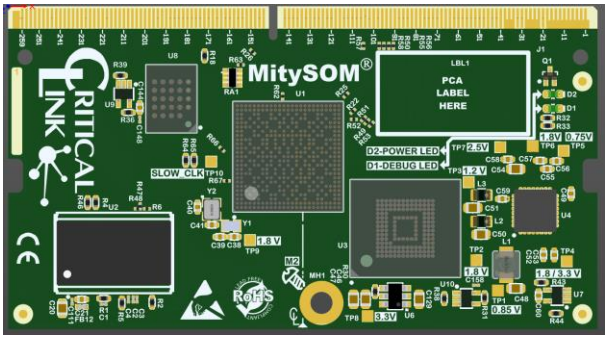
FEATURES

- TI AM62x Application Processor
  - Up to Quad Arm Cortex-A53 MPU at up to 1.4 GHz
  - 32 KB L1 Program Cache per Core
  - 32 KB L1 Data Cache per Core
  - 512 KB Shared L2 Cache
  - Advanced SIMD and floating-point extension (Arm Neon)
  - JTAG Emulation/Debug
- Single Core Arm Cortex-M4F MCU at up to 400 MHz with 256 KB SRAM
- Dual Core Programmable Real Time Unit (PRU) at up to 333 MHz
- 3D Graphics Processing Unit supporting OpenGL ES 3.x - Processor Dependent
- AM62x Processor Choices
  - AM6254 (Quad Core, 3D)
  - AM6252 (Dual Core, 3D)
  - AM6251 (Single Core, 3D)
  - AM6234 (Quad Core)
  - AM6232 (Dual Core)
  - AM6231 (Single Core)
- Up To 4 GB DDR4 CPU RAM
  - 16 bits wide, 3.2 GB/sec transfer rate
- Up to 128 GB eMMC FLASH
  - 8 bits wide, HS200 speed
- Up to 256 MB Octal/Quad SPI NOR FLASH
- Arm Cortex-R5F processor for boot, resource, and power management.
- Watchdog Timer
- Real-time clock
- Secure Boot
- Crypto Hardware Accelerators (AES, SHA, DRBG, PKA)



STANDARD DDR4 SO-DIMM-260 INTERFACE

- 2 10/100/1000 Mbps EMACs
- 1 MIPI CSI 1.3 Camera Input, 4 lanes up to 2.5 Gbps
- Dual Display Support
  - Up to 1080p for each display
  - 1 24-bit RGB output
  - 2x4 lanes OLDI/LVDS
- 3 CAN ports
- 7 UARTs
- 2 USB 2.0 Dual Role Device Ports
- 3 multi-Channel MCASPs
- 2 4 lane MMC/SD/SDIO
- 3 SPI, 3 I2C, GPIO
- eHRPWM, eQEP
- Single 3.3V Input Power Supply

APPLICATIONS

- Embedded Instrumentation
- Industrial Automation
- Industrial Instrumentation
- Medical Instrumentation
- Human Machine Interfaces (HMI)
- Closed Loop Motor Control

BENEFITS

- Rapid Development / Deployment
- Multiple Connectivity / Interface Options
- Rich User Interfaces
- High System Integration
- High Level OS Support
  - Linux Kernel
  - Android

DESCRIPTION

The MitySOM-AM62 series of highly configurable, small form-factor processor cards features one of Texas Instruments Sitara AM62x Processors. The module includes (optional) eMMC FLASH, (optional) Octal or Quad SPI NOR FLASH, and DDR4 RAM memory subsystems. A MitySOM-AM62 provides a complete and flexible CPU infrastructure for highly integrated embedded systems.

The onboard AM62x processor provides up to a Quad Core Cortex-A53 64-bit RISC processor with a NEON SIMD coprocessor. This microprocessor unit (MPU) can run a rich set of real-time operating systems containing software applications programming interfaces (APIs) expected by modern system designers. The ARM architecture supports several operating systems, including Linux and Android.

In addition to the Cortex-A53, the AM62x family also offers a Single Core Arm Cortex-M4F MCU at up to 400 MHz as well as a dual core 32 bit Programmable Real-Time Units (PRUs) that may be clocked at up to 333 MHz. The Cortex-M4F and the PRUs are RISC processors that run independently of the main Cortex-A53 MPU complex and have access to all the on-chip peripherals as well as all external memory. These can be used for any purpose. Typical applications for the M4F might include safety critical software operation or realtime handling of attached peripherals, etc. Applications for the PRUs include the implementation of custom, industrial serial, or Ethernet protocols such as PROFIBUS or EtherCAT.

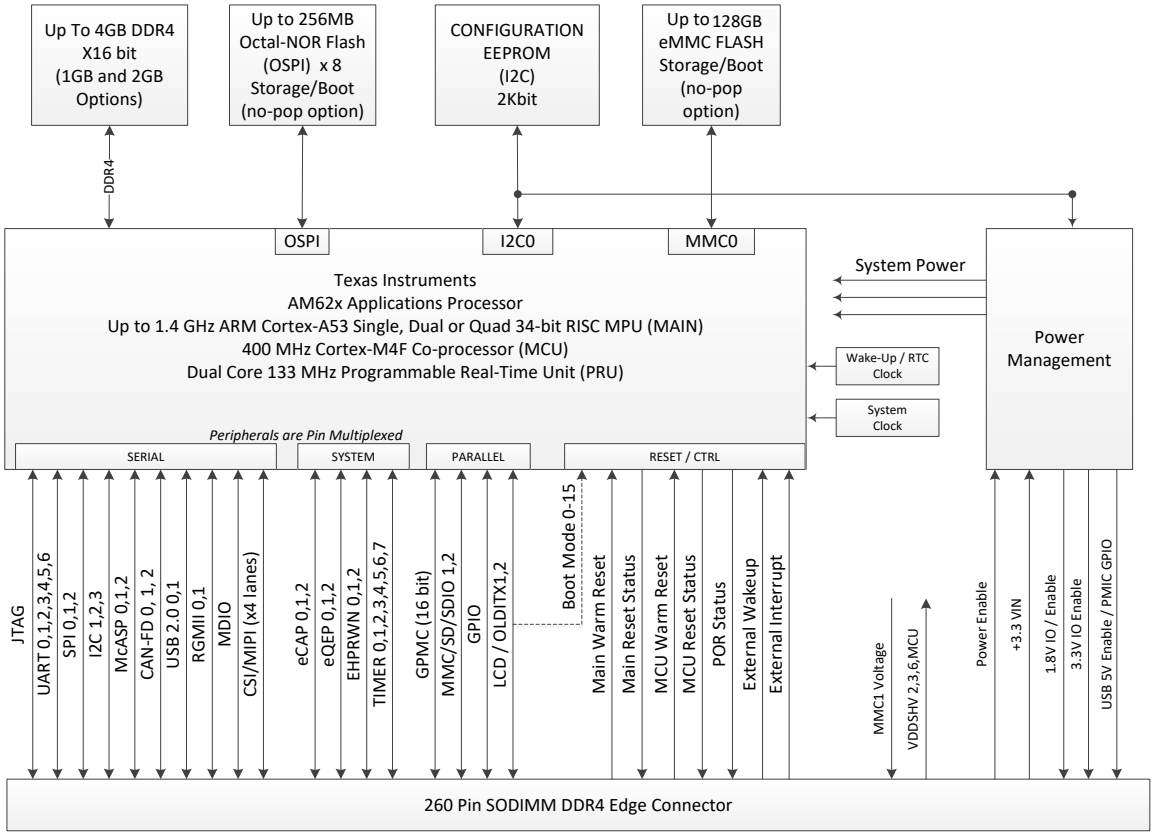


Figure 1 MitySOM-AM62 Block Diagram

Figure 1 provides a top level block diagram of the MitySOM-AM62 processor card. As shown in the figure, the primary interface to the MitySOM-AM62 is through a standard DDR4 SO-DIMM-260 card edge interface. The interface provides power, synchronous serial connectivity, and many other interfaces provided by the Sitara processor. Details of the SO-DIMM-260 connector interface are included in the SO-DIMM-260 Interface Description, below.

MitySOM-AM62 Onboard DDR Memory Options

The AM62x processor includes one dedicated 16 bit DDR4 SDRAM memory interface. The MitySOM-AM62 includes up to 4 GB of DDR4 RAM integrated on board the module. The memory bus interface is capable of burst transfer rates of 3200 MB / second.

MitySOM-AM62 Onboard Storage Memory

eMMC FLASH (Optional)

Up to 128GB of on-board eMMC FLASH memory is connected to the AM62x processor using the MMC0 interface peripheral. The eMMC FLASH memory is typically used to store the following types of data:

- Bootloaders
- ARM Linux / Android embedded root file-system
- runtime ARM software
- runtime application data (non-volatile storage)

NOR FLASH (Optional)

Up to 256 MB of on-board Octal or Quad SPI NOR FLASH memory is connected to the AM62x using the OSPI/QSPI peripheral interface. The AM62x provides additional SPI interfaces with both interfaces available on the SO-DIMM connector. This memory may be desirable for applications requiring more reliable/tolerant storage or faster access times.

Configuration EEPROM

The MitySOM-AM62 contains a (minimum) 256 x 8-bit EEPROM that is used to hold configuration data for the module. The EEPROM is connected to the AM62x using the I2C0 interface at address 1010XXXb (0x50 to 0x57). This EEPROM is not available for customer use.

External Interfaces

The AM62x makes extensive use of functional pin multiplexing to provide a highly configurable device that can be tailored to a multitude of applications. A list of the interfaces/functions that are available to the user via the edge connector interface is provided below.

- 2 Universal Serial Bus (USB) 2.0 High-Speed port supporting host/peripheral/dual role mode
- 3 Controller-Area Network (CAN) ports with Can-FD support
- 3 Multichannel Audio Serial Ports (McASP)
- 2 Industrial Gigabit Ethernet MAC's (10/100/1000 Mbps)
- 2 SD/SDIO 4-bit ports supporting UHS-I
- 2 OLDI/LVDS display drivers
- 1 24 bit RGB display driver
- 1 MIPI Camera Serial Interface (CSI-Rx), 4 Lane with DPHY.
- 3 Enhanced Capture (eCAP) Modules
- 3 Enhanced PWM (ePWM) modules
- 3 32-bit Enhanced Quadrature Pulse Encoder (eQPE) modules
- 4 Timers
- 3 Serial Peripheral (SPI) ports
- 7 Universal Asynchronous Receive/Transmit (UART) ports
- 3 Inter-Integrated Circuit (I2C) ports (I2C1, I2C2, & I2C3)
- General Purpose Memory Controller (GPMC) interface
- JTAG/Debugger port

Additionally, most of the pin multiplexed signals can be configured as general purpose I/O signals with interrupt capability.

Software and Application Development Support

Users of the AM62x are encouraged to develop applications using the MitySOM-AM62 software development kit provided by Critical Link LLC. The SDK is an expansion of the TI platform support package for the AM62x and includes a Linux root filesystem/distribution and compatible gcc compiler tool-chain with debugger.

Growth Options

The AM62x has been designed to support several upgrade options. These options include various speed grades, memory configurations, and operating temperature specifications including commercial and industrial temperature ranges. The available options are listed in the section below containing ordering information. For additional ordering information and details regarding these options, or to inquire about a particular configuration not listed below, please contact a Critical Link sales representative.

ABSOLUTE MAXIMUM RATINGS

If Military/Aerospace specified cards are required, please contact the Critical Link Sales Office or unit Distributors for availability and specifications.

Maximum Supply Voltage, Vcc	3.5 V
Storage Temperature Range	-65ºC to 80ºC

OPERATING CONDITIONS

Commercial Temperature Range	0ºC to 70ºC
Industrial Temperature Range	-40ºC to 85ºC

SO-DIMM-260 Interface Description

The primary interface connector for the MitySOM-AM62 is the DDR4 SO-DIMM card edge interface which contains 5 types of signals:

- Power input (P)
- Power Output (PO)
- Dedicated signals mapped to the on-board Power Management device (PM)
- Dedicated signals mapped to the AM62x device (I/O)
- Multi-function signals mapped to the AM62x device (I/O/IO)

Table 1 contains a summary of the MitySOM-AM62 pin mapping.

Table 1 SO-DIMM Pin-Out

Note 1: GPMC_AD[0..15] are strapped during power on reset as the BOOTMODE[0..15] pins. GPMC_AD[3..15] must be pulled up or pulled down while the PORz_OUT signal is asserted to VDDSHV3 or GND in order to select the proper boot device and configuration. See the AM62x Technical Reference Manual for more information. GPMC_AD0, GPMCA_AD1, and GPMC_AD2 are set to logic 1, 1, 0 (respectively) on the SOM using 10K pullup/pulldown resistors to select a 25 MHz input clock frequency.

Note 2: Please reference Table 2 for information on the maximum current supply of these voltage outputs.

Note 3: PMIC_PBn is tied to pin 25 of the TPS65219 PMIC. It must be pulled to VIN to power on the SOM.

Note 4: USB0_VBUS_DETECT and USB1_VBUS_DETECT are not 5V compliant and should not be connected directly to the VBUS signal of a USB circuit. The voltage must be reduced to be compliant with a 3.3V IO input. See the AM62x Technical Reference Manual for more information.

Note 5: VMON_VSYS may be used for an external power supply monitor. It has a valid range of 0 to 1V and the threshold is 0.45V. If it is not used, it should be tied to GND.

Note 6 : VPP should be 1.8V, used for programming AM62x Crypto Keys. VPP should only be powered after VDD_1V8 is available and immediately prior to attempts to program the keys using AM62x software. Otherwise, tie to GND.

ELECTRICAL CHARACTERISTICS

Table 2: Electrical Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Units
VIN	Voltage supply, volt input.		3.2	3.3	3.5	Volts
I_{VIO_3P3}	Max current draw[2]	3.3 volt IO output			250	mA
I_{VIO_1P8}	Max current draw[2]	1.8 volt IO output			1500	mA
$I_{3.3}$	Quiescent Current draw[1]	3.3 volt input	-	240	-	mA
$I_{3.3\text{-}max}$	Max current draw[1]	3.3 volt input	-	520	TBS	mA
FCPU	CPU internal clock Frequency (PLL output)		800	1250	1400	MHz
FEMIF	GPMC bus frequency		-	133	-	MHz

1. Power utilization of the MitySOM-AM62 is heavily dependent on end-user application. Major factors include: ARM CPU PLL configuration, CPU Utilization, and external DDR4 RAM utilization.
2. The MitySOM-AM62 module provides both 1.8V (Pins xx) and 3.3V (Pins xx) output supplies from the module. These outputs are sequenced from the PMIC and the maximum power output specified should not be exceeded as these supplies also power the module itself. The 3.3V output signal, in general, should be used as an enable control for a load switch on the carrier card for 3.3V digital logic connected to the MitySOM-AM62.

ORDERING INFORMATION

The following table lists the standard module configurations. For shipping status, availability, and lead time of these or other configurations please contact Critical Link at info@criticallink.com.

Table 3: Standard Model Numbers

Model	A53 Cores	GPU	Max Cortex-A53 Speed	NOR Flash	eMMC	DDR4 RAM	Operating Temp
6231-HX-XXA-RC	1	N	800 MHz	N/A	N/A	1G	0C to 70C
6231-HX-XXA-RI	1	N	800 MHz	N/A	N/A	1G	-40C to 85C
6252-IX-XXD-RC	2	Y	1000 MHz	N/A	N/A	2G	0C to 70C
6252-IX-XXD-RI	2	Y	1000 MHz	N/A	N/A	2G	-40C to 85C
6252-IX-X8D-RC	2	Y	1000 MHz	N/A	16GB	2G	0C to 70C
6252-IX-X8D-RI	2	Y	1000 MHz	N/A	16GB	2G	-40C to 85C
6254-TX-XXD-RC	4	Y	1400 MHz	N/A	N/A	2G	0C to 70C
6254-TX-XXD-RI	4	Y	1400 MHz	N/A	N/A	2G	-40C to 85C
6254-TX-X9E-RC	4	Y	1400 MHz	N/A	32GB	4G	0C to 70C

MECHANICAL INTERFACE

A mechanical outline of the MitySOM-AM62 is illustrated in Figure 2, below. Provisions for an M2 screw have been included for the side of the board away from the DDR4 SO-

DIMM edge connector if heavy vibration environments are expected. A full STEP model of the SOM may be downloaded from the Critical Link support site.

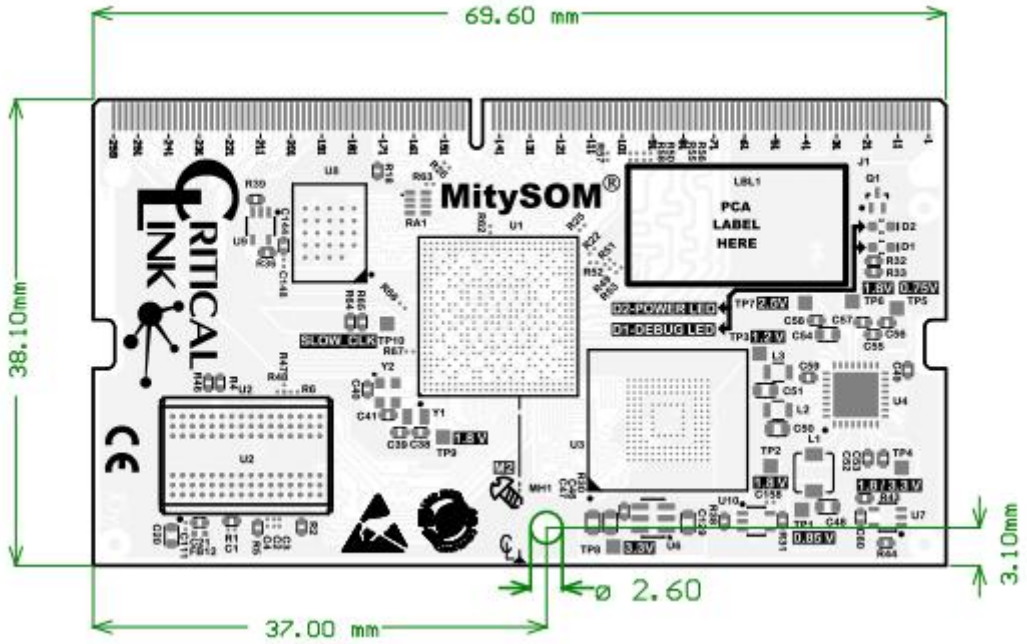

Figure 2 MitySOM-AM62 Mechanical Outline

REVISION HISTORY

Date	Rev	Change Description
15-SEPT-2022	1A	Draft Spec
16-NOV-2022	1B	Updated standard parts list in Table 3 and maximum eMMC available.
